CS 380S

### Web Browser Security

#### Vitaly Shmatikov

(most slides from the Stanford Web security group)

### Reading Assignment

- Jackson and Barth. "Beware of Finer-Grained Origins" (W2SP 2008).
- Chen et al. "Pretty-Bad-Proxy: An Overlooked Adversary in Browsers' HTTPS Deployments" (Oakland 2009).
- Optional: Barth et al. "Securing Frame Communication in Browsers" (Usenix Security 2008 and CACM).
- Optional: Barth et al. "Cross-Origin JavaScript Capability Leaks" (Usenix Security 2009).

### JavaScript Security Model (Redux)

#### Same-origin policy

- Frame can only read properties of documents and windows from same place: server, protocol, port
- Does <u>not</u> apply to scripts loaded in enclosing frame from arbitrary site

<script type="text/javascript">

src="http://www.example.com/scripts/somescript.js">

</script>

• This script runs as if it were loaded from the site that provided the page!

### OS vs. Browser Analogies (Redux)

#### Operating system

#### Primitives

- System calls
- Processes
- Disk

#### Principals: Users

• Discretionary access control

#### Vulnerabilities

- Buffer overflow
- Root exploit

#### Web browser

#### Primitives

- Document object model
- Frames
- Cookies / localStorage
- Principals: "Origins"
  - Mandatory access control
- Vulnerabilities
  - Cross-site scripting
  - Universal scripting

#### JavaScript Contexts

JavaScript context 3

JavaScript context 2

#### **DOM and Access Control**

Granted: give reference to object to JavaScript

### DOM vs. JavaScript Engine

DOM: performs access control checks

- When a DOM object is initially accessed, check if it's Ok to give out a reference to this object
- JavaScript engine: uses references as if they were capabilities
  - If context has a reference to an object, can use it without any access control checks
- ... but these are the same DOM objects!
- What if a reference to an object leaks from one JavaScript context to another?

#### **Cross-Context References**

DOM reference monitor Each window & prevents bar() from Window 1 Window 2 frame has one acquiring these references via global object **Global Object Global Object** function document function document foo()bar() If bar() somehow managed to acquire <u>direct</u> references, no access checks would be performed on them!

#### **Detecting Reference Leaks**

 Instrument WebKit's JavaScript engine with calls to heap analysis library

- On object creation, reference, and destruction
- Goal: detect references between two contexts

Sample heap graphs

google.com (not much JS there)

### Heap Graph Statistics

Empty page

• 82 nodes, 170 edges

- google.com
  - 384 nodes, 733 edges
- store.apple.com/us
  - 5332 nodes, 11691 edges

#### gmail.com

• 55106 nodes, 133567 edges

### Computing JavaScript Contexts

Global Object Context is defined by its global object (new context: create new global object) Object Ultimate parent of all objects in prototype class hierarchy **Object Prototype** When an object is created, there is a path to prototype via \_\_\_proto\_ proto property (direct or indirect) Context is the transitive closure Object of \_\_proto\_\_ references Signal a problem if ever see a reference between

non-global objects of different contexts

### Example Vulnerability in WebKit

normal converses to the second second sector with a converse second second second second second second sector  $[\mathsf{Barth}\ \mathsf{et}\ \mathsf{al},]$ 

Attacker's object can then <u>redefine the behavior of functions</u>, such as toString, that apply to all Objects created in the other context, so that they execute arbitrary JavaScript.

#### Solution

#### Add access control to JavaScript references

• get and put: check that context matches

#### 2% overhead

- Inline caching helps: when a property is looked up for the first time, look up in hash table and record offset; subsequent accesses use recorded offset directly
  - If offset is available, no need for access control checks (why?)
- 10% overhead without caching

 See "Cross-Origin JavaScript Capability Leaks" for details

#### Web Browser: the New OS

#### Origins are similar to processes

- One origin should not interfere with another
- Sites often want and need to communicate
  - Google AdSense
    - <script src="http://googlesyndication.com/show\_ads.js">
  - Mashups
  - Gadget aggregators iGoogle, live.com ...
  - To communicate with B, site A must give B full control
    - <script src=http://siteB.com/script.html>
  - Now script from site B runs as if its origin were site A

### Sending a Cross-Domain GET

#### Script can send anywhere

- This is the basis of cross-site request forgery (XSRF)
- Data must be URL encoded

<img src="http://othersite.com/file.cgi?foo=1&bar=x y">

• Browser sends

GET file.cgi?foo=1&bar=x%20y HTTP/1.1

Can't send to some restricted ports

• For example, port 25 (SMTP)

Can use GET for denial of service (DoS) attacks

• A popular site can DoS another site [Puppetnets]

#### Mashups

### iGoogle

#### Windows Live.com

### **Browser Security Policy**

#### Frame-Frame relationships

- canScript(A,B)
  - Can Frame A execute a script that manipulates arbitrary/nontrivial DOM elements of Frame B?
- canNavigate(A,B)
  - Can Frame A change the origin of content for Frame B?
- Frame-principal relationships
  - readCookie(A,S), writeCookie(A,S)
    - Can Frame A read/write cookies from site S?
- Security indicator (lock icon)
  - securityIndicator(W) is it displayed for window W?

### **Common Misunderstanding**

Often simply stated as "same-origin policy"

- This usually just refers to the canScript relation
- Full policy of current browsers is complex
  - Evolved via "penetrate-and-patch"
  - Different features evolved slightly different policies
- Common scripting and cookie policies
  - canScript considers: scheme, host, and port
  - canReadCookie considers: scheme, host, and path
  - canWriteCookie considers: host

#### **Cross-Frame Scripting**

- **canScript(A,B) only if Origin(A) = Origin(B)** 
  - Basic same-origin policy, where origin is the scheme, host and port from which the frame was loaded
- What about frame content?
- Some browsers allow any frame to navigate any other frame

#### **SOP Examples**

#### Suppose the following HTML is hosted at site.com

#### Disallowed access

<iframe src="http://othersite.com"></iframe> alert( frames[0].contentDocument.body.innerHTML ) alert( frames[0].src )

#### Allowed access

<img src="http://othersite.com/logo.gif">

alert( images[0].height )

or

Navigating child frame is allowed, but reading frame[0].src is not

frames[0].location.href = "http://mysite.com/"

#### Guninski Attack

1 4

Contract and the Contract of Contract Contract (Contract)

If bad frame can navigate good frame, attacker gets password!

### Gadget Hijacking in Mashups

### Gadget Hijacking

### **Possible Frame Navigation Policies**

#### **Implemented Browser Policies**

	Browser	Policy
	IE 6 (default)	Permissive
	IE 6 (option)	Child
	IE7 (no Flash)	Descendant
	IE7 (with Flash)	Permissive
<b>(</b>	Firefox 2	Window
	Safari 3	Permissive
	Opera 9	Window
?	HTML 5	Child

### **Principle: Pixel Delegation**

#### Frames delegate screen pixels

- Child cannot draw outside its frame
- Parent can draw over the child's pixels
- Navigation similar to drawing
  - Navigation replaces frame contents
  - "Simulate" by drawing over frame
- Policy ought to match pixel delegation
  - Navigate a frame if can draw over the frame

### **Best Solution: Descendant Policy**

#### Best security / compatiblity trade-off

- Security: respects pixel delegation
- Compatibly: least restrictive such policy
- Implementation (Adam Barth, Collin Jackson)
  - Wrote patches for Firefox and Safari
  - Wrote over 1000 lines of regression tests

#### Deployment

- Apple released patch as security update
- Mozilla implemented in Firefox 3

#### Frame Communication

If frames provide isolation, how can they communicate?

#### Desirable properties of interframe communication

- Confidentiality
- Integrity
- Authentication

### Fragment Identifier Messaging

Send information by navigating a frame

http://gadget.com/<u>#hello</u>

Navigating to fragment doesn't reload frame

- No network traffic, but frame can read its fragment
- Not a secure channel
  - Confidentiality
  - Integrity
  - Authentication

D. Thorpe, Secure Cross-Domain Communication in the Browser http://msdn2.microsoft.com/en-us/library/bb735305.aspx

### Identifier Messaging: Example

```
Host page: foo.com/main.html

function sendData() {

    iframe.src = "http://bar.com/receiver.html#data_here";

    iframe: bar.com/receiver.html
```

window.onLoad = function () {
 data = window.location.hash;

### **Problems and Limitations**

- No ack that the iframe received the data
- Message overwrites
  - Host doesn't know when the iframe is done processing a message... when is it safe to send the next message?

#### Capacity limits

- URL length limit varies by browser family
- Data has unknown origin
- No replies

#### Loss of context

• Page is reloaded with every message, losing DOM state

### With Return Communication

```
Host page: foo.com/main.html
 function sendDataToBar() {
     iframe.src = " http://bar.com/receiver.html#data_here";
  }
     iframe: bar.com/receiver.html
       window.onLoad = function () {
           data = window.location.hash;
       function sendDataToFoo(){
           iframe2.src = "http://foo.com/receiver.html#data_here";
            iframe2: foo.com/receiver.html
            window.onLoad = function () {
               window.parent.parent.receiveFromBar(
                  window.location.hash);
```

#### postMessage

New API for inter-frame communication

Supported in latest betas of many browsers

Not a secure channel

- Confidentiality
- Integrity
- Authentication

#### Example of postMessage Usage

frames[0].postMessage("Hello world.");

document.addEventListener("message", receiver); function receiver(e) { if (e.domain == "example.com") { if (e.data == "Hello world") e.source.postMessage("Hello");

### Message Eavesdropping (1)

Descendant frame navigation policy

### Message Eavesdropping (2)

#### Works in all navigation policies

### **Finer-Grained Origins**

Some browser features grant privileges to a subset of documents in an origin

- Cookie paths
- Mixed content
  - For example, documents with invalid certificates mixed with documents with valid certificates
- Any "less trusted" document can inject an arbitrary script into a "more trusted" one (why?)
  - Gain the same privileges as the most trusted document in the same origin!

#### The Lock Icon

#### Goal: identify secure connection

• This is a network security issue

# SSL/TLS is used between client and server to protect against active network attacker

# Lock icon should only be shown when page is secure against network attacker

### Checkered History of the Lock

#### Positive trust indicator

Semantics subtle and not widely understood

• This page is not under the control of an active network attacker (unless the principal named in the location bar has chosen to trust the attacker)

#### Innovation required in user interface design

- Lock icon largely ignored by users
- Innovations require browser accuracy in determining whether to show security indicators

### Problem with Embedded Content

Show lock icon if ...

Page retrieved over HTTPS

Every embedded object retrieved over HTTPS

• Firefox allows HTTP images, but it's a known bug

Every frame would have shown lock icon

### Mixed Content: HTTP and HTTPS

- Page loads over HTTPS, but contains content over HTTP
- IE: displays mixed-content dialog to user
  - Flash files over HTTP are loaded with no warning (!)
  - Flash can script the embedding page!
- Firefox: red slash over lock icon (no dialog)
  - Flash files over HTTP do not trigger the slash

Safari: does not attempt to detect mixed content

### Mixed Content: UI Challenges

Security	nformation 🔀			
P	This page contains both secure and nonsecure items.			
Do you want to display the nonsecure items?				
	Yes <u>N</u> o <u>M</u> ore Info

#### Mixed Content and Network Attacks

Banks: after login, all content served over HTTPS

- Developer error: somewhere on bank site write <script src=http://www.site.com/script.js> </script>
  - Active network attacker can now hijack any session
- Better way to include content:
  - <script src=//www.site.com/script.js> </script>
  - Served over the same protocol as embedding page

#### Mixed Content Issues

#### All browsers fail to account for canScript

- One fix: Safelock browser extension revokes the ability to dispay the lock icon from all documents in the same origin as an insecure document
- Lots of other bugs
  - Fail to detect insecure SWF movies (IE, Firefox)
  - Navigation forgets mixed content (Firefox)
  - Firefox architecture make detection difficult

### Example of a Vulnerability

€ c	🖉 Chase OnlineSM - Logon - Windows Internet Explorer						
G	💽 👻 🚺 https://chaseonline.chase.com/onli	ne/home/sso_co_home.jsp	•

### SSL/TLS and Its Adversary Model

HTTPS: end-to-end secure protocol for Web

 Designed to be secure against man-in-the-middle (MITM) attacks

HTTPS provides encryption and integrity checking

#### **PBP: Pretty-Bad-Proxy**

Bad proxy can exploit browser bugs to render unencrypted, potentially malicious content in the context of an HTTPS session!

#### Attack #1: Error Response

Proxy error page: 502, other 4xx/5xx response
 Script in error page runs in HTTPS context!

### Attack #2: Redirection (3XX)

[Chen et al.]

#### bank.com

### Attack #3: HPIHSL Pages

Many websites provide both HTTP and HTTPS services

- Sensitive pages: HTTPS only
  - Login, checkout, etc.
- Non-sensitive pages: intended for HTTP
  - For example, merchandise pages
- Non-sensitive pages often accessible through HTTPS
   HPIHSL: HTTP-intended-but-HTTPS-loadable
- What's wrong with HPIHSL pages?
  - They often import scripts through HTTP ...
  - ... these scripts will run in HTTPS context

### Browsers Warn About This, Right?

- The objective of this detection logic is to determine the appearance of the address bar
  - Address bar only concerns the top-level page!

## Bypassing Detection Logic

[Chen et al.]

Using an HTTPS iframe in an HTTP top-level page

### Prevalence of HPIHSL Pages

Chen et al. show 12 major websites with HPIHSL pages that import scripts

- Online shopping sites
- Banks, credit card companies
- Open-source projects management site
- Top computer science departments
- Even the home domain of a leading certificate authority
- You cannot trust their SSL!

#### Attack #4: Visual Context

IE, Opera, Chrome display a certificate on the GUI as long as it in the certificate cache
