Background: Basic Cryptography

- □ Symmetric Key System
 - o a shared symmetric key
 - o examples, DES, IDEA, RC4, AES
- □ Asymmetric Key System
 - o a pair of private and public keys
 - o examples, RSA, DSA, ElGamal, Rabin, FFS

Key graphs (Simon Lam)

Background: Authentication Services

- □ Needham-Schroeder Protocols (CACM, 1978)
 - Kerberos (MIT, 1988) part of Athena (1983-1991) to develop campus-wide distributed computing environment
 - O ...
- Secure sockets layers
 - SNP (U. Texas at Austin, 1993)
 - offshoot from authentication protocol verification
 - in Proceedings USENIX, June 1994
 - SSL (Netscape, 1995)
 - o TLS (1999)

Motivation (circa 1997)

- Traditional network applications
 - message-oriented unicast,
 e.g., email, file transfer, client-server
- Emerging network applications
 - o flow-oriented, e.g., audio, video, stock quotes
 - o multicast, e.g., teleconference, software distribution
- □ Problem 1: Secure group communications scalability
- □ Problem 2: How to sign efficiently?

Key graphs (Simon Lam)

Secure Group Communications Using Key Graphs

by Chung Kei Wong, Mohamed Gouda, and Simon S. Lam in *Proc. ACM SIGCOMM '98*

Secure group communications

- Applications
 - o teleconference
 - o information services
 - o collaborative work
 - o virtual private networks
- □ Group members share a symmetric key to
 - o encrypt/decrypt communications
 - providing confidentiality, integrity, and authenticity of messages delivered between group members
 - o access resources

Key graphs (Simon Lam)

5

Group key management

- A group session may persist for a long time
- □ Secure rekeying
 - o after each join
 - o after each leave
 - o periodically -> batch rekeying
- □ Scalable server and protocols
 - \circ for large groups with frequent joins and leaves
- □ Scalable and reliable transport (Zhang et al. 2003)

Key graphs (Simon Lam)

6

Assumptions

- Key server is trusted and secure
- ☐ An authentication service
 - o for example, SSL
 - o mutual authentication of server and joining user
 - distribution of a key shared by server and joining user (individual key)
- Access control by key server or by an authorization service

Key graphs (Simon Lam)

7

Group rekeying

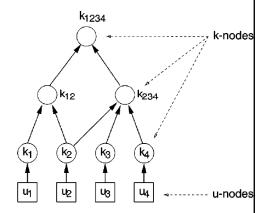

- □ Non problem after a join
 - o new group key encrypted by old group key
 - o one encryption/rekey msg for all existing users
- □ After a leave has occurred
 - new group key encrypted by individual key of each user
 - \circ *n*-1 encryptions/rekey messages for group size n
 - o not scalable

Key graphs (Simon Lam)

8

Key graph

- A directed acyclic graph with *u*-nodes and k-nodes
 - *u*-node no incoming edge
 - o root a k-node with no outgoing edge
 - o user *u* has key *k* ⇔ there is a directed path from node u to node k
 - one or more roots

Key covering problem after a leave is NP-hard in general

Key graphs (Simon Lam)

Special cases of key graph

- n users, 1 key server manages key graph
- □ Star
- □ Tree
- Complete
 - \circ a key for every nonempty subset of users (there are $2^n 1$)

	Star	Tree	Complete
Total # of keys	n+1	$\frac{d}{d-1}n$	$2^{n}-1$
# of keys per user	2	\bar{h}	2^{n-1}

(tree assumed to be full and balanced with height h, degree d)

Key star

Group of *n* users, one group key, *n* individual keys

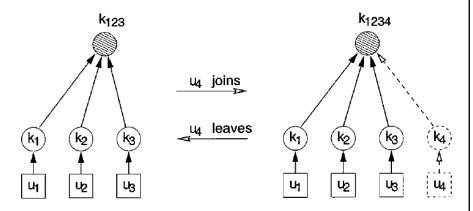

Fig. 3. Star key graphs before and after a join (leave).

Key graphs (Simon Lam) 11

Join Protocol

□ Protocol

 $u_4 \to s : join \ request$

 $s \leftrightarrow u_4 \colon mutual$ authentication, distribute k_4

s : generate k₁₂₃₄

 $s \rightarrow u_4 : \{k_{1234}\}_{k_4}$

 $s \rightarrow \{u_1, u_2, u_3\} : \{k_{1234}\}_{k_{123}}$

□ Encryption cost: 2

Leave Protocol

Protocol

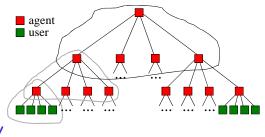

```
u_4 \rightarrow s: {leave request} _{ka}
s \rightarrow u_4: {leave granted} _{k_4}
         s: generate k<sub>123</sub>
s \to \{u_1\}: \{k_{123}\}_{k_1}
s \to \{u_2\}: \{k_{123}\}_{k_2}
s \to \{u_3\}: \{k_{123}\}_{k_3}
```

- \square Encryption cost: n-1 for group size n
- \square O(n) cost is not scalable

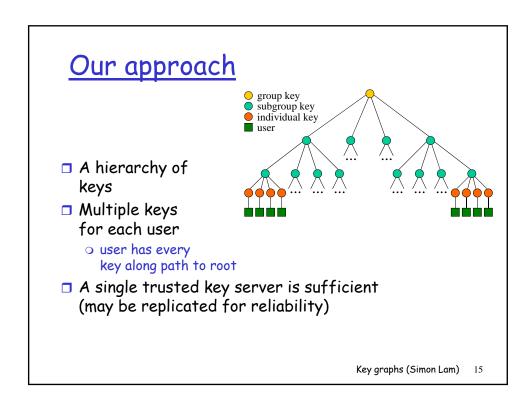

Key graphs (Simon Lam) 13

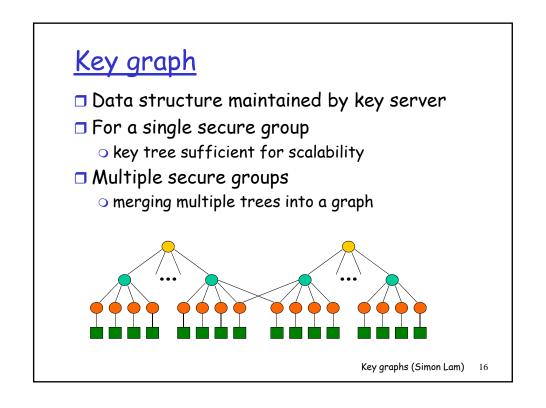

Iolus approach [Mittra 1997]

- A hierarchy of security agents
- □ No globally shared group key
 - o join/leave affects (local subgroup only

- □ Agents forward message key
 - o decrypting and re-encrypting it with subgroup
- □ Requirement: many trusted agents

Rekeying strategies

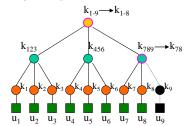

How to compose and deliver rekey messages

- □ user-oriented
- key-oriented
- group-oriented

Key graphs (Simon Lam) 17

User-oriented rekeying

- Select new keys needed by a user or subset of users, form a rekey message and encrypt it
- □ (d-1)(h-1) rekey messages - sent by unicast or subgroup multicast
- Most work on server, least work on user

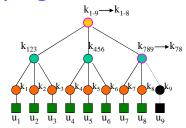

Leaving

 $s \to \{u_1, u_2, u_3\} : \{k_{1-8}\}_{k_{1/3}}$ $s \to \{u_4, u_5, u_6\} : \{k_{1-8}\}_{k_{456}}$ $s \to u_7$: $\{k_{1-8}, k_{78}\}_{k_7}$ $\{k_{1-8},k_{78}\}_{k_{9}}$ $s \rightarrow u_8$

Key-oriented rekeying

- □ Encrypt each new key, then compose rekey messages
- □ (d-1)(h-1) rekey messages - sent by unicast or subgroup multicast
- Less work on server than user-oriented

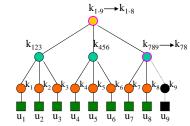

Leaving

 $s \rightarrow \{u_1, u_2, u_3\} : \{k_{1-8}\}_{k_{123}}$ $s \rightarrow \{u_4, u_5, u_6\} : \{k_{1-8}\}_{k_{456}}$ $s \rightarrow u_7$ $\{k_{1-8}\}_{k_{78}},\{k_{78}\}_{k_7}$ $\{k_{1-8}\}_{k_{78}},\{k_{78}\}_{k_{8}}$ $s \rightarrow u_8$

Key graphs (Simon Lam) 19

Group-oriented rekeying

- One rekey message containing all encrypted new keys sent by multicast
- \square Message size $O(\log n)$
- Each user decrypts what it needs
- Least work on server, most work on user

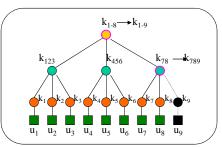

Leaving

$$\begin{split} s \to & \{u_1, ..., u_8\} \quad : \\ & \{k_{78}\}_{k_7}, \{k_{78}\}_{k_8}, \\ & \{k_{1-8}\}_{k_{123}}, \{k_{1-8}\}_{k_{456}}, \\ & \{k_{1-8}\}_{k_{78}} \end{split}$$

Join: group-oriented rekeying

- Encryption cost: 2(h-1)
- Key tree incurs a larger cost than key star

Joining of u₉:

 $s \rightarrow \{u_1, \dots u_8\}$ $\{k_{1-9}\}_{k_{1-8}}, \{k_{789}\}_{k_{78}}$

 $\{k_{1-9}, k_{789}\}_{k_0}$ $s \rightarrow u_0$

Key graphs (Simon Lam)

Ave. encryption cost of a request

(a)

\ <i>\</i>					
	Star	Tree	Complete		
join	1	h-1	2^n		
leave	0	0	0		
(b)	a nor	n-requesting	-requesting user		
	Star	Tree	Complete		
join	1	d/(d-1)	2^{n-1}		
leave	1	d/(d-1)	0		
(c)	the server				
, ,	Star	Tree	Complete		
join	2	2(h-1)	2^{n+1}		
leave	n-1	d(h-1)	0		
			Vou enember (C		

the requesting user

Average encryption cost of a request (join or leave)

	Star	Tree	Complete
cost of the server	n/2	(d+2)(h-1)/2	2^n
cost of a user	1	d/(d-1)	2^n

- \square For a full and balanced tree, $h = \log_d(n)$
- □ For a key tree (instead of key star), server does less work, but user does slightly more work
- Optimal key tree degree is 4

Key graphs (Simon Lam) 23

Experiments

- Two SGI machines connected by 100 Mbps Ethernet
 - o server on one, users on the other
- □ Rekey messages sent as UDP packets
- □ DES, MD5, RSA from CryptoLib
- \square *n* joins, then 1000 randomly generated join/leave requests

Technique for signing rekey messages

	one signature per rekey msg					
	msg size (byte)		proc	proc time (msec)		
	join	leave	join	leave	ave	
user-oriented	263.1	233.8	76.7	204.6	140.6	
key-oriented	303.0	270.9	76.3	203.8	140.1	
group-oriented	525.5	1005.7	11.9	12.0	11.9	
	one signature for all rekey msgs					
	msg siz	e (byte)	proc time (msec)			
	join	leave	join	leave	ave	
user-oriented	312.8	306.9	13.6	17.1	15.3	
key-oriented	352.8	344.0	13.1	15.9	14.5	

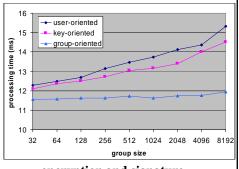

key tree degree 4, initial group size 8192, encryption and signature

Key graphs (Simon Lam)

25

Server processing time (per request) versus group size

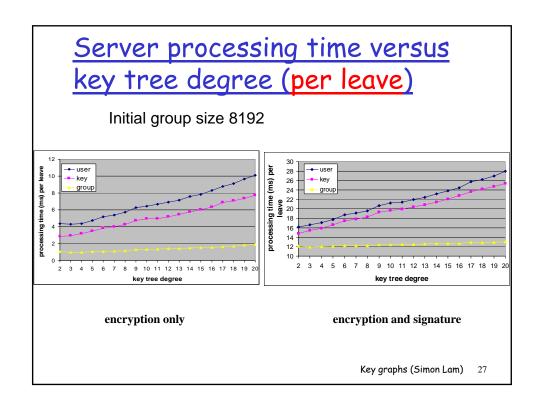

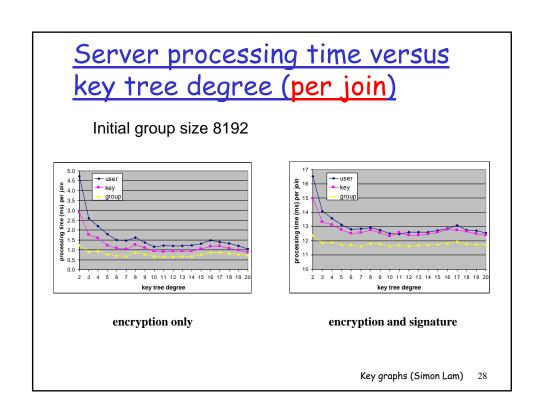

encryption and signature

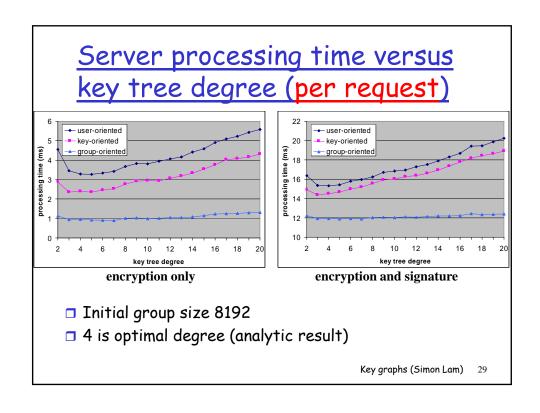

□ Increases linearly with logarithm of group size

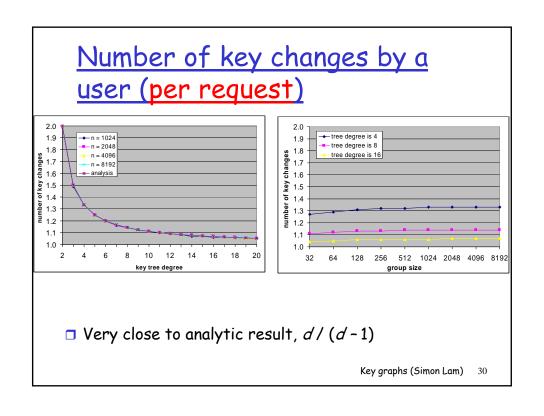

Key graphs (Simon Lam)

26

Rekey messages sent by server

□ With encryption and signature (initial group size 8192, key tree degree 4)

	Ave. rekey message size (bytes)		Ave. number of rekey messages	
	per join	per leave	per join	per leave
User-oriented	312.8	306.9	7.00	19.02
Key-oriented	352.8	344.0	7.00	19.02
Group-oriented	525.5	1005.7	1	1

□ Total number of bytes sent is much smaller for group-oriented rekeying than the others

Key graphs (Simon Lam) 31

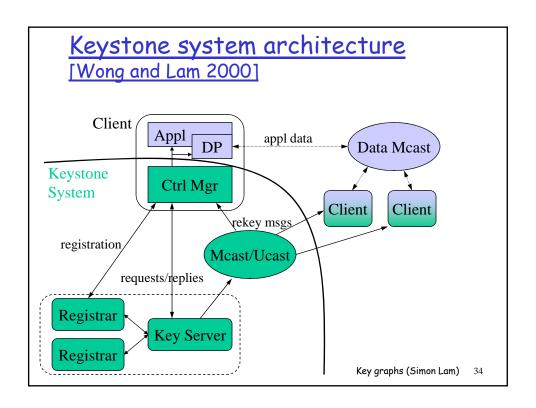

Rekey messages received by user

□ With encryption and signature (initial group size 8192, key tree degree 4)

	Ave. rekey message size (bytes)		Ave. number of rekey messages	
	per join	per leave	per join	per leave
User-oriented	209.3	237.4	1	1
Key-oriented	227.9	256.0	1	1
Group-oriented	525.5	1005.7	1	1

Conclusions

- Scalable server performance demonstrated experimentally and analytically
 - o Group-oriented rekeying requires smallest processing time and transmission bandwidth of server, but requires each user to do more work
 - O Hybrid approach with use of user- or key-oriented rekeying for users with limited capabilities
- Hybrid approach with use of some Iolus agents at strategic locations

Extensions

- □ Batch rekeying
- □ Reliable and scalable communications [Zhang et al. 2003]
 - O Proactive FEC with unicast recovery this works well because each client needs only a small fraction of new keys
 - Adaptive FEC
 - O Key identification, block id estimation, etc.
- Replicated servers and registrars
- □ Multiple groups
 - o access control of resources
