Topic 7 Interfaces

I once attended a Java user group meeting where James Gosling (one of Java's creators) was the featured speaker. During the memorable Q&A session, someone asked him: "If you could do Java over again, what would you change?" **'I'd leave out classes**," he replied. After the laughter died down, he explained that the real problem wasn't classes per se, but rather implementation inheritance (the extends relationship). Interface inheritance (the implements relationship) is preferable.

How many sorts do you want to have to write?

```
public static void selSort(double[] data) {
   for (int i = 0; i < data.length; i++) {
      int small = i;
      for (int j = i + 1; j < data.length; j++) {
          if (data[j] < data[small])</pre>
             small = j;
      double temp = data[i];
                                          A. 0
      data[i] = data[small];
                                          B. 1
      data[small] = temp;
                                          C. 2
                                          D. 3
                                          F_{>}=4
 CS314
                       Interfaces
```

Why interfaces?

- Interfaces allow the creation of abstract types
 - "A set of data values and associated operations that are precisely specified independent of any particular implementation."
 - multiple implementations allowed
- Interfaces allow a data type to be specified without worrying about the implementation
 - do design first
 - What will this data type do?
 - Don't worry about implementation until design is done.
 - separation of concerns.
 - allow us to create generic algorithms

Interfaces

Interfaces

public interface List<E> {

- No constructors
- No instance variables
- abstract instance methods
- default instance methods
- static methods
- class constants (prefer enums)
 public static final int DEFAULT_CAP = 10;
 public void add(E val);

 Implementing Interfaces In Java, a class inherits (extends) exactly one other class, but A class can <i>implement</i> as many interfaces as it likes public class ArrayList implements List A class that implements an interface must provide implementations of all non default method declared in the interface or the class must be abstract interfaces can extend other interfaces 		<section-header><list-item><list-item><list-item></list-item></list-item></list-item></section-header>		
– multiple in fact, unlike Java classes CS314 Interfaces	5	CS314 Interfaces 6		
Comparable Interface		Interfaces		
<pre>package java.lang; public interface Comparable<t> { public int compareTo(T other); }</t></pre>		 "Use interfaces to ensure a class has methods that other classes or methods will use." (In other words, clients of your class.) Anthony, Spring 2013 		
 compareTo must return 		The other classes or methods may already be		
 an int <0 if the calling object is less than the paramete 0 if they are equal 	r,	 written. The other methods or classes use interface 		
 an int >0 if the calling object is greater than the parameter other 		type for the parameters of methods.		
compareTo should be consistent with equal	POLYMORPHISM			
but this isn't required.	7	- old code using new code		
	7	CS314 Interfaces 8		

<pre>Clicker Question 2 • What is output by the following code? Comparable c1 = new Comparable(); Comparable c2 = new Comparable(); System.out.println(c1.compareTo(c2)); A. A value < 0 B. 0 C. A value < 0 D. Unknown until program run E. Compile error</pre>		 Example compareTo Suppose we have a class to model playing cards Ace of Spades, King of Hearts, Two of Clubs each card has a suit and a value, represented by ints this version of compareTo will compare values first and then break ties with suits 			
CS314	Interfaces	9	CS314	Interfaces	10
public class public } // oth } Assume ints	<pre>compareTo in a Card class full c class Card implements Comparable<card> { public int compareTo(Card otherCard) { return this.rank - other.rank; } // other methods not shown } Assume ints for ranks (2, 3, 4, 5, 6,) and suits (0 is clubs, 1 is diamonds, 2 is hearts, 3 is spades). </card></pre> Interface and Polymorphism Interfaces may be used as the data type for object variables Interfaces may be used as the data type for object variables Interface or descendants Interfa				
CS314	Interfaces	11	CS314	Interfaces	12

Why Make More Work?			
 Why bother implementing an interface such as Comparable objects can use method that expect an interface type 			
 Example if I implement Comparable: Arrays.sort(Object[] a) public static void sort(Object[] a) All elements in the array must implement the Comparable interface. Furthermore, all elements in the array must be <i>mutually comparable</i> 			
• objects of my type can be stored in data structures that accept Comparables			
CS314 Interfaces 14			
List Interface			
<pre>public interface List <e> { public void add(E val); public int size(); public E get(int location); public void insert(int location, E val); public E remove(int location); }</e></pre>

One Sort

```
public static void sort(Comparable[] data) {
   final int LIMIT = data.length - 1;
   for(int i = 0; i < LIMIT; i++) {</pre>
      int small = i;
      for(int j = i + 1; j < data.length; j++) {
          int d = data[j].compareTo(data[small]);
          if (d < 0)
             small = j;
      }
      Comparable temp = data[i];
      data[i] = data[small];
      data[small] = temp;
   } // end of i loop
}
