

Problem 33. (4 points):

Consider the following fragment of IA32 code from the C standard library:

```
0x400446e3 <malloc+7>: call    0x400446e8 <malloc+12>  
0x400446e8 <malloc+12>: popl    %eax
```

After the `popl` instruction completes, what hex value does register `%eax` contain?
