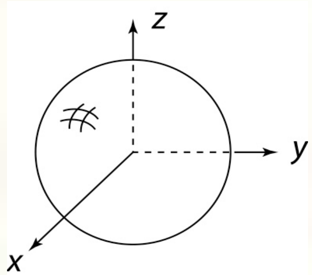
Mathematical surface representations

- Explicit $z = f(x,y)$ (a.k.a., a "height field")
  - what if the curve isn't a function, like a sphere?



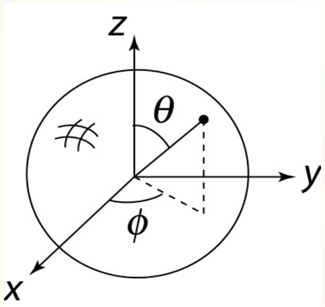
- Implicit $g(x,y,z) = 0$

- Parametric $S(u,v) = (x(u,v), y(u,v), z(u,v))$
  - For the sphere:

    $x(u,v) = r \cos 2\pi v \sin \pi u$

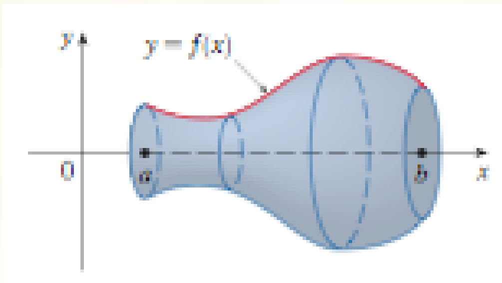
    $y(u,v) = r \sin 2\pi v \sin \pi u$

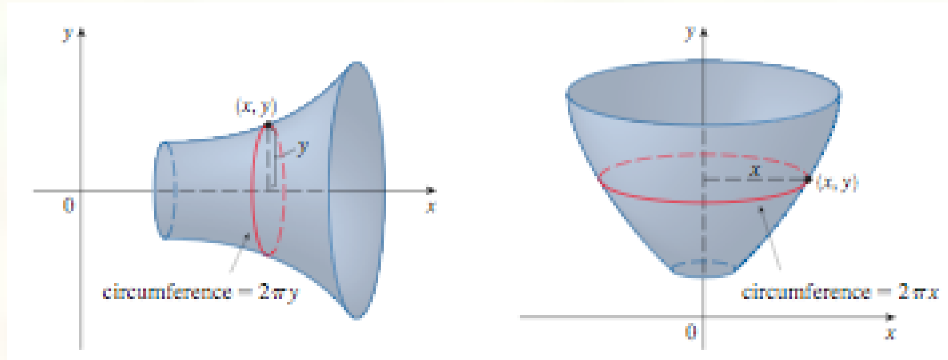
    $z(u,v) = r \cos \pi u$



As with curves, we'll focus on parametric surfaces.

Surfaces of revolution





- Idea: rotate a 2D **profile curve** around an axis.
- What kinds of shapes can you model this way?
- **Find:** A surface $S(u,v)$ which is radius(z) rotated about the z axis.
- **Solution:**

$$x = \text{radius}(u)\cos(v)$$

$$y = \text{radius}(u)\sin(v)$$

$$z = u \qquad u \in [z_{\min}, z_{\max}], \quad v \in [0, 2\pi]$$

Extruded surfaces

- **Given:** A curve $C(u)$ in the xy-plane:

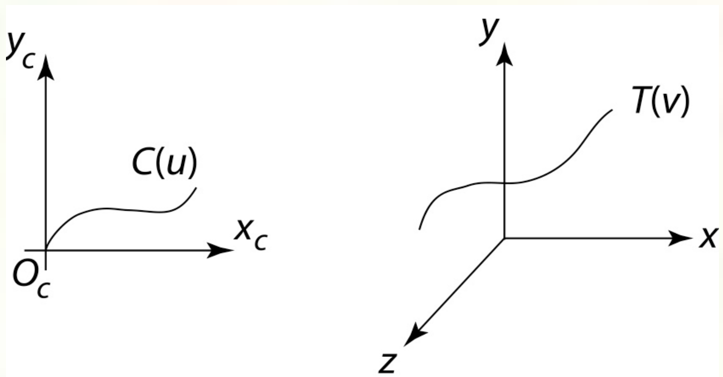
$$C(u) = \begin{bmatrix} c_x(u) \\ c_y(u) \\ 0 \\ 1 \end{bmatrix}$$

- **Find:** A surface $S(u,v)$ which is $C(u)$ extruded along the z axis.
- **Solution:**

$$\begin{aligned} x &= c_x(u) \\ y &= c_y(u) \qquad u \in [u_{\min}, u_{\max}], \quad v \in [z_{\min}, z_{\max}] \\ z &= v \end{aligned}$$

General sweep surfaces

- The **surface of revolution** is a special case of a **swept surface**.
- Idea: Trace out surface $S(u,v)$ by moving a **profile curve** $C(u)$ along a **trajectory curve** $T(v)$.



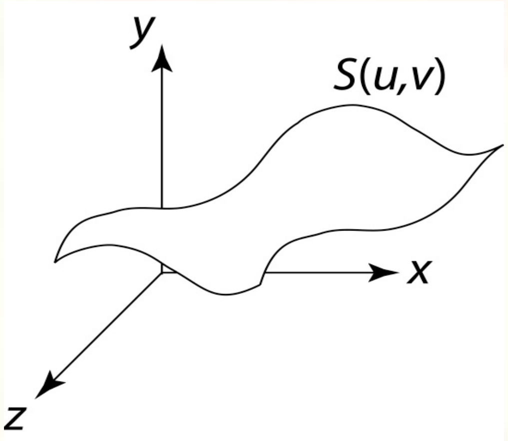
- More specifically:
  - Suppose that $C(u)$ lies in an (x_c,y_c) coordinate system with origin O_c.
  - For every point along $T(v)$, lay $C(u)$ so that O_c coincides with $T(v)$.

Orientation

- The big issue:
  - How to orient $C(u)$ as it moves along $T(v)$?

- Here are two options:

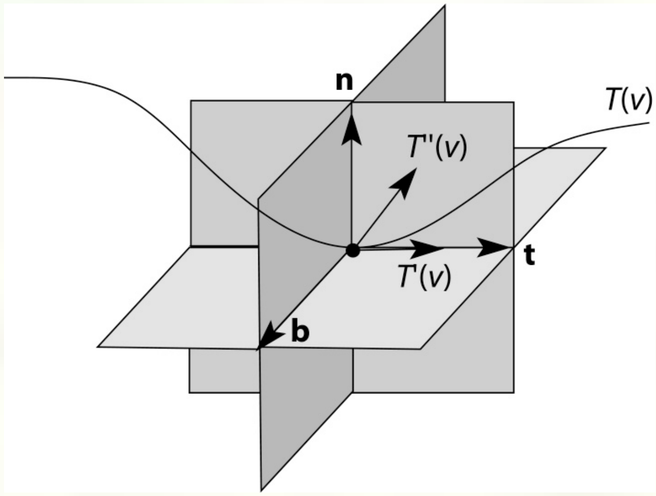
1. **Fixed** (or **static**): Just translate O_c along $T(v)$.



2. Moving. Use the **Frenet frame** of $T(v)$.
   - Allows smoothly varying orientation.
   - Permits surfaces of revolution, for example.

Frenet frames

- Motivation: Given a curve $T(v)$, we want to attach a smoothly varying coordinate system.



- To get a 3D coordinate system, we need 3 independent direction vectors.

$$\mathbf{t}(v) = \text{normalize}[T'(v)]$$

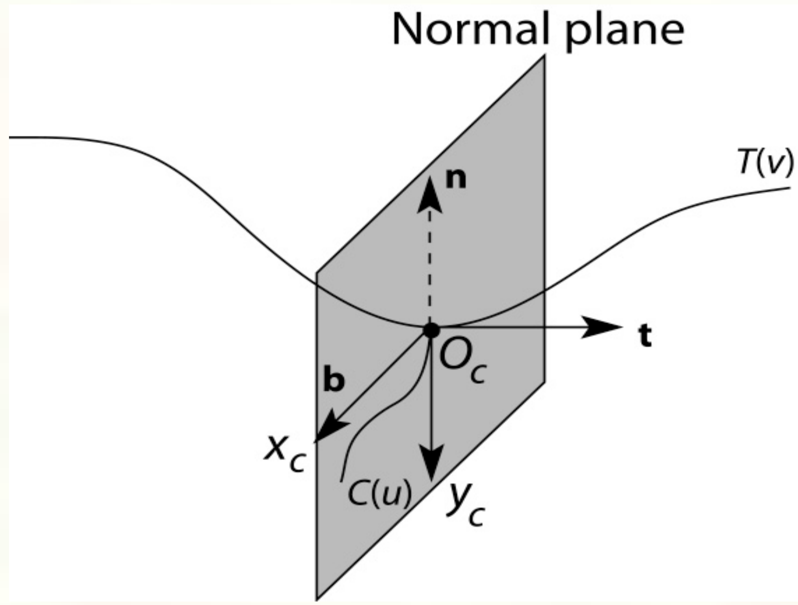
$$\mathbf{b}(v) = \text{normalize}[T'(v) \times T''(v)]$$

$$\mathbf{n}(v) = \mathbf{b}(v) \times \mathbf{t}(v)$$

- As we move along $T(v)$, the Frenet frame $(\mathbf{t},\mathbf{b},\mathbf{n})$ varies smoothly.

Frenet swept surfaces

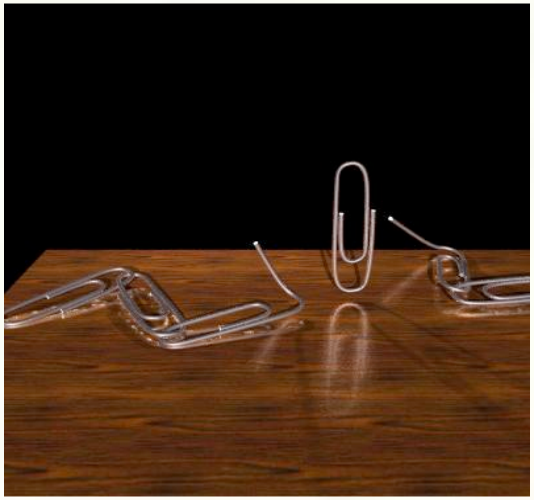
- Orient the profile curve $C(u)$ using the Frenet frame of the trajectory $T(v)$:
  - Put $C(u)$ in the **normal plane** .
  - Place O_c on $T(v)$.
  - Align x_c for $C(u)$ with **b**.
  - Align y_c for $C(u)$ with **-n**.

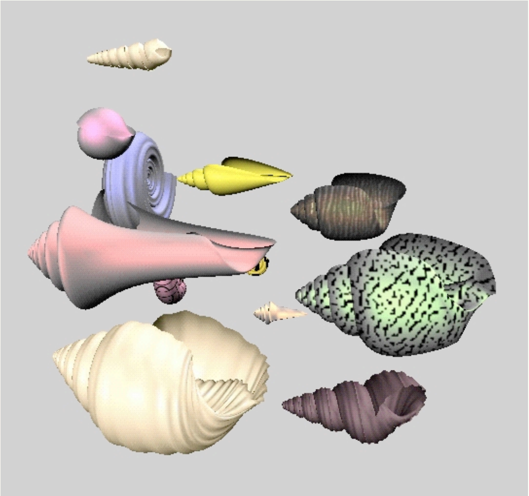


- If $T(v)$ is a circle, you get a surface of revolution exactly!
- What happens at inflection points, i.e., where curvature goes to zero?

Variations

- Several variations are possible:
  - Scale $C(u)$ as it moves, possibly using length of $T(v)$ as a scale factor.
  - Morph $C(u)$ into some other curve $\overline{C}(u)$ as it moves along $T(v)$.
  - …





Generalizing from Parametric Curves

- Flashback to curves:

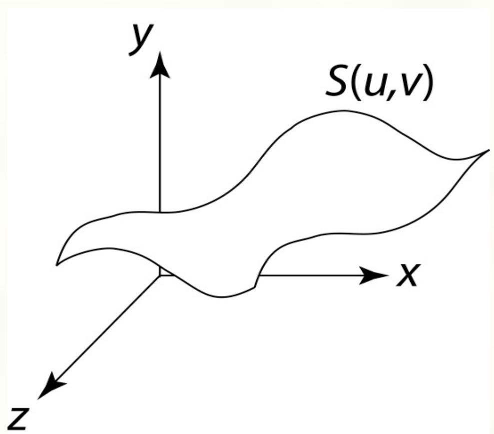
  We directly defined parametric function f(u), as a cubic polynomial.

- Why a cubic polynomial?

  - minimum degree for C2 continuity
  - "well behaved"

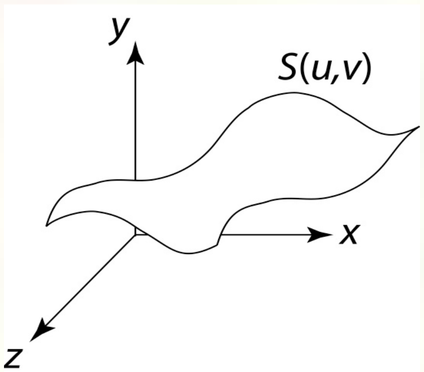
- Can we do something similar for surfaces?

Initially, just think of a height field: height = f(u,v).



Cubic patches

Cubics curves are good… Let's extend them in the obvious way to surfaces:



$$f(u) = 1 + u + u^2 + u^3$$

$$g(v) = 1 + v + v^2 + v^3$$

$$f(u)g(v) = 1 + u + v + uv + u^2 + v^2 + uv^2 + vu^2 + \ldots + u^3v^3$$

16 terms in this function.

Let's allow the user to pick the coefficient for each of them:

$$f(u)g(v) = c_0 + c_1u + c_2v + \ldots + c_{15}u^3v^3$$

Interesting properties

$$f(u,v) = c_0 + c_1 u + c_2 v + \ldots + c_{15} u^3 v^3$$

What happens if I pick a particular '*u*'?

$$f(u,v) =$$

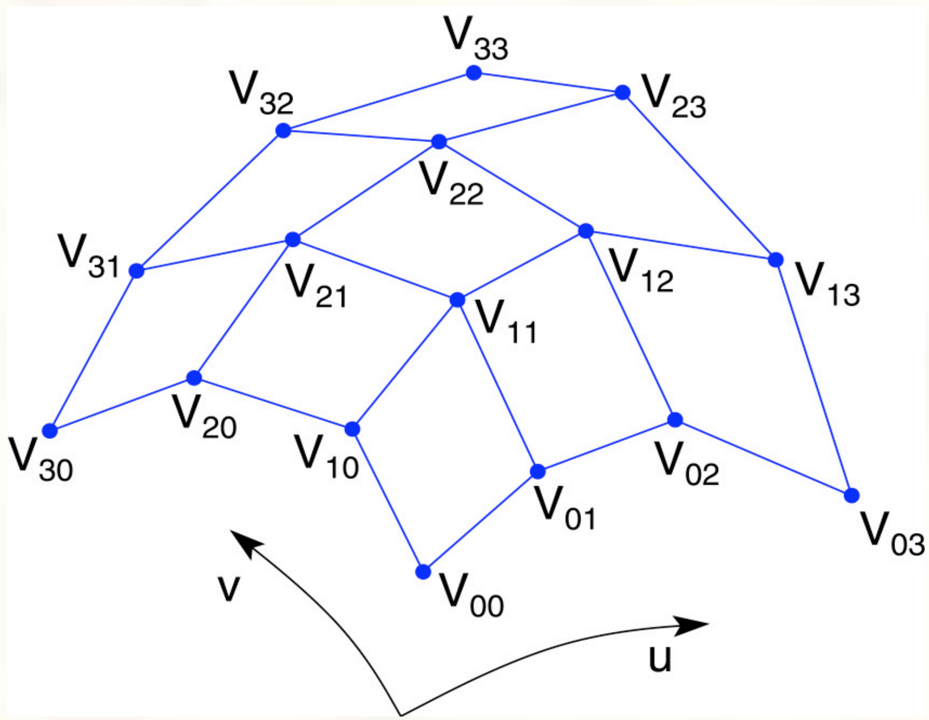
What happens if I pick a particular '*v*'?

$$f(u,v) =$$

What do these look like graphically on a patch?

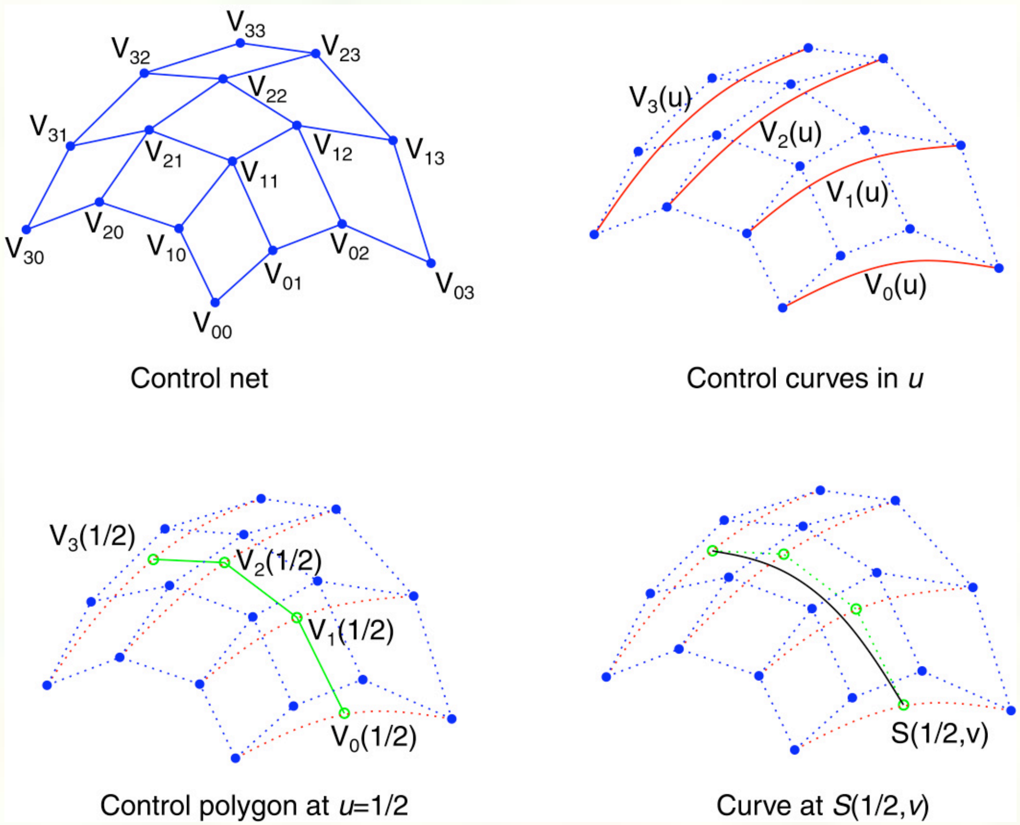
Use control points

- As before, directly manipulating coefficients is not intuitive.
  - Instead, directly manipulate control points.
  - These control points indirectly set the coefficients, using approaches like those we used for curves.



Tensor product Bézier surface

- Let's walk through the steps:



- Which control points are interpolated by the surface?

Matrix form of Bézier surfaces

- Recall that Bézier curves can be written in terms of the Bernstein polynomials:

$$\mathbf{p}(u) = \sum_{i=0}^{n} \mathrm{B}_{i,n}(u)\,\mathbf{p}_i$$

- They can also be written in a matrix form:

$$\mathbf{p}(u) = \begin{bmatrix} u^3 & u^2 & u & 1 \end{bmatrix} \begin{bmatrix} -1 & 3 & -3 & 1 \\ 3 & -6 & 3 & 0 \\ -3 & 3 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} \mathbf{p}_0 \\ \mathbf{p}_1 \\ \mathbf{p}_2 \\ \mathbf{p}_3 \end{bmatrix} = \mathbf{U}\mathbf{M}_{\mathrm{B}}\mathbf{P}$$

- Tensor product surfaces can be written out similarly:

$$\mathbf{p}(u) = \sum_{i=0}^{n}\sum_{j=0}^{n} \mathrm{B}_{i,n}(u)\mathrm{B}_{j,n}(v)\,\mathbf{p}_{i,j}$$

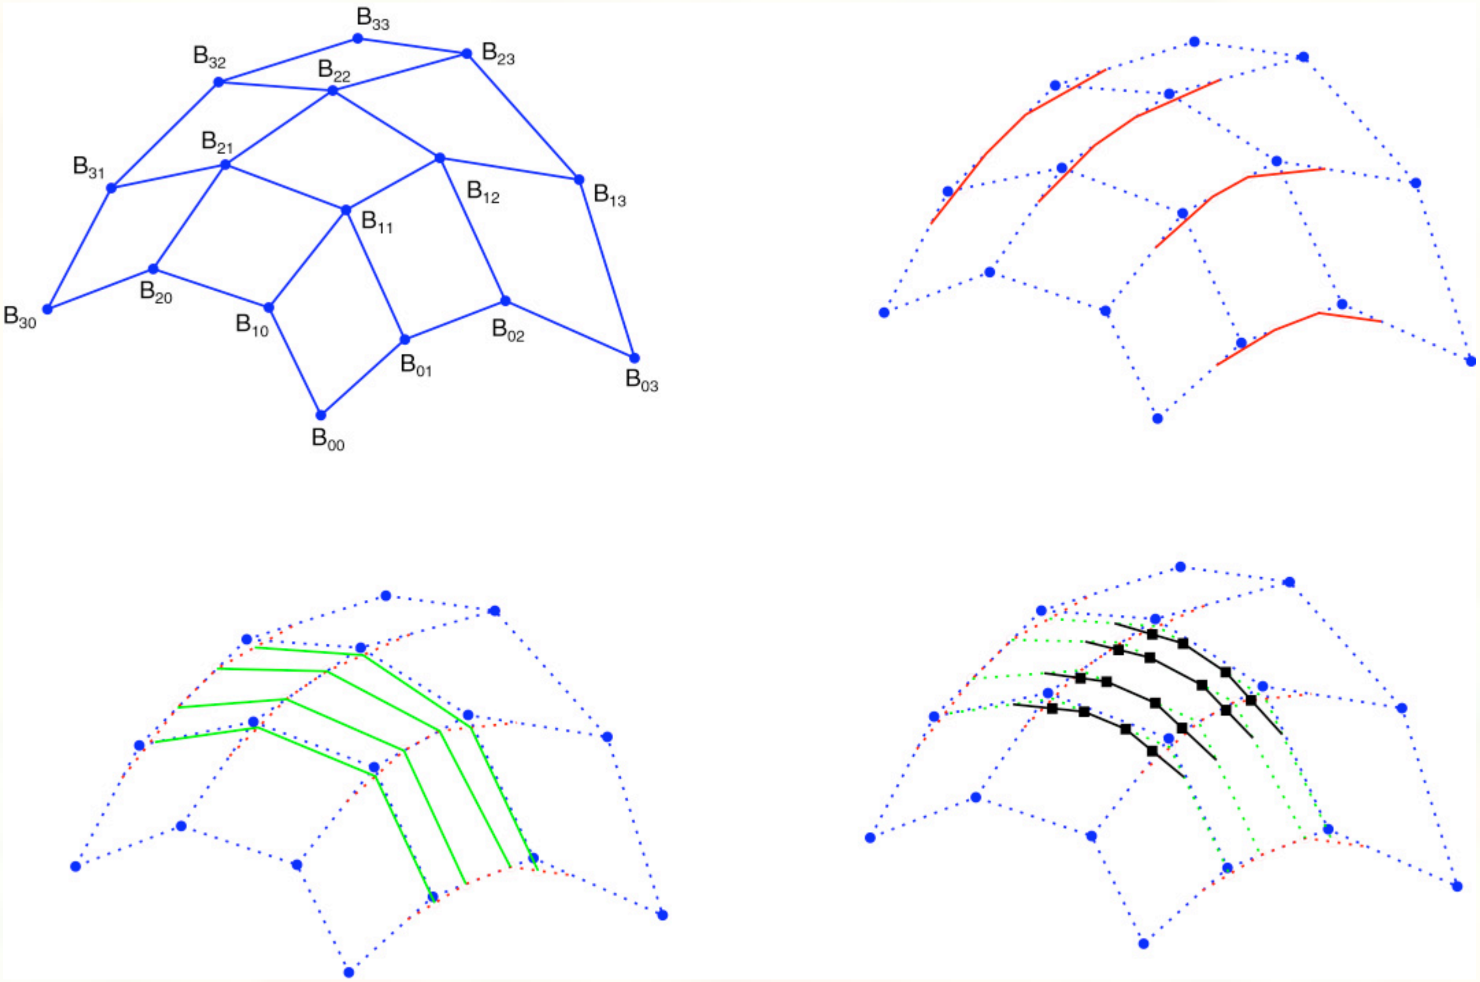
$$= \mathbf{U}\mathbf{M}_{\mathrm{B}}\mathbf{P}_{\mathrm{s}}\mathbf{M}_{\mathrm{B}}^{T}\mathbf{V}^{T}$$

Tensor product B-spline surfaces

- As with spline curves, we can piece together a sequence of Bézier surfaces to make a spline surface. If we enforce C^2 continuity and local control, we get B-spline curves:

  - treat rows of *B* as control points to generate Bézier control points in *u*.
  - treat Bézier control points in *u* as B-spline control points in *v*.
  - treat B-spline control points in *v* to generate Bézier control points in *u*.

Tensor product B-spline surfaces

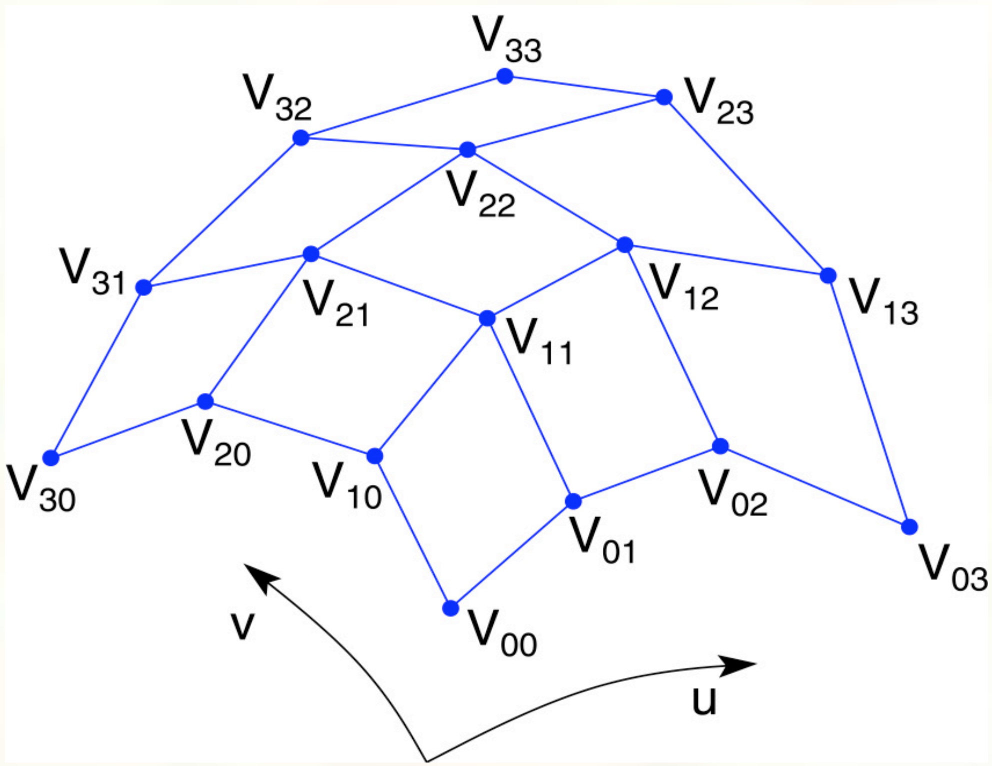


Which B-spline control points are interpolated by the surface?

Continuity for surfaces

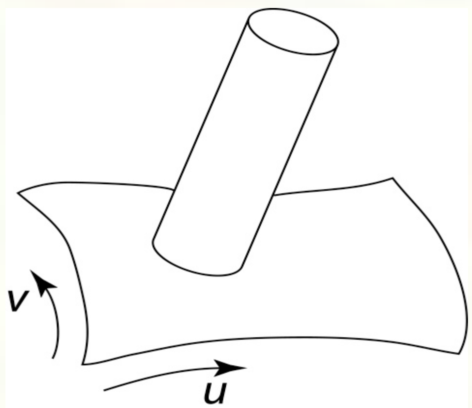
Continuity is more complex for surfaces than curves. Must examine partial derivatives at patch boundaries.

G^1 continuity refers to tangent plane.



Trimmed NURBS surfaces

- Uniform B-spline surfaces are a special case of NURBS surfaces.
- Sometimes, we want to have control over which parts of a NURBS surface get drawn.
- For example:



- We can do this by **trimming** the *u-v* domain.
  - Define a closed curve in the *u-v* domain (a **trim curve**)
  - Do not draw the surface points inside of this curve.
- It's really hard to maintain continuity in these regions, especially while animating.

Next class: Subdivision surfaces

- **Topic:**

  How do we extend ideas from subdivision curves to the problem of representing surfaces?

- **Recommended Reading:**
