Homework 0: Display your eid

Submission:

All submissions should be done via github. Refer to the course home page about setting up your github and how to submit assignments. We will post the invitation link for hw0.

Overview:

This assignment will get you familiar with Android Studio and github, and ensure that you have a working environment.

For most of you, this will likely take less than 15 minutes. However, if you have trouble setting up Android Studio then it could take much longer. Don't wait until the last minute, and please ask for help if you need it.

Directions:

For this project, you will create an app that displays your EID. Simple as that. You are given a simple hw0 directory. Use Android studio to create an empty activity Kotlin project (API 32) in the hw0 directory. This process will create more files that you will add to your git repository.

Take a screenshot of your emulator when it is running your app (that displays your eid). Include this screenshot in your submission in a file called screenshot.png (or screenshot.jpg). It should be in the hw0 directory, along with the files generated by Android Studio.

Please submit all of the files generated by Android Studio. You should be able to download your repository and build it within Android Studio. You can test this correctness property.

Please create a README file in your hw0 directory and add it to your repository. Copy the tags listed below into your README file and fill them in. I hope the information they request is self-explanatory. For homework, your collaborator list should be empty, but if you talk to someone deeply about an assignment, just note that in the README. Time is the number of hours it took you to do the assignment.

1. Name:
2. EID:
3. Email:
4. Time:
5. Slip days:
6. Collaborators:
7. Comments:

8. Video demo: None
