

# CS395T: Structured Models for NLP

## Lecture 19: Advanced NNs I

Greg Durrett

# Administrivia

---

- ▶ Kyunghyun Cho (NYU) talk Friday 11am GDC 6.302
- ▶ Project 3 due today!
- ▶ Final project out today!
  - ▶ Proposal due in 1 week
  - ▶ Project presentations December 5/7 (timeslots to be assigned when proposals are turned in)
  - ▶ Final project due December 15 (no slip days!)

# Project Proposals

---

- ▶ ~1 page
  - ▶ Define a problem, give context of related work (at least 3-4 relevant papers)
  - ▶ Propose a direction that you think is feasible and outline steps to get there, including what dataset you'll use
- ▶ Okay to change directions after the proposal is submitted, but run it by me if it's a big change

# This Lecture

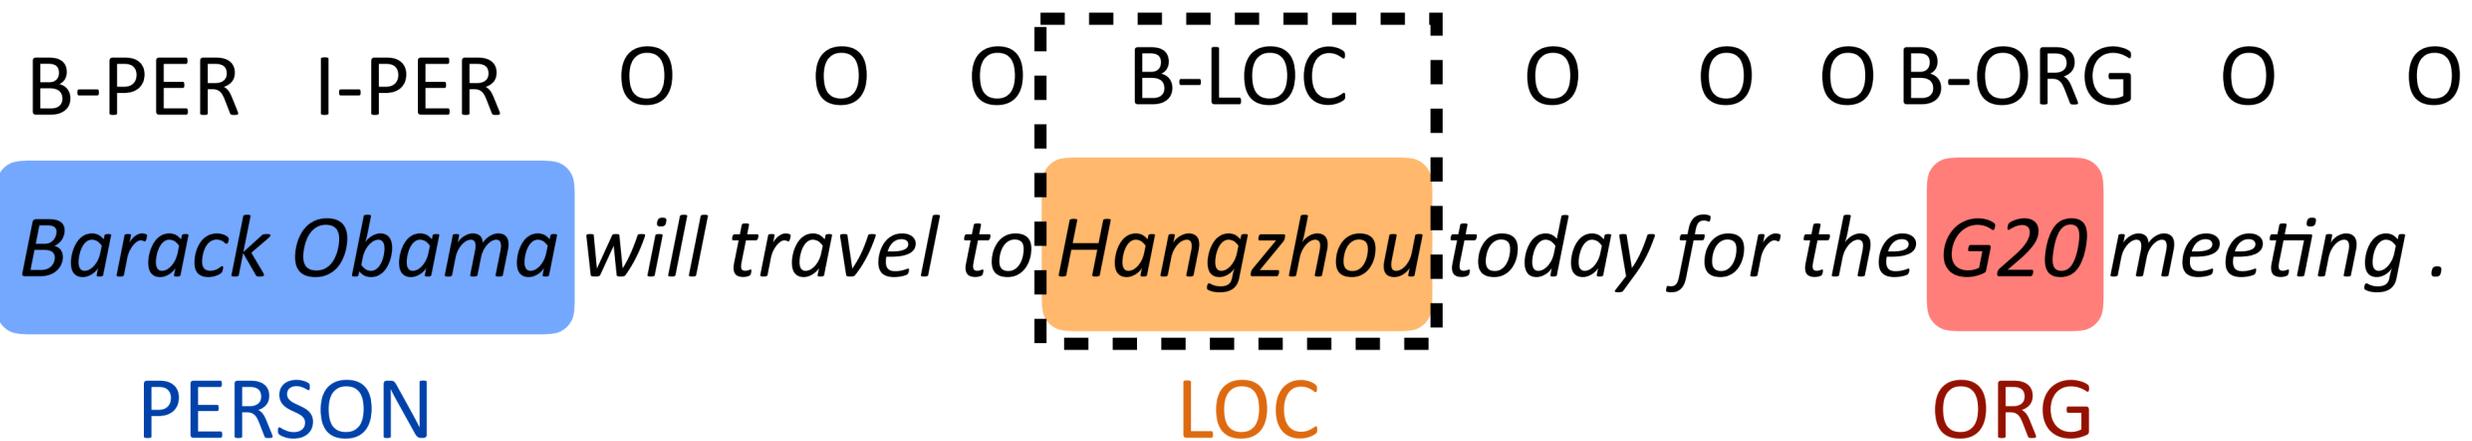

---

- ▶ Neural CRFs
- ▶ Tagging / NER
- ▶ Parsing

# Neural CRF Basics

# NER Revisited

- ▶ Features in CRFs:  $I[\text{tag}=\text{B-LOC} \ \& \ \text{curr\_word}=\text{Hangzhou}]$ ,  $I[\text{tag}=\text{B-LOC} \ \& \ \text{prev\_word}=\text{to}]$ ,  $I[\text{tag}=\text{B-LOC} \ \& \ \text{curr\_prefix}=\text{Han}]$
- ▶ Linear model over features
- ▶ Downsides:
  - ▶ Lexical features mean that words need to be seen in the training data
  - ▶ Can only use limited context windows
  - ▶ Linear model can't capture feature conjunctions effectively

# LSTMs for NER

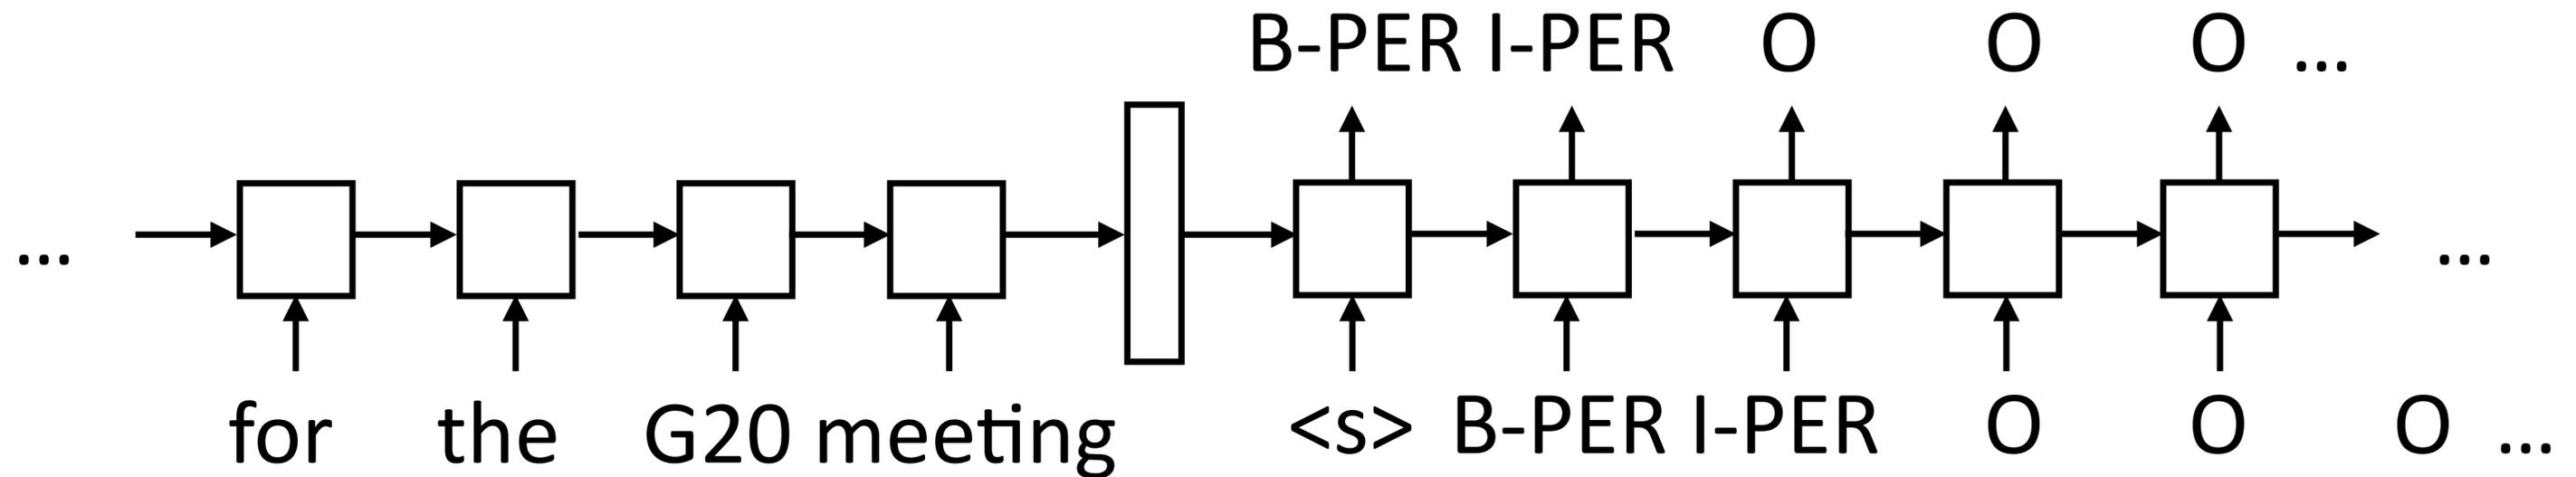

B-PER I-PER O O O B-LOC O O O B-ORG O O

PERSON

LOC

ORG

B-PER I-PER O O O B-LOC

Barack Obama will travel to Hangzhou

- ▶ Bidirectional transducer model
- ▶ What are the strengths and weaknesses of this model compared to CRFs?

# Neural CRFs

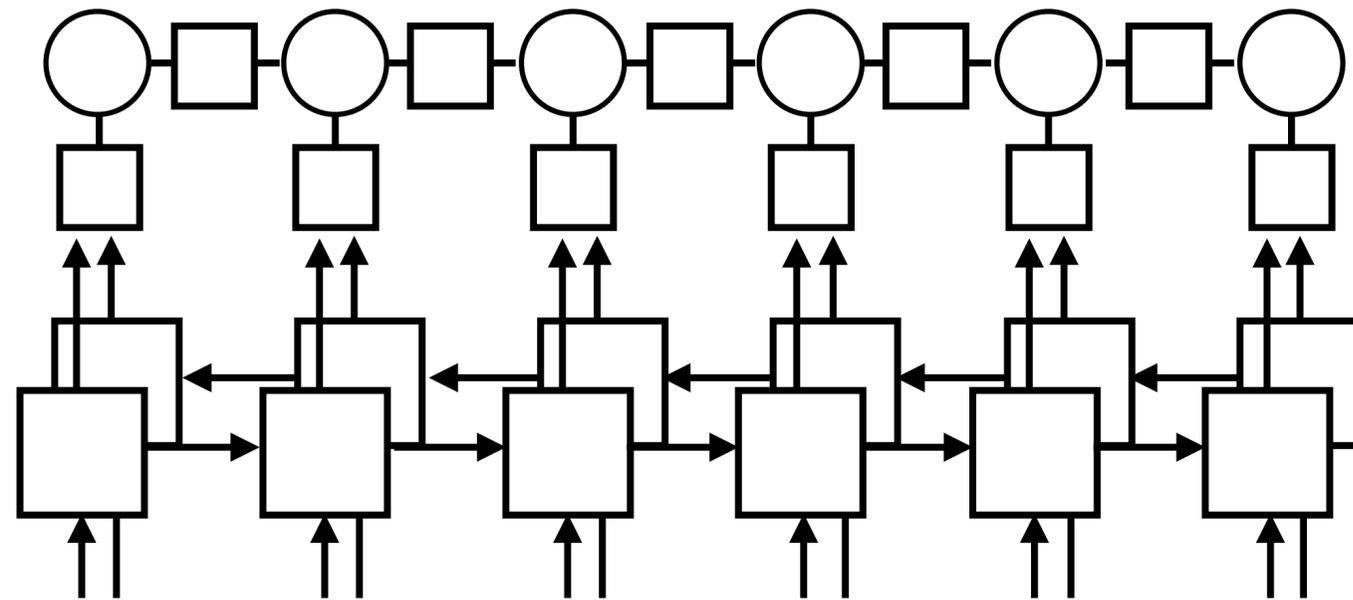

B-PER I-PER O O O B-LOC O O O B-ORG O O

Barack Obama will travel to Hangzhou today for the G20 meeting .

PERSON

LOC

ORG

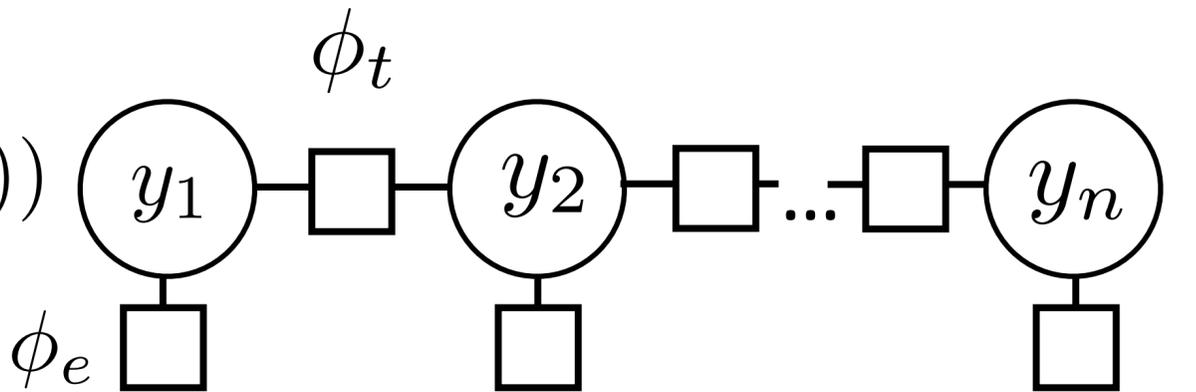

Barack Obama will travel to Hangzhou

- ▶ Neural CRFs: bidirectional LSTMs (or some NN) compute emission potentials, capture structural constraints in transition potentials

# Neural CRFs

$$P(\mathbf{y}|\mathbf{x}) = \frac{1}{Z} \prod_{i=2}^n \exp(\phi_t(y_{i-1}, y_i)) \prod_{i=1}^n \exp(\phi_e(y_i, i, \mathbf{x}))$$

- ▶ Conventional:  $\phi_e(y_i, i, \mathbf{x}) = w^\top f_e(y_i, i, \mathbf{x})$
- ▶ Neural:  $\phi_e(\mathbf{y}, i, \mathbf{x}) = W f(i, \mathbf{x})$  f/phi are vectors, len(phi) = num labels
- ▶  $f(i, \mathbf{x})$  could be the output of a feedforward neural network looking at the words around position  $i$ , or the  $i$ th output of an LSTM, ...
- ▶ Neural network computes unnormalized potentials that are consumed and “normalized” by a structured model
- ▶ Inference: compute  $f$ , use Viterbi (or beam)

# Computing Gradients

$$P(\mathbf{y}|\mathbf{x}) = \frac{1}{Z} \prod_{i=2}^n \exp(\phi_t(y_{i-1}, y_i)) \prod_{i=1}^n \exp(\phi_e(y_i, i, \mathbf{x}))$$

▶ Conventional:  $\phi_e(y_i, i, \mathbf{x}) = w^\top f_e(y_i, i, \mathbf{x})$

▶ Neural:  $\phi_e(\mathbf{y}, i, \mathbf{x}) = W f(i, \mathbf{x})$

$\frac{\partial \mathcal{L}}{\partial \phi_{e,i}} = -P(y_i = s|\mathbf{x}) + I[s \text{ is gold}]$  “error signal”, compute with F-B

▶ For linear model:  $\frac{\partial \phi_{e,i}}{w_i} = f_{e,i}(y_i, i, \mathbf{x})$  chain rule say to multiply together, gives our update

▶ For neural model: compute gradient of phi w.r.t. parameters of neural net

# Neural CRFs

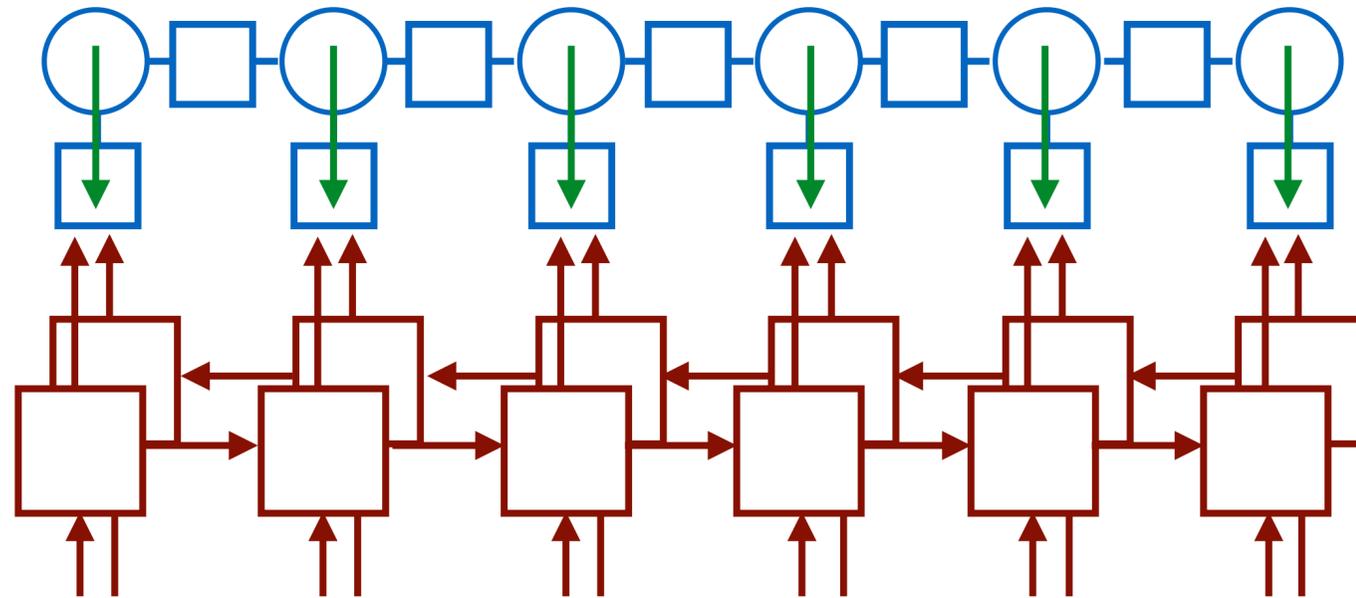

B-PER I-PER O O O B-LOC O O O B-ORG O O

Barack Obama will travel to Hangzhou today for the G20 meeting .

PERSON

LOC

ORG

Barack Obama will travel to Hangzhou

2) Run forward-backward

3) Compute error signal

1) Compute  $f(\mathbf{x})$

4) Backprop (no knowledge of sequential structure required)

# FFNN Neural CRF for NER

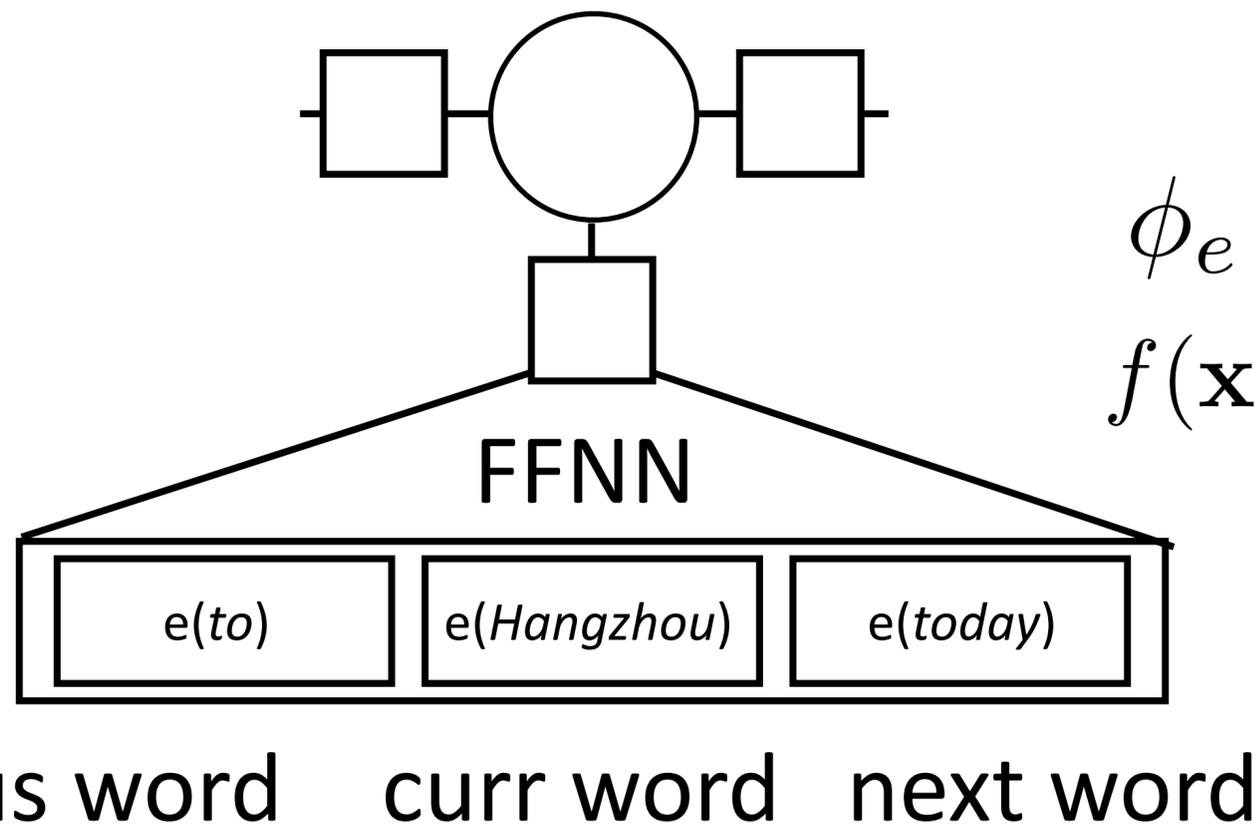

B-PER I-PER O O O B-LOC O O O B-ORG O O

Barack Obama will travel to Hangzhou today for the G20 meeting .

PERSON

LOC

ORG

$$\phi_e = Wg(Vf(\mathbf{x}, i))$$

$$f(\mathbf{x}, i) = [\text{emb}(\mathbf{x}_{i-1}), \text{emb}(\mathbf{x}_i), \text{emb}(\mathbf{x}_{i+1})]$$

- ▶ Or  $f(\mathbf{x})$  looks at output of LSTM, or another model...

*to Hangzhou today*

# Neural CRFs

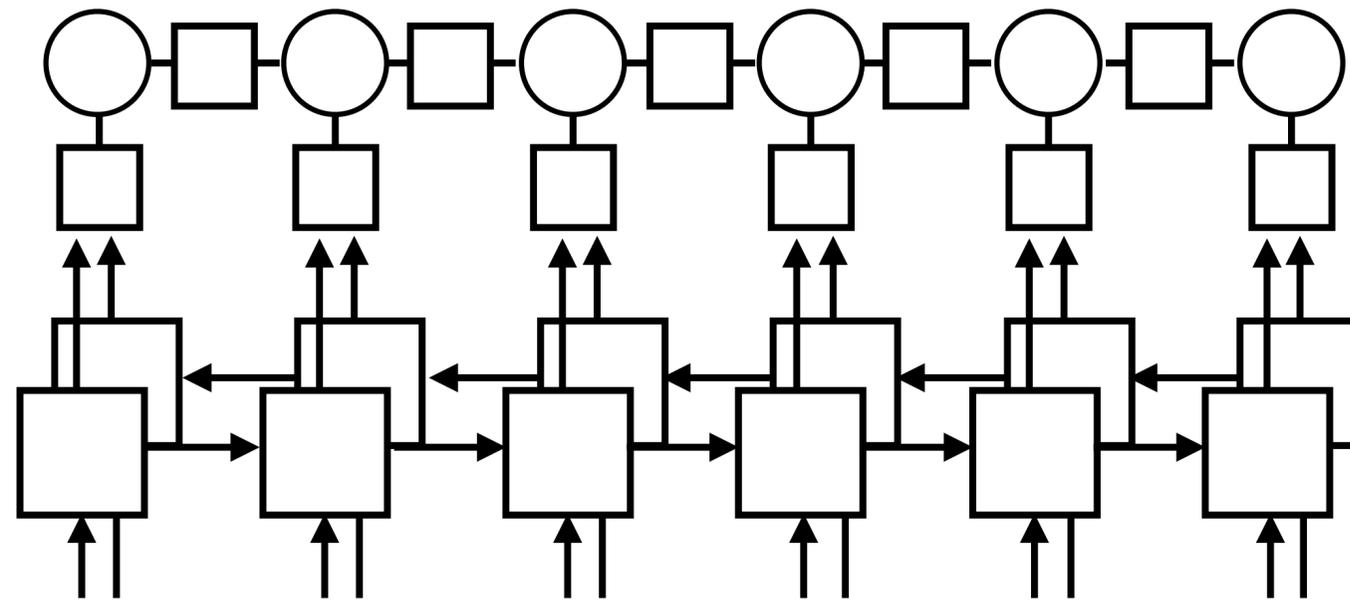

B-PER I-PER O O O B-LOC O O O B-ORG O O

Barack Obama will travel to Hangzhou today for the G20 meeting .

PERSON

LOC

ORG

Barack Obama will travel to Hangzhou

- ▶ Neural CRFs: bidirectional LSTMs compute emission potentials, also transition potentials (usually based on sparse features)

# LSTMs for NER

ORG

B-PER I-PER O O O B-LOC

Barack Obama will travel to Hangzhou

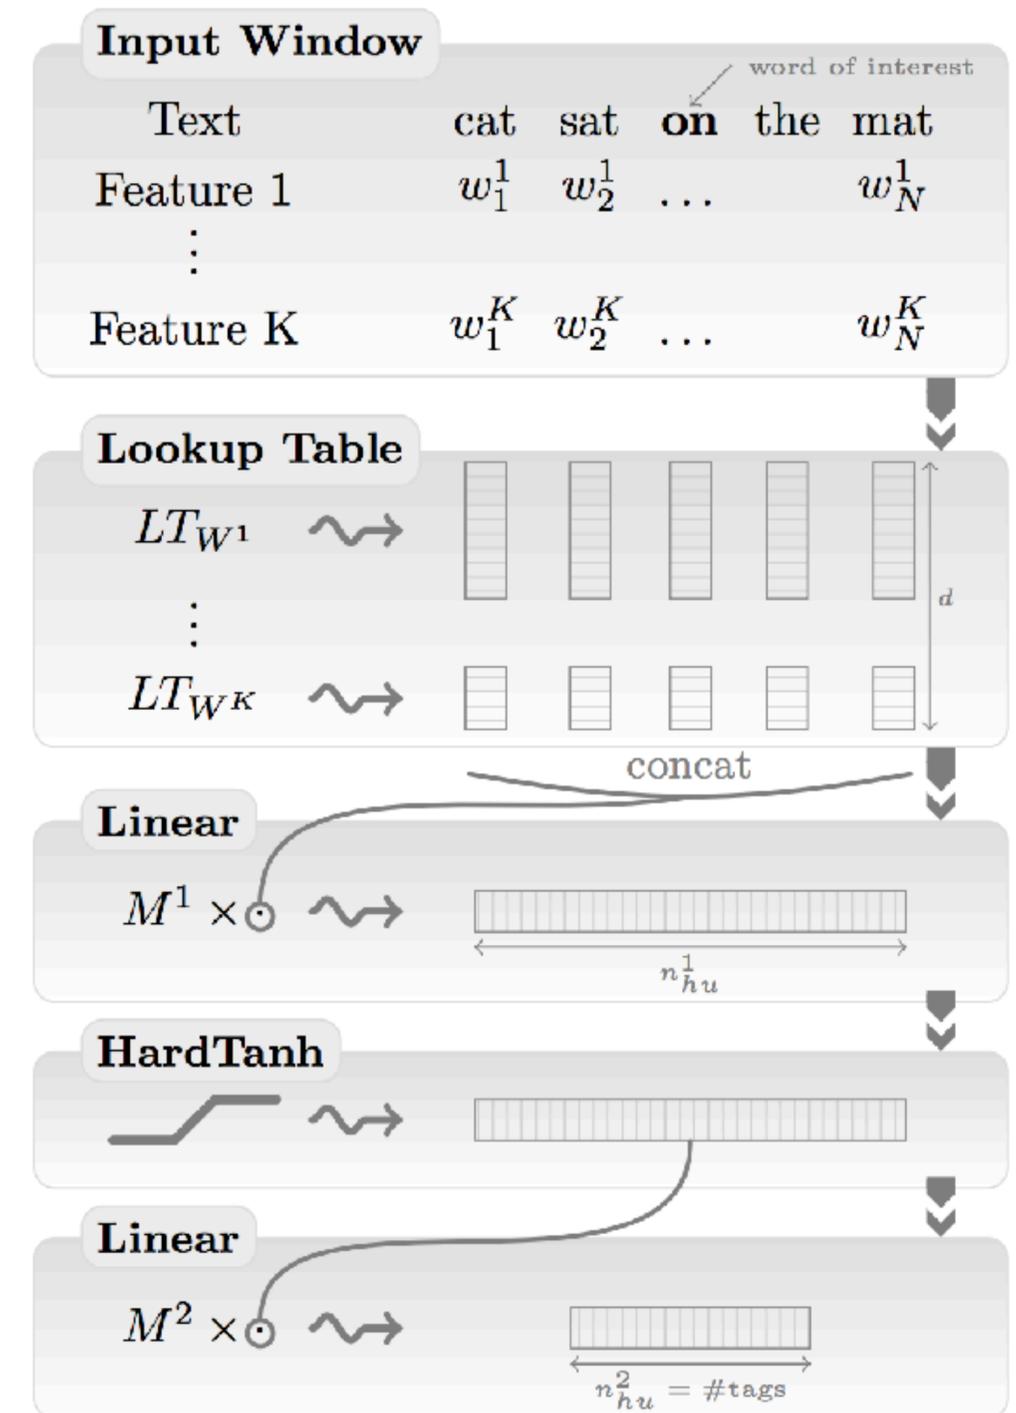

- ▶ How does this compare to neural CRF?

# “NLP (Almost) From Scratch”

Approach	POS (PWA)	CHUNK (F1)	NER (F1)	SRL (F1)
<b>Benchmark Systems</b>	97.24	94.29	89.31	77.92
NN+WLL	96.31	89.13	79.53	55.40
NN+SLL	96.37	90.33	81.47	70.99
NN+WLL+LM1	97.05	91.91	85.68	58.18
NN+SLL+LM1	97.10	93.65	87.58	73.84
NN+WLL+LM2	97.14	92.04	86.96	58.34
NN+SLL+LM2	97.20	93.63	88.67	74.15

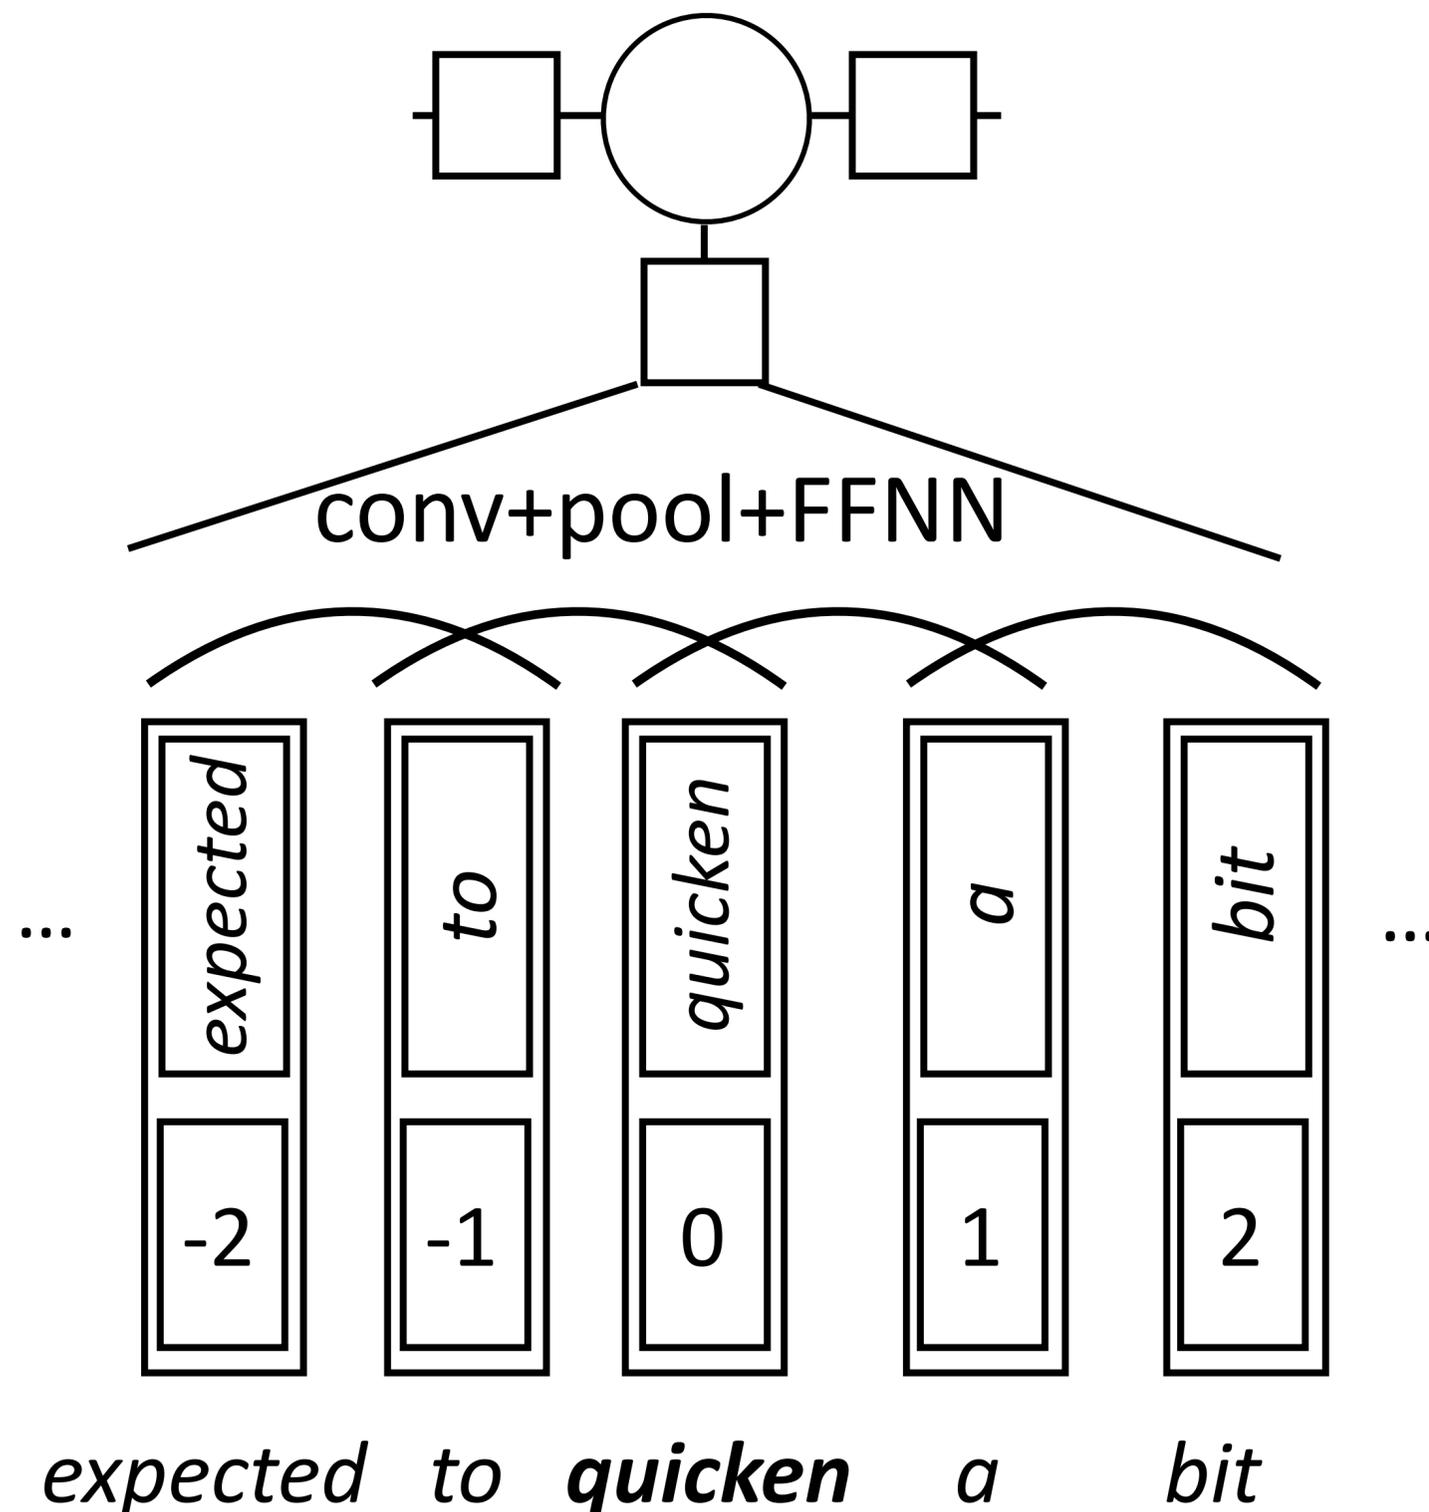

- ▶ WLL: independent classification; SLL: neural CRF
- ▶ LM1/LM2: pretrained word embeddings from a language model over large corpora

# CNN Neural CRFs

- ▶ Append to each word vector an *embedding of the relative position* of that word
- ▶ Convolution over the sentence produces a position-dependent representation
- ▶ Use this for SRL: the verb (predicate) is at position 0, CNN looks at the whole sentence “relative” to the verb

# CNN NCRFs vs. FFNN NCRFs

<b>Approach</b>	<b>POS (PWA)</b>	<b>CHUNK (F1)</b>	<b>NER (F1)</b>	<b>SRL (F1)</b>
<b>Benchmark Systems</b>	97.24	94.29	89.31	77.92
	<i>Window Approach</i>			
NN+SLL+LM2	97.20	93.63	88.67	–
	<i>Sentence Approach</i>			
NN+SLL+LM2	97.12	93.37	88.78	74.15

- ▶ Sentence approach (CNNs) is comparable to window approach (FFNNs) except for SRL where they claim it works much better

# How “from scratch” was this?

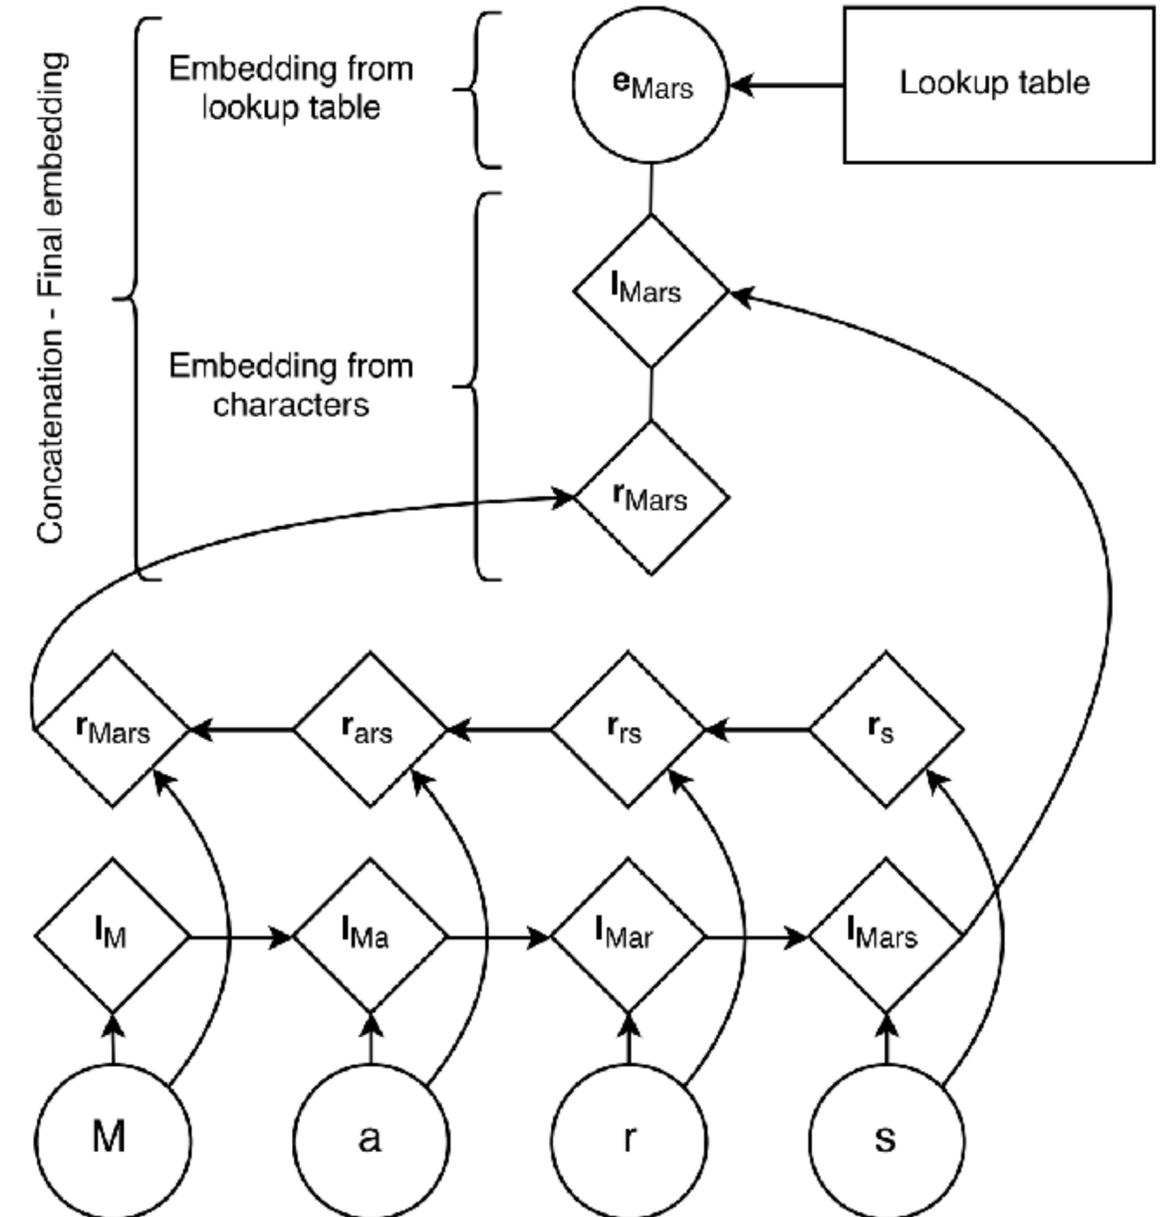

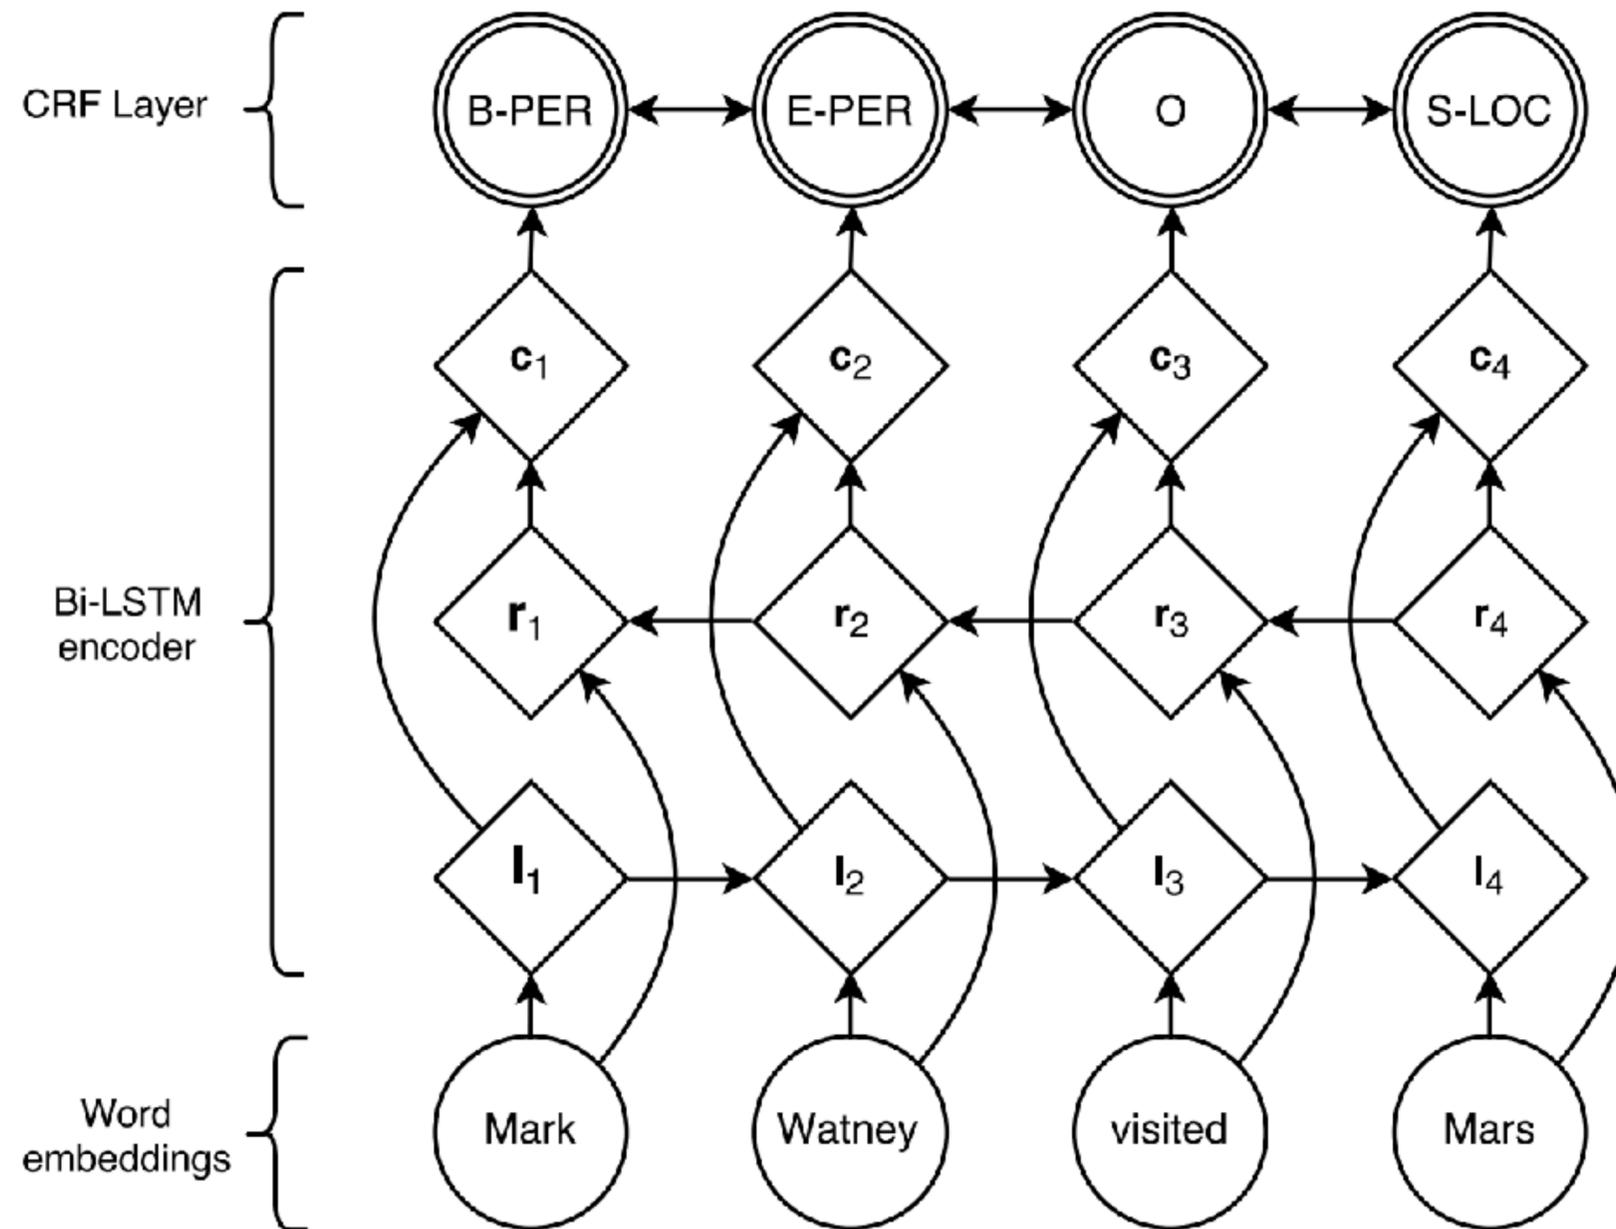

<b>Approach</b>	<b>POS (PWA)</b>	<b>CHUNK (F1)</b>	<b>NER (F1)</b>	<b>SRL (F1)</b>
<b>Benchmark Systems</b>	97.24	94.29	89.31	77.92
NN+WLL	96.31	89.13	79.53	55.40
NN+SLL	96.37	90.33	81.47	70.99
NN+WLL+LM1	97.05	91.91	85.68	58.18
NN+SLL+LM1	97.10	93.65	87.58	73.84
NN+WLL+LM2	97.14	92.04	86.96	58.34
NN+SLL+LM2	97.20	93.63	88.67	74.15
NN+SLL+LM2+Suffix2	97.29	—	—	—
NN+SLL+LM2+Gazetteer	—	—	89.59	—
NN+SLL+LM2+POS	—	94.32	88.67	—
NN+SLL+LM2+CHUNK	—	—	—	74.72

- ▶ NN+SLL isn't great
- ▶ LM2: trained for 7 weeks on Wikipedia+Reuters — very expensive!
- ▶ Sparse features needed to get best performance on NER+SRL anyway
- ▶ No use of sub-word features...

# Neural CRFs with LSTMs

- ▶ Neural CRF using character LSTMs to compute word representations

# Neural CRFs with LSTMs

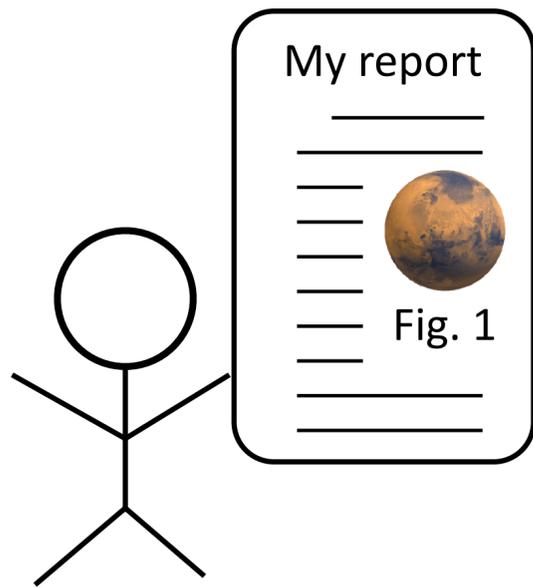

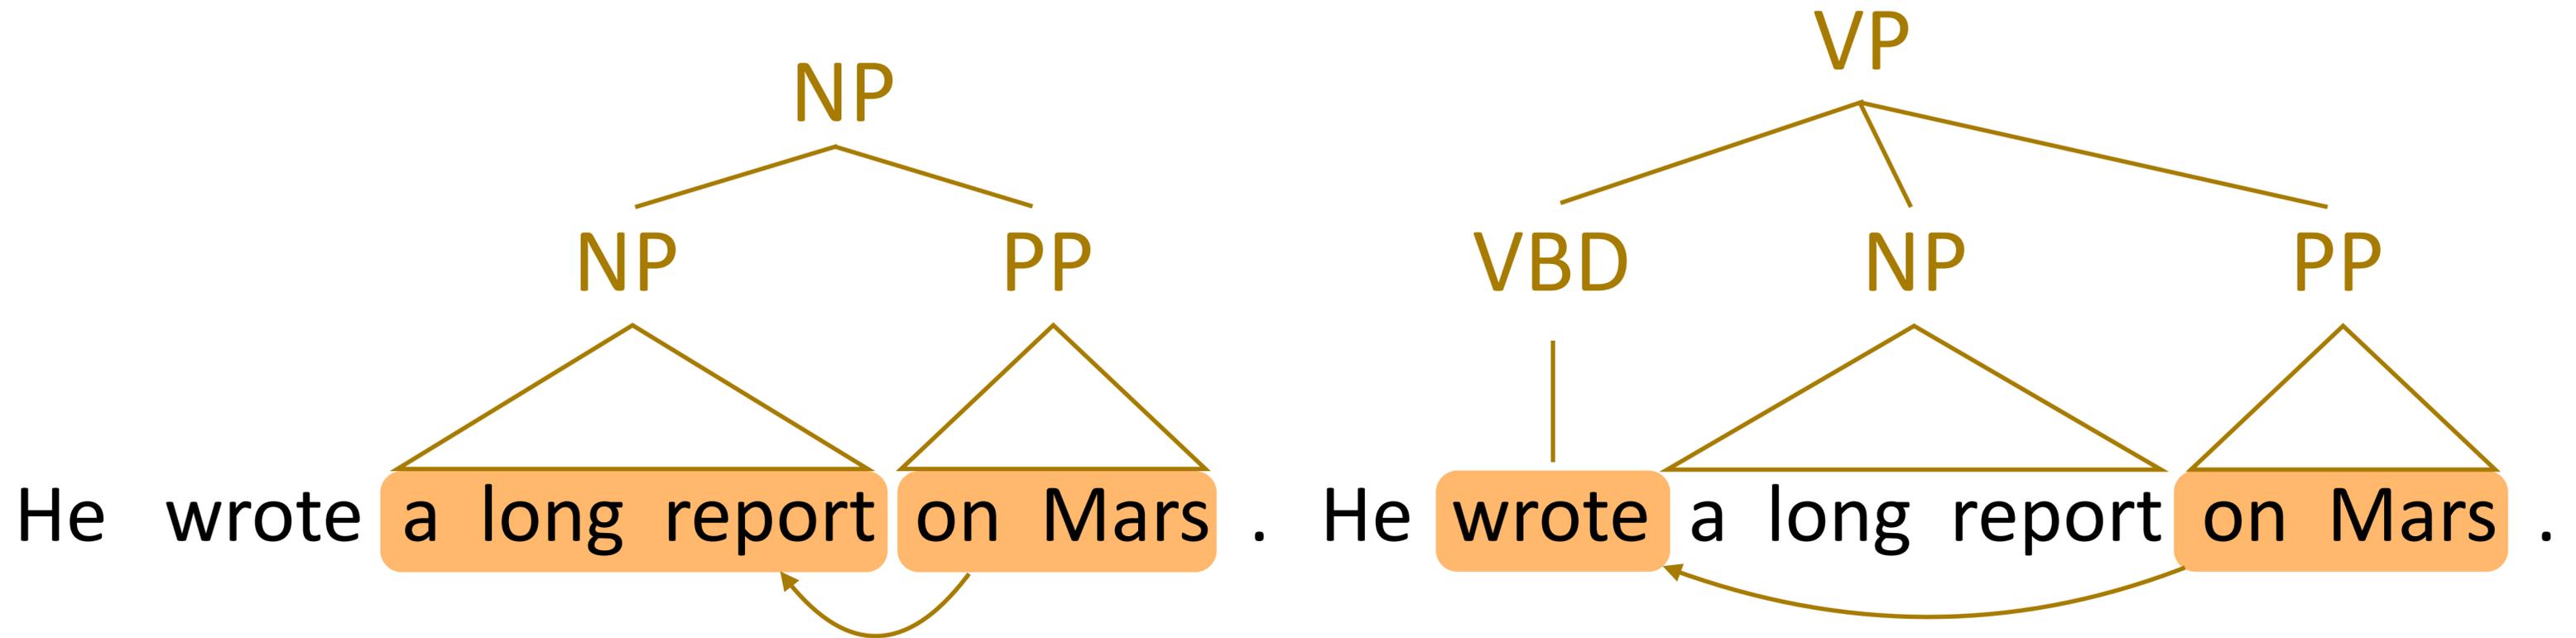

- ▶ Chiu+Nichols: character CNNs instead of LSTMs
- ▶ Lin/Passos/Luo: use external resources like Wikipedia
- ▶ LSTM-CRF captures the important aspects of NER: word context (LSTM), sub-word features (character LSTMs), outside knowledge (word embeddings)

# Neural CRFs for Parsing

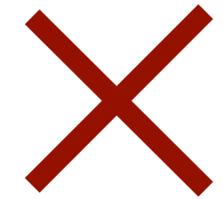

# Constituency Parsing

report—on Mars

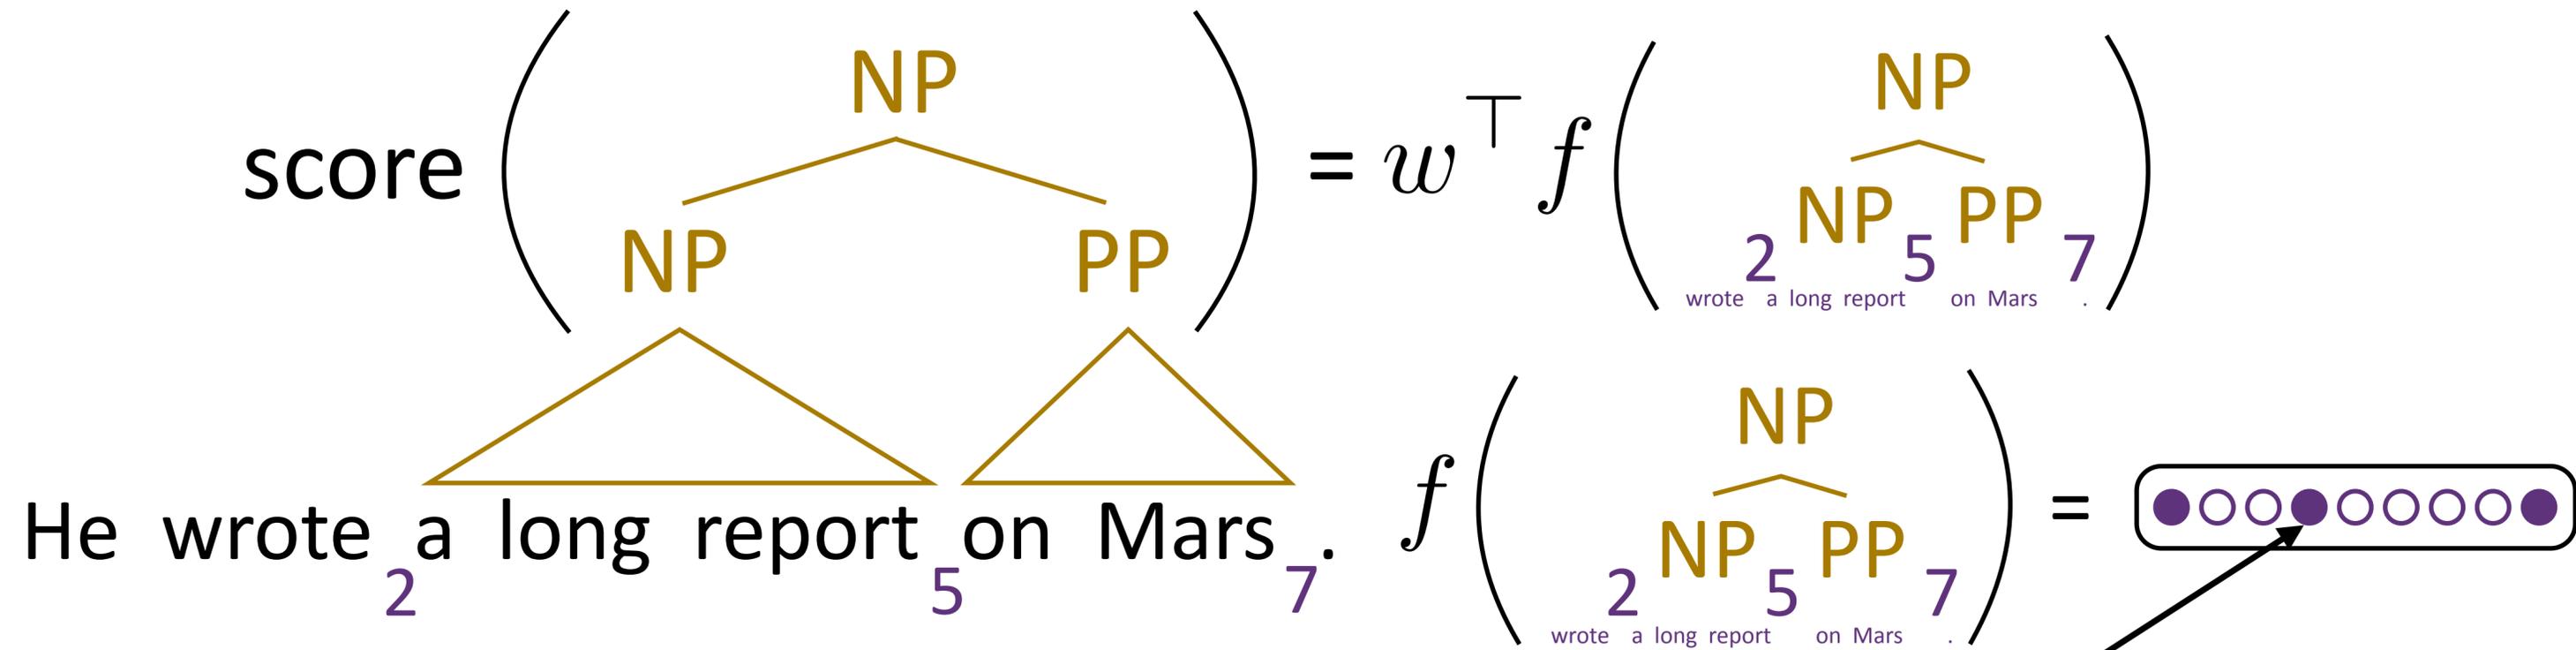

wrote—on Mars

# Discrete Parsing

Left child last word = *report*  $\wedge$   $\begin{array}{c} \text{NP} \\ / \quad \backslash \\ \text{NP} \quad \text{PP} \end{array}$

## Drawbacks

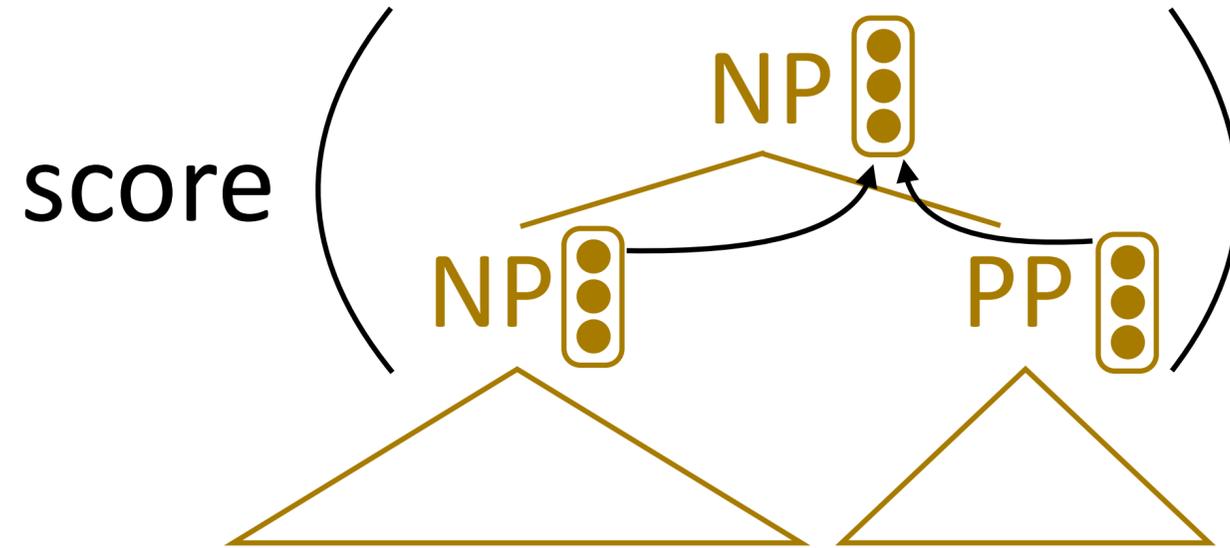

- ▶ Need to learn each word's properties individually
- ▶ Hard to learn feature conjunctions (*report on X*)

Taskar et al. (2004)

Hall, Durrett, and Klein (ACL 2014)

# Continuous-State Grammars

He wrote a long report on Mars .

Powerful nonlinear featurization, but inference is intractable

# Joint Discrete and Continuous Parsing

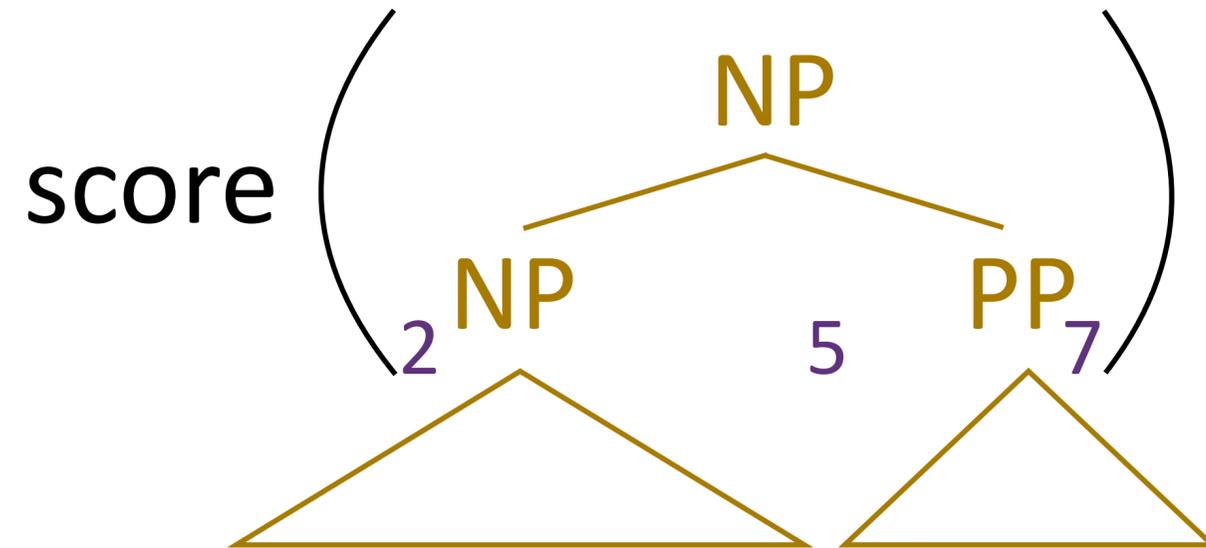

$$\text{score} \left( \begin{array}{c} \text{NP} \\ / \quad \backslash \\ \text{NP} \quad \text{PP} \\ / \quad \backslash \quad / \quad \backslash \\ 2 \quad 5 \quad 7 \end{array} \right) = w^T f \left( \begin{array}{c} \text{NP} \\ / \quad \backslash \\ \text{NP} \quad \text{PP} \\ / \quad \backslash \quad / \quad \backslash \\ 2 \quad 5 \quad 7 \end{array} \right)$$

He wrote a long report on Mars

$$+ s^T \left( \begin{array}{c} X \\ / \quad \backslash \\ X \quad X \\ / \quad \backslash \quad / \quad \backslash \\ 2 \quad 5 \quad 7 \end{array} \right) W \ell \left( \begin{array}{c} \text{NP} \\ / \quad \backslash \\ \text{NP} \quad \text{PP} \\ / \quad \backslash \quad / \quad \backslash \\ 2 \quad 5 \quad 7 \end{array} \right)$$

# Joint Discrete and Continuous Parsing

He wrote a long report on Mars

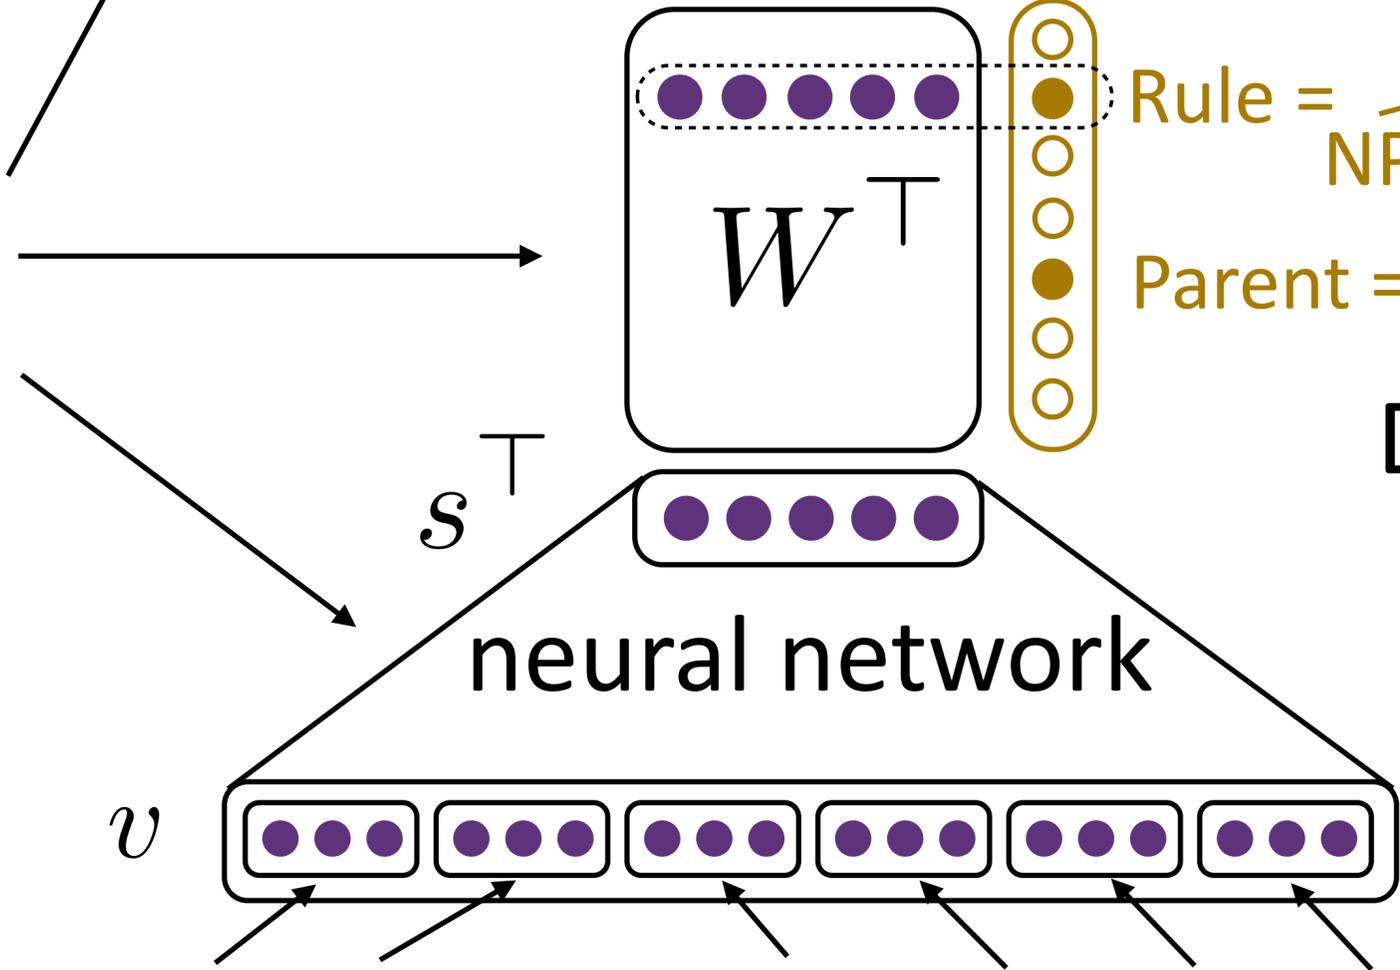

$$= w^T f \left( \begin{array}{c} \text{NP} \\ \swarrow \quad \searrow \\ \text{NP} \quad \text{PP} \\ \swarrow \quad \searrow \quad \swarrow \quad \searrow \\ 2 \quad 5 \quad 7 \end{array} \right) + s^T \left( \begin{array}{c} X \\ \swarrow \quad \searrow \\ X \quad X \\ \swarrow \quad \searrow \quad \swarrow \quad \searrow \\ 2 \quad 5 \quad 7 \end{array} \right) W \ell \left( \begin{array}{c} \text{NP} \\ \swarrow \quad \searrow \\ \text{NP} \quad \text{PP} \end{array} \right)$$

# Joint Discrete and Continuous Parsing

$$\text{score} \left( \begin{array}{c} \text{NP} \\ \text{NP} \text{ PP} \\ 2 \quad 5 \quad 7 \end{array} \right) = w^T f \left( \begin{array}{c} \text{NP} \\ \text{NP} \text{ PP} \\ 2 \quad 5 \quad 7 \end{array} \right) + s^T \left( \begin{array}{c} X \\ X \text{ } X \\ 2 \quad 5 \quad 7 \end{array} \right) \underbrace{W \ell \left( \begin{array}{c} \text{NP} \\ \text{NP} \text{ PP} \end{array} \right)}_{\text{rule embeddings}}$$

Learned jointly

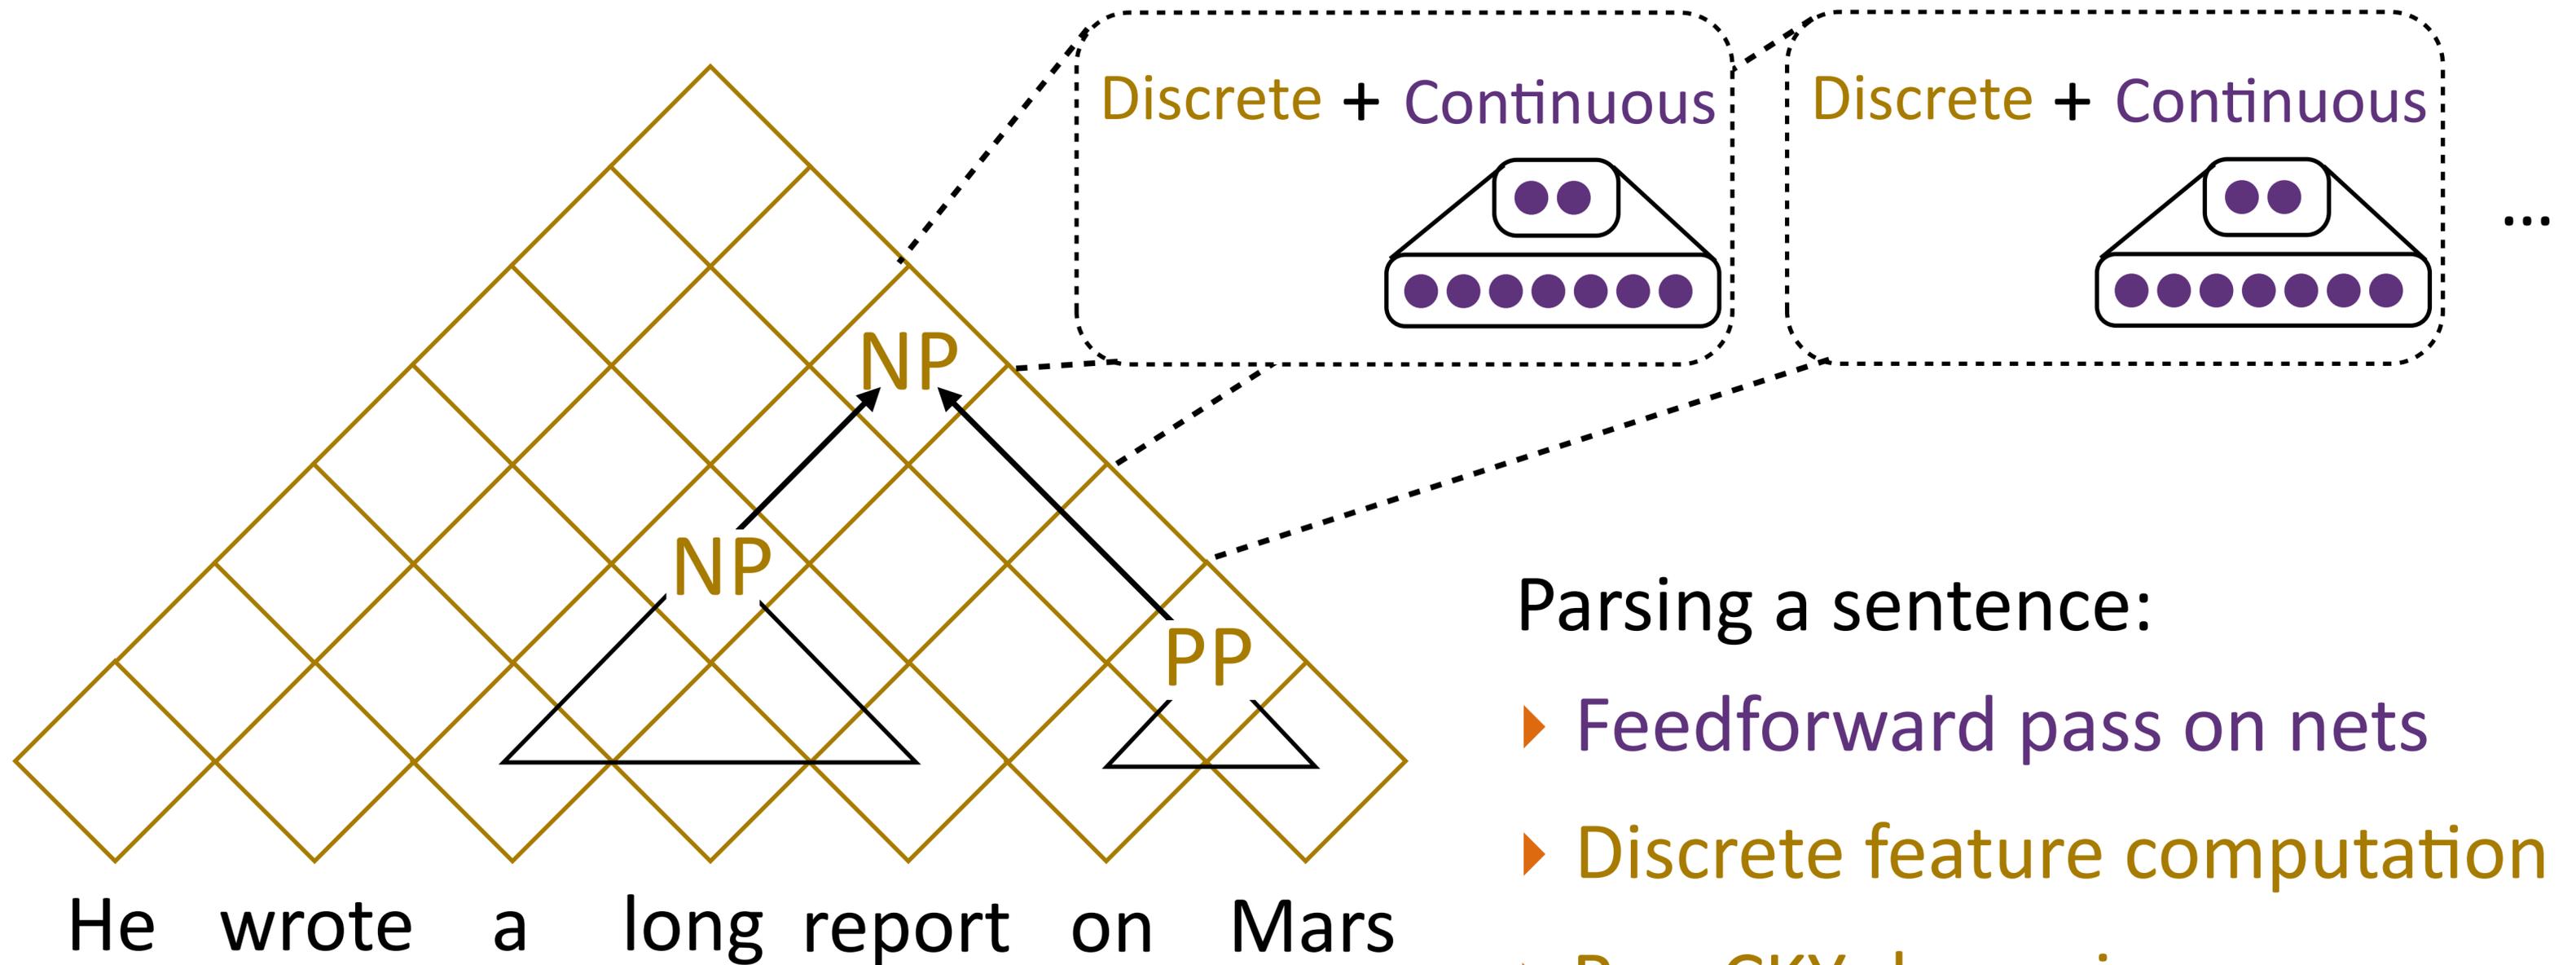

Discrete structure

He wrote<sub>2</sub> a long report<sub>5</sub> on Mars<sub>7</sub>.

# Joint Discrete and Continuous Parsing

- ▶ Chart remains discrete!

Parsing a sentence:

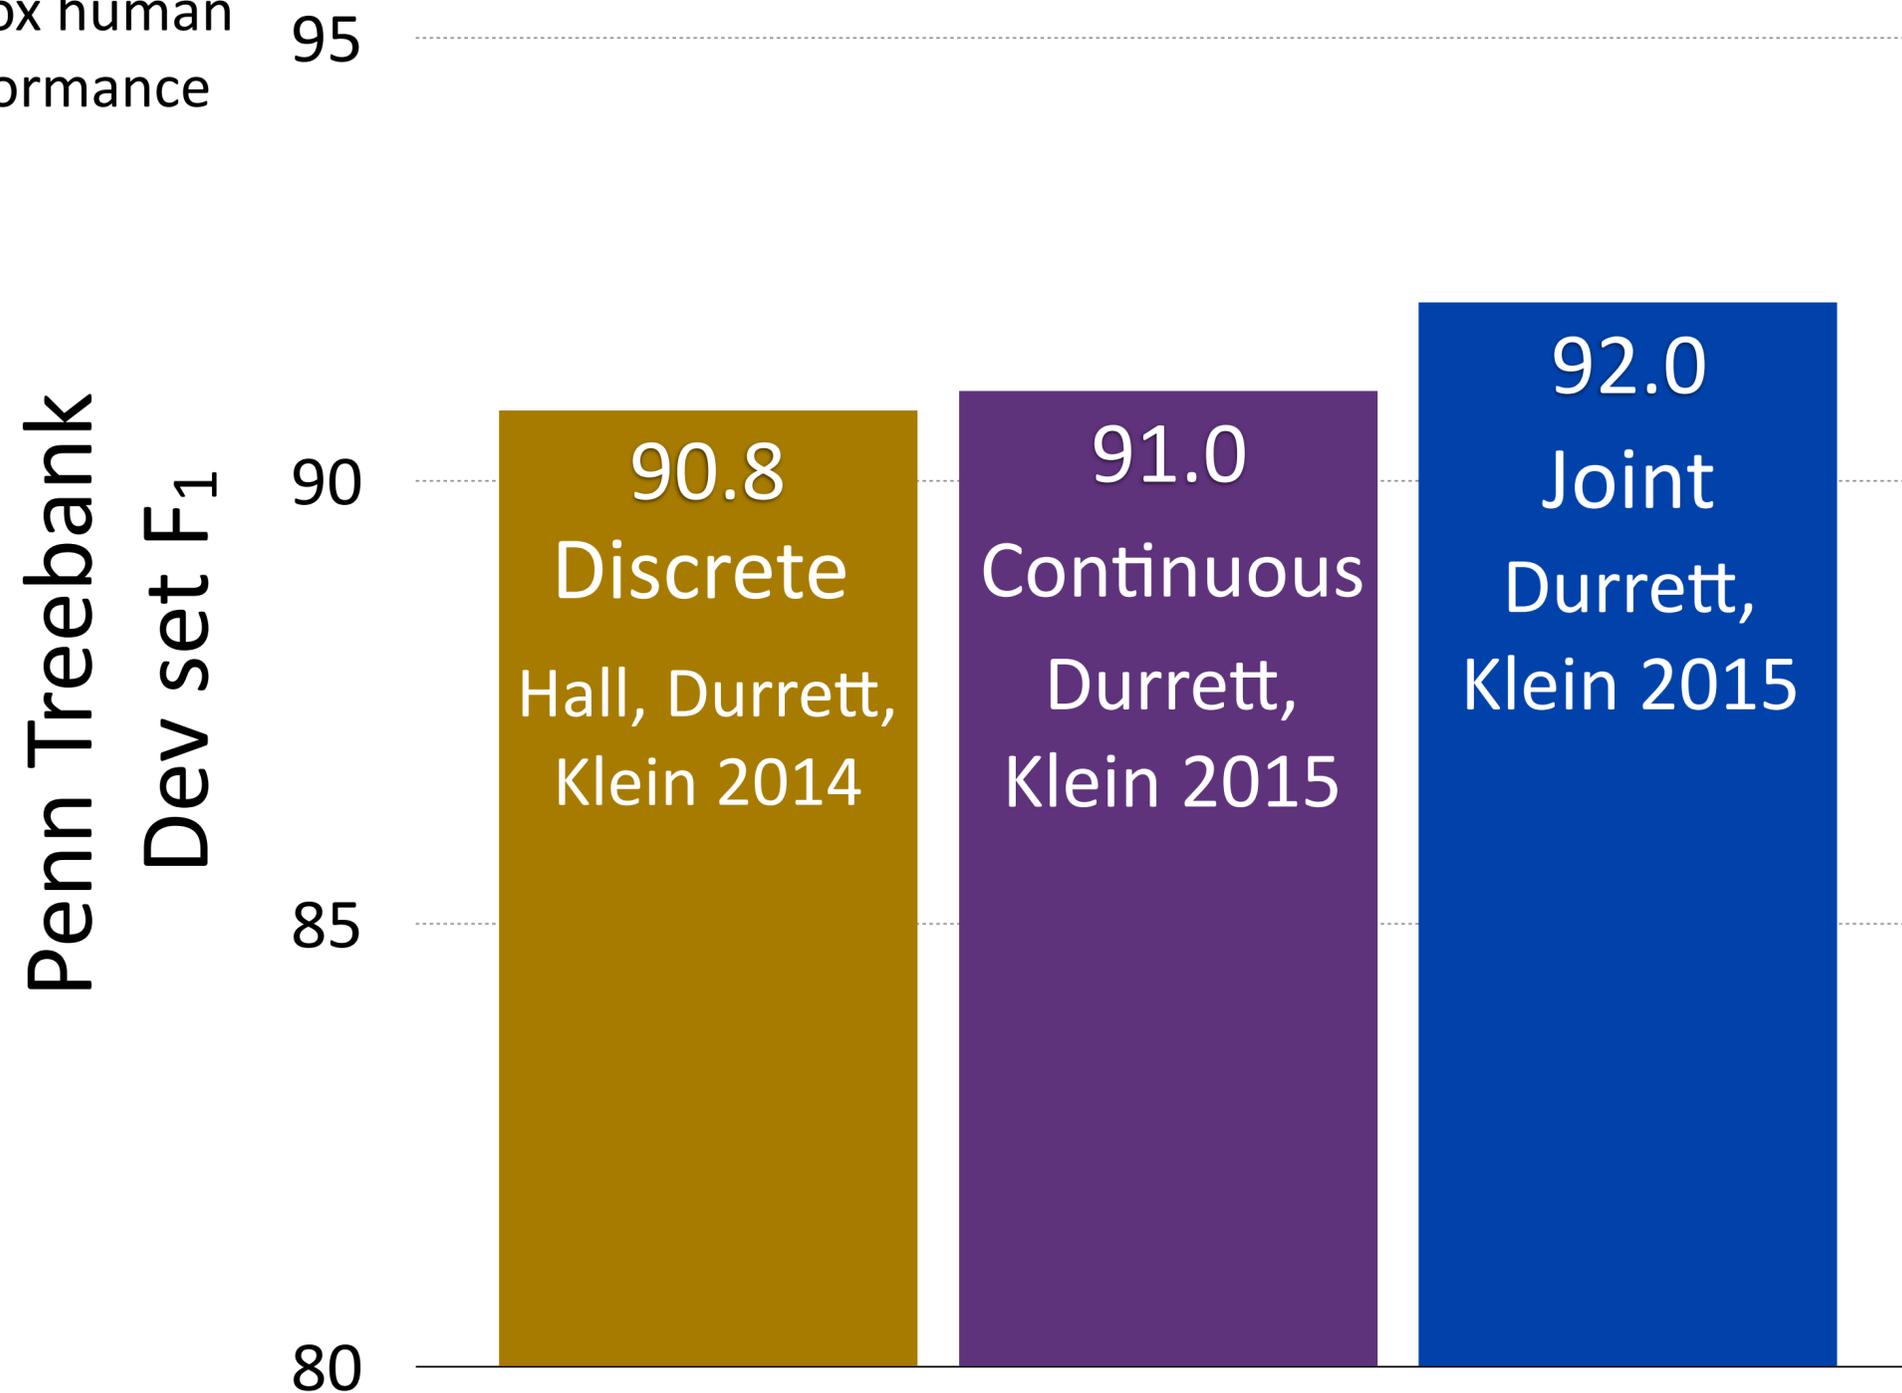

- ▶ Feedforward pass on nets
- ▶ Discrete feature computation
- ▶ Run CKY dynamic program

Durrett and Klein (ACL 2015)

# Joint Modeling Helps!

Approx human performance

# Comparison to Neural Parsers

Approx human performance

# Results: 8 languages

# Dependency Parsing

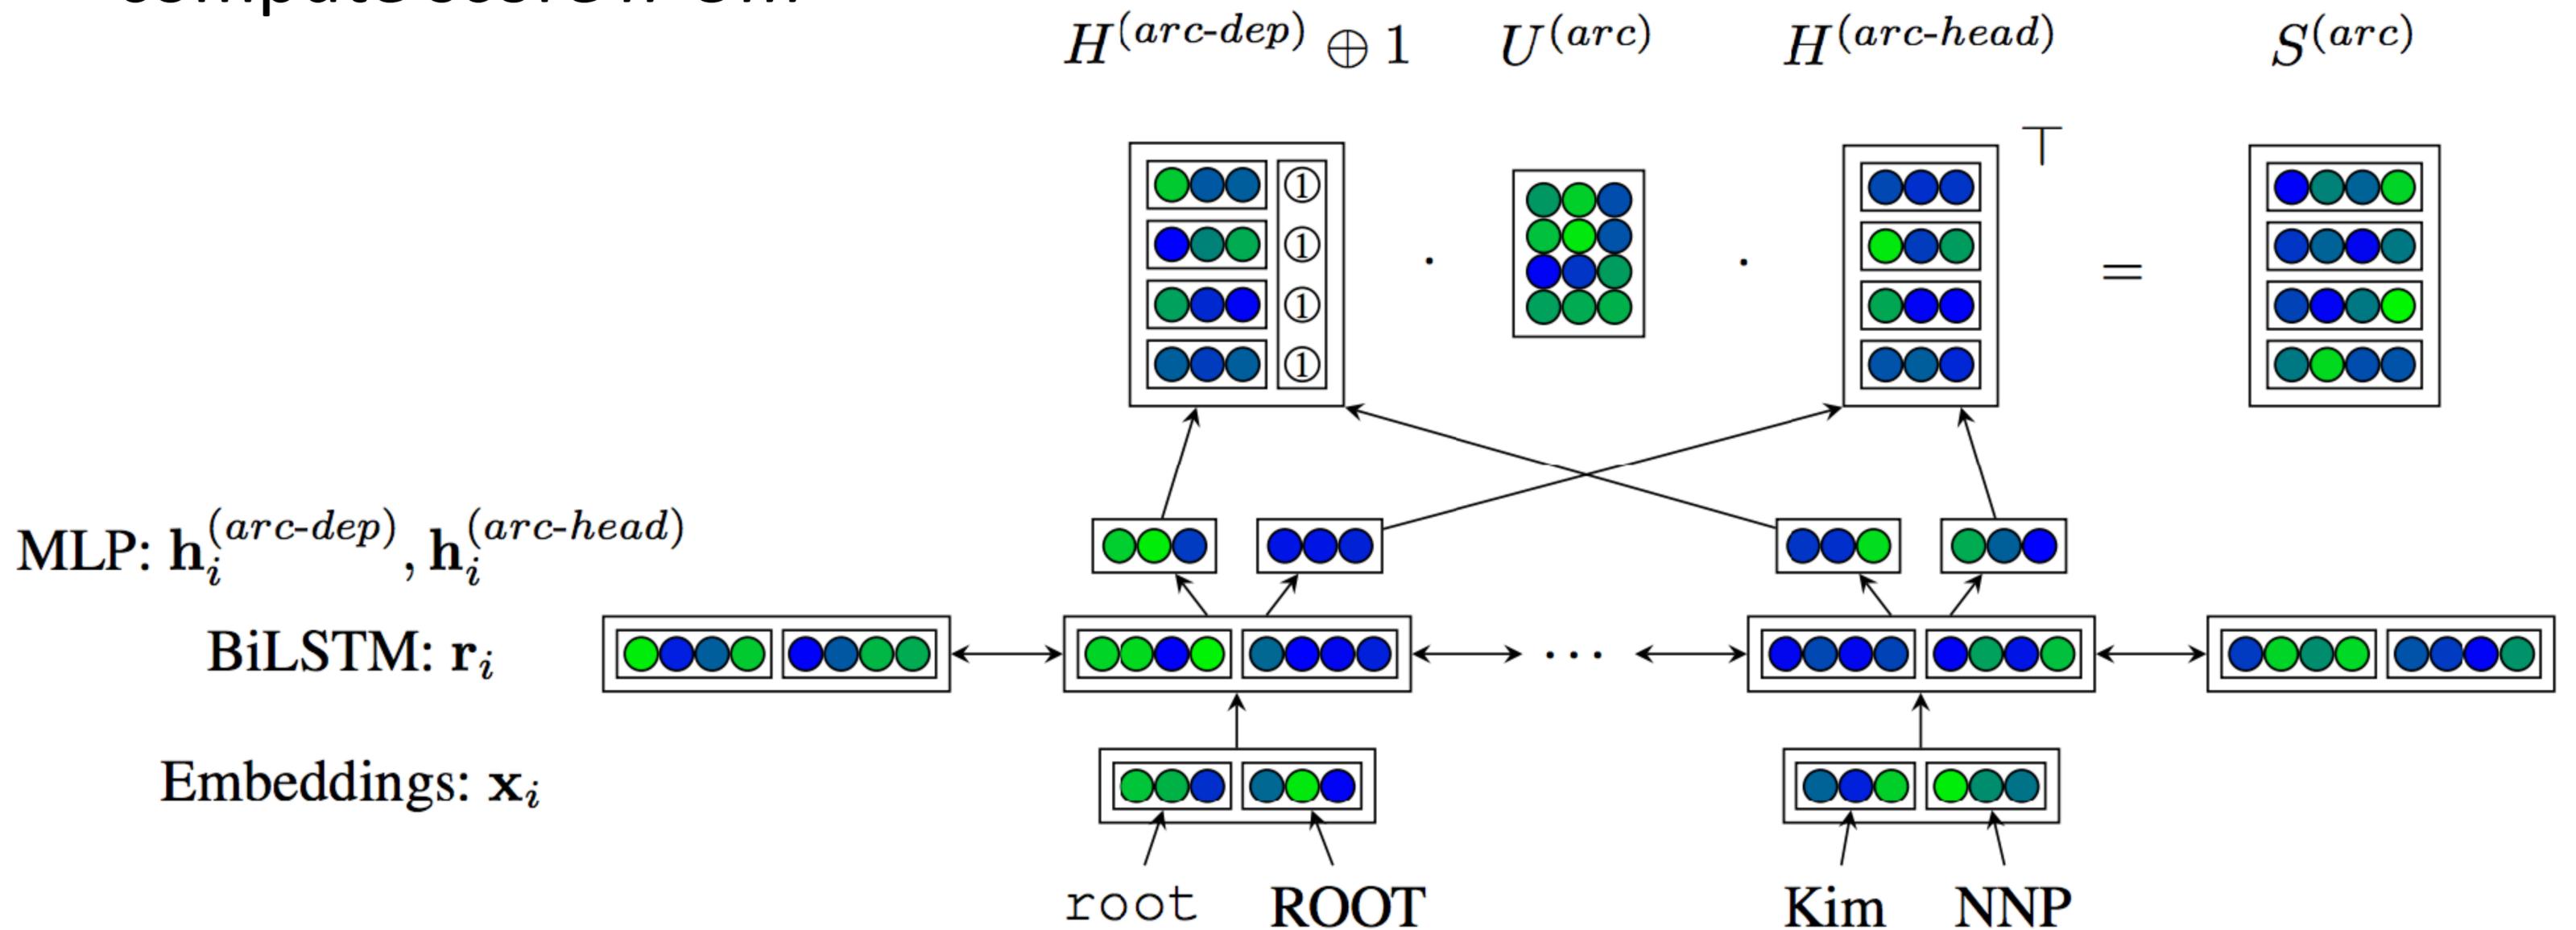

- ▶ Score each head-child pair in a dependency parse, use Eisner's algorithm or MST to assemble a parse
- ▶ Feedforward neural network approach: use features on head and modifier

# Dependency Parsing

- Biaffine approach: condense each head and modifier separately, compute score  $h^T U m$

# Results

Type	Model	English PTB-SD 3.3.0		Chinese PTB 5.1	
		UAS	LAS	UAS	LAS
Transition	Ballesteros et al. (2016)	93.56	91.42	87.65	86.21
	Andor et al. (2016)	94.61	92.79	–	–
	Kuncoro et al. (2016)	<b>95.8</b>	<b>94.6</b>	–	–
Graph	Kiperwasser & Goldberg (2016)	93.9	91.9	87.6	86.1
	Cheng et al. (2016)	94.10	91.49	88.1	85.7
	Hashimoto et al. (2016)	94.67	92.90	–	–
	Deep Biaffine	95.74	94.08	<b>89.30</b>	<b>88.23</b>

- ▶ Biaffine approach works well (other neural CRFs are also strong)

# Neural CRFs

---

- ▶ State-of-the-art for:
  - ▶ POS
  - ▶ NER without extra data (Lample et al.)
  - ▶ Dependency parsing (Dozat and Manning)
  - ▶ Semantic Role Labeling (He et al.)
- ▶ Why do they work so well?
  - ▶ Word-level LSTMs compute features based on the word + context
  - ▶ Character LSTMs/CNNs extract features per word
  - ▶ Pretrained embeddings capture external semantic information
  - ▶ CRF handles structural aspects of the problem

# Takeaways

---

- ▶ Any structured model / dynamic program + any neural network to compute potentials = neural CRF
- ▶ Can incorporate transition potentials or other scores over the structure like grammar rules
- ▶ State-of-the-art for many text analysis tasks
