1/27

Review

- ▶ What does it mean for a graph to be bipartite?
- ▶ What is the chromatic number of a graph?
- ▶ How do you prove that the chromatic number is n ?

Instructor: Işıl Dillig,

CS311H: Discrete Mathematics Graph Theory II

2/27

Bipartite Graphs and Colorability

Prove that a graph $G = (V, E)$ is **bipartite** if and only if it is **2-colorable**.

Instructor: Işıl Dillig,

CS311H: Discrete Mathematics Graph Theory II

3/27

Complete graphs and Colorability

Prove that any complete graph K_n has chromatic number n .

Instructor: Işıl Dillig,

CS311H: Discrete Mathematics Graph Theory II

4/27

Degree and Colorability

Theorem: Let G be a simple graph such that $\max_degree(G) = n$. Then, G is $n + 1$ -colorable.

Instructor: Işıl Dillig,

CS311H: Discrete Mathematics Graph Theory II

5/27

Degree and Colorability, cont.

Instructor: Işıl Dillig,

CS311H: Discrete Mathematics Graph Theory II

6/27

Star Graphs and Colorability

- ▶ A **star graph** S_n is a graph with one vertex u at the center and the only edges are from u to each of v_1, \dots, v_{n-1} .
- ▶ Draw S_2, S_3, S_4, S_5 .
- ▶ What is the chromatic number of S_n ?

Instructor: Işıl Dillig.

CS311H: Discrete Mathematics Graph Theory II

7/27

Question About Star Graphs

Suppose we have two star graphs S_k and S_m . Now, pick a random vertex from each graph and connect them with an edge.

Which of the following statements must be true about the resulting graph G ?

1. The chromatic number of G is 3
2. G is 2-colorable.
3. $\max_degree(G) = \max(k, m)$.

Instructor: Işıl Dillig.

CS311H: Discrete Mathematics Graph Theory II

8/27

Connectivity in Graphs

- ▶ Typical question: Is it possible to get from some node u to another node v ?
- ▶ Example: Train network – if there is path from u to v , possible to take train from u to v and vice versa.
- ▶ If it's possible to get from u to v , we say u and v are **connected** and there is a **path** between u and v

Instructor: Işıl Dillig.

CS311H: Discrete Mathematics Graph Theory II

9/27

Paths

- ▶ A **path** between u and v is a sequence of edges that starts at vertex u , moves along adjacent edges, and ends in v .
- ▶ **Example:** u, x, y, w is a path, but u, y, v and u, a, x are not
- ▶ Length of a path is the number of edges traversed, e.g., length of u, x, y, w is 3
- ▶ A **simple path** is a path that does not repeat any edges
- ▶ u, x, y, w is a simple path but u, x, u is not

Instructor: Işıl Dillig.

CS311H: Discrete Mathematics Graph Theory II

10/27

Example

- ▶ Consider a graph with vertices $\{x, y, z, w\}$ and edges $(x, y), (x, w), (x, z), (y, z)$
- ▶ What are all the simple paths from z to w ?
- ▶ What are all the simple paths from x to y ?
- ▶ How many paths (can be non-simple) are there from x to y ?

Instructor: Işıl Dillig.

CS311H: Discrete Mathematics Graph Theory II

11/27

Connectedness

- ▶ A graph is **connected** if there is a path between every pair of vertices in the graph
- ▶ **Example:** This graph not connected; e.g., no path from x to d
- ▶ A **connected component** of a graph G is a maximal connected subgraph of G

Instructor: Işıl Dillig.

CS311H: Discrete Mathematics Graph Theory II

12/27

Example

- **Prove:** Suppose graph G has exactly two vertices of odd degree, say u and v . Then G contains a path from u to v .

13/27

Circuits

- A **circuit** is a path that begins and ends in the same vertex.
- u, x, y, x, u and u, x, y, u are both circuits
- A **simple circuit** does not contain the same edge more than once
- u, x, y, u is a simple circuit, but u, x, y, x, u is not
- Length of a circuit is the number of edges it contains, e.g., length of u, x, y, u is 3
- In this class, we only consider circuits of length 3 or more

Instructor: Işıl Dillig.

CS311H: Discrete Mathematics Graph Theory II

14/27

Cycles

- A **cycle** is a simple circuit with no repeated vertices other than the first and last ones.
- For instance, u, x, a, b, x, y, u is a circuit but not a cycle
- However, u, x, y, u is a cycle

Instructor: Işıl Dillig.

CS311H: Discrete Mathematics Graph Theory II

15/27

Example

- **Prove:** If a graph has an odd length circuit, then it also has an odd length cycle.
- **Huh?** Recall that not every circuit is a cycle.
- According to this theorem, if we can find an odd length circuit, we can also find odd length cycle.
- **Example:** d, c, a, b, c, d is an odd length circuit, but graph also contains odd length cycle

Instructor: Işıl Dillig.

CS311H: Discrete Mathematics Graph Theory II

16/27

Proof

Prove: If a graph has an odd length circuit, then it also has an odd length cycle.

- Proof by strong induction on the length of the circuit.

►

Instructor: Işıl Dillig.

CS311H: Discrete Mathematics Graph Theory II

17/27

Proof, cont.

Prove: If a graph has an odd length circuit, then it also has an odd length cycle.

CS311H: Discrete Mathematics Graph Theory II

19/27

Colorability and Cycles

Prove: If a graph is 2-colorable, then all cycles are of even length.

- ▶
- ▶
- ▶
- ▶
- ▶

Instructor: Işıl Dillig.

CS311H: Discrete Mathematics Graph Theory II

20/27

Example

- ▶ Is this graph 2-colorable?

Instructor: Işıl Dillig.

CS311H: Discrete Mathematics Graph Theory II

21/27

Distance Between Vertices

- ▶ The **distance between** two vertices u and v is the length of the shortest path between u and v
- ▶ What is the distance between u and b ?
- ▶ What is the distance between u and x ?
- ▶ What is the distance between x and w ?

Instructor: Işıl Dillig.

CS311H: Discrete Mathematics Graph Theory II

22/27

More Colorability and Cycles

Prove: If graph has no odd length cycles, then graph is 2-colorable.

- ▶ To prove this, we first consider an algorithm for coloring the graph with two colors.
- ▶ Then, we will show that this algorithm works if graph does not have odd length cycles.

Instructor: Işıl Dillig.

CS311H: Discrete Mathematics Graph Theory II

23/27

The Algorithm

- ▶ Pick any vertex v in the graph.
- ▶ If a vertex u has odd distance from v , color it **blue**
- ▶ Otherwise, color it **red**

Instructor: Işıl Dillig.

CS311H: Discrete Mathematics Graph Theory II

24/27

Proof

- ▶ We will now prove: "If the graph does not have odd length cycles, the algorithm is correct."
- ▶ Correctness of the algorithm implies graph is 2-colorable.
- ▶ Proof by contradiction.
- ▶ Suppose graph does not have odd length cycles, but the algorithm produces an invalid coloring.
- ▶ Means there exist two vertices x and y that are assigned the same color.

Proof, cont.

- ▶ Case 1: They are both assigned red

- ▶ We know n, m are both even
- ▶ This means we now have an **odd-length circuit** involving n, m
- ▶ By theorem from earlier, this implies that graph has odd length cycle, i.e., contradiction
- ▶ Case 2 is exactly the same.

Putting It All Together

- ▶ **Theorem:** A graph is 2-colorable **if and only if** it does not have odd-length cycles
- ▶ **Corollary:** A graph is bipartite **if and only if** it does not have odd-length cycles
- ▶ **Example:** Consider a graph G with vertices a, b, c, d, e, f
 - ▶ Is G bipartite if its edges are $(a, f), (e, f), (e, d), (c, d), (a, c)$?
