

CS243: Discrete Structures

Strong Induction and Recursively Defined Structures

Işıl Dillig

Işıl Dillig,

CS243: Discrete Structures Strong Induction and Recursively Defined Structures

1/34

Announcements

- ▶ Homework 4 is due today
- ▶ Homework 5 is out today
- ▶ Covers induction (last lecture, this lecture, and next lecture)
- ▶ Homework 5 due next Thursday Nov. 1
- ▶ 7 questions, all of them require proofs \Rightarrow start early!

Işıl Dillig,

CS243: Discrete Structures Strong Induction and Recursively Defined Structures

2/34

Review

- ▶ Induction is used to prove universally quantified properties about natural numbers and other countably infinite sets
- ▶ Consists of a **base case** and **inductive step**
- ▶ **Base case**: prove property about the least element(s)
- ▶ **Inductive step**: assume $P(k)$ and prove $P(k+1)$
- ▶ The assumption that $P(k)$ is true is called **inductive hypothesis**

Işıl Dillig,

CS243: Discrete Structures Strong Induction and Recursively Defined Structures

3/34

Example (review)

- ▶ Prove the following statement by induction:

$$\forall n \in \mathbb{Z}^+. \sum_{i=1}^n i = \frac{n(n+1)}{2}$$

- ▶ **Base case**: $n = 1$. In this case, $\sum_{i=1}^1 i = 1$ and $\frac{(1)(1+1)}{2} = 1$; thus, the base case holds.
- ▶ **Inductive step**: By the inductive hypothesis, we assume $P(k)$:

$$\sum_{i=1}^k i = \frac{k(k+1)}{2}$$

- ▶ Now, we want to show $P(k+1)$:

$$\sum_{i=1}^{k+1} i = \frac{(k+1)(k+2)}{2}$$

Işıl Dillig,

CS243: Discrete Structures Strong Induction and Recursively Defined Structures

4/34

Example (review), cont.

- ▶ First, observe:

$$\sum_{i=1}^{k+1} i = \sum_{i=1}^k i + (k+1)$$

- ▶ By the inductive hypothesis, $\sum_{i=1}^k i = \frac{k(k+1)}{2}$; thus:

$$\sum_{i=1}^{k+1} i = \frac{k(k+1)}{2} + (k+1)$$

- ▶ Rewrite left hand side as:

$$\sum_{i=1}^{k+1} i = \frac{k^2 + 3k + 2}{2} = \frac{(k+1)(k+2)}{2}$$

- ▶ Since we proved both base case and inductive step, property holds.

Işıl Dillig,

CS243: Discrete Structures Strong Induction and Recursively Defined Structures

5/34

Plan for Today

- ▶ Strong induction
- ▶ Recursive definitions
- ▶ Proving properties of recursively defined functions

Işıl Dillig,

CS243: Discrete Structures Strong Induction and Recursively Defined Structures

6/34

Strong Induction

- ▶ **Strong induction** is a proof technique that is a slight variation on mathematical (regular) induction
- ▶ Just like regular induction, have to prove base case and inductive step, but inductive step is slightly different
- ▶ **Regular induction**: assume $P(k)$ holds and prove $P(k+1)$
- ▶ **Strong induction**: assume $P(1), P(2), \dots, P(k)$; prove $P(k+1)$
- ▶ Regular induction and strong induction are equivalent, but strong induction can sometimes make proofs easier

Motivation for Strong Induction

- ▶ Prove that if n is an integer greater than 1, then it is either a prime or can be written as the product of primes.
- ▶ Let's first try to prove the property using regular induction.
- ▶ **Base case ($n=2$)**: Since 2 is a prime number, $P(2)$ holds.
- ▶ **Inductive step**: Assume k is either a prime or the product of primes.
- ▶ But this doesn't really help us prove the property about $k+1$!
- ▶ Claim is proven much easier using strong induction!

Proof Using Strong Induction

Prove that if n is an integer greater than 1, then it is either a prime or can be written as the product of primes.

- ▶ **Base case**: same as before.
- ▶ **Inductive step**: Assume each of $2, 3, \dots, k$ is either prime or product of primes.
- ▶ Now, we want to prove the same thing about $k+1$
- ▶ Two cases: $k+1$ is either (i) prime or (ii) composite
- ▶ If it is prime, property holds.

Proof, cont.

- ▶ If composite, $k+1$ can be written as pq where $2 \leq p, q \leq k$
 - ▶ Because a composite number has a divisor distinct from 1 and itself
- ▶ By the IH, p, q are either primes or product of primes.
- ▶ Thus, $k+1$ can also be written as product of primes
- ▶ **Observe**: Much easier to prove this property using strong induction!

A Word about Base Cases

- ▶ In all examples so far, we had only one base case
 - ▶ i.e., only proved the base case for one integer
- ▶ In some inductive proofs, there may be **multiple base cases**
 - ▶ i.e., prove base case for the **first m numbers**
- ▶ Perfectly fine to have inductive proofs with multiple base cases
- ▶ In such proofs, inductive step only needs to consider numbers **greater than m**

Example

- ▶ Prove that every integer $n \geq 12$ can be written as $n = 4a + 5b$ for some non-negative integers a, b .
- ▶ Proof by **strong induction** on n and consider 4 base cases
- ▶ **Base case 1 ($n=12$)**:
- ▶ **Base case 2 ($n=13$)**:
- ▶ **Base case 3 ($n=14$)**:
- ▶ **Base case 4 ($n=15$)**:

Example, cont.

Prove that every integer $n \geq 12$ can be written as $n = 4a + 5b$ for some non-negative integers a, b .

- ▶ **Inductive hypothesis:** Suppose every $12 \leq i \leq k$ can be written as $i = 4a + 5b$.
- ▶ **Inductive step:** We want to show $k + 1$ can also be written this way for $k + 1 \geq 16$
- ▶ **Observe:** $k + 1 = (k - 3) + 4$
- ▶ By IH, $k - 3 = 4a + 5b$ for some a, b because $k - 3 \geq 12$
- ▶ But then, $k + 1$ can be written as $4(a + 1) + 5b$
- ▶ Would this proof work if we only showed base case for $n = 12$?

Recursive Definitions

- ▶ In this class, we saw how to define functions and sequences:
 - ▶ $f(n) = 2n$
 - ▶ $a_n = 3n + 1$
- ▶ These are examples of **direct (non-recursive) definitions**
- ▶ But in some cases, it is easier to define functions/sets in terms of themselves rather than directly

Recursive Definitions

- ▶ Definitions of structures that refer to themselves are called **recursive definitions**
- ▶ Picture below is "defined" recursively because each picture contains a smaller version of itself

Recursive Definitions in Math

- ▶ Recursive definitions come up a lot in discrete math
- ▶ Consider the factorial function: $n! = 1 \cdot 2 \cdot 3 \dots n$
- ▶ This is a direct definition, but easier to define factorial recursively:
$$\begin{aligned} 1! &= 1 \\ n! &= (n - 1)! \cdot n \end{aligned}$$
- ▶ Definition is **recursive** because we use ! when defining !

General Structure of Recursive Definitions

- ▶ Recursive definitions consist of **base case** and **recursive step**
- ▶ Base case defines function for least element in the domain
- ▶ Recursive step shows how to compute $f(k + 1)$ assuming $f(k)$ can be computed
- ▶ For factorial, base case is $1! = 1$
- ▶ For factorial, recursive step is $n! = (n - 1)! \cdot n$
- ▶ Recursive definitions are similar to proofs by induction
- ▶ In fact, recursive definitions sometimes called **inductive definitions**

Recursively Defined Function Example

- ▶ Here is another recursive definition:

$$\begin{aligned} f(0) &= 3 \\ f(n + 1) &= 2f(n) + 3 \quad (n \geq 1) \end{aligned}$$

- ▶ What is $f(1)$?
- ▶ What is $f(2)$?
- ▶ What is $f(3)$?

Recursively Defined Sequences

- ▶ Just like functions, sequences can also be defined recursively
- ▶ For example, consider the following sequence:

$$1, 3, 9, 27, 81, \dots$$

- ▶ What is a **recursive** definition of this sequence?
- ▶ **Base case:**
- ▶ **Recursive step:**

Recursive Definition Examples

- ▶ Consider $f(n) = 2n + 1$ where n is non-negative integer
- ▶ What's a recursive definition for f ?
- ▶ Consider the sequence $1, 4, 9, 16, \dots$
- ▶ What is a recursive definition for this sequence?
- ▶ Recursive definition of function defined as $f(n) = \sum_{i=1}^n i$?

Recursive Definitions of Important Functions

- ▶ Some important functions/sequences defined recursively
- ▶ **Factorial function:**

$$\begin{aligned} f(1) &= 1 \\ f(n) &= n \cdot f(n-1) \quad (n \geq 2) \end{aligned}$$

- ▶ **Fibonacci numbers:** $0, 1, 1, 2, 3, 5, 8, 13, 21, \dots$

$$\begin{aligned} a_0 &= 0 \\ a_1 &= 1 \\ a_n &= a_{n-1} + a_{n-2} \quad (n \geq 2) \end{aligned}$$

- ▶ Just like there can be multiple bases cases in inductive proofs, there can be multiple base cases in recursive definitions

Inductive Proofs for Recursively Defined Structures

- ▶ Recursive definitions and inductive proofs are very similar
- ▶ Therefore, it's natural to use induction to prove properties about recursively defined functions and sequences
- ▶ In these proofs, base case of induction shows property holds for base case of recursive definition
- ▶ Similarly, the inductive step shows the property holds for the recursive part of the definition

Example 1

- ▶ Consider the function defined recursively as follows:

$$\begin{aligned} f(0) &= 1 \\ f(n) &= f(n-1) + 3 \end{aligned}$$

- ▶ Prove that $f(n) = 3n + 1$
- ▶ We'll prove this by regular mathematical induction
- ▶ **Base case:**

Example 1, cont.

$$\begin{aligned} f(0) &= 1 \\ f(n) &= f(n-1) + 3 \end{aligned}$$

- ▶ **Inductive step:** We need to show $f(k+1) = 3(k+1) + 1$ assuming $f(k) = 3k + 1$
- ▶ Using the recursive case of definition, $f(k+1) = f(k) + 3$
- ▶ From IH, $f(k) = 3k + 1$
- ▶ Thus, $f(k+1) = 3k + 1 + 3 = 3(k+1) + 1$ □

Example 2

- ▶ Let f_n denote the n 'th element of the Fibonacci sequence
- ▶ Prove: For $n \geq 3$, $f_n > \alpha^{n-2}$ where $\alpha = \frac{1+\sqrt{5}}{2}$
- ▶ Proof is by **strong induction** on n with two base cases
- ▶ **Base case 1 (n=3)**: $f_3 = 2$, and $\alpha < 2$, thus $f_3 > \alpha$
- ▶ **Base case 2 (n=4)**: $f_4 = 3$ and $\alpha^2 = \frac{(3+\sqrt{5})}{2} < 3$

Example 2, cont.

Prove: For $n \geq 3$, $f_n > \alpha^{n-2}$ where $\alpha = \frac{1+\sqrt{5}}{2}$

- ▶ **Inductive step**: We need to show $f_{k+1} > \alpha^{k-1}$ for $k+1 > 4$
- ▶ Using IH, we can assume $f_i > \alpha^{i-2}$ for $3 \leq i \leq k$
- ▶ First, rewrite α^{k-1} as $\alpha^2 \alpha^{k-3}$
- ▶ α^2 is equal to $1 + \alpha$ because:

$$\alpha^2 = \left(\frac{1+\sqrt{5}}{2} \right)^2 = \frac{\sqrt{5}+3}{2} = \alpha + 1$$

- ▶ Thus, $\alpha^{k-1} = (\alpha + 1)(\alpha^{k-3}) = \alpha^{k-2} \alpha^{k-3}$

Example, cont.

- ▶ $\alpha^{k-1} = \alpha^{k-2} \alpha^{k-3}$
- ▶ By recursive definition, we know $f_{k+1} = f_k + f_{k-1}$
- ▶ Furthermore, by inductive hypothesis:
$$f_k > \alpha^{k-2} \quad f_{k-1} > \alpha^{k-3}$$
- ▶ Therefore, $f_{k+1} > \alpha^{k-2} \alpha^{k-3} = \alpha^{k-1}$

□

Recursively Defined Sets and Structures

- ▶ We saw how to define functions and sequences recursively
- ▶ We can also define sets and other data structures recursively
- ▶ **Example**: Consider the set S defined as:

$$3 \in S$$

If $x \in S$ and $y \in S$, then $x + y \in S$

- ▶ What is the set S defined as above?

More Examples

- ▶ Give a recursive definition of the set E of all even integers:
 - ▶ Base case:
 - ▶ Recursive step:
- ▶ Give a recursive definition of \mathbb{N} , the set of all natural numbers:
 - ▶ Base case:
 - ▶ Recursive step:

Strings and Alphabets

- ▶ Recursive definitions play important role in study of **strings**
- ▶ Strings are defined over an **alphabet** Σ
 - ▶ Example: $\Sigma_1 = \{a, b\}$
 - ▶ Example: $\Sigma_2 = \{0\}$
- ▶ Examples of strings over Σ_1 : $a, b, aa, ab, ba, bb, \dots$
- ▶ Set of all strings formed from Σ forms **language** called Σ^*
 - ▶ $\Sigma_2^* = \{\epsilon, 0, 00, 000, \dots\}$

Recursive Definition of Strings

- ▶ The language Σ^* has natural recursive definition:
 - ▶ **Base case:** $\epsilon \in \Sigma^*$ (empty string)
 - ▶ **Recursive step:** If $w \in \Sigma^*$ and $x \in \Sigma$, then $wx \in \Sigma^*$
- ▶ Since ϵ is the empty string, $\epsilon s = s$
- ▶ Consider the alphabet $\Sigma = \{0, 1\}$
- ▶ How is the string "1" formed according to this definition?
- ▶ How is "10" formed?

Recursive Definitions of String Operations

- ▶ Many operations on strings can be defined recursively.
- ▶ Consider function $l(w)$ which yields length of string w
- ▶ **Example:** Give recursive definition of $l(w)$
 - ▶ **Base case:**
 - ▶ **Recursive step:**

Another Example

- ▶ The **reverse** of a string s is s written backwards.
- ▶ **Example:** Reverse of "abc" is "bca"
- ▶ Give a recursive definition of the **reverse**(s) operation
 - ▶ **Base case:**
 - ▶ **Recursive step:**

Palindromes

- ▶ A **palindrome** is a string that reads the same forwards and backwards
- ▶ **Examples:** "mom", "dad", "abba", "Madam I'm Adam", ...
- ▶ Give a recursive definition of the set P of all palindromes over the alphabet $\Sigma = \{a, b\}$
- ▶ **Base cases:**
- ▶ **Recursive step:**
