Exercise: Patients and blood samples

Patient

“A patient is any person who has done blood test at the clinic or who might do blood test in future. We need to know this person’s name, age, phone number, and address to start a chart.”

Blood Test

“A test is created when a patient performs a blood test. We need to know when the test is performed, the substance tested, and the measured level of that substance.”

Each patient does zero or more tests.
Each test is done by one and only one patient.
