Parametric surfaces
Reading

- Required:
  - Watt, 2.1.4, 3.4-3.5.

- Optional
  - Watt, 3.6.
Mathematical surface representations

- **Explicit** \( z = f(x,y) \) (a.k.a., a “height field”)
  - what if the curve isn’t a function, like a sphere?

- **Implicit** \( g(x,y,z) = 0 \)

- **Parametric** \( S(u,v) = (x(u,v), y(u,v), z(u,v)) \)
  - For the sphere:
    - \( x(u,v) = r \cos 2\pi v \sin \pi u \)
    - \( y(u,v) = r \sin 2\pi v \sin \pi u \)
    - \( z(u,v) = r \cos \pi u \)

As with curves, we’ll focus on parametric surfaces.
Surfaces of revolution

- Idea: rotate a 2D profile curve around an axis.
- What kinds of shapes can you model this way?
- **Find:** A surface \( S(u,v) \) which is radius(\( z \)) rotated about the \( z \) axis.

**Solution:**

\[
\begin{align*}
  x &= \text{radius}(u) \cos(v) \\
  y &= \text{radius}(u) \sin(v) \\
  z &= u \\
  &\quad u \in [z_{\text{min}}, z_{\text{max}}], \quad v \in [0,2\pi]
\end{align*}
\]
Extruded surfaces

- **Given:** A curve $C(u)$ in the $xy$-plane:

  $$C(u) = \begin{bmatrix} c_x(u) \\ c_y(u) \\ 0 \\ 1 \end{bmatrix}$$

- **Find:** A surface $S(u,v)$ which is $C(u)$ extruded along the $z$ axis.

- **Solution:**

  $$x = c_x(u)$$

  $$y = c_y(u) \quad u \in [u_{\text{min}}, u_{\text{max}}], \quad v \in [z_{\text{min}}, z_{\text{max}}]$$

  $$z = v$$
General sweep surfaces

- The **surface of revolution** is a special case of a **swept surface**.
- Idea: Trace out surface $S(u,v)$ by moving a **profile curve** $C(u)$ along a **trajectory curve** $T(v)$.

More specifically:
- Suppose that $C(u)$ lies in an $(x_c, y_c)$ coordinate system with origin $O_c$.
- For every point along $T(v)$, lay $C(u)$ so that $O_c$ coincides with $T(v)$. 
Orientation

- The big issue:
  - How to orient $C(u)$ as it moves along $T(v)$?

- Here are two options:
  1. **Fixed** (or **static**): Just translate $O_c$ along $T(v)$.

  ![Diagram](image)

  2. **Moving**. Use the **Frenet frame** of $T(v)$.
     - Allows smoothly varying orientation.
     - Permits surfaces of revolution, for example.
Frenet frames

- Motivation: Given a curve $T(v)$, we want to attach a smoothly varying coordinate system.

To get a 3D coordinate system, we need 3 independent direction vectors.

- $t(v) = \text{normalize}[T'(v)]$
- $b(v) = \text{normalize}[T'(v) \times T''(v)]$
- $n(v) = b(v) \times t(v)$

- As we move along $T(v)$, the Frenet frame $(t, b, n)$ varies smoothly.
Frenet swept surfaces

- Orient the profile curve \( C(u) \) using the Frenet frame of the trajectory \( T(v) \):
  - Put \( C(u) \) in the normal plane.
  - Place \( O_c \) on \( T(v) \).
  - Align \( x_c \) for \( C(u) \) with \( b \).
  - Align \( y_c \) for \( C(u) \) with \(-n\).

- If \( T(v) \) is a circle, you get a surface of revolution exactly!
- What happens at inflection points, i.e., where curvature goes to zero?
Variations

Several variations are possible:
- Scale $C(u)$ as it moves, possibly using length of $T(v)$ as a scale factor.
- Morph $C(u)$ into some other curve $\overline{C}(u)$ as it moves along $T(v)$.
- …
Generalizing from Parametric Curves

- Flashback to curves:
  We directly defined parametric function $f(u)$, as a cubic polynomial.

- Why a cubic polynomial?
  - minimum degree for C2 continuity
  - “well behaved”

- Can we do something similar for surfaces?
  Initially, just think of a height field: $\text{height} = f(u,v)$. 

![Diagram of a surface with parameters $u$ and $v$]
Cubic patches

Cubics curves are good… Let’s extend them in the obvious way to surfaces:

\[ f(u) = 1 + u + u^2 + u^3 \]
\[ g(v) = 1 + v + v^2 + v^3 \]

\[ f(u)g(v) = 1 + u + v + uv + u^2 + v^2 + uv^2 + vu^2 + ... + u^3v^3 \]

16 terms in this function.

Let’s allow the user to pick the coefficient for each of them:

\[ f(u)g(v) = c_0 + c_1u + c_2v + ... + c_{15}u^3v^3 \]
Interesting properties

\[ f(u, v) = c_0 + c_1u + c_2v + \ldots + c_{15}u^3v^3 \]

What happens if I pick a particular ‘u’?

\[ f(u, v) = \]

What happens if I pick a particular ‘v’?

\[ f(u, v) = \]

What do these look like graphically on a patch?
Use control points

- As before, directly manipulating coefficients is not intuitive.
  - Instead, directly manipulate control points.
  - These control points indirectly set the coefficients, using approaches like those we used for curves.
Tensor product Bézier surface

Let’s walk through the steps:

Which control points are interpolated by the surface?
Matrix form of Bézier surfaces

- Recall that Bézier curves can be written in terms of the Bernstein polynomials:

\[ p(u) = \sum_{i=0}^{n} B_{i,n}(u) p_i \]

- They can also be written in a matrix form:

\[
p(u) = \begin{bmatrix} u^3 & u^2 & u & 1 \end{bmatrix} \begin{bmatrix} -1 & 3 & -3 & 1 \\ 3 & -6 & 3 & 0 \\ -3 & 3 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} p_0 \\ p_1 \\ p_2 \\ p_3 \end{bmatrix} = UM_B P
\]

- Tensor product surfaces can be written out similarly:

\[
p(u) = \sum_{i=0}^{n} \sum_{j=0}^{n} B_{i,n}(u) B_{j,n}(v) p_{i,j} = UM_B P_s M_B^T V^T
\]
Tensor product B-spline surfaces

- As with spline curves, we can piece together a sequence of Bézier surfaces to make a spline surface. If we enforce $C^2$ continuity and local control, we get B-spline curves:

- treat rows of $B$ as control points to generate Bézier control points in $u$.
- treat Bézier control points in $u$ as B-spline control points in $v$.
- treat B-spline control points in $v$ to generate Bézier control points in $u$. 
Which B-spline control points are interpolated by the surface?
Continuity is more complex for surfaces than curves. Must examine \textit{partial} derivatives at patch boundaries.

\(G^1\) continuity refers to tangent \textit{plane}.
Trimmed NURBS surfaces

- Uniform B-spline surfaces are a special case of NURBS surfaces.
- Sometimes, we want to have control over which parts of a NURBS surface get drawn.
- For example:

  We can do this by **trimming** the $u$-$v$ domain.
  - Define a closed curve in the $u$-$v$ domain (a **trim curve**)
  - Do not draw the surface points inside of this curve.
  - It’s really hard to maintain continuity in these regions, especially while animating.
Next class: Subdivision surfaces

- **Topic:**
  How do we extend ideas from subdivision curves to the problem of representing surfaces?

- **Recommended Reading:**
    [Course reader pp. 262-268]
