Abstract

ACL2 comes with a number of useful libraries that can help you to be a more productive and successful user. A little over a year ago, we established a Subversion repository so that the ACL2 community can take a more active role in improving and expanding upon these books. Since that time, many new books have been added and a number of existing books have also been updated. This talk will give a brief summary of some of the new books and libraries that are available. We will also explain how you can join the project to see what is being added, and how you can get updates as they are released.
