Compressed file

4/19/20 14:39

why? we want to make sure this is actually a huffman compressed file before we start decompression. since an int is 32 bits there is a $\frac{1}{2^{32}}$ chance we decompress a file that is not actually a huffman file. That's a 0.00000000232 8% chance!

why? we need to know what type of header content is coming so we can rebuild our tree correctly

32 bits = integer size

*use BITS_PER_INT constant provided

why? tells us to stop decompression

extra padding of 0's (your computer will do this for you)
why? files have to be in 8 bit (1 byte) increments. Depending on the encoding, we might be missing a few bits at the end so the computer will add on some 0's for us.

HEADER FORMATS:

COUNTS FORMAT:

there are 256 different values we can encode
($2^8 = 256$)
(bits per byte)

to remake the tree, we need to know the frequency of each value.

we store them like an array

Note: we do not include the PEOF because that frequency is always 1, you will have to add it yourself to the priority queue when decompressing

TREE FORMAT:

instead of storing frequencies (because this takes quite a bit of memory when a lot of values might not even be in the original file i.e. freq of 0) we can pass along the tree!

we use 0 to represent a non-leaf node
we use 1 to represent a leaf node
↳ a leaf node represents a value that was compressed after we store a 1 for the leaf node, we use 9 bits to to store the value (not freq) of that tree node
why 9? we have 256 values + 1 PEOF which means there are 257 values which fits into a minimum of 9 bits

the nodes are stored using a pre-order traversal

ex. 0 0 0 0 1 00 01000011 1 1000000000 1 001000001 0 1 00101001 1 001000010 1 000100000

Steps to read: (use recursion)
- read in 1 bit
- if 0 it is inner leaf node
  - make empty node
  - set left child to recursive call
  - set right child to recursive call
  - return self
- if 1 it is leaf node
  - read in 9 more bits (this is value of node)
  - make new node w/ this value
  - return this
- if it is -1
  throw exception

should not happen if header is formed correctly

* note that the numbers and letters in each node each represent the value of the node. They mean the same thing

not in the ascii table. we made this up!
