Topic 18
Binary Trees

"A tree may grow a thousand feet tall, but its leaves will return to its roots."
- Chinese Proverb

Properties of Trees

- Only access point is the root
- All nodes, except the root, have one parent – like the inheritance hierarchy in Java
- Traditionally trees drawn upside down

Properties of Trees and Nodes

- siblings: two nodes that have the same parent
- edge: the link from one node to another
- path length: the number of edges that must be traversed to get from one node to another

Definitions

- A tree is an abstract data type
  - one entry point, the root
  - Each node is either a leaf or an internal node
  - An internal node has 1 or more children, nodes that can be reached directly from that internal node.
  - The internal node is said to be the parent of its child nodes
More Properties of Trees

- **depth**: the path length from the root of the tree to this node
- **height of a node**: The maximum distance (path length) of any leaf from this node
  - a leaf has a height of 0
  - the height of a tree is the height of the root of that tree
- **descendants**: any nodes that can be reached via 1 or more edges from this node
- **ancestors**: any nodes for which this node is a descendant

---

Tree Visualization

---

Clicker Question 1

- What is the depth of the node that contains M on the previous slide?
  - A. 0
  - B. 1
  - C. 2
  - D. 3
  - E. 4

---

Binary Trees

- There are many variations on trees but we will start with **binary trees**
  - **binary tree**: each node has at most two children
    - the possible children are usually referred to as the left child and the right child
Full Binary Tree

- *full binary tree*: a binary tree in which each node was exactly 2 or 0 children

![Full Binary Tree Diagram]

Clicker Question 2

- What is the maximum height of a full binary tree with 11 nodes?
  
  A. 1  
  B. 3  
  C. 5  
  D. 7  
  E. Not possible to construct a full binary tree with 11 nodes.

Complete Binary Tree

- *complete binary tree*: a binary tree in which every level, except possibly the deepest is completely filled. At depth $n$, the height of the tree, all nodes are as far left as possible

![Complete Binary Tree Diagram]

Where would the next node go to maintain a complete tree?

Clicker Question 3

- What is the height of a complete binary tree that contains $N$ nodes?
  
  A. 1  
  B. $\log N$  
  C. $N^{1/2}$  
  D. $N$  
  E. $N \log N$
Perfect Binary Tree

- **perfect binary tree**: a binary tree with all leaf nodes at the same depth. All internal nodes have exactly two children.
- A perfect binary tree has the maximum number of nodes for a given height
- A perfect binary tree has \(2^{(n+1)} - 1\) nodes where \(n\) is the height of the tree
  - height = 0 \(\rightarrow\) 1 node
  - height = 1 \(\rightarrow\) 3 nodes
  - height = 2 \(\rightarrow\) 7 nodes
  - height = 3 \(\rightarrow\) 15 nodes

A Binary Node class

```java
public class Bnode <E> {
    private E myData;
    private Bnode<E> myLeft;
    private Bnode<E> myRight;

    public BNode();
    public BNode(E data, Bnode<E> left, Bnode<E> right)
    public E getData()
    public Bnode<E> getLeft()
    public Bnode<E> getRight()

    public void setData(E data)
    public void setLeft(Bnode<E> left)
    public void setRight(Bnode<E> right)
}
```

Binary Tree Traversals

- Many algorithms require all nodes of a binary tree be visited and the contents of each node processed or examined.
- There are 4 traditional types of traversals
  - preorder traversal: process the root, then process all sub trees (left to right)
  - in order traversal: process the left sub tree, process the root, process the right sub tree
  - post order traversal: process the left sub tree, process the right sub tree, then process the root
  - level order traversal: starting from the root of a tree, process all nodes at the same depth from left to right, then proceed to the nodes at the next depth.

Results of Traversals

- To determine the results of a traversal on a given tree draw a path around the tree.
  - start on the left side of the root and trace around the tree. The path should stay close to the tree.
    - pre order: process when pass down left side of node 12 49 13 5 42
    - in order: process when pass underneath node 13 49 5 12 42
    - post order: process when pass up right side of node 13 5 49 42 12
Tree Traversals

Implement Traversals

- Implement preorder, inorder, and post order traversal
  - Big O time and space?
- Implement a level order traversal using a queue
  - Big O time and space?
- Implement a level order traversal without a queue
  - target depth

Attendance Question 2

- What is the result of a post order traversal of the tree on the previous slide?
  A. F C G A K H L D J
  B. F G C K L H J D A
  C. A C F G D H K L J
  D. A C D F G H J K L
  E. L K J H G F D C A

Breadth First - Depth First

- from NIST - DADS
- breadth first search: Any search algorithm that considers neighbors of a vertex (node), that is, outgoing edges (links) of the vertex's predecessor in the search, before any outgoing edges of the vertex
- depth first search: Any search algorithm that considers outgoing edges (links of children) of a vertex (node) before any of the vertex's (node) siblings, that is, outgoing edges of the vertex's predecessor in the search. Extremes are searched first.
Breadth First

- A level order traversal of a tree could be used as a breadth first search
- Search all nodes in a level before going down to the next level

BFS - DFS

- Breadth first search typically implemented with a Queue
- Depth first search typically implemented with recursion
- which technique do I use?  
  - depends on the problem
