

Concurrent Programming Issues & Readers/Writers

1

Summary of Our Discussions

- ◆ Developing and debugging concurrent programs is hard
 - Non-deterministic interleaving of instructions
- ◆ Safety: isolation and atomicity
- ◆ Scheduling: busy-waiting and blocking
- ◆ Synchronization constructs
 - Locks: mutual exclusion
 - Condition variables: wait while holding a lock
 - Transactions: isolation by conflict detection and rollback, atomicity by buffering
 - Semaphores: Mutual exclusion (binary) and condition synchronization (counting)
- ◆ How can you use these constructs effectively?
 - Develop and follow strict programming style/strategy

2

Programming Strategy

- ◆ Decompose the problem into objects
- ◆ Object-oriented style of programming
 - Identify shared chunk of state
 - Encapsulate shared state and synchronization variables inside objects
- ◆ Don't manipulate shared variables or synchronization variables along with the logic associated with a thread
- ◆ Programs with race conditions always fail.
 - A. True, B. False

3

General Programming Strategy

- ◆ Two step process
- ◆ Threads:
 - Identify units of concurrency – these are your threads
 - Identify chunks of shared state – make each shared “thing” an object; identify methods for these objects (how will the thread access the objects?)
 - Write down the main loop for the thread
- ◆ Shared objects:
 - Identify synchronization constructs
 - ◆ Mutual exclusion vs. conditional synchronization
 - Create a lock/condition variable for each constraint
 - Develop the methods –using locks and condition variables – for coordination

4

Coding Style and Standards

- Always do things the same way
- Always use locks and condition variables
- Always hold locks while operating on condition variables
- Always acquire lock at the beginning of a procedure and release it at the end
 - If it does not make sense to do this → split your procedures further
- Always use while to check conditions, not if

```
while (predicate on state variable) {
    conditionVariable->wait(&lock);
};
```
- (Almost) never sleep(), yield(), or isLocked() in your code
 - Use condition variables to synchronize

5

Readers/Writers: A Complete Example

- **Motivation**
 - Shared databases accesses
 - ❖ Examples: bank accounts, airline seats, ...
- **Two types of users**
 - Readers: Never modify data
 - Writers: read and modify data
- **Problem constraints**
 - Using a single lock is too restrictive
 - ❖ Allow multiple readers at the same time
 - ❖ ...but only one writer at any time
 - Specific constraints
 - ❖ Readers can access database when there are no writers
 - ❖ Writers can access database when there are no readers/writers
 - ❖ Only one thread can manipulate shared variables at any time

6

Readers/Writer: Solution Structure

- Basic structure: two methods

```
Database::Read() {  
    Wait until no writers;  
    Block any writers;  
    Access database;  
    Let in one writer or reader;  
}
```

```
Database::Write() {  
    Wait until no readers/writers;  
    Write database;  
    Let all readers/writers in;  
}
```

7

Solution Details

```
Lock dbLock;  
Condition dbAvail;  
int reader = 0;  
bool writer = false;
```

```
Public Database::Read() {  
    dbLock.lock();  
    while(writer) {  
        dbAvail.wait();  
    }  
    reader++;  
    dbLock.unlock();  
    Read database;  
    dbLock.lock();  
    reader--;  
    if(reader == 0) {  
        dbAvail.signal();  
    }  
    dbLock.unlock();  
}
```

```
Public Database::Write() {  
    dbLock.lock();  
    while(reader > 0 || writer){  
        dbAvail.wait();  
    }  
    writer = true;  
    dbLock.unlock();  
    Write database;  
    dbLock.lock();  
    writer = false;  
    dbAvail.signalAll();  
    dbLock.unlock();  
}
```

This solution favors

1. Readers
2. Writers
3. Neither, it is fair

8

Self-criticism can lead to self-understanding

- ◆ Our solution works, but it favors readers over writers.
 - Any reader blocks all writers
 - All readers must finish before a writer can start
 - Last reader will wake any writer, but a writer will wake readers and writers (statistically which is more likely?)
 - If a writer exits and a reader goes next, then all readers that are waiting will get through
- ◆ Are threads guaranteed to make progress?
 - A. Yes B. No

9

Readers/Writer: Using Monitors

- ◆ Basic structure: two methods

```
Database::Read() {  
    Wait until no writers;  
    Access database;  
    Wake up waiting writers;  
}
```

```
Database::Write() {  
    Wait until no readers/writers;  
    Access database;  
    Wake up waiting readers/writers;  
}
```

- ◆ State variables

```
AR = 0; // # of active readers  
AW = false; // is there an active writer  
WR = 0; // # of waiting readers  
WW = 0; // # of waiting writers  
Condition okToRead;  
Condition okToWrite;  
Lock lock;
```

10

Solution Details: Readers

```
AR = 0; // # of active readers
AW = false; // is there an active writer
WR = 0; // # of waiting readers
WW = 0; // # of waiting writers
Condition okToRead;
Condition okToWrite;
Lock lock;
```

```
Public Database::Read() {
    StartRead();
    Access database;
    DoneRead();
}
```

```
Private Database::StartRead() {
    lock.Acquire();
    while (AW || WW > 0) {
        WR++;
        okToRead.wait(&lock);
        WR--;
    }
    AR++;
    lock.Release();
}
```

```
Private Database::DoneRead() {
    lock.Acquire();
    AR--;
    if (AR == 0 && WW > 0) {
        okToWrite.notify();
    }
    lock.Release();
}
```

11

Solution Details: Writers

```
AR = 0; // # of active readers
AW = false; // is there an active writer
WR = 0; // # of waiting readers
WW = 0; // # of waiting writers
Condition okToRead;
Condition okToWrite;
Lock lock;
```

```
Database::Write() {
    StartWrite();
    Access database;
    DoneWrite();
}
```

```
Private Database::StartWrite() {
    lock.Acquire();
    while (AW || AR > 0) {
        WW++;
        okToWrite.wait(&lock);
        WW--;
    }
    AW = true;
    lock.Release();
}
```

```
Private Database::DoneWrite() {
    lock.Acquire();
    AW = false;
    if (WR > 0) {
        okToRead.notifyAll();
    }
    else if (WW > 0) {
        okToWrite.notify();
    }
    lock.Release();
}
```

What if okToWrite.notify() is called first?
