

TacTex'13: A Champion Adaptive Power Trading Agent

Daniel Urieli Peter Stone

Department of Computer Science
The University of Texas at Austin
{urieli, pstone}@cs.utexas.edu

AAAI 2014

The Smart Grid Vision

- “Grid 2030” - vision for a smart-grid
 - Major challenge: aligning supply-demand in the presence of renewable, intermittent generation
- AI: a main building block
- Smart-grid: new challenges for AI
[Ramchurn et. al 2012]

The Smart Grid Vision

- “Grid 2030” - vision for a smart-grid
 - Major challenge: aligning supply-demand in the presence of renewable, intermittent generation

- AI: a main building block
- Smart-grid: new challenges for AI

[Ramchurn et. al 2012]

The Smart Grid Vision

- “Grid 2030” - vision for a smart-grid
 - Major challenge: aligning supply-demand in the presence of renewable, intermittent generation

- AI: a main building block
- Smart-grid: new challenges for AI

[Ramchurn et. al 2012]

- Grid 2030 milestone:

“Customer participation in power markets through demand-side management and distributed generation”

- Power TAC (Power Trading Agent Competition)
 - Uses a rich smart grid simulation platform
 - Focuses on retail power markets structure and operation
 - Competitors: autonomous broker agents

The Power Trading Agent Competition (Power TAC)

- Grid 2030 milestone:

“Customer participation in power markets through demand-side management and distributed generation”

- Power TAC (Power Trading Agent Competition)
 - Uses a rich smart grid simulation platform
 - Focuses on retail power markets structure and operation
 - Competitors: autonomous broker agents

The Power Trading Agent Competition (Power TAC)

- Grid 2030 milestone:

“Customer participation in power markets through demand-side management and distributed generation”

- Power TAC (Power Trading Agent Competition)
 - Uses a rich smart grid simulation platform
 - Focuses on retail power markets structure and operation
 - Competitors: autonomous broker agents

Application domain: autonomous energy-trading

- In this domain:
 - An agent is deployed into an **unknown** environment
 - The agent is expected to make **robust, real-time** decisions
 - Environment is **realistic** \implies **complex**
- To perform robustly, agent need to:
 - Learn
 - Predict
 - Plan
 - Adapt
- A natural approach: **Reinforcement Learning**

- To perform robustly, agent need to:
 - **Learn**
 - **Predict**
 - **Plan**
 - **Adapt**
- A natural approach: **Reinforcement Learning**

- Reinforcement Learning (RL):

- **Our domains require from an RL agent:**
 - Sample-efficiency
 - Computationally-efficiency
 - Handle high-dimensional continuous state
 - Handle continuous-actions and/or delayed-actions
 - Handle possible non-stationarity
- Combination that was not addressed by past RL algorithms

- Reinforcement Learning (RL):

TacTex'13: Tariff Market Strategy

TacTex'13: Tariff Market Strategy

Decision Making in the Tariff Market

- **Available actions:** tariff publications
- **Tariff:** contract for selling/buying energy
 - E.g.: [`type=consumption`, `rates=(rate1, rate2,...)`, `signup-fee=none,...`]
- **Rate:** energy prices per time and/or quantity
 - Rate types: fixed, time-of-use (TOU), real-time (RT)...
 - Fixed: [`fixed=true`, `price=7cent/kWh`]
 - TOU: [(`time1=Mon-Fri 7am-6pm`, `price=8cent/kWh`), (`time2=Sat, ...`), ...]
 - RT: [`expected/min/max-price=7/5/8 cent/kWh`, `rate-notice=3 hours...`]
- Customers **subscribe** to tariffs they find **attractive**
 - Cheap, minimizes inconvenience...

Challenge: what tariffs should a broker publish?

Decision Making in the Tariff Market

Challenge: what tariffs should a broker publish?

- TACTEX uses a **utility-based approach**
 - Optimizes long-term utility (= profits)
- **Core computation:**
“if I publish tariff t , how would it affect my long-term utility?”

- TACTEX uses a **utility-based approach**
 - Optimizes long-term utility (= profits)
- **Core computation:**
“if I publish tariff t , how would it affect my long-term utility?”

Tariff Utility Estimation

- Considering only **fixed-rate tariffs**
 - More attractive to customers
 - Optimizing **one** future price instead of a **sequence**

- **Estimate** future customers demand
- **Estimate** future wholesale costs
- **Select** price that maximizes profits

Tariff Utility Estimation

- Considering only **fixed-rate tariffs**
 - More attractive to customers
 - Optimizing **one** future price instead of a **sequence**

- **Estimate** future customers demand
- **Estimate** future wholesale costs
- **Select** price that maximizes profits

Tariff Utility Estimation

Decision Making in the Wholesale Market

- **Available actions:** bid submissions
 - Bid: [needed-amount=2mWh, limit=25\$/mWh, when=5pm]
- Bids cleared in a double auction:

- Day ahead market \implies 24 auctions for each timeslot
- Need to:
 - Buy energy cheaply
 - Avoid imbalance costs \implies buy all needed energy

Challenge: what bidding strategy to use?

Decision Making in the Wholesale Market

- **Available actions:** bid submissions
 - Bid: [needed-amount=2mWh, limit=25\$/mWh, when=5pm]

Wholesale Market Strategy

- Per timeslot: **estimate future demand**
- **Minimize cost** for satisfying this demand
- Online RL bidding algorithm:

MDP States:

$\{0, 1, \dots, 24, success\}$

MDP Actions:

limit-price $\in \mathbb{R}$

Controlled Experiments - Ablation Analysis

- Round-Robin 2-agent tournament between:
 - B: baseline agent
 - U1: adding tariff-market strategy
 - U9_MDP: adding wholesale-market strategy
 - U9_MDP_LWR: adding LWR customer prediction
- Each pair played 200 games with similar conditions

	B	U1	U9_MDP
U9_MDP_LWR	1278.3 (43.2)	708.9 (35.6)	34.2 (23.2)
U9_MDP	966.4 (40.5)	592.6 (22.2)	
U1	547.4 (27.7)		

Ablation Analysis Using Available Finalist Agents

- 4-agent games using 3 available finalist agents

Broker	Cash
cwiBroker	340.9 (8.4)
Mertacor	-276.2 (40.2)
CrocodileAgent	-287.1 (14.5)
B	-334.6 (8.0)

Broker	Cash
cwiBroker	315.4 (9.3)
U1	135.3 (12.3)
CrocodileAgent	-372.1 (17.0)
Mertacor	-485.5 (28.1)

Broker	Cash
U9_MDP	389.9 (13.3)
cwiBroker	138.3 (8.7)
CrocodileAgent	-333.3 (17.0)
Mertacor	-494.1 (29.6)

Broker	Cash
U9_MDP_LWR	350.8 (13.3)
cwiBroker	132.4 (9.0)
CrocodileAgent	-336.9 (17.3)
Mertacor	-566.1 (26.8)

- Tariff and Wholesale strategies improve performance
- LWR customer prediction reduces performance
 - Should relax LWR's extrapolation assumptions?

Ablation Analysis Using Available Finalist Agents

- 4-agent games using 3 available finalist agents

Broker	Cash
cwiBroker	340.9 (8.4)
