CS378 - Mobile Computing

Intents
Intents

- Allow us to use applications and components that are part of Android System
- and allow other applications to use the components of the applications we create
- Examples of Google applications:
  http://developer.android.com/guide/appendix/g-app-intents.html
Intents

• "An intent is an abstract description of an operation to be performed"

• consist of
  – Action (what to do, example visit a web page)
  – Data (to perform operation on, example the url of the web page)

• use via startActivity, startActivityForResult, startService, bindService
Four Primary Application Components

• Activity
  – single screen with a user interface, app may have several activities, subclass of Activity

• Service
  – Application component that performs long-running operations in background with no UI

• Content Providers
  – a bridge between applications to share data

• Broadcast Receivers
  – component that responds to system wide announcements
Activation of Components

• 3 of the 4 core application components (activities, services, and broadcast receivers) are started via \textit{intents}

• intents are a messaging system to activate components in the same application

• \textit{and} to start one application from another
• Recall the manifest is part of the application project.

• The manifest contains important data about the application that is required by the Android system before the system will run any of the application's code
  – common error: Activity in application that is not included in manifest
  – runtime error when application tries to start Activity not declared in manifest
AndroidManifest.xml Purpose

• contains Java package name of application - unique id for application
• describes components of application: activities, services, broadcast receivers, content providers and *intent messages each component can handle*
• declares permissions requested by application
• minimum required API level
• libraries application to link to
Declare this as Activity to start when application started

<activity>
  android:name=".LifeCycleTestActivity"
  android:label="@string/app_name" />
  <intent-filter>
    <action android:name="android.intent.action.MAIN" />
    <category android:name="android.intent.category.LAUNCHER" />
  </intent-filter>
</activity>

<activity>
  android:name=".NameGetter"
  android:label="@string/getName" />
</application>
Types of Intents

• http://developer.android.com/reference/android/content/Intent.html

• Categories include:

• Action
  – e.g. VIEW, EDIT, CALL, DIAL, SEARCH

• Broadcast Action
  – e.g. TIMEZONE_CHANGED,
      POWER_CONNECTED
Multiple Apps To Handle Intent

- Intent class contains constants for Intents
- Applications and activities list intents they can handle in manifest
- If multiple available asked to choose
- android.intent.action.WEB_SEARCH
Intent Class and Objects

• `android.content.Intent`

• passive data structure
  – description of action to performed or if created by a broadcast, a description of something that has happened and is being announced to broadcast receivers

• Intent objects carry information, but do not perform any actions themselves
Intents and App Components

Intent to Launch Activity or change purpose of existing Activity
- `Context.startActivity()`
- `Activity.startActivityForResult()`
- `Activity.setResult()`

Intent to Initiate Service or give new instructions to existing Service
- `Context.startService()`
- `Context.bindService()`

Intents intended for Broadcast Receivers
- `Context.sendBroadcast()`
- `Context.sendOrderedBroadcast()`
- `Context.sendStickyBroadcast()`

The Android System finds the right application component to respond to intents, instantiating them if necessary.
Intent Object Information

• component name (of desired component)
• action (to execute)
• data (to work on)
• category (of action)
• type (of intent data)
• extras (a Bundle with more data)
• flags (to help control how Intent is handled)
Intent Object Info - Component

• data for the component that receives the intent
  – action to take
  – data to act on

• data for the Android system
  – category of component to handle intent (activity, service, broadcast receiver)
  – instructions on how to launch component if necessary
Intent Info - *Component*

- Component name that should deal with Intent
- fully qualified class name of component and
- the package name set in the manifest file of the application where the component resides
- optional! if not provided Android system uses resolves suitable target
- name is set by `setComponent()`, `setClass()`, or `setClassName()`
/** Called when the user clicks the Send button */
public void sendMessage(View view) {
    Intent intent = new Intent(this, DisplayMessageActivity.class);
    EditText editText = (EditText) findViewById(R.id.edit_message);
    String message = editText.getText().toString();
    intent.putExtra(EXTRA_MESSAGE, message);
    startActivity(intent);
}

public final static String EXTRA_MESSAGE = "scottm.utexas.myfirstapp.MESSAGE";
Intent Info - Action Name

• Action desired (or for broadcast intents, the action / event that took place)
• Many actions defined in Intent class
• Other actions defined through the API
  — example, MediaStore class declares ACTION_IMAGE_CAPTURE and ACTION_VIDEO_CAPTURE
• You can define your own Intent Action names so other applications can activate the components in your application
Intent Action Name

• Action acts like a method name
• determines what rest of data in Intent object is and how it is structured, especially the *data* and *extras*
• setAction() and getAction() methods from Intent class
## Intent Action

<table>
<thead>
<tr>
<th>Constant</th>
<th>Target component</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTION_CALL</td>
<td>activity</td>
<td>Initiate a phone call.</td>
</tr>
<tr>
<td>ACTION_EDIT</td>
<td>activity</td>
<td>Display data for the user to edit.</td>
</tr>
<tr>
<td>ACTION_MAIN</td>
<td>activity</td>
<td>Start up as the initial activity of a task, with no data input and no returned output</td>
</tr>
<tr>
<td>ACTION_SYNC</td>
<td>activity</td>
<td>Synchronize data on a server with data on the mobile device.</td>
</tr>
<tr>
<td>ACTION_BATTERY_LOW</td>
<td>broadcast receiver</td>
<td>A warning that the battery is low.</td>
</tr>
<tr>
<td>ACTION_HEADSET_PLUG</td>
<td>broadcast receiver</td>
<td>A headset has been plugged into the device, or unplugged from it.</td>
</tr>
<tr>
<td>ACTION_SCREEN_ON</td>
<td>broadcast receiver</td>
<td>The screen has been turned on.</td>
</tr>
<tr>
<td>ACTION_TIMEZONE_CHANGED</td>
<td>broadcast receiver</td>
<td>The setting for the time zone has changed.</td>
</tr>
</tbody>
</table>
Intent Info - *Data*

- URI (uniform resource identifier) of data to work with / on
  - for content on device a content provider and identifying information, for example an audio file or image or contact

- MIME (Multipurpose Internet Mail Extension, now internet media type) initially for email types, but extended to describe type information in general about data / content
  - *image/png* or *audio/mpeg*
## Intent Info - Category

- String with more information on what kind of component should handle Intent

<table>
<thead>
<tr>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CATEGORY_BROWSABLE</td>
<td>The target activity can be safely invoked by the browser to display data referenced by a link — for example, an image or an e-mail message.</td>
</tr>
<tr>
<td>CATEGORY_GADGET</td>
<td>The activity can be embedded inside of another activity that hosts gadgets.</td>
</tr>
<tr>
<td>CATEGORY_HOME</td>
<td>The activity displays the home screen, the first screen the user sees when the device is turned on or when the Home button is pressed.</td>
</tr>
<tr>
<td>CATEGORY_LAUNCHER</td>
<td>The activity can be the initial activity of a task and is listed in the top-level application launcher.</td>
</tr>
<tr>
<td>CATEGORY_PREFERENCE</td>
<td>The target activity is a preference panel.</td>
</tr>
</tbody>
</table>
Intent - *Extras*

• A *Bundle* (like a map / dictionary, key-value pairs) of additional information to be given to the component handling the Intent

• Some Action will have specified extras
  – ACTION_TIMEZONE_CHANGED will have an extra with key of "time-zone"
    (documentation is your friend)
  – Intent method has put methods or put a whole Bundle
Example

• Use an Intent so app asks camera to take picture and displays the resulting picture
• important details:
  – permission to write and read (JellyBean) to and from SD card
  – getting file names correct
  – reduce size of original image
IntentExample
Layout

- LinearLayout with
  - button
  - ImageView
- ImageView initially displays default Image
- button click results in call to takePhoto
  - android:onClick attribute set
public void takePhoto(View v) {
    // create directory if necessary
    File photoDir = new File(Environment.getExternalStorageDirectory() + "\intentExamplePhotos/");

    if(photoDir.mkdirs())
        Log.d(TAG, "mkdirs returned true: " + photoDir);
    else
        Log.d(TAG, "mkdirs returned false: " + photoDir);

    // create Intent to take picture via camera and specify location
    // to store image so we can retrieve easily
    Intent intent = new Intent(MediaStore.ACTION_IMAGE_CAPTURE);
    File file = new File(fileName);
    outputFileUri = Uri.fromFile(file);
    intent.putExtra(MediaStore.EXTRA_OUTPUT, outputFileUri);
    startActivityForResult(intent, TAKE_PICTURE);
}
Result

• Clicking button starts Camera Activity
• IntentExample stops
  – recall Activity lifecycle, play well with others
• when picture taken return to IntentExample activity
onActivityResult

• when camera app checks Android system will call this method (callback)
• look at result and take appropriate action
• verify our requested action was completed
@Override
protected void onActivityResult(int requestCode, int resultCode, Intent data) {

    if (requestCode == TAKE_PICTURE) {
        // change picture in ImageView to image just taken

        // reduce size of image
        BitmapFactory.Options options = new BitmapFactory.Options();
        options.inSampleSize = 4;
        Bitmap bmp = BitmapFactory.decodeFile(fileName, options);

        ImageView img = (ImageView) this.findViewById(R.id.imageView1);
        img.setImageBitmap(bmp);
        Toast.makeText(this, "Photo saved to: ", Toast.LENGTH_LONG).show();
        + outputFile.toString(), Toast.LENGTH_LONG).show();
Intent Resolution

• How does the Android system determine what component should handle an Intent?

• explicit
  – Intent designates target component by name
  – typically used for inter application messaging and activity starting
  – recall, LifeCycleTest

```java
public void getName(View v) {
    Intent intent = new Intent(this, NameGetter.class);
    startActivityForResult(intent, GET_NAME);
}
```
Intent Resolution - Implicit

• component name is blank (unknown)
• typically used when starting component in another application
• Android system uses data from Intent (action, category, data) and tries to find / match best component for job
• Intent Filters
Intent Filters

• Applications and components that can receive implicit Intents advertise what they can do via Intent Filters
• components with no Intent Filters can only receive explicit Intents — typical of many activities
• activities, services, and broadcast receivers can have one or more intent filters
Intent Filters

• Android system should know what application can do without having to start the component
  – before runtime
  – exception is Broadcast Receivers registered dynamically; they create IntentFilter objects at runtime

• intent filters generally declared as element of applications AndroidManifest.xml file
IntentFilter - Example

- filter declares action, category, and data

```xml
<activity android:name="TitleEditor"
    android:label="@string/title_edit_title"
    android:theme="@android:style/Theme.Dialog">
    <intent-filter android:label="@string/resolve_title"/>
        <action android:name="com.android.notepad.action.EDIT_TITLE" />
    <category android:name="android.intent.category.DEFAULT" />
    <category android:name="android.intent.category.DEFAULT" />
    <category android:name="android.intent.category.SELECTION" />
    <data android:mimeType="vnd.android.cursor.item/vnd.google.note" />
</intent-filter>
</activity>
```
IntentFilter - Example

• The Android system populates the application launcher via IntentFilters

```xml
<activity
    android:name=".IntentExample"
    android:label="@string/title_activity_intent_example" >
    <intent-filter>
        <action android:name="android.intent.action.MAIN" />
        <category android:name="android.intent.category.LAUNCHER" />
    </intent-filter>
</activity>
```
