

# Intermediate Code

## Where We Are

## Intermediate Code

- Usually two IRs:

**High-level IR**  
Language-independent  
(but closer to language)

**Low-level IR**  
Machine independent  
(but closer to machine)

## High-level IR

- **Tree node structure**, essentially **ASTs**
- High-level constructs common to many languages
  - Expression nodes
  - Statement nodes
- Expression nodes for:
  - Integers and program variables
  - Binary operations: **e1 OP e2**
    - Arithmetic operations
    - Logic operations
    - Comparisons
  - Unary operations: **OP e**
  - Array accesses: **e1[e2]**

## High-level IR

- Statement nodes:
  - Block statements (statement sequences):  $(s1, \dots, sN)$
  - Variable assignments:  $v = e$
  - Array assignments:  $e1[e2] = e3$
  - If-then-else statements:  $\text{if } c \text{ then } s1 \text{ else } s2$
  - If-then statements:  $\text{if } c \text{ then } s$
  - While loops:  $\text{while } (c) \ s$
  - Function call statements:  $f(e1, \dots, eN)$
  - Return statements:  $\text{return}$  or  $\text{return } e$
- May also contain:
  - For loop statements:  $\text{for}(v = e1 \text{ to } e2) \ s$
  - $\text{Break}$  and  $\text{continue}$  statements
  - Switch statements:  $\text{switch}(e) \{ v1: s1, \dots, vN: sN \}$

## Low-Level IR

- Low-level representation is essentially an instruction set for an **abstract machine**
- Alternatives for low-level IR:
  - **Three-address code** or **quadruples** (Dragon Book):  
 $a = b \text{ OP } c$
  - **Tree representation** (Tiger Book)
  - **Stack machine** (like Java bytecode)

## Three-Address Code

- In this class: **three-address code**  
 $a = b \text{ OP } c$
- Has at most three addresses (may have fewer)
- Also named **quadruples** because can be represented as:  $(a, b, c, OP)$
- Example:  
 $a = (b+c)*(-e);$   
 $t1 = b + c$   
 $t2 = -e$   
 $a = t1 * t2$

## Low IR Instructions

- Assignment instructions:
  - Binary operations:  $a = b \text{ OP } c$ 
    - arithmetic: ADD, SUB, MUL, DIV, MOD
    - logic: AND, OR, XOR
    - comparisons: EQ, NEQ, LT, GT, LEQ, GEQ
  - Unary operation  $a = \text{OP } b$ 
    - Arithmetic MINUS or logic NEG
  - Copy instruction:  $a = b$
  - Load /store:  $a = *b, *a = b$
  - Other data movement instructions

## Low IR Instructions, cont.

- Flow of control instructions:
  - label L : label instruction
  - jump L : Unconditional jump
  - tjump a L : conditional jump if a is true
  - fjump a L : conditional jump if a is false
- Function call
  - call f(a<sub>1</sub>, ..., a<sub>n</sub>)
  - a = call f(a<sub>1</sub>, ..., a<sub>n</sub>)
  - is an extension to quads
- ... IR describes the Instruction Set of an abstract machine

## Example

```
m = 0;
if (c == 0) {
  m = m + n * n;
} else {
  m = m + n;
}
```

```
m = 0
t1 = (c == 0)
fjump t1 falseb
t2 = n * n
m = m + t2
jump end
label falseb
m = m + n
label end
```

## How To Translate?

- May have nested language constructs
  - Nested if and while statements
- Need an algorithmic way to translate
- Solution:
  - Start from the AST representation
  - Define translation for each node in the AST in terms of a (recursive) translation of its constituents

## Notation

- Use the notation  $T[e]$  = low-level IR of high-level IR construct e
- $T[e]$  is sequence of low-level IR instructions
- If e is expression (or statement expression),  $T[e]$  represents a value
- Denote by  $t = T[e]$  the low-level IR of e, whose result value is stored in t
- For variable v, define  $T[v]$  to be v, i.e.,  $t = T[v]$  is copy instruction  $t = v$

## Translating Expressions

- Binary operations:  $t = T[ e1 \text{ OP } e2 ]$   
(arithmetic operations and comparisons)

$t1 = T[ e1 ]$   
 $t2 = T[ e2 ]$   
 $t = t1 \text{ OP } t2$

- Unary operations:  $t = T[ \text{OP } e ]$   
 $t1 = T[ e ]$   
 $t = \text{OP } t1$

## Translating Boolean Expressions

- $t = T[ e1 \text{ OR } e2 ]$

$t1 = T[ e1 ]$   
 $t2 = T[ e2 ]$   
 $t = t1 \text{ OR } t2$

- ... but how about short-circuit OR, for which we should compute  $e2$  only if  $e1$  evaluates to false

## Translating Short-Circuit OR

- Short-circuit OR:  $t = T[ e1 \text{ SC-OR } e2 ]$

$t = T[ e1 ]$   
tjump t Lend  
 $t = T[ e2 ]$   
label Lend

- ... how about short-circuit AND?

## Translating Short-Circuit AND

- Short-circuit AND:  $t = T[ e1 \text{ SC-AND } e2 ]$

$t = T[ e1 ]$   
fjump t Lend  
 $t = T[ e2 ]$   
label Lend

## Array and Field Accesses

- Array access:  $t = T[ v[e] ]$

$t1 = T[ e ]$   
 $t = v[t1]$

- Field access:  $t = T[ e1.f ]$

$t1 = T[ e1 ]$   
 $t = t1.f$

## Nested Expressions

- In these translations, expressions may be nested;
- Translation recurses on the expression structure

- Example:  $t = T[ (a - b) * (c + d) ]$

$t1 = a$

$t2 = b$

$t3 = t1 - t2$

$t4 = b$

$t5 = c$

$t5 = t4 + t5$

$t = t3 * t5$

}  $T[ (a - b) ]$

}  $T[ (c + d) ]$

}  $T[ (a - b) * (c + d) ]$

## Translating Statements

- Statement sequence:  $T[ s1; s2; \dots; sN ]$

$T[ s1 ]$

$T[ s2 ]$

...

$T[ sN ]$

- IR instructions of a statement sequence = concatenation of IR instructions of statements

## Assignment Statements

- Variable assignment:  $T[ v = e ]$

$t = T[ e ]$

$v = t$

[alternatively]

$v = T[ e ]$

var-assign

- Array assignment:  $T[ v[e1] = e2 ]$

$t1 = T[ e1 ]$

$t2 = T[ e2 ]$

$v[t1] = t2$

array-assign

## Translating If-Then-Else

- $T[ \text{if } (e) \text{ then } s1 \text{ else } s2 ]$

```
t1 = T[ e ]
fjump t1 Lfalse
T[ s1 ]
jump Lend
label Lfalse
T[ s2 ]
label Lend
```

## Translating If-Then

- $T[ \text{if } (e) \text{ then } s ]$

```
t1 = T[ e ]
fjump t1 Lend
T[ s ]
label Lend
```

## While Statements

- $T[ \text{while } (e) \{ s \} ]$

```
label Ltest
t1 = T[ e ]
fjump t1 Lend
T[ s ]
jump Ltest
label Lend
```

## Switch Statements

- $T[ \text{switch } (e) \{ \text{case } v1: s1, \dots, \text{case } vN: sN \} ]$

```
t = T[ e ]
c = t != v1
tjump c L2
T[ s1 ]
jump Lend
label L2
c = t != v2
tjump c L3
T[ s2 ]
jump Lend
...
label LN
c = t != vN
tjump c Lend
T[ sN ]
label Lend
```

## Call and Return Statements

- $T[ \text{call } f(e_1, e_2, \dots, e_N) ]$

$t_1 = T[ e_1 ]$   
 $t_2 = T[ e_2 ]$   
 $\dots$   
 $t_N = T[ e_N ]$   
 $\text{call } f(t_1, t_2, \dots, t_N)$

- $T[ \text{return } e ]$

$t = T[ e ]$   
 $\text{return } t$

## Nested Statements

- Same for statements as expressions: recursive translation

- Example:  $T[ \text{if } c \text{ then if } d \text{ then } a = b ]$

$t_1 = c$   
 $\text{fjump } t_1 \text{ Lend1}$   
 $t_2 = d$   
 $\text{fjump } t_2 \text{ Lend2}$   
 $t_3 = b$   
 $a = t_3$   
 $\text{label Lend2}$   
 $\text{label Lend1}$

$\left. \begin{array}{l} T[ a = b ] \\ T[ \text{if } d \dots ] \end{array} \right\} T[ \text{if } d \dots ]$

$\left. \begin{array}{l} T[ \text{if } d \dots ] \\ T[ \text{if } c \text{ then } \dots ] \end{array} \right\} T[ \text{if } c \text{ then } \dots ]$

## IR Lowering Efficiency
