Lecture 3: Binary image analysis

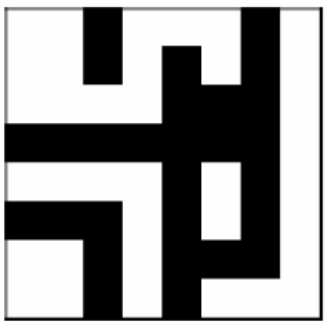
Thursday, Sept 6

- Sudheendra’s office hours
  - Mon, Wed 1-2 pm
  - ENS 31NR
- Forsyth and Ponce book

Binary images

- Two pixel values
- Foreground and background
- Regions of interest

1	1	0	1	1	1	0	1
1	1	0	1	0	1	0	1
1	1	1	1	0	0	0	1
0	0	0	0	0	0	0	1
1	1	1	1	0	1	0	1
0	0	0	1	0	1	0	1
1	1	0	1	0	0	0	1
1	1	0	1	0	1	1	1



Constrained image capture setting

Outline

- Thresholding
- Connected components
- Morphological operators
- Region properties
  - Spatial moments
  - Shape
- Distance transforms
  - Chamfer distance

Thresholding

- Grayscale -> binary mask
- Useful if object of interest's intensity distribution is distinct from background

$$F_T[i,j] = \begin{cases} 1 & \text{if } F[i,j] \geq T \\ 0 & otherwise. \end{cases}$$

$$F_T[i,j] = \begin{cases} 1 & \text{if } T_1 \leq F[i,j] \leq T_2 \\ 0 & otherwise. \end{cases}$$

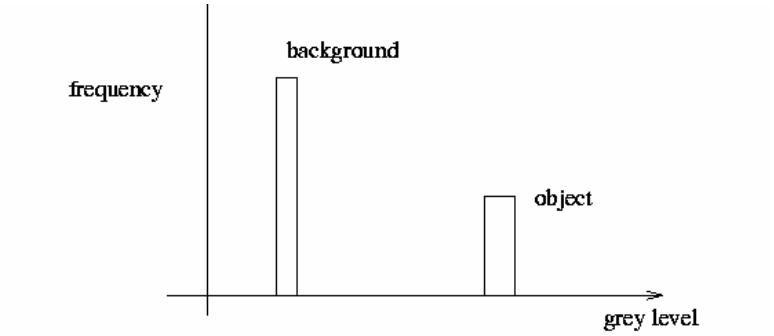
$$F_T[i,j] = \begin{cases} 1 & \text{if } F[i,j] \in Z \\ 0 & otherwise. \end{cases}$$

- Example http://homepages.inf.ed.ac.uk/rbf/CVonline/LOCAL_COPIES/FITZGIBBON/simplebinary.html

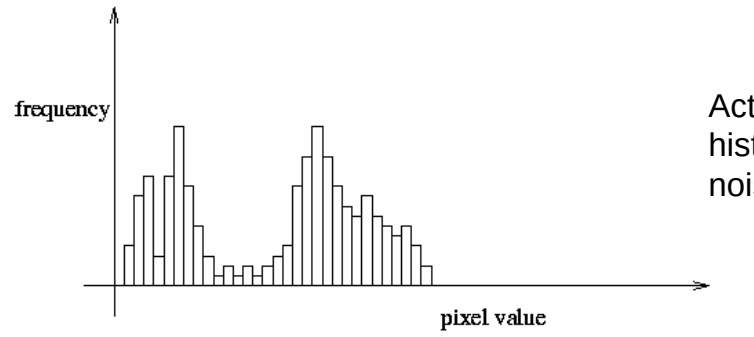
Selecting thresholds

- Partition a bimodal histogram
- Fit Gaussians
- Dynamic or local thresholds

A nice case: bimodal intensity histograms



Ideal histogram, light object on dark background



Actual observed histogram with noise

Images: http://homepages.inf.ed.ac.uk/rbf/CVonline/LOCAL_COPIES/OWENS/LECT2/node3.html

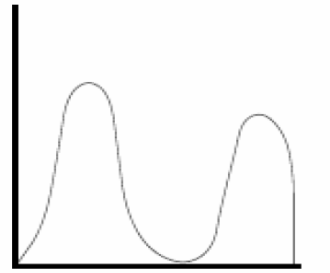
A nice case: bimodal intensity histograms

- Example
- Thresholding a bimodal histogram

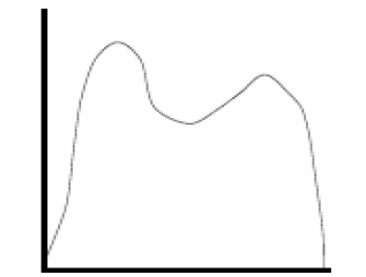
- Otsu method (1979) : automatically select threshold by minimizing the weighted *within-group variance* of the two groups of pixels separated by the threshold.

Not so nice cases

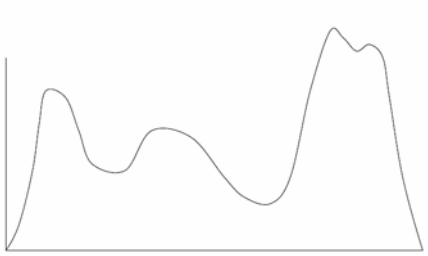
- Threshold selection is an art, not a science



Two distinct modes



Overlapped modes



Shapiro and Stockman

Connected components

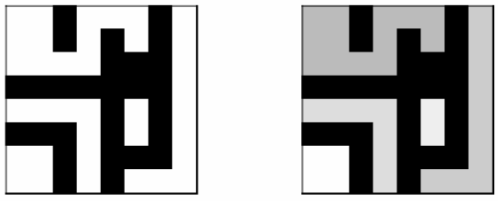
- Identify distinct regions

1	1	0	1	1	1	0	1
1	1	0	1	0	1	0	1
1	1	1	1	0	0	0	1
0	0	0	0	0	0	0	1
1	1	1	1	0	1	0	1
0	0	0	1	0	1	0	1
1	1	0	1	0	0	0	1
1	1	0	1	0	1	1	1

a) binary image

1	1	0	1	1	1	0	2
1	1	0	1	0	1	0	2
1	1	1	1	0	0	0	2
0	0	0	0	0	0	0	2
3	3	3	3	0	4	0	2
0	0	0	3	0	4	0	2
5	5	0	3	0	0	0	2
5	5	0	3	0	2	2	2

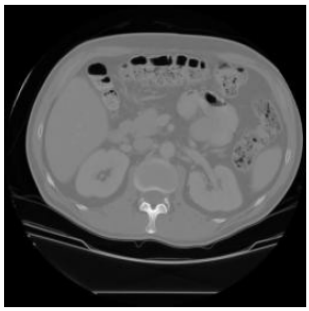
b) connected components labeling

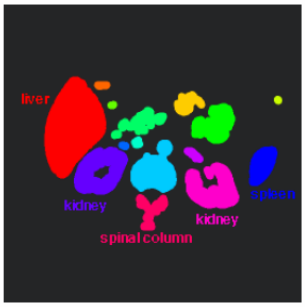


c) binary image and labeling, expanded for viewing

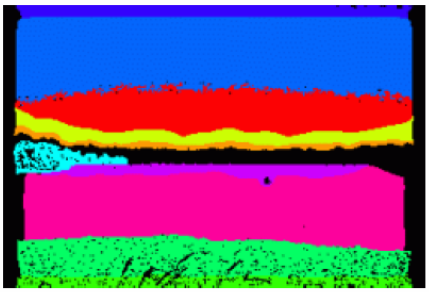
Shapiro and Stockman

Connected components





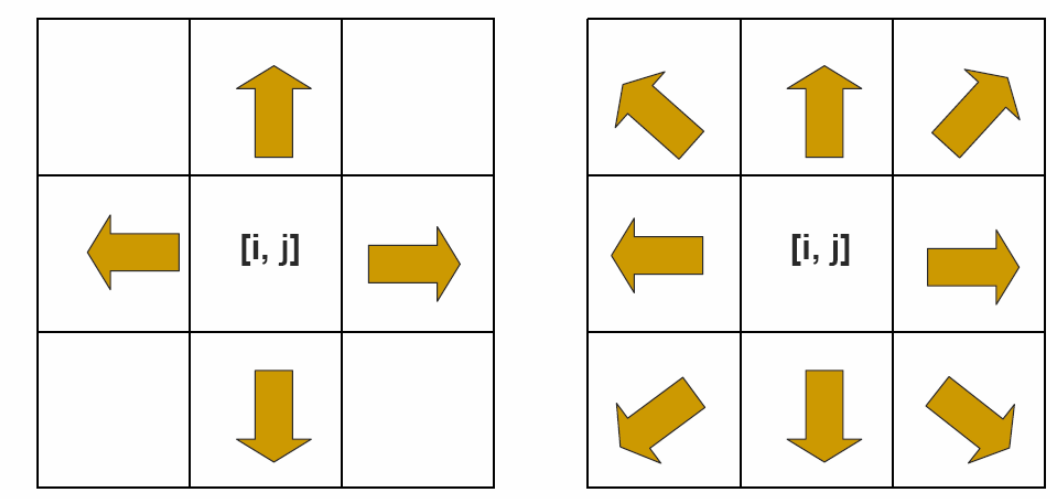
connected components of 1's from thresholded image



connected components of cluster labels

Connectedness

- Which pixels are considered neighbors



4-connected

8-connected

Image from http://www-ee.uta.edu/Online/Devarajan/ee6358/BIP.pdf

Connected components

- Various algorithms to compute
  - Recursive (in memory)
  - Two rows at a time (image not necessarily in memory)
  - Parallel propagation strategy

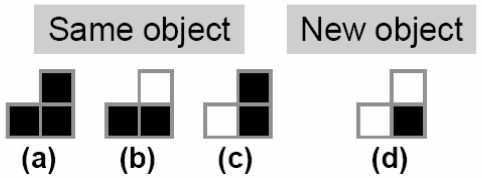
Recursive connected components

- Find an unlabeled pixel, assign it a new label
- Search to find its neighbors, and recursively repeat to find their neighbors til there are no more
- Repeat

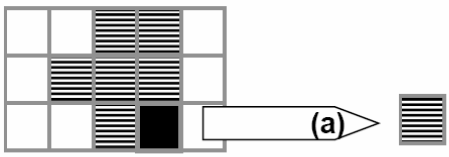
  - Demo http://www.cosc.canterbury.ac.nz/mukundan/covn/Label.html

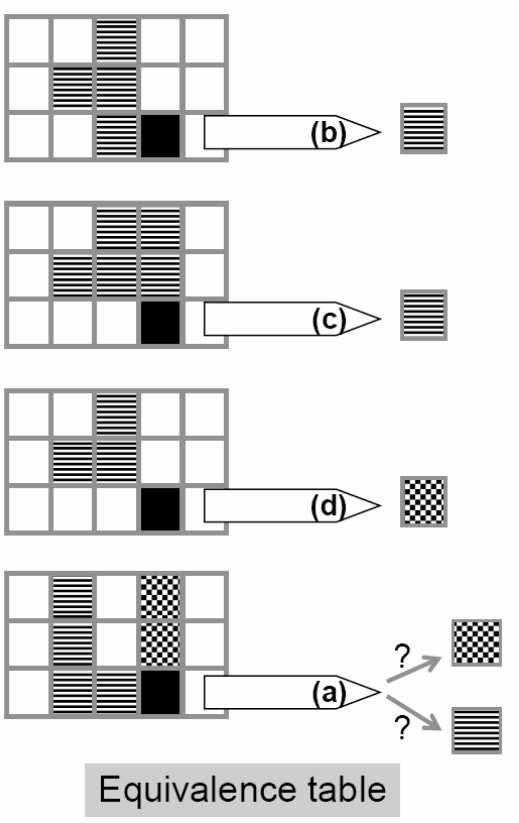
Sequential connected components

- Labeling a pixel only requires to consider its prior and superior neighbors.
- It depends on the type of connectivity used for foreground (4-connectivity here).



What happens in these cases?





Equivalence table

Slide from J. Neira

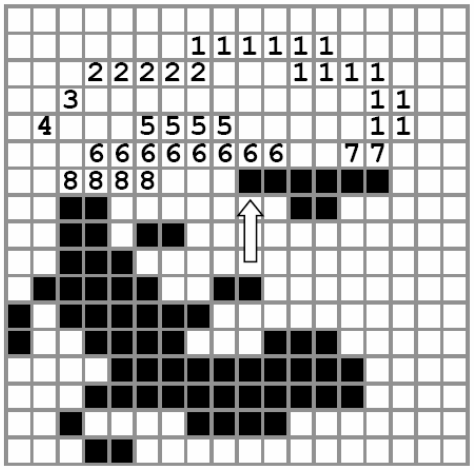
- Process the image from left to right, top to bottom.
  1. If the next pixel to process is 1-pixel:

     Already processed

     1. If only one of its neighbors (superior or left) is 1-pixel, copy its label.
     2. If both are, and have the same label, copy it.
     3. If they have different labels:

        superior? smallest?

        1. Copy the label from the prior.
        2. Reflect the change in the table of equivalences.
     4. Otw, assign a new label.
  2. More pixels? Go to step 1.



```
{1, 2, 7}
{3}
{4}
{5, 6, 8}
{}
```

- Re-label with the smallest of equivalent labels.
- Pixels of the same segment always have the same label.

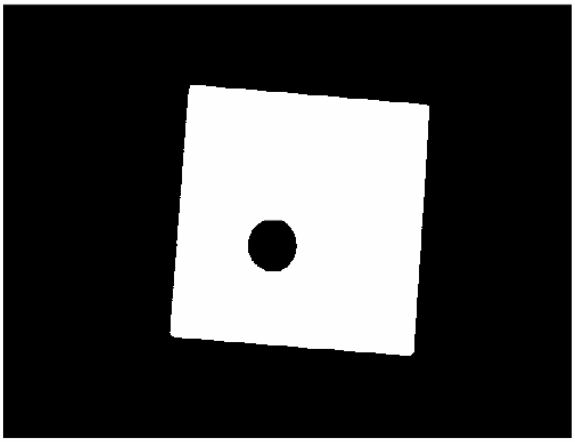
Morphological operators

- Dilation
- Erosion

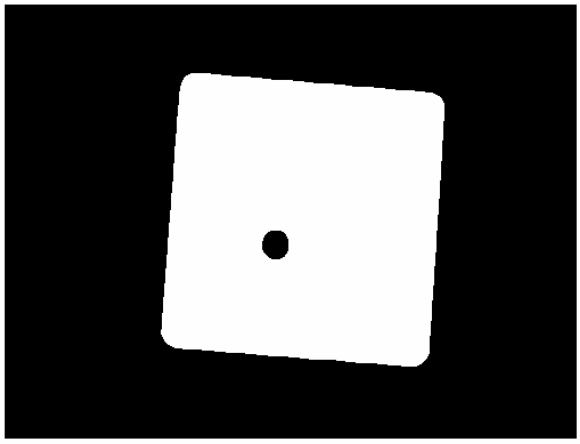
- Open, close

Dilation

- Expands connected components
- Grow features
- Fill holes



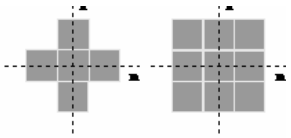
Before dilation



After dilation

Structuring elements

- Masks of varying shapes used to perform morphology

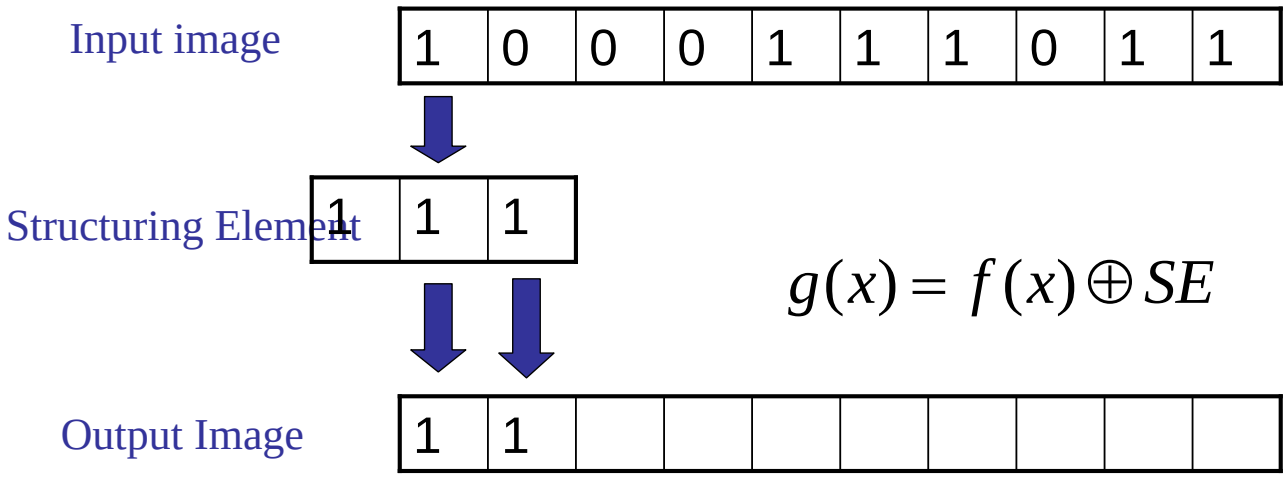


- Scan mask across foreground pixels to transform the binary image

Dilation / Erosion

- Dilation: if current pixel is foreground, set all pixels under S to foreground in output (OR)
- Erosion: if every pixel under S is foreground, leave as is; otherwise, set current pixel to background in output

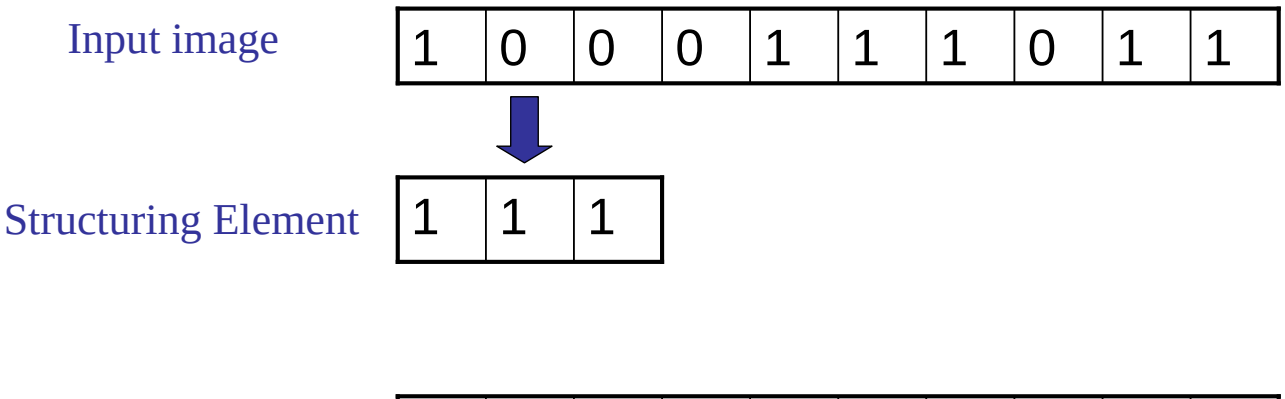
Example for Dilation (1D)



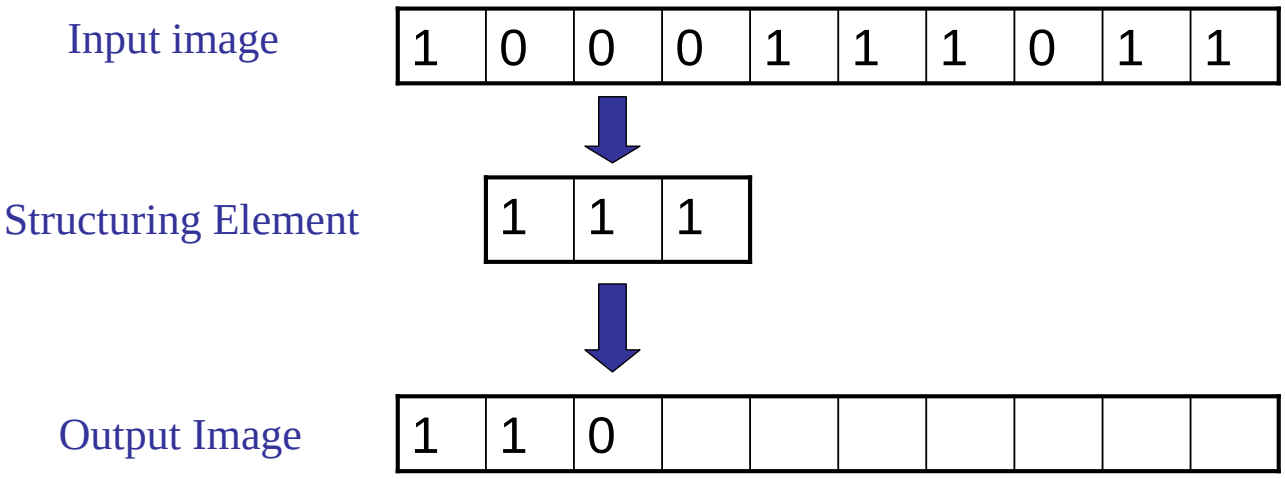
$$g(x) = f(x) \oplus SE$$

Adapted from T. Moeslund

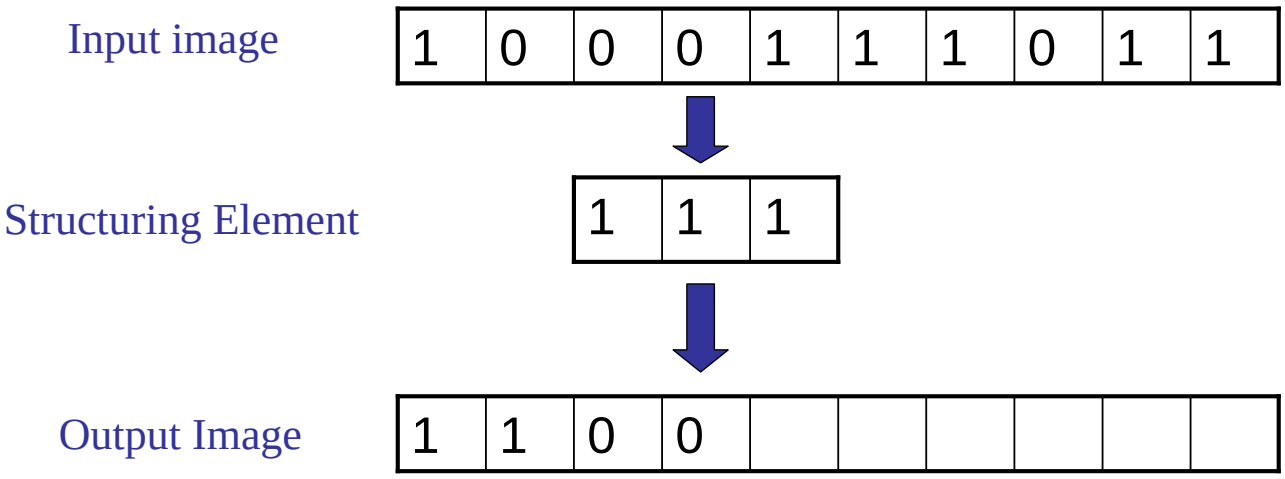
Example for Dilation



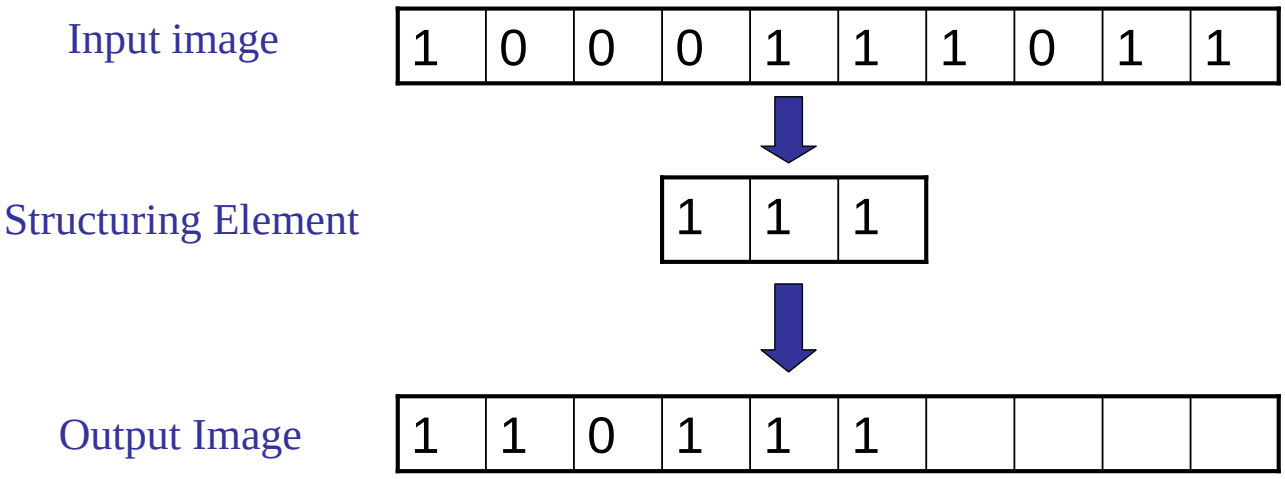
Example for Dilation



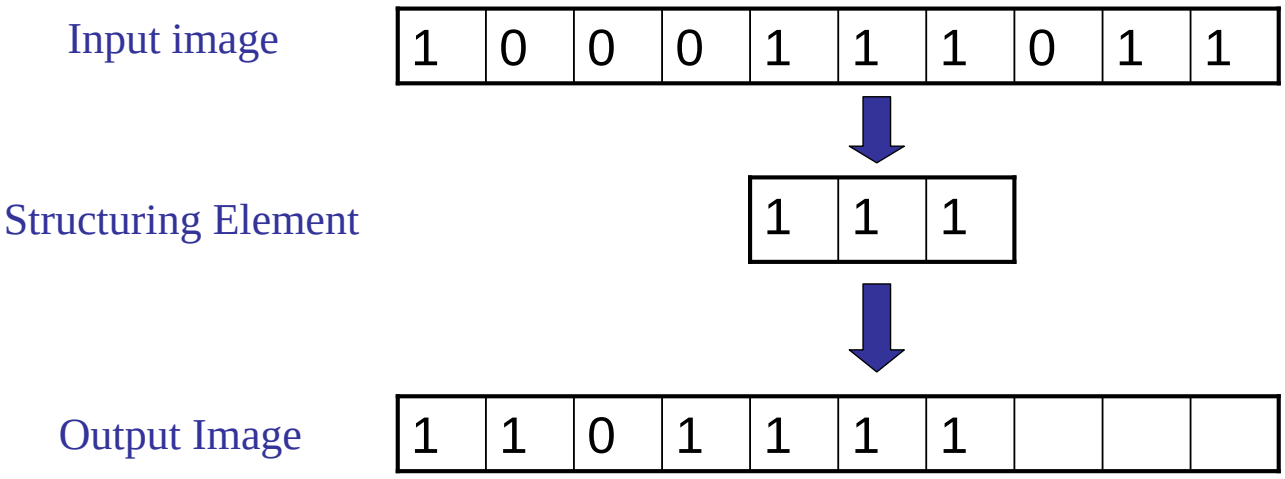
Example for Dilation



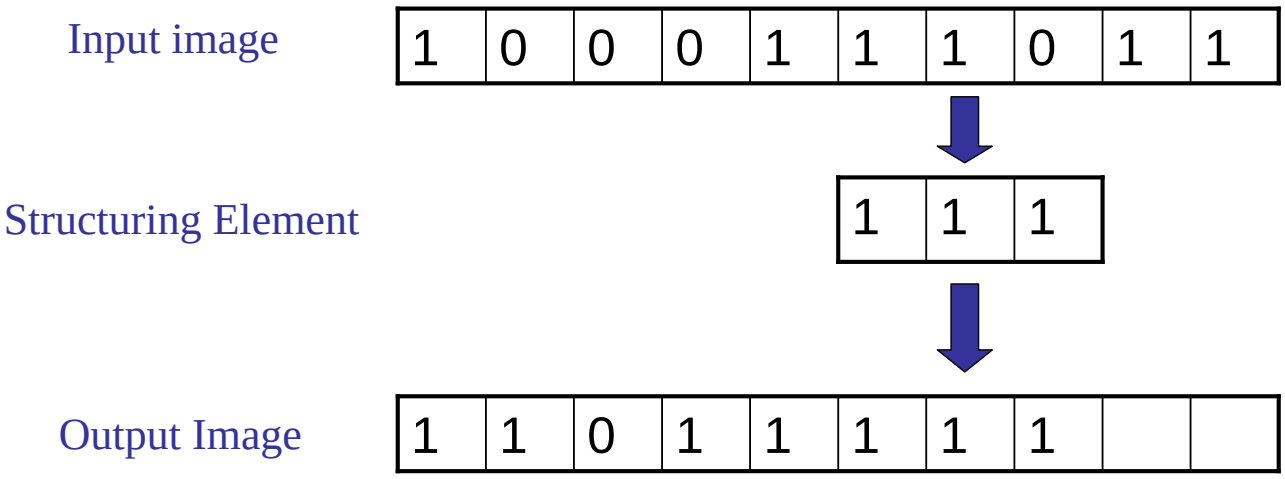
Example for Dilation



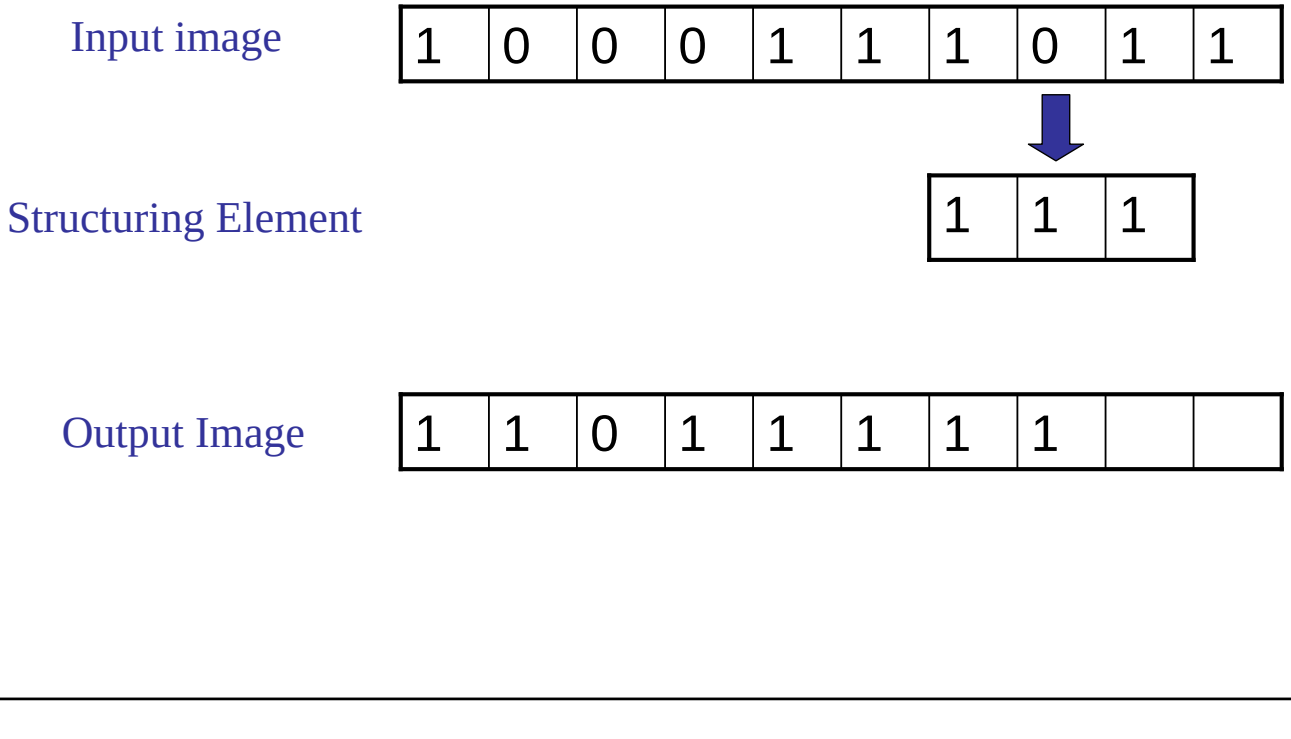
Example for Dilation



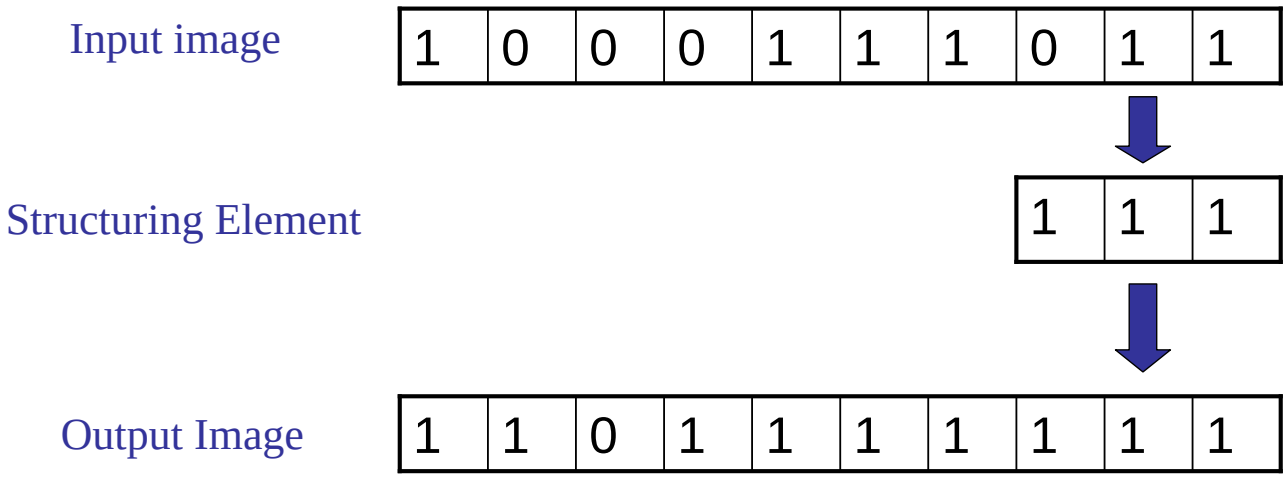
Example for Dilation



Example for Dilation



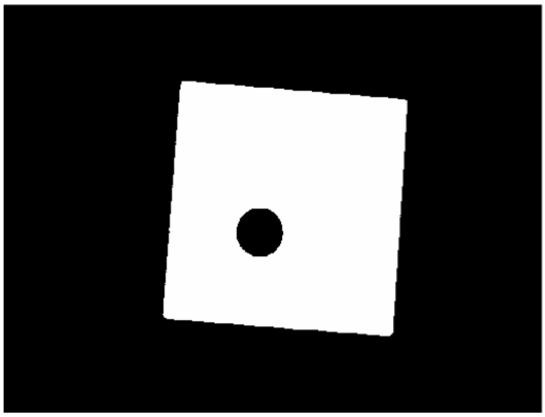
Example for Dilation



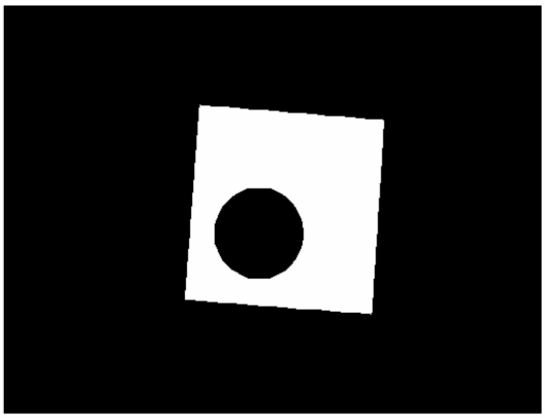
The object gets bigger and holes are filled!

Erosion

- Erode connected components
- Shrink features
- Remove bridges, branches, noise

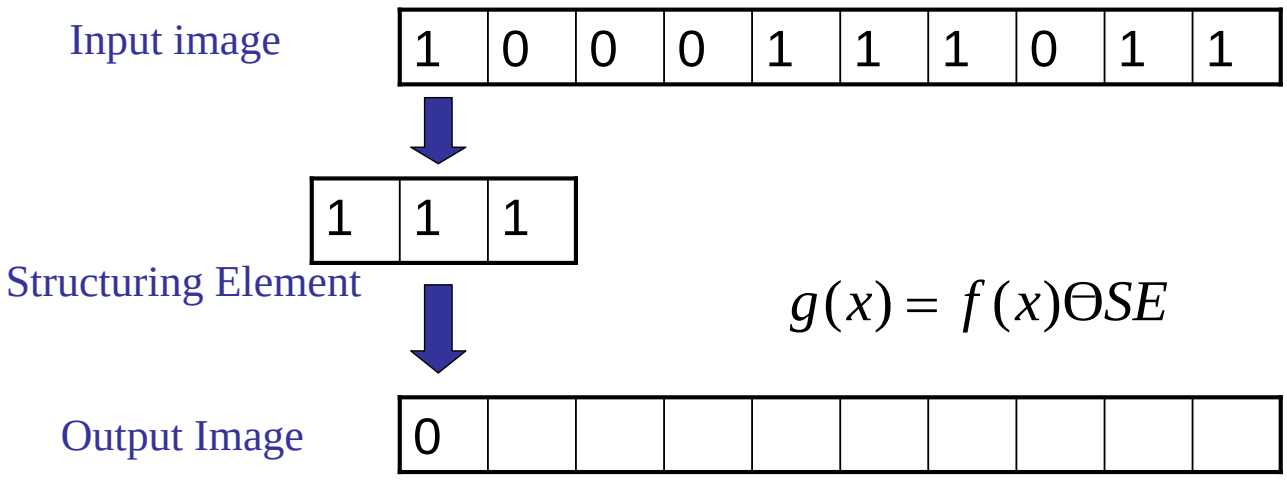


Before erosion



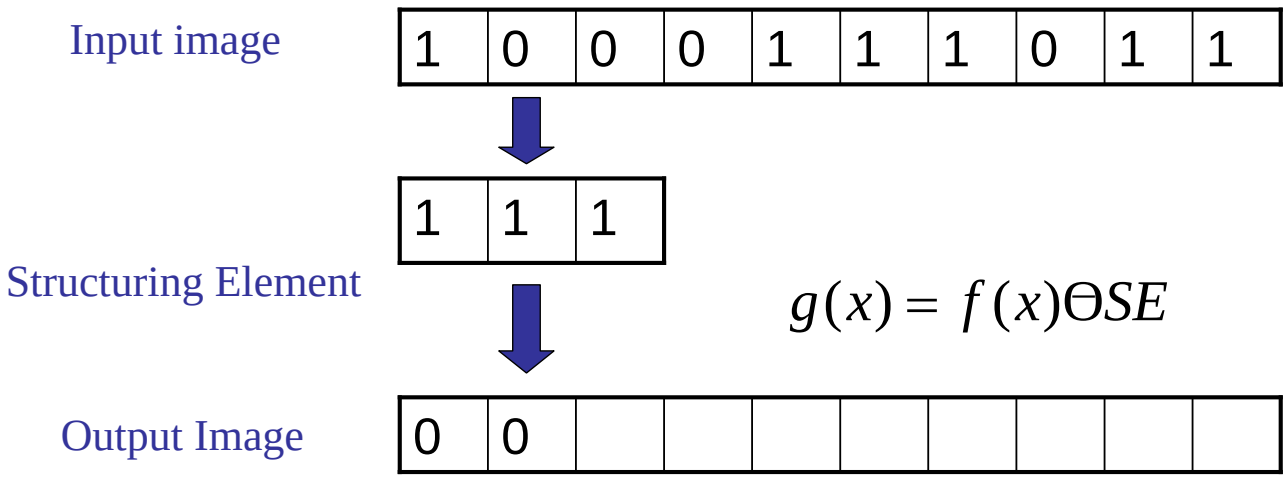
After erosion

Example for Erosion (1D)



$$g(x) = f(x) \Theta SE$$

Example for Erosion (1D)



Example for Erosion

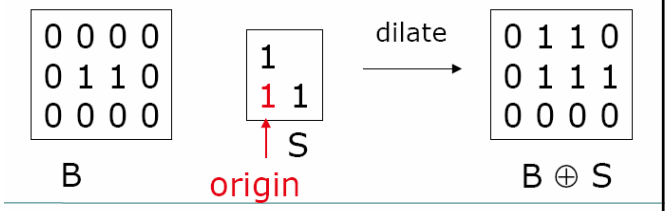
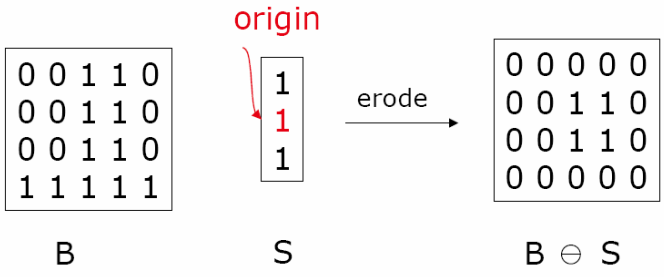
The object gets smaller

Dilation / Erosion

- Dilation: if current pixel is foreground, set all pixels under S to foreground in output (OR)



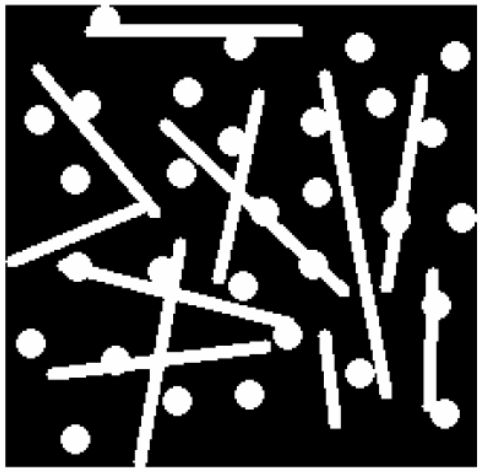
- Erosion: if every pixel under S is foreground, leave as is; otherwise, set current pixel to background in output



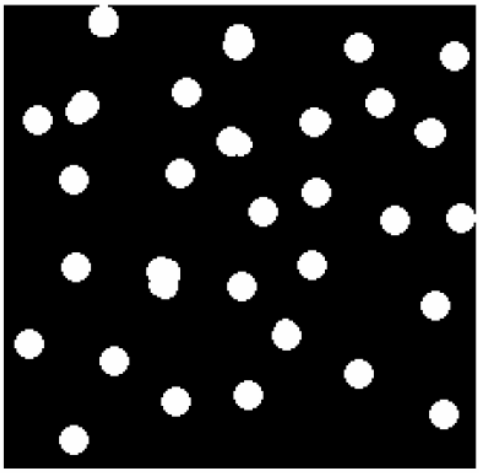
Images by P. Duygulu

Opening

- Erode, then dilate
- Remove small objects, keep original shape



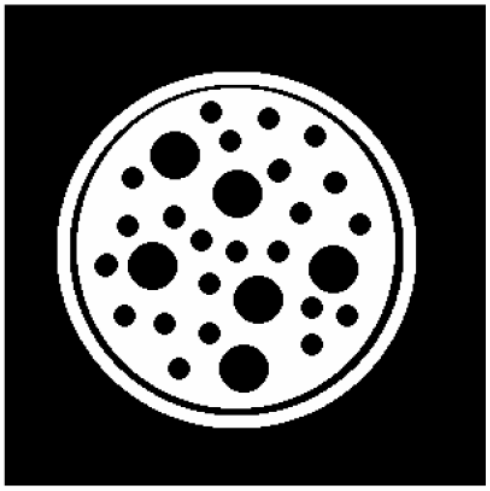
Before opening



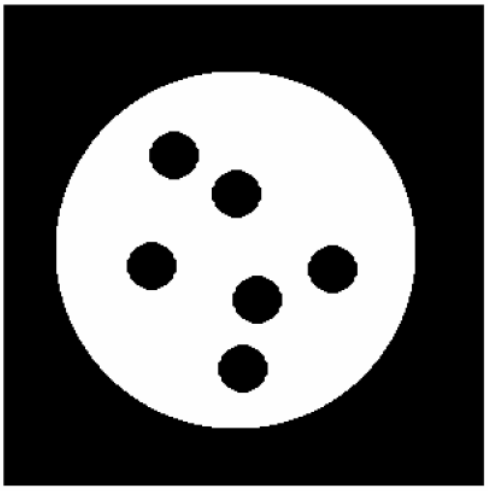
After opening

Closing

- Dilate, then erode
- Fill holes, but keep original shape

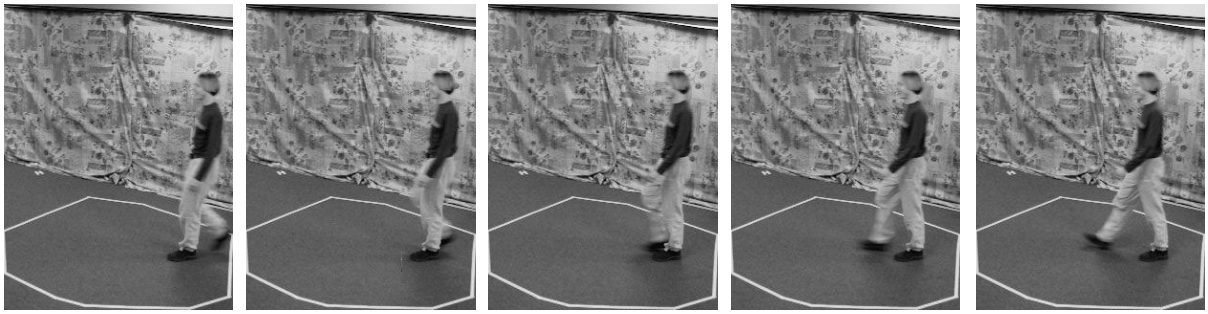


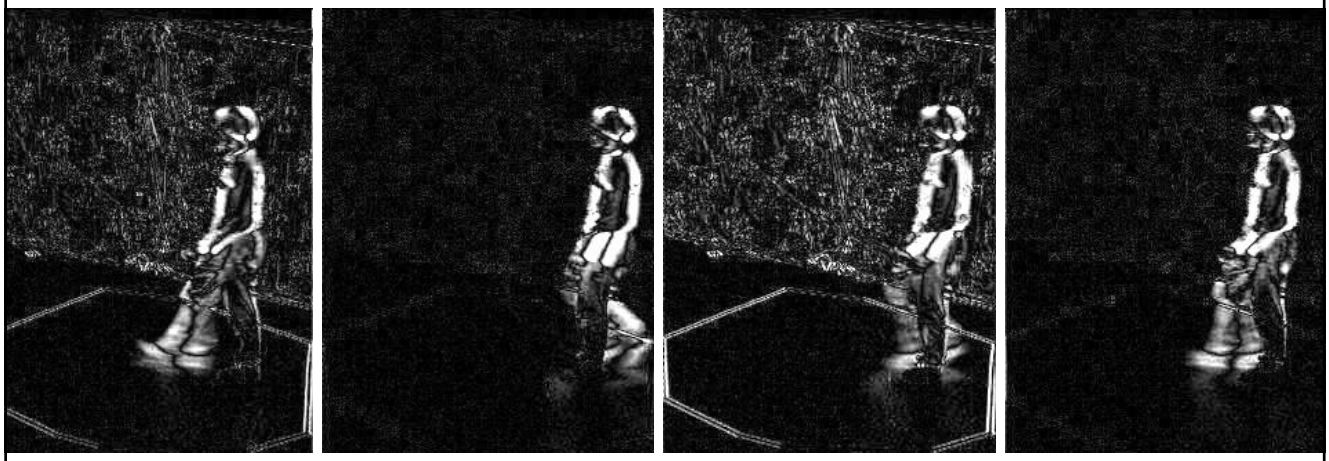
Before closing



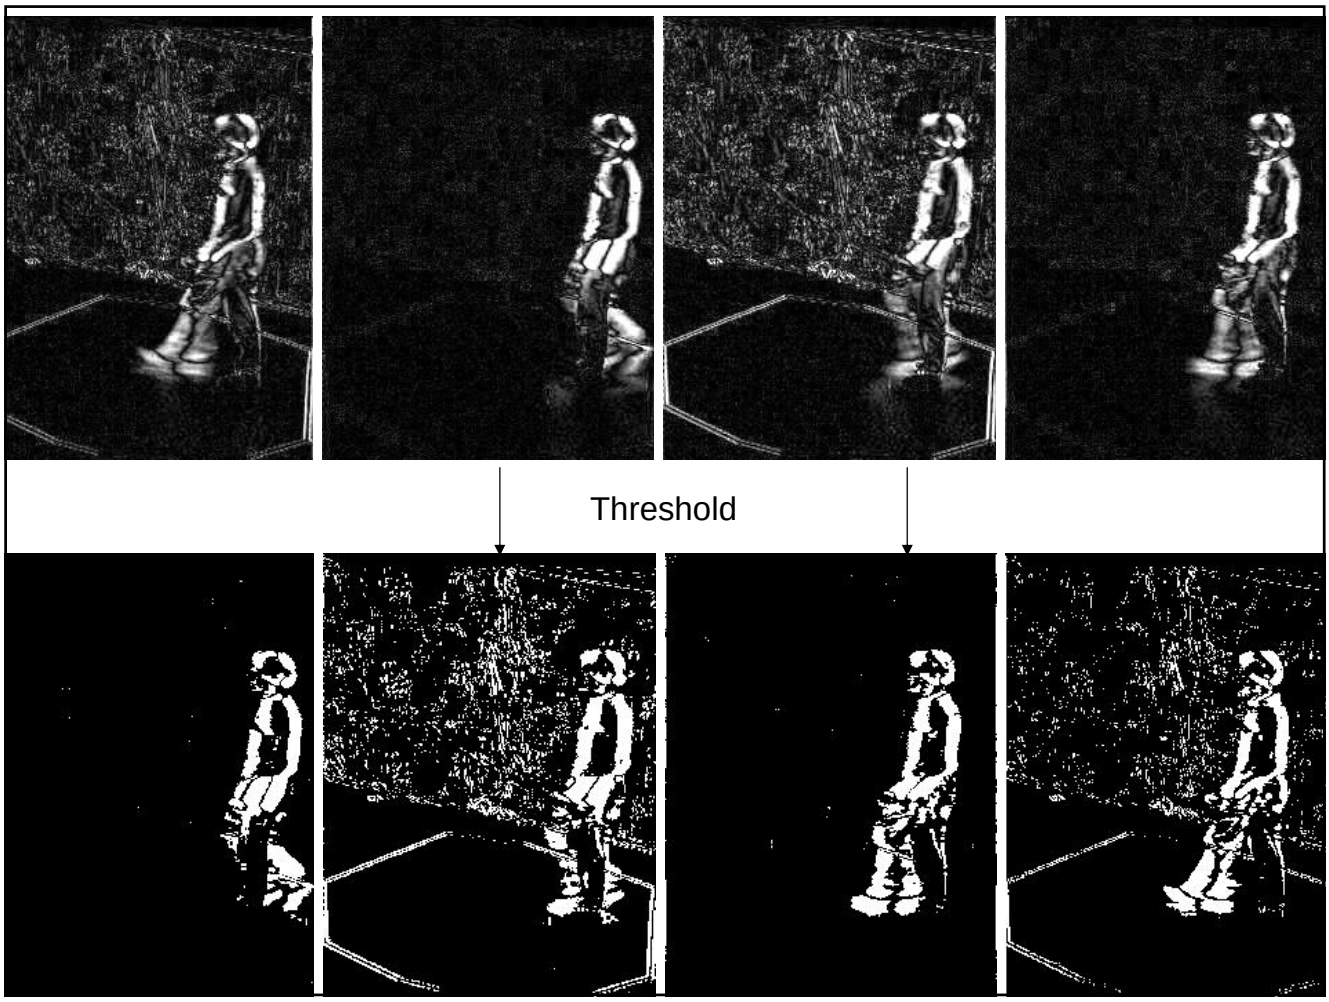
After closing

Application: blob tracking

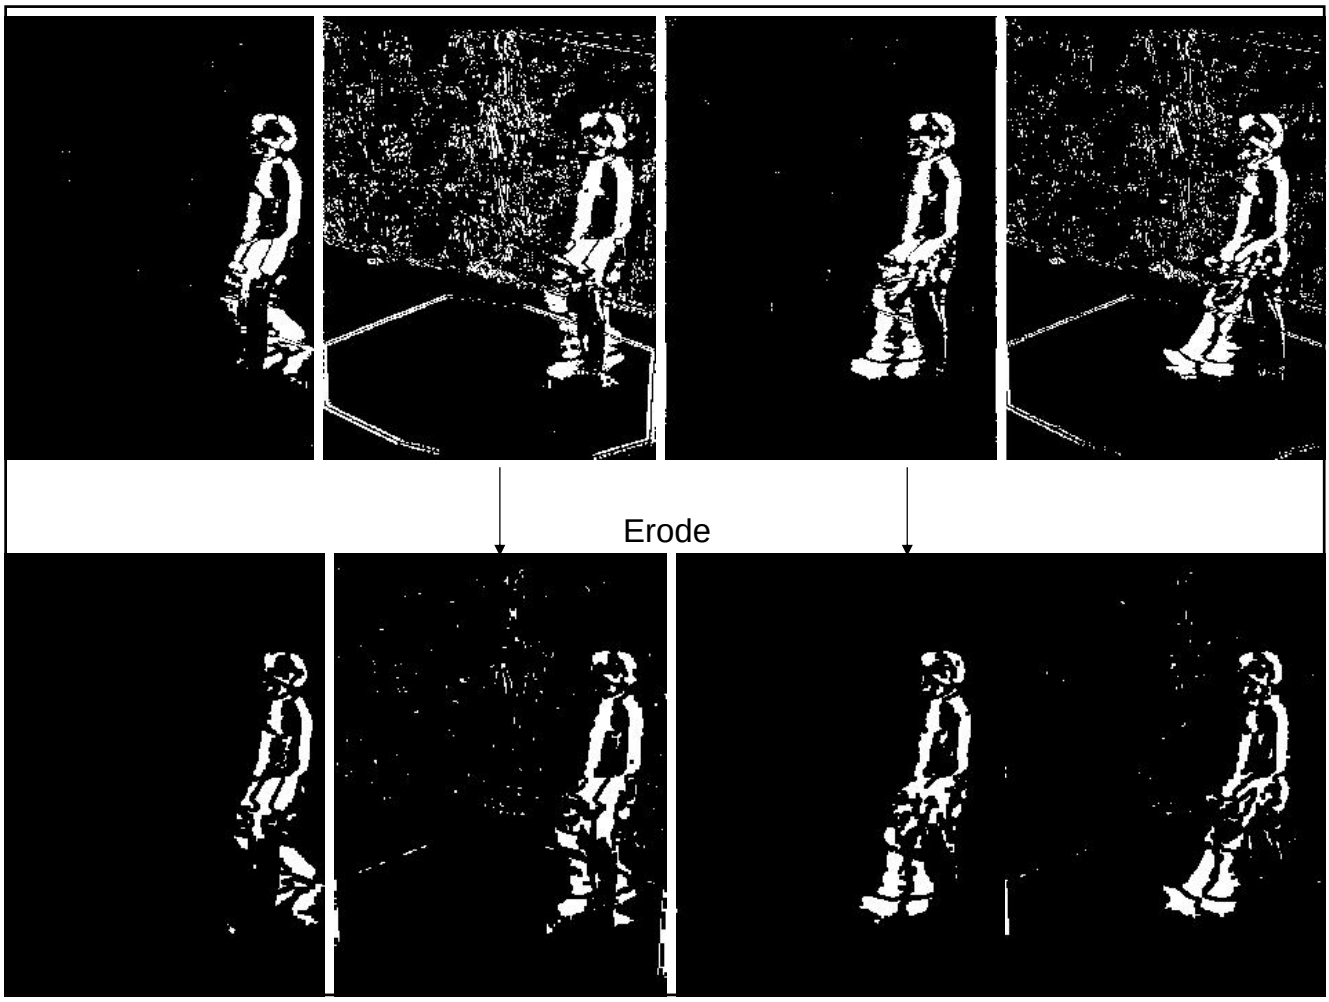




Absolute differences from frame to frame



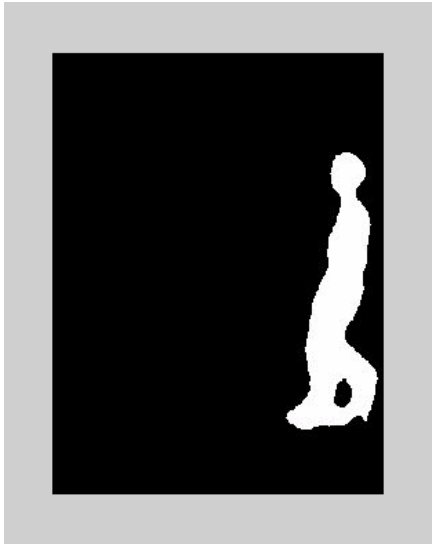
Threshold



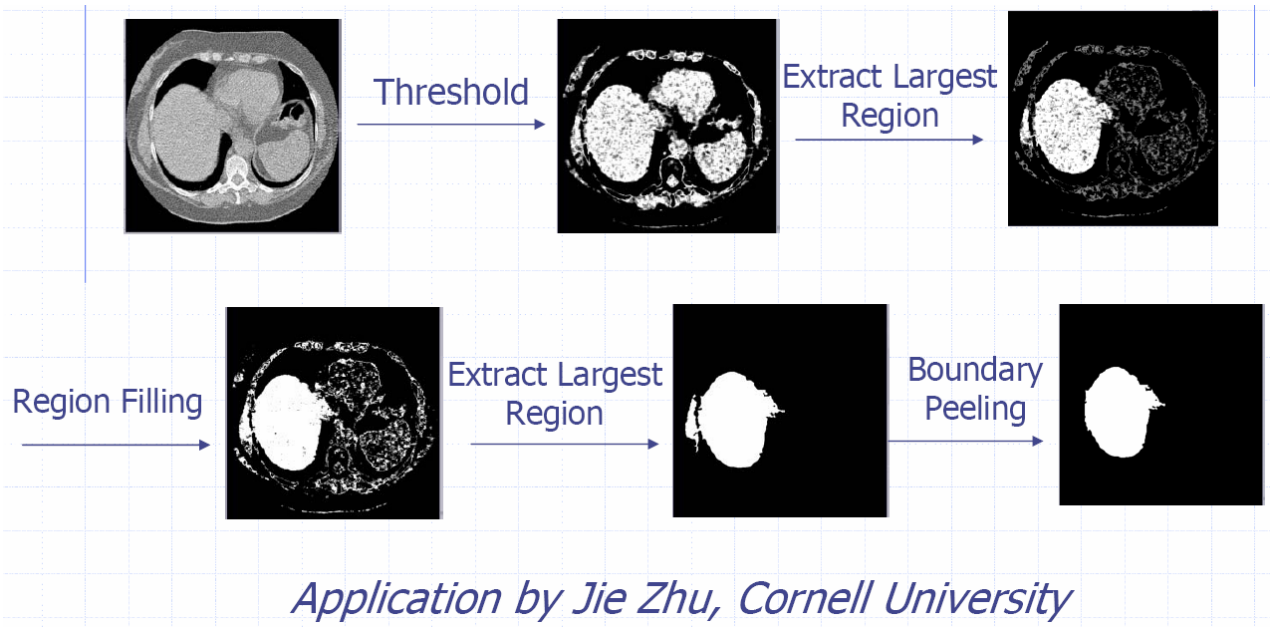
Erode

Application: blob tracking

- Background subtraction + blob tracking



Application: segmentation of a liver



Slide credit: Li Shen

Region properties

Some useful features can be extracted once we have connected components, including

- Area
- Centroid
- Extremal points, bounding box
- Circularity
- Spatial moments

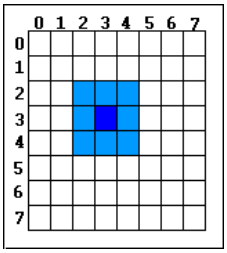
Area and centroid

- We denote the set of pixels in a region by R.
- **assuming square pixels:**
  area:

$$A = \sum_{(r,c) \in R} 1$$

  centroid:

$$\bar{r} = \frac{1}{A} \sum_{(r,c) \in R} r$$
$$\bar{c} = \frac{1}{A} \sum_{(r,c) \in R} c$$



- $(\bar{r}, \bar{c})$ is generally not a pair of integers.

Shapiro & Stockman

Circularity

a second measure uses variation off of a circle

circularity(2):

$$C_2 = \frac{\mu_R}{\sigma_R}$$

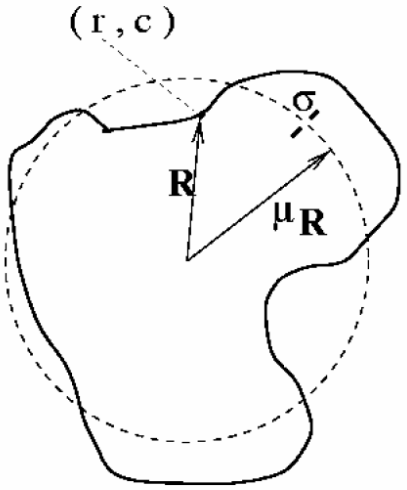
where μ_R and ${\sigma_R}^2$ are the mean and variance of the distance from the centroid of the shape to the boundary pixels (r_k, c_k).

mean radial distance:

$$\mu_R = \frac{1}{K} \sum_{k=0}^{K-1} \|(r_k, c_k) - (\bar{r}, \bar{c})\|$$

variance of radial distance:

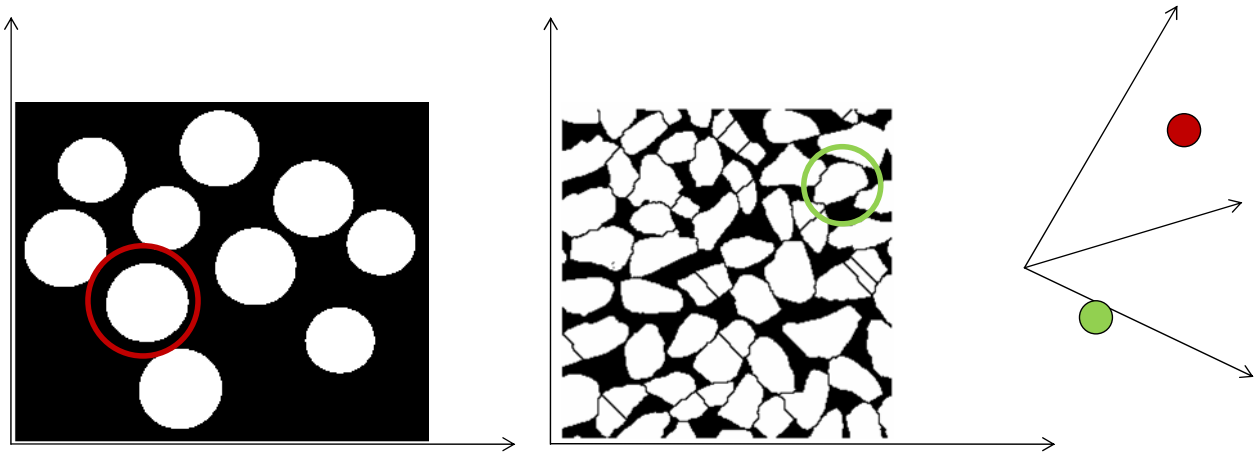
$$\sigma_R^2 = \frac{1}{K} \sum_{k=0}^{K-1} [\|(r_k, c_k) - (\bar{r}, \bar{c})\| - \mu_R]^2$$



[Haralick]

Shapiro & Stockman

Invariant descriptors



[a1, a2, a3,…]

[b1, b2, b3,…]

Feature space distance

Often want features independent of position, orientation, scale.

Central moments

S is a subset of pixels (region).

Central $(j,k)^{th}$ moment defined as:

$$\mu_{jk} = \sum_{(x,y)\in S} (x - \bar{x})^j (y - \bar{y})^k$$

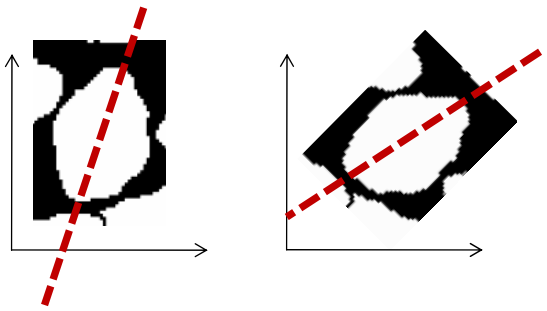
- Invariant to translation of S.

Central moments

- 2^{nd} central moment: variance
- 3^{rd} central moment: skewness
- 4^{th} central moment: kurtosis

Axis of least second moment

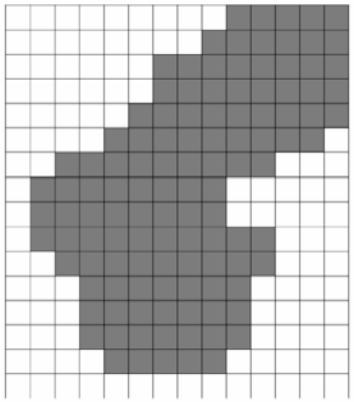
- Invariance to orientation?
  Need a common alignment

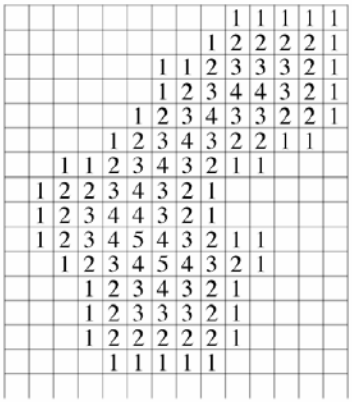


Axis for which the squared distance to 2d object points is minimized.

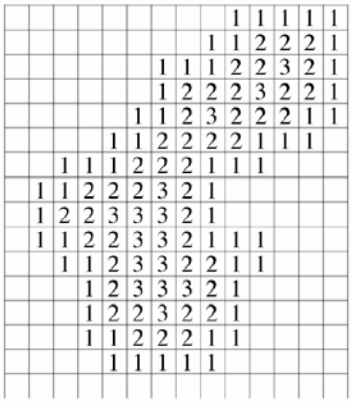
Distance transform

- Image reflecting distance to nearest point in point set (e.g., foreground pixels).



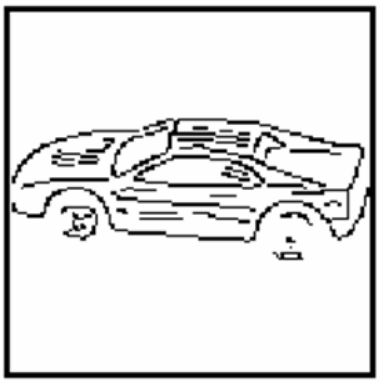


4-connected adjacency

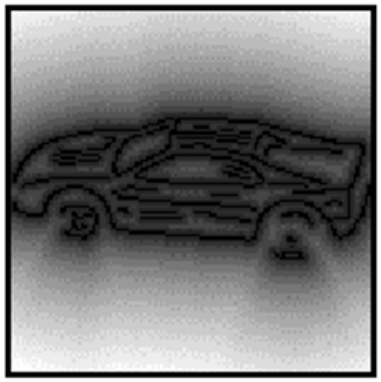


8-connected adjacency

Distance transform



Edge image



Distance transform image

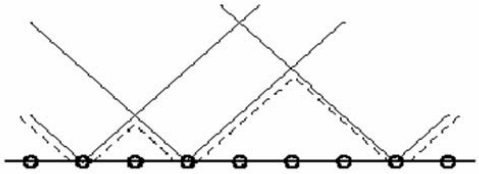
Distance transform (1D)

Two pass O(n) algorithm for 1D L_1 norm

1. Initialize: For all j
   $D[j] \leftarrow 1_P[j]$
2. Forward: For j from 1 up to n-1
   $D[j] \leftarrow \min(D[j], D[j-1]+1)$
3. Backward: For j from n-2 down to 0
   $D[j] \leftarrow \min(D[j], D[j+1]+1)$

1	0

0	1



∞	0	∞	0	∞	∞	∞	0	∞

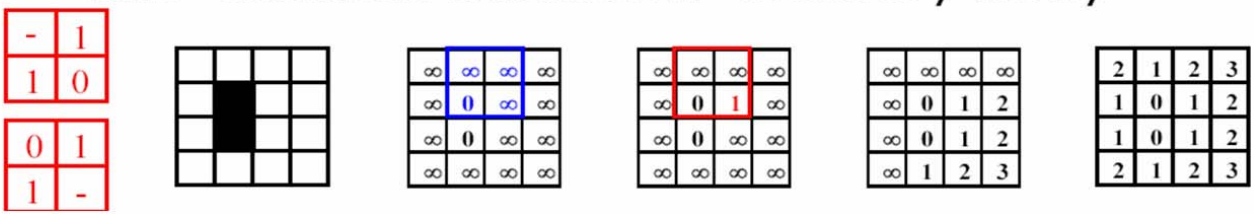
∞	0	1	0	1	2	3	0	1

1	0	1	0	1	2	1	0	1

Adapted from D. Huttenlocher

Distance Transform (2D)

- 2D case analogous to 1D
  - Initialization
  - Forward and backward pass
    - Fwd pass finds closest above and to left
    - Bwd pass finds closest below and to right
- Note nothing depends on 0,∞ form of initialization
  - Can "distance transform" arbitrary array

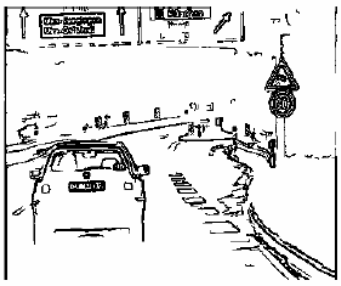


Adapted from D. Huttenlocher

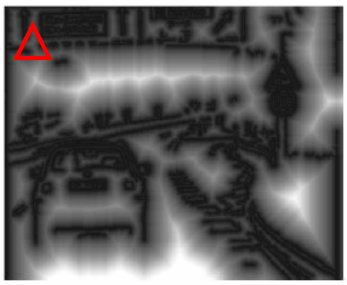
Chamfer distance

- Average distance to nearest feature

$$D_{chamfer}(T, I) \equiv \frac{1}{|T|} \sum_{t \in T} d_I(t)$$



Edge image

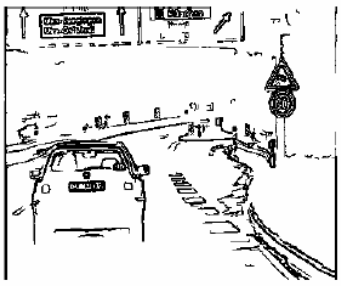


Distance transform image

D. Gavrila, DAGM 1999

Chamfer distance

More on this and other distances later



Edge image

Distance transform image

D. Gavrila, DAGM 1999

Generalized distance transforms

- Same forward/backward algorithm applicable with different initialization
- Initialize with function values F(x,y):

Generalized Distance Transform

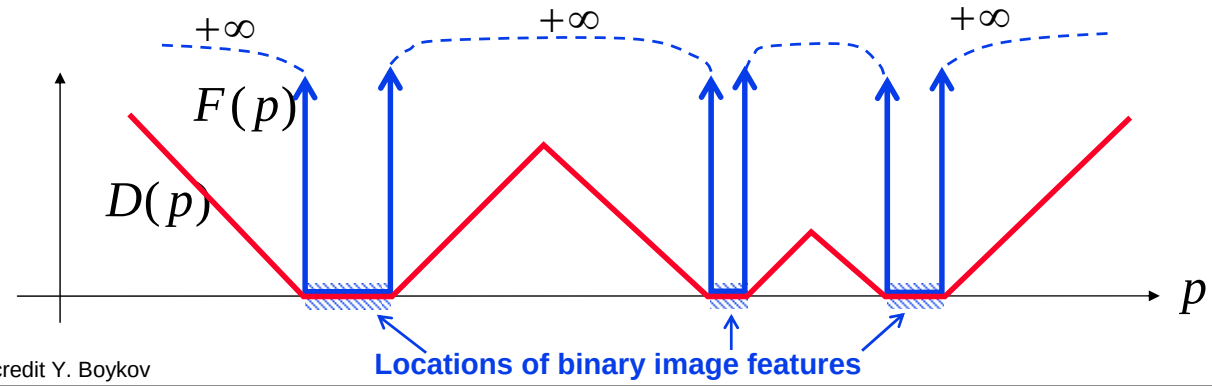
$$D(p) = \min_{q \in I} (\| p - q \| + F(q))$$

Distance Transform vs. Generalized Distance Transform

- Assuming $F(p) = \begin{cases} 0 & if \ \ pixel \ \ p \ \ is \ image \ \ feature \\ \infty & O.W. \end{cases}$

then $D(p) = \min_q \{ \| p - q \| + F(q) \} = \min_{q:F(q)=0} \| p - q \|$

is standard *Distance Transform* (of image features)



Slide credit Y. Boykov

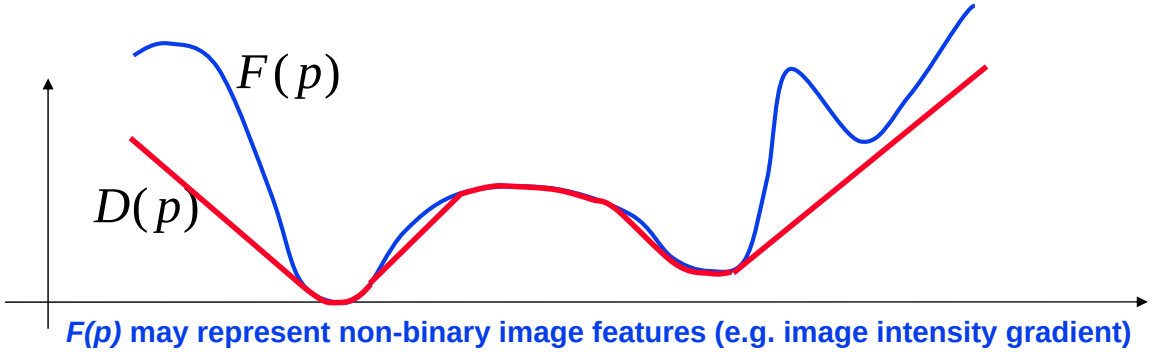
Distance Transform vs. Generalized Distance Transform

- For general $F(p)$

$$D(p) = \min_q \{ \| p - q \| + F(q) \}$$

Location of q is close to p, and F(q) is small there

is *Generalized Distance Transform* of $F(p)$



F(p) **may represent non-binary image features (e.g. image intensity gradient)**

Slide credit Y. Boykov

Binary images

- Pros
  - Can be fast to compute, easy to store
  - Simple processing techniques available
  - Lead to some useful compact shape descriptors
- Cons
  - Hard to get “clean” silhouettes, noise common in realistic scenarios
  - Can be too coarse of a representation
  - Not 3d

Matlab

- N = HIST(Y,M)
- L = BWLABEL(BW,N);
- STATS = REGIONPROPS(L,PROPERTIES) ;
  - 'Area'
  - 'Centroid'
  - 'BoundingBox'
  - 'Orientation', …
- IM2 = imerode(IM,SE);
- IM2 = imdilate(IM,SE);
- IM2 = imclose(IM, SE);
- IM2 = imopen(IM, SE);
- [D,L] = bwdist(BW,METHOD);

- Everything is matrix

```
%%%% Matrix Definition 1 %%%%
A = [1 2 3 4;5 6 7 8];

%%%% Matrix Definition 2 %%%%
A = [1:1:4; 5:1:8];

%%%% Matrix Definition 3 %%%%
for i = 1:2
    for j = 1:4
        A(i,j) = (i-1)*4+j;
    end
end

%%%% Matrix Definition 4 %%%%
A = [];
A = zeros(n,n); %ones zeros eye rand randn
```

Tutorial adapted from W. Freeman, MIT 6.896

- Matrix index

```
%%%% Matrix index
A = magic(4);
    >> A =
    16     2     3    13
     5    11    10     8
     9     7     6    12
     4    14    15     1
A(1:2, 1:2)
    >> ans =
    16     2
     5    11
A(:,1)
    >> ans =
    16
     5
     9
     4
A(1,:)
    >> ans =
    16     2     3    13
A([6 7])
    >> ans =
    11     7
```

- Manipulate matrices

```
44  A = [1 NaN 2 NaN;3 Inf 4 Inf]; %1/0=Inf 0/0=NaN
45  %%%% replace Nan/Inf with 0
46  for i = 1:size(A,1)
47      for j = 1:size(A,2)
48          if isnan(A(i,j)) | isinf(A(i,j))
49              A(i,j) = 0;
50          end
51      end
52  end
53
54  %%%% 'find'
55  a = [0 1 0 2;0 3 0 4]
56      >> a =
57       0     1     0     2
58       0     3     0     4
59  find(a)
60      >> ans = [3 4 7 8]'
61  [ii jj] = find(a);
62      >> ii = [1 2 1 2]
63      >> jj = [2 2 4 4]
64
65  nanflag = isnan(A)
66      >> nanflag =
67       0     1     0     1
68       0     0     0     0
69  infflag = isinf(A)
70      >> infflag =
71       0     0     0     0
72       0     1     0     1
```

- Manipulate matrices

```
%%%% Matrix operation
A = [1 2;3 4];
B = [1 1;1 -1];
A*B
    >> ans =
     3    -1
     7    -1
A.*B
    >> ans =
     1     2
     3    -4
A/B %= A * inv(B)
    >>ans =
   1.5  -0.5
   3.5  -0.5
A./B
    >> ans =
     1     2
     3    -4
```

```
%%%% Matrix concatenation
A = [1 2];B = [3 4];
C = [A B]
    >>C =
     1     2     3     4
C = [A;B]
    >>C =
     1     2
     3     4
```

```
A = [1 2];
A*A' = 5
A.*A =
     1     4
sum(A.*A) = 5
```

- Scripts and functions
  - Scripts are m-files containing MATLAB statements
  - Functions are like any other m-file, but they accept arguments
  - Name the function file the same as the function name

myfunction.m

```
function y = myfunction(x)
% Function of one argument with one return value

a = [-2 -1 0 1];              % Have a global variable of the same name
y = a + x;
```

myotherfunction.m

```
function [y, z] = myotherfunction(a, b)
% Function of two arguments with two return values

y = a + b;
z = a - b;
```

- Try to code in matrix ways

```
106  %use for loops
107  A = [1 2 3 4];
108  for i = 1:4
109      A(i) = A(i)^2;
110  end
111  %or use matrix
112  A = [1 2 3 4];
113  A = A.^2;
```

```
115  %use for loops
116  A = [1 2 3 4;5 6 7 8];
117  sum(A)
118      >> ans =
119       6     8    10    12
120  ASUM = sum(A,2)
121      >> ASUM =
122      10
123      26
124  for i = 1:size(A,1)
125      for j = 1:size(A,2)
126          APROB(i,j) = A(i,j)/ASUM(i);
127      end
128  end
129
130  %use matrix
131  A = [1 2 3 4;5 6 7 8];
132  ASUM = sum(A,2)
133  APROB = A./repmat(ASUM, 1, size(A,2));
134
135  repmat(ASUM, 1, size(A,2))
136      >> ans =
137      10    10    10    10
138      26    26    26    26
```
