Alert Views
Alert Views

- Alert views are an easy way to display concise and informative information to the user.
- The kind of UI that is displayed in a UI Alert Controller is specified by the controller’s preferred style when creating the controller.
- You customize the UI by identifying what buttons or text fields you want to include.
The primary classes used in an Alert are:

- **UIAlertController**
  displays an alert message to the user

- **UIAlertAction**
  represents an action that can be taken when tapping a button in an alert

You create a `UIAlertController` object first, and then add as many `UIAlertAction` objects as needed, typically based on the number of buttons defined.
A **UIAlertAction** represents an action that can be taken when tapping a button in an alert.

You use this class to configure information about a single action, including:
- The title to display in the button
- Any style information
- A handler to execute when the user taps the button
UIAlertController **Style Settings**

- **Alert**: a UI that displays over and grays out the current UI

- **Action Sheet**: a UI that slides up from the bottom of the screen and grays out the current UI
**UIAlertAction Style Settings**

- **Default:**
  - Apply the default style to the action’s button
  - Normal text

- **Cancel:**
  - Apply a style that indicate the action cancels the operation and leaves things unchanged
  - Can only have one of these. (App crashes if you define more than one for a given button)
  - Bold text

- **Destructive:**
  - Apply a style that indicates the action might change or delete data
  - Red text color
