**Table 18-240. CONTROL\_DEBOBS\_FINAL\_MUX\_SEL**

<b>Address Offset</b>	0x0000 0400	<b>Instance</b>	SYSCTRL_GENERAL_CORE
<b>Physical Address</b>	0x4A00 2400		
<b>Description</b>	Final mux select signal. It selects between core and wkup signal (controls external observability logic). Access conditions. Read: unrestricted, Write: unrestricted		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SELECT																															

Bits	Field Name	Description	Type	Reset
31:0	SELECT	The i-th (i=0..31) bit from this bit field controls the multiplexing between the core and the wake-up signals to be observed at i-th hw_dbg line.  Ob0:     Selects a signal from the WAKEUP domain Ob1:     Select a signal from the CORE domain	RW	0x0000 0000

15:14	EMIF2_SDRAM_NARROW_MODE	<p>SDRAM data bus width:</p> <p>Set to 0x0 for 64-bit width.</p> <p>Set to 0x1 for 32-bit width.</p> <p>Set to 0x2 for 16-bit width.</p> <p>All other values are reserved.</p>	RW	0x0
13:10	EMIF2_SDRAM_CL	<p>CAS latency (RL latency). The value of this field defines the CAS latency to be used when accessing connected SDRAM devices:</p> <p>Supported for LPDDR2-SDRAM:</p> <p>0x3: CAS latency of 3 cycles</p> <p>0x4: CAS latency of 4 cycles</p> <p>0x5: CAS latency of 5 cycles</p> <p>0x6: CAS latency of 6 cycles</p> <p>0x7: CAS latency of 7 cycles</p> <p>0x8: CAS latency of 8 cycles</p> <p>All other values are reserved.</p>	RW	0x3
9:7	EMIF2_SDRAM_ROWSIZE	<p>Row size. Defines the number of row address bits of connected SDRAM devices:</p> <p>Set to 0x0 for 9 row bits.</p> <p>Set to 0x1 for 10 row bits.</p> <p>Set to 0x2 for 11 row bits.</p> <p>Set to 0x3 for 12 row bits.</p> <p>Set to 0x4 for 13 row bits.</p> <p>Set to 0x5 for 14 row bits.</p> <p>Set to 0x6 for 15 row bits.</p> <p>Set to 0x7 for 16 row bits.</p> <p>This field is used only when the <code>ibank_pos</code> field in the SDRAM Config register is set to 0x1, 0x2, or 0x3.</p>	RW	0x4

Bits	Field Name	Description	Type	Reset
6:4	EMIF2_SDRAM_IBANK	Internal bank setup. Defines number of banks inside connected SDRAM devices: Set to 0x0 for 1 bank. Set to 0x1 for 2 banks. Set to 0x2 for 4 banks. Set to 0x3 for 8 banks. All other values are reserved.	RW	0x3
3	EMIF2_SDRAM_EBANK	External CS setup. Defines whether SDRAM accesses will use 1 or 2 CS lines. Set to 0 to use pad_cs_o_n[0] only: Set to 0x0 to use only pad_cs_o_n[0]. Set to 0x1 to use pad_cs_o_n[1:0]. This bit is automatically set to 0 if either the cs0nvmem or cs1nvmem field in the LPDDR2-NVM is set to 1.	RW	0x0
2:0	EMIF2_SDRAM_PAGESIZE	Page size. Defines the internal page size of the connected SDRAM devices: Set to 0x0 for 256-word page (8 column bits). Set to 0x1 for 512-word page (9 column bits). Set to 0x2 for 1024-word page (10 column bits). Set to 0x3 for 2048-word page (11 column bits). All other values are reserved.	RW	0x0

<b>Description</b>	Register control for Pads gpio65 and gpio66 Access conditions. Read: unrestricted, Write: unrestricted		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
GPIO66_WAKEUPEVENT	GPIO66_WAKEUPENABLE	GPIO66_OFFMODEPULLTYPESELECT	GPIO66_OFFMODEPULLUDENENABLE	GPIO66_OFFMODEOUTVALUE	GPIO66_OFFMODEOUTENABLE	GPIO66_OFFMODEENABLE	GPIO66_INPUTENABLE	RESERVED			GPIO66_PULLTYPESELECT	GPIO66_PULLUDENENABLE	GPIO66_MUXMODE			GPIO65_WAKEUPEVENT	GPIO65_WAKEUPENABLE	GPIO65_OFFMODEPULLTYPESELECT	GPIO65_OFFMODEPULLUDENENABLE	GPIO65_OFFMODEOUTVALUE	GPIO65_OFFMODEOUTENABLE	GPIO65_OFFMODEENABLE	GPIO65_INPUTENABLE	RESERVED			GPIO65_PULLTYPESELECT	GPIO65_PULLUDENENABLE	GPIO65_MUXMODE		

Bits	Field Name	Description	Type	Reset
31	GPIO66_WAKEUPEVENT	Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred	R	0
30	GPIO66_WAKEUPENABLE	Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled	RW	0
29	GPIO66_OFFMODEPULLTYPESELECT	OffMode mode pullup/down selection for pad gpio66 0x0: Offmode pulldown selected 0x1: Offmode pullup selected	RW	0
28	GPIO66_OFFMODEPULLUDENENABLE	OffMode mode pullup/down enable for pad gpio66 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled	RW	0
27	GPIO66_OFFMODEOUTVALUE	OffMode mode output value for pad gpio66 0x0: Set value at 0 0x1: Set value at 1	RW	0
26	GPIO66_OFFMODEOUTENABLE	OffMode mode output enable value for pad gpio66. This is an active low signal 0x0: Output enable 0x1: Output disable	RW	0
25	GPIO66_OFFMODEENABLE	OffMode mode override control for pad gpio66 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active	RW	0
24	GPIO66_INPUTENABLE	Input enable value for pad gpio66 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled	RW	1
23:21	RESERVED		R	0x0
20	GPIO66_PULLTYPESELECT	pullup/down selection for pad gpio66 0x0: pulldown selected 0x1: pullup selected	RW	1
19	GPIO66_PULLUDENENABLE	pullup/down enable for pad gpio66 0x0: pullup/down disabled 0x1: pullup/down enabled	RW	1

Bits	Field Name	Description	Type	Reset
18:16	GPIO66_MUXMODE	Functional multiplexing selection for pad gpio66 0x0: Reserved 0x3: Select gpio_66 <sup>(1)</sup> 0x7: Select safe_mode	RW	0x7
15	GPIO65_WAKEUPEVENT	Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred	R	0
14	GPIO65_WAKEUPENABLE	Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled	RW	0
13	GPIO65_OFFMODEPULLTYPES ELECT	OffMode mode pullup/down selection for pad gpio65 0x0: Offmode pulldown selected 0x1: Offmode pullup selected	RW	0
12	GPIO65_OFFMODEPULLUDEN ABLE	OffMode mode pullup/down enable for pad gpio65 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled	RW	0
11	GPIO65_OFFMODEOUTVALUE	OffMode mode output value for pad GPIO65 0x0: Set value at 0 0x1: Set value at 1	RW	0
10	GPIO65_OFFMODEOUTENABL E	OffMode mode output enable value for pad gpio65. This is an active low signal 0x0: Output enable 0x1: Output disable	RW	0
9	GPIO65_OFFMODEENABLE	OffMode mode override control for pad gpio65 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active	RW	0
8	GPIO65_INPUTENABLE	Input enable value for pad gpio65 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled	RW	1
7:5	RESERVED		R	0x0
4	GPIO65_PULLTYPESELECT	pullup/down selection for pad gpio65 0x0: pulldown selected 0x1: pullup selected	RW	1
3	GPIO65_PULLUDENABLE	pullup/down enable for pad gpio65 0x0: pullup/down disabled 0x1: pullup/down enabled	RW	1
2:0	GPIO65_MUXMODE	Functional multiplexing selection for pad gpio65 0x0: Reserved 0x3: Select gpio_65 <sup>(2)</sup> 0x7: Select safe_mode	RW	0x7

<sup>(1)</sup> To configure gpio\_66 pad in GPIO mode, CONTROL\_I2C\_1[22] GPIO66\_NMODE must be set to 0x1.

<sup>(2)</sup> To configure gpio\_65 pad in GPIO mode, CONTROL\_I2C\_1[20] GPIO65\_NMODE must be set to 0x1.

## Mailbox

---

---

---

This chapter describes the Mailbox module in the device.

Topic	Page
<b>19.1 Mailbox Overview .....</b>	<b>4403</b>
<b>19.2 Mailbox Integration .....</b>	<b>4405</b>
<b>19.3 Mailbox Functional Description .....</b>	<b>4409</b>
<b>19.4 Mailbox Programming Guide .....</b>	<b>4415</b>
<b>19.5 Mailbox Register Manual .....</b>	<b>4418</b>

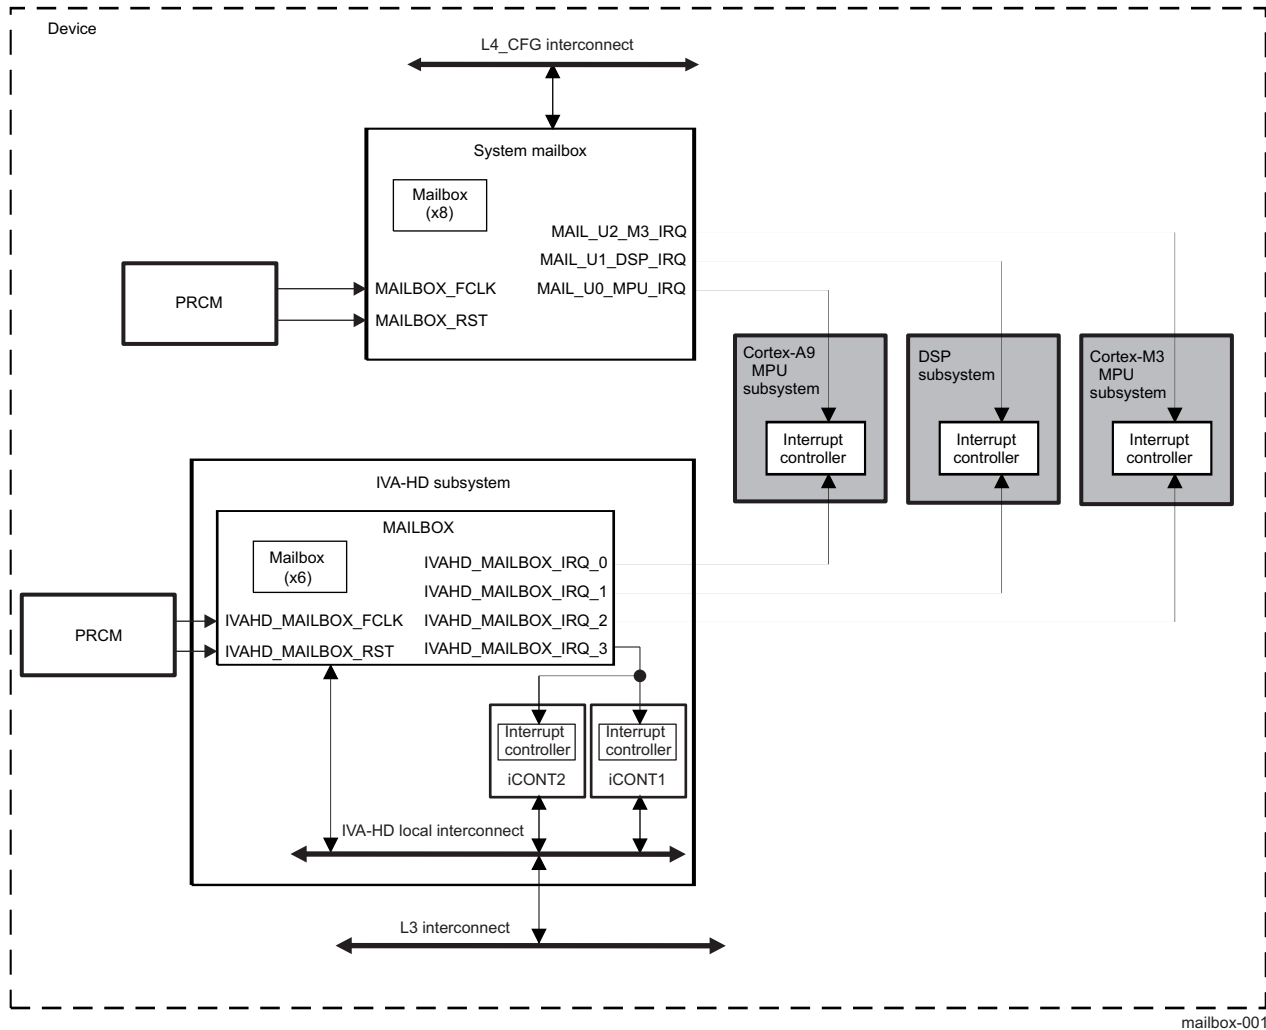

## 19.1 Mailbox Overview

Communication between the on-chip processors of the device uses a queued mailbox-interrupt mechanism.

The queued mailbox-interrupt mechanism allows the software to establish a communication channel between two processors through a set of registers and associated interrupt signals by sending and receiving messages (mailboxes).

Figure 19-1 shows an overview of the mailbox module.

Figure 19-1. Mailbox Overview

mailbox-001

There are two mailbox module instances in the device:

- System mailbox - used for Cortex-A9 microprocessor unit (Cortex-A9 MPU), digital signal processor (DSP) and Cortex-M3 microprocessor unit (Cortex-M3 MPU) communications.
- IVA-HD mailbox - used for communication between one internal to the IVA-HD subsystem user (imaging controller 1 - iCONT1, or imaging controller 2 - iCONT2) and three external to the IVA-HD subsystem users (Cortex-A9 MPU, DSP and Cortex-M3 MPU). This communication is insured through three pairs of mailboxes.

The mailbox module includes the following features:

- Three users for the system mailbox instance (Cortex-A9 MPU, DSP and Cortex-M3 MPU)/four users for the IVA-HD mailbox instance (iCONT1/iCONT2, Cortex-A9 MPU, DSP and Cortex-M3 MPU)
- Eight mailbox message queues for the system mailbox instance/six mailbox message queues for the

## IVA-HD mailbox instance

- Flexible assignment of receiver and sender for each mailbox through interrupt configuration
- Three interrupts (one per user) for the system mailbox instance/four interrupts (one per user) for the IVA-HD mailbox instance
- 32-bit message width
- Four-message FIFO depth for each message queue
- Message reception and queue-not-full notification using interrupts
- Support of 16-/32-bit addressing scheme
- Power management support

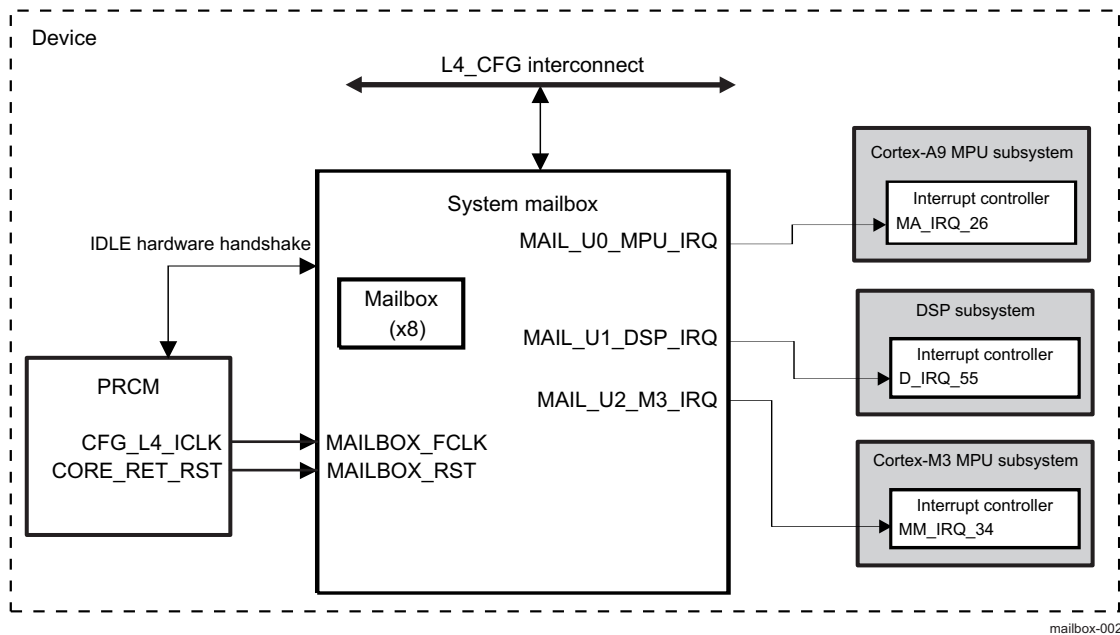

## 19.2 Mailbox Integration

This section describes the mailbox integration in the device, including information about clocks, resets, and hardware requests.

### 19.2.1 System Mailbox Integration

Figure 19-2 shows the system mailbox integration.

Figure 19-2. System Mailbox Integration

**NOTE:** For more information about the IDLE hardware handshake, see [Section 3.1.1.1.2, Module Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

Table 19-1 through Table 19-3 summarize the system mailbox integration in the device.

Table 19-1. Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
SYSTEM_MAILBOX	PD_CORE	NA	L4_CFG

**Table 19-2. Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description

	IVAHD_MAILBOX_IRQ_3	IRQ#11	iCONT1/iCONT2	IVA-HD mailbox user 3 interrupt request. For information about iCONT1/iCONT2 interrupt mapping, see , <i>iCONT</i> .
<b>No DMA Requests</b>				

**NOTE:** For information about interrupt source description, see [Section 19.3.4, Interrupt Requests](#).

## 19.3 Mailbox Functional Description

**NOTE:** In the mailbox functional description,  $u$  is the user number and  $m$  is the mailbox number as follows:

- for the system mailbox module instance,  $u=0$  to 2 and  $m=0$  to 7
- for the IVA-HD mailbox module instance,  $u=0$  to 3 and  $m=0$  to 5

The mailbox module provides a means of communication through message queues among the users (depending on the mailbox module instance). The individual mailbox modules (8 for the system mailbox instance, 6 for the IVA-HD mailbox instance), or FIFOs, can associate (or de-associate) with any of the processors using the [MAILBOX\\_IRQENABLE\\_SET\\_u](#) (or [MAILBOX\\_IRQENABLE\\_CLR\\_u](#)) register.

### CAUTION

For the IVA-HD mailbox instance, communication is possible only if one of the users is iCONT1 or iCONT2.

The mailbox module includes the following user subsystems:

- User 0: Cortex-A9 MPU subsystem ( $u = 0$ )
- User 1: DSP subsystem ( $u = 1$ )
- User 2: Cortex-M3 MPU subsystem ( $u = 2$ )
- User 3: IVA-HD subsystem ( $u = 3$ ) - only available to the IVA-HD mailbox instance

Each user has a dedicated interrupt signal from the corresponding mailbox module instance and dedicated interrupt enabling and status registers.

Each [MAILBOX\\_IRQSTATUS\\_RAW\\_u](#)/[MAILBOX\\_IRQSTATUS\\_CLR\\_u](#) interrupt status register corresponds to a particular user.

For the system mailbox instance, a user can query its interrupt status register through the L4\_CFG interconnect.

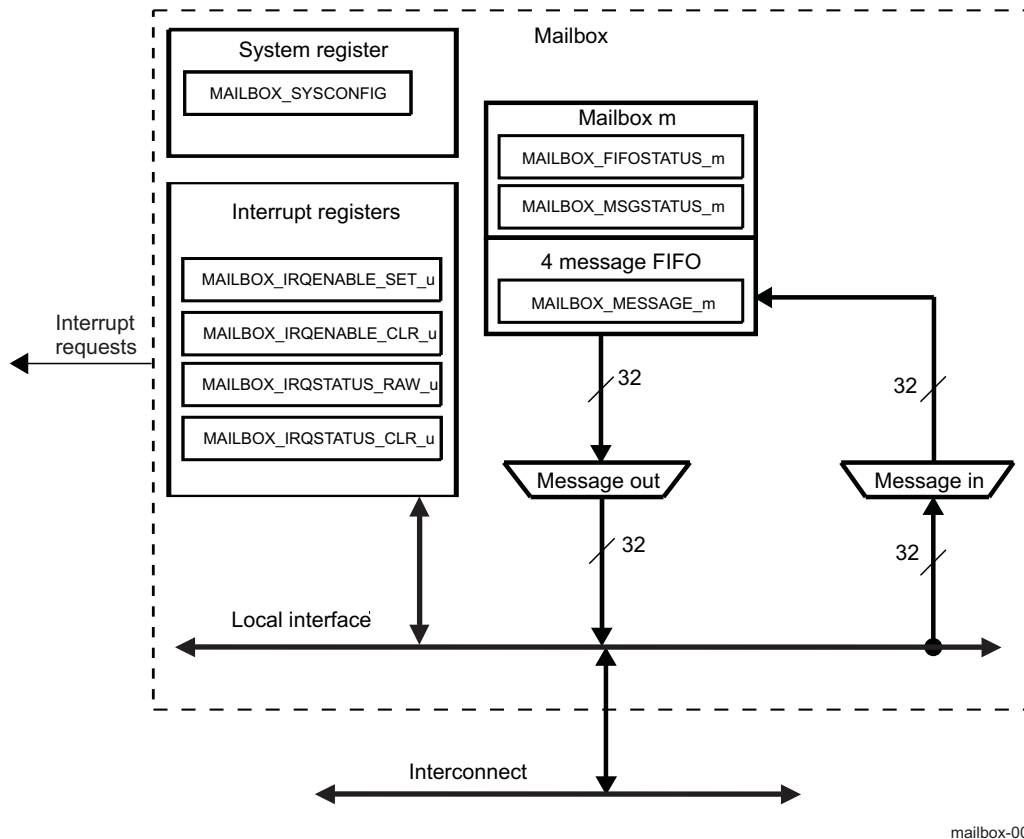

For the IVA-HD mailbox instance, a user can query its interrupt status register as follows:

- Cortex-A9 MPU and Cortex-M3 MPU - through the L3 interconnect
- iCONT1/iCONT2 and DSP - private access (directly through the IVA-HD local interconnect)

### 19.3.1 Mailbox Block Diagram

Figure 19-4 shows the mailbox block diagram.

**Figure 19-4. Mailbox Block Diagram**

**NOTE:** The interrupt requests and the interconnect depend on the mailbox module instance. For more information, see [Section 19.2, Mailbox Integration](#).

### 19.3.2 Mailbox Software Reset

The mailbox module supports a software reset through the `MAILBOX_SYSCONFIG[0]` SOFTRESET bit. Setting this bit to 1 enables an active software reset that is functionally equivalent to a hardware reset. Reading the `MAILBOX_SYSCONFIG[0]` SOFTRESET bit gives the status of the software reset:

- Read 1: the software reset is on-going.
- Read 0: the software reset is complete.

The software must ensure that the software reset completes before doing mailbox operations.

### 19.3.3 Mailbox Power Management

[Table 19-7](#) describes power-management features available for the mailbox module.

**NOTE:**

- For information about source clock gating and sleep/wake-up transitions description, see [Section 3.1.1.1.4, Clock-Domain Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).
- For descriptions of EnaWakeUp, IdleMode, ClockActivity, and StandbyMode features, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

**Table 19-7. Local Power Management Features**

Feature	Registers	Description
Clock autogating	NA	Feature not available
Slave idle modes	<a href="#">MAILBOX_SYSCONFIG</a> [3:2] SIDLEMODE bit field	Force-idle, no-idle and smart-idle modes are available
Clock activity	NA	Feature not available
Master standby modes	NA	Feature not available
Global wake-up enable	NA	Feature not available
Wake-up sources enable	NA	Feature not available

The mailbox module can be configured using the [MAILBOX\\_SYSCONFIG](#)[3:2] SIDLEMODE bit field to one of the following acknowledgment modes:

- Force-idle mode (SIDLEMODE = 0x0): The mailbox module immediately enters the idle state on receiving a low-power-mode request from the PRCM module. In this mode, the software must ensure that there are no asserted output interrupts before requesting this mode to go into the idle state.
- No-idle mode (SIDLEMODE = 0x1): The mailbox module never enters the idle state.
- Smart-idle mode (SIDLEMODE = 0x2): After receiving a low-power-mode request from the PRCM module, the mailbox module enters the idle state only after all asserted output interrupts are acknowledged.

### 19.3.4 Mailbox Interrupt Requests

An interrupt request allows the user of the mailbox to be notified when a message is received or when the message queue is not full. There is one interrupt per user.

**NOTE:** For more information about interrupt requests, see [Section 19.2, Mailbox Integration](#).

[Table 19-8](#) lists the event flags, and their mask, that can cause module interrupts.

**Table 19-8. Interrupt Events**

Non-Maskable Event Flag <sup>(1)</sup>	Maskable Event Flag	Event Mask Bit	Event Unmask Bit	Description
<a href="#">MAILBOX_IRQSTATUS_RAW_u</a> [0+m*2]	<a href="#">MAILBOX_IRQSTATUS_CLR_u</a> [0+m*2]	<a href="#">MAILBOX_IRQENABLE_CLR_u</a> [0+m*2]	<a href="#">MAILBOX_IRQENABLE_SET_u</a> [0+m*2]	Mailbox <i>m</i> receives a new message.
NEWMSGSTATUSUUM Bm	NEWMSGSTATUSUUM Bm	NEWMSGSTATUSUUM Bm	NEWMSGSTATUSUUM Bm	
<a href="#">MAILBOX_IRQSTATUS_RAW_u</a> [1+m*2]	<a href="#">MAILBOX_IRQSTATUS_CLR_u</a> [1+m*2]	<a href="#">MAILBOX_IRQENABLE_CLR_u</a> [1+m*2]	<a href="#">MAILBOX_IRQENABLE_SET_u</a> [1+m*2]	Mailbox <i>m</i> message queue is not full.
NOTFULLSTATUSUUM Bm	NOTFULLSTATUSUUM Bm	NOTFULLSTATUSUUM Bm	NOTFULLSTATUSUUM Bm	

<sup>(1)</sup> MAILBOX.MAILBOX\_IRQSTATUS\_RAW\_u register is mostly used for debug purposes.

**CAUTION**

Once an event generating the interrupt request has been processed by the software, it must be cleared by writing a logical 1 in the corresponding bit of the [MAILBOX\\_IRQSTATUS\\_CLR\\_u](#) register.

Writing a logical 1 in a bit of the [MAILBOX\\_IRQSTATUS\\_CLR\\_u](#) register will also clear to 0 the corresponding bit in the appropriate [MAILBOX\\_IRQSTATUS\\_RAW\\_u](#) register.

An event can generate an interrupt request when a logical 1 is written to the corresponding unmask bit in the [MAILBOX\\_IRQENABLE\\_SET\\_u](#) register. Events are reported in the appropriate [MAILBOX\\_IRQSTATUS\\_CLR\\_u](#) and [MAILBOX\\_IRQSTATUS\\_RAW\\_u](#) registers.

An event stops generating interrupt requests when a logical 1 is written to the corresponding mask bit in the [MAILBOX\\_IRQENABLE\\_CLR\\_u](#) register. Events are only reported in the appropriate [MAILBOX\\_IRQSTATUS\\_RAW\\_u](#) register.

In case of the [MAILBOX\\_IRQSTATUS\\_RAW\\_u](#) register, the event is reported in the corresponding bit even if the interrupt request generation is disabled for this event.

**19.3.5 Mailbox Assignment****19.3.5.1 Description**

To assign a receiver to a mailbox, set the new message interrupt enable bit corresponding to the desired mailbox in the [MAILBOX\\_IRQENABLE\\_SET\\_u](#) register. The receiver reads the [MAILBOX\\_MESSAGE\\_m](#) register to retrieve a message from the mailbox.

An alternate method for the receiver that does not use the interrupts is to poll the [MAILBOX\\_FIFOSTATUS\\_m](#) and/or [MAILBOX\\_MSGSTATUS\\_m](#) registers to know when to send or retrieve a message to or from the mailbox. This method does not require assigning a receiver to a mailbox. Because this method does not include the explicit assignment of the mailbox, the software must avoid having multiple receivers use the same mailbox, which can result in incoherency.

To assign a sender to a mailbox, set the queue-not-full interrupt enable bit of the desired mailbox in the [MAILBOX\\_IRQENABLE\\_SET\\_u](#) register, where *u* is the number of the sending user. However, direct allocation of a mailbox to a sender is not recommended because it can cause the sending processor to be constantly interrupted.

It is recommended that register polling be used to:

- Check the status of either the [MAILBOX\\_FIFOSTATUS\\_m](#) or [MAILBOX\\_MSGSTATUS\\_m](#) registers
- Write the message to the corresponding [MAILBOX\\_MESSAGE\\_m](#) register, if space is available.

The sender might use the queue-not-full interrupt when the initial mailbox status check indicates the mailbox is full. In this case, the sender can enable the queue-not-full interrupt for its mailbox in the appropriate [MAILBOX\\_IRQENABLE\\_SET\\_u](#) register. This allows the sender to be notified by interrupt only when a FIFO queue has at least one available entry.

Reading the [MAILBOX\\_IRQSTATUS\\_CLR\\_u](#) register determines the status of the new message and the queue-not-full interrupts for a particular user. Writing 1 to the corresponding bit in the [MAILBOX\\_IRQSTATUS\\_CLR\\_u](#) register acknowledges, and subsequently clears, an interrupt.

**CAUTION**

Assigning multiple senders or multiple receivers to the same mailbox is not recommended.

## 19.3.6 Sending and Receiving Messages

### 19.3.6.1 Description

When a 32-bit message is written to the [MAILBOX\\_MESSAGE\\_m](#) register, the message is appended into the FIFO queue. This queue holds four messages. If the queue is full, the message is discarded.

Queue overflow can be avoided by first reading the [MAILBOX\\_FIFOSTATUS\\_m](#) register to check that the mailbox message queue is not full before writing a new message to it.

Reading the [MAILBOX\\_MESSAGE\\_m](#) register returns the message at the beginning of the FIFO queue and removes it from the queue. If the FIFO queue is empty when the [MAILBOX\\_MESSAGE\\_m](#) register is read, the value 0 is returned.

The new message interrupt is asserted when at least one message is in the mailbox message FIFO queue. To determine the number of messages in the mailbox message FIFO queue, read the [MAILBOX\\_MSGSTATUS\\_m](#) register.

## 19.3.7 16-Bit Register Access

### 19.3.7.1 Description

So that 16-bit processors can access the mailbox module, the module allows 16-bit register read and write access, with restrictions for the [MAILBOX\\_MESSAGE\\_m](#) registers. The 16-bit half-words are organized in little endian fashion; that is, the least-significant 16 bits are at the low address and the most-significant 16 bits are at the high address (low address + 0x02).

All mailbox module registers can be read or written to directly using individual 16-bit accesses with no restriction on interleaving, except the [MAILBOX\\_MESSAGE\\_m](#) registers, which must always be accessed by either single 32-bit accesses or two consecutive 16-bit accesses.

#### **CAUTION**

When using 16-bit accesses, it is critical to ensure that the mailbox used has only one assigned receiver and only one assigned sender.

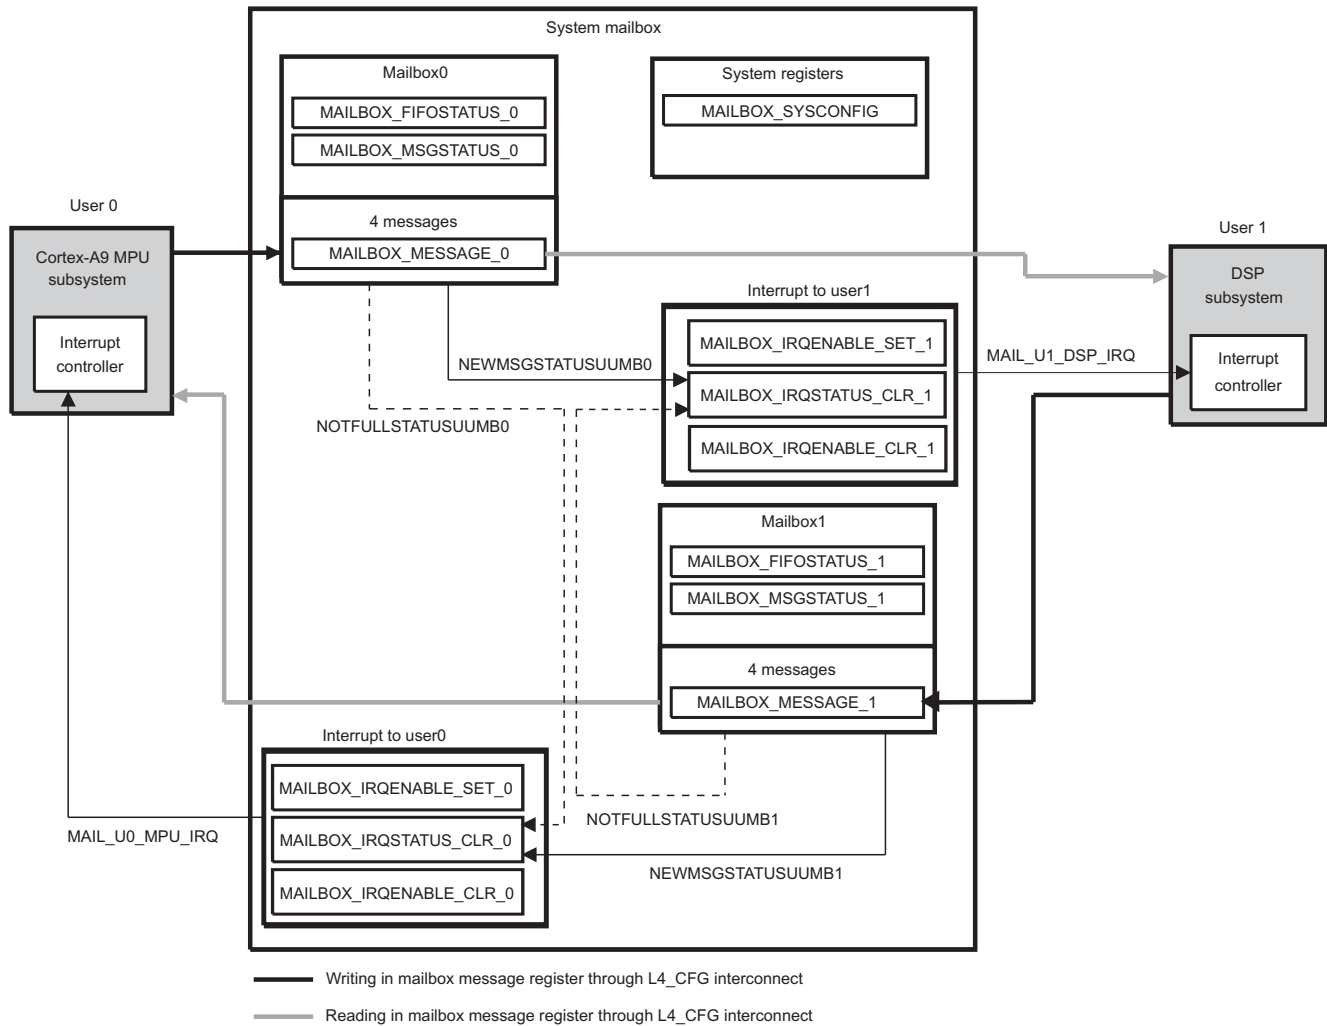

When using 16-bit accesses to the [MAILBOX\\_MESSAGE\\_m](#) registers, the order of access must be the least-significant half-word first (low address) and the most-significant half-word last (high address). This requirement is because of the update operation by the message FIFO of the [MAILBOX\\_MSGSTATUS\\_m](#) registers. The update of the FIFO queue contents and the associated status registers and possible interrupt generation occurs only when the most-significant 16 bits of a [MAILBOX\\_MESSAGE\\_m](#) are accessed.

### 19.3.8 Example of Communication

Figure 19-5 shows an example of communication between Cortex-A9 MPU and DSP subsystems.

Figure 19-5. Example of Communication

mailbox-005

## 19.4 Mailbox Programming Guide

### 19.4.1 Mailbox Low-level Programming Models

This section covers the low-level hardware programming sequences for configuration and usage of the mailbox module.

#### 19.4.1.1 Global Initialization

##### 19.4.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the mailbox module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration of the mailbox.

See [Section 19.2, Mailbox Integration](#), for further information.

**Table 19-9. Global Initialization of Surrounding Modules for System Mailbox**

Surrounding Modules	Comments
PRCM	Mailbox functional/interface clock must be enabled. For more information, see <a href="#">Section 3.6.15</a> , <i>CD_L4_CFG Clock Domain</i> , in <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Interrupt Controllers	Cortex-A9 MPU, or Cortex-M3 MPU, or DSP interrupt controller must be configured to enable the interrupt request generation to the Cortex-A9 MPU, or Cortex-M3 MPU, or DSP subsystem. For information about enabling interrupts in Cortex-A9 MPU INTC, see the <i>ARM Cortex™-A9 MPCore Technical Reference Manual</i> (available at <a href="http://infocenter.arm.com/help/index.jsp">infocenter.arm.com/help/index.jsp</a> ). For information about enabling interrupts in Cortex-M3 MPU INTC, see the <i>ARM Cortex™-M3 Technical Reference Manual</i> (available at <a href="http://infocenter.arm.com/help/index.jsp">infocenter.arm.com/help/index.jsp</a> ). For information about enabling interrupts in DSP INTC, see <a href="#">Chapter 5, DSP Subsystem</a> .
Interconnect	For information about L4-CFG interconnect configuration, see <a href="#">Section 13.3, L4 Interconnects</a> , in <a href="#">Chapter 13, Interconnect</a> .

**Table 19-10. Global Initialization of Surrounding Modules for IVA-HD Mailbox**

Surrounding Modules	Comments
PRCM	Mailbox functional/interface clock must be enabled. For more information, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Interrupt Controllers	Cortex-A9 MPU, or Cortex-M3 MPU, or DSP, or iCONT1/iCONT2 interrupt controller must be configured to enable the interrupt request generation to the Cortex-A9 MPU, or Cortex-M3 MPU, or DSP, or IVA-HD subsystem. For information about enabling interrupts in Cortex-A9 MPU INTC, or Cortex-M3 MPU INTC, or DSP INTC, see <a href="#">Table 19-9, Global Initialization of Surrounding Modules for System Mailbox</a> . For information about enabling interrupts in iCONT1/iCONT2, see <i>iCONT</i> in <a href="#">Chapter 6, IVA-HD Subsystem</a> .
Interconnect	For information about L3 interconnect configuration, see <a href="#">Section 13.2, L3 Interconnects</a> , in <a href="#">Chapter 13, Interconnect</a> .

##### 19.4.1.1.2 Mailbox Global Initialization

###### 19.4.1.1.2.1 Main Sequence - Mailbox Global Initialization

This procedure initializes the mailbox module after a power-on or software reset.

**Table 19-11. Mailbox Global Initialization**

Step	Register/ Bit Field / Programming Model	Value
Perform a software reset	<a href="#">MAILBOX_SYSCONFIG</a> [0] SOFTRESET	0x1
Wait until reset is complete	<a href="#">MAILBOX_SYSCONFIG</a> [0] SOFTRESET	= 0x0
Set idle mode configuration	<a href="#">MAILBOX_SYSCONFIG</a> [3:2] SIDLEMODE	0x-

## 19.4.1.2 Mailbox Operational Modes Configuration

### 19.4.1.2.1 Mailbox Processing modes

#### 19.4.1.2.1.1 Main Sequence - Sending a Message (Polling Method)

**Table 19-12. Sending a Message (Polling Method)**

Step	Register/ Bit Field / Programming Model	Value
IF : Is FIFO full ?	MAILBOX_FIFOSTATUS_m[0] FIFOFULLMB	= 0x1
Wait until at least one message slot is available	MAILBOX_FIFOSTATUS_m[0] FIFOFULLMB	= 0x0
<b>ELSE</b>		
Write message	MAILBOX_MESSAGE_m[31:0] MESSAGEVALUEMBM	0x----
<b>ENDIF</b>		

#### 19.4.1.2.1.2 Main Sequence - Sending a Message (Interrupt Method)

**Table 19-13. Sending a Message (Interrupt Method)**

Step	Register/ Bit Field / Programming Model	Value
IF : Is FIFO full ?	MAILBOX_FIFOSTATUS_m[0] FIFOFULLMB	= 0x1
Enable interrupt event	MAILBOX_IRQENABLE_SET_u[1+ m*2]	0x1
User (processor) can perform another task until interrupt occurs See <a href="#">Section 19.4.1.3.1</a> for interrupt handling in sending mode		
<b>ELSE</b>		
Write message	MAILBOX_MESSAGE_m[31:0] MESSAGEVALUEMBM	0x----
<b>ENDIF</b>		

#### 19.4.1.2.1.3 Main Sequence - Receiving a Message (Polling Method)

**Table 19-14. Receiving a Message (Polling Method)**

Step	Register/ Bit Field / Programming Model	Value
IF : Number of messages is not equal to 0	MAILBOX_MSGSTATUS_m[2:0] NBOFMSGMB	!= 0x0
Read message	MAILBOX_MESSAGE_m[31:0] MESSAGEVALUEMBM	0x----
<b>ENDIF</b>		

#### 19.4.1.2.1.4 Main Sequence - Receiving a Message (Interrupt Method)

**Table 19-15. Receiving a Message (Interrupt Method)**

Step	Register/ Bit Field / Programming Model	Value
Enable interrupt event	MAILBOX_IRQENABLE_SET_u[0 + m*2]	0x1
User (processor) can perform another task until interrupt occurs See <a href="#">Section 19.4.1.3.2</a> for interrupt handling in receiving mode		

### 19.4.1.3 Mailbox Events Servicing

#### 19.4.1.3.1 Events Servicing in Sending Mode

Table 19-16 describes the events servicing in sending mode.

**Table 19-16. Events Servicing in Sending Mode**

Step	Register/ Bit Field / Programming Model	Value
Read interrupt status bit	MAILBOX_IRQSTATUS_CLR_u[1 + m*2]	0x1
Write message	MAILBOX_MESSAGE_m[31:0] MESSAGEVALUEMBM	0x----
Write 1 to acknowledge interrupt	MAILBOX_IRQSTATUS_CLR_u[1 + m*2]	0x1

#### 19.4.1.3.2 Events Servicing in Receiving Mode

Table 19-17 describes the events servicing in receiving mode.

**Table 19-17. Events Servicing in Receiving Mode**

Step	Register/ Bit Field / Programming Model	Value
Read interrupt status bit	MAILBOX_IRQSTATUS_CLR_u[0 + m*2]	0x1
<b>IF</b> : Number of messages is not equal to 0 ?	MAILBOX_MSGSTATUS_m[2:0] NBOFMSGMB	!= 0x0
Read message	MAILBOX_MESSAGE_m[31:0] MESSAGEVALUEMBM	0x----
<b>ELSE</b>		
Write 1 to acknowledge interrupt	MAILBOX_IRQSTATUS_CLR_u[0 + m*2]	0x1
<b>ENDIF</b>		

## 19.5 Mailbox Register Manual

### 19.5.1 Mailbox Instance Summary

**Table 19-18. System Mailbox Instance Summary**

Module Name	Base Address L4_CFG Interconnect	Size
System Mailbox	0x4A0F 4000	4KB

**Table 19-19. IVAHD Mailbox Instance Summary**

Module Name	Base Address L3 Interconnect	Base Address DSP Subsystem Private Access	Base Address Private Access	Size
IVAHD Mailbox	0x5A05 A800	0x01E5 A800	0x008D A800	4KB

**NOTE:** Private access is an access that does not use the L3/L4 interconnects.

## 20.1 MMU Overview

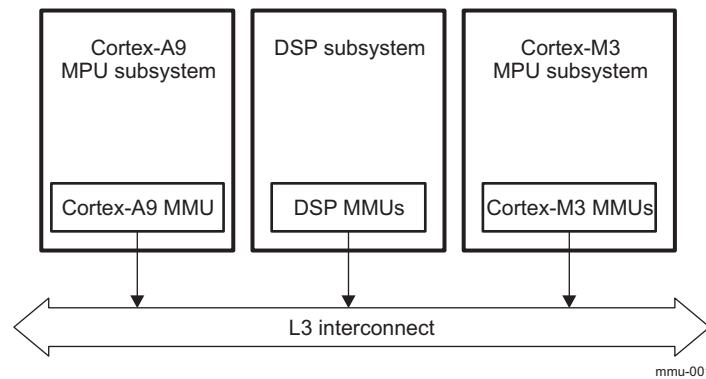

A memory management unit (MMU) is a hardware component responsible for handling accesses to memory requested by a processing unit. MMU functions include translation of virtual addresses to physical addresses (that is, virtual memory management) and cache control.

The device contains the following MMUs:

- In DSP - L1 Shared cache MMU and attribute MMU.
- In Dual Cortex-M3 MPU Subsystem - L1 Shared cache MMU and L2 MMU
- Cortex-A9 MMU

Figure 20-1 shows the MMU instances in the device.

**Figure 20-1. Device MMU Instances**

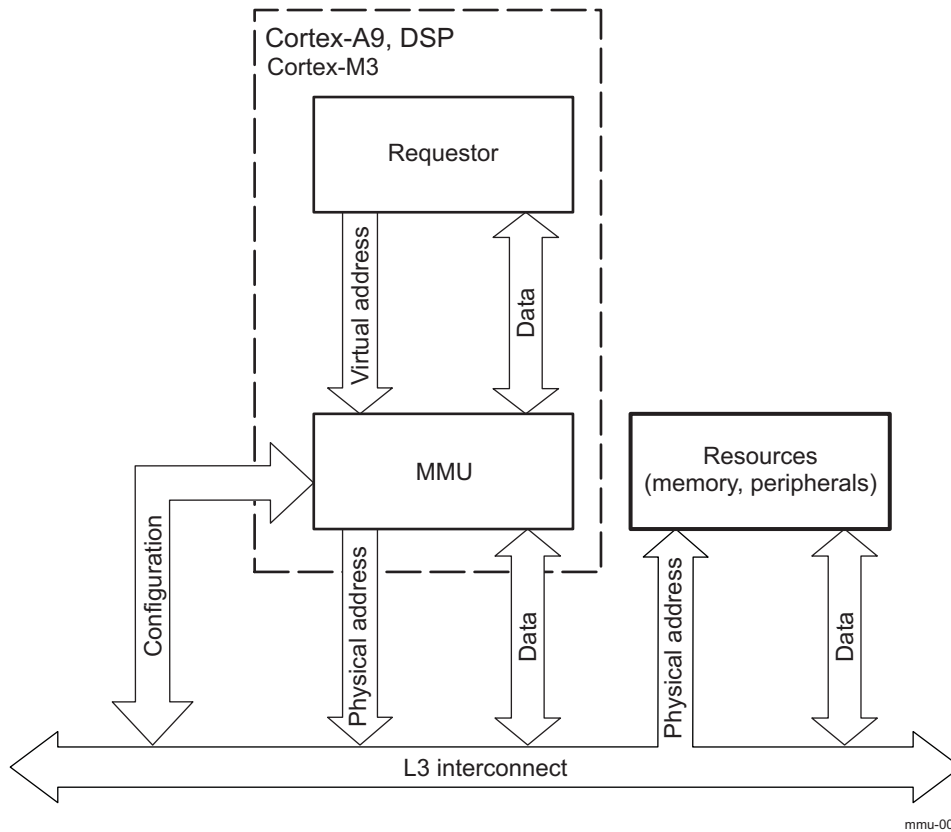

## 20.2 MMU Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

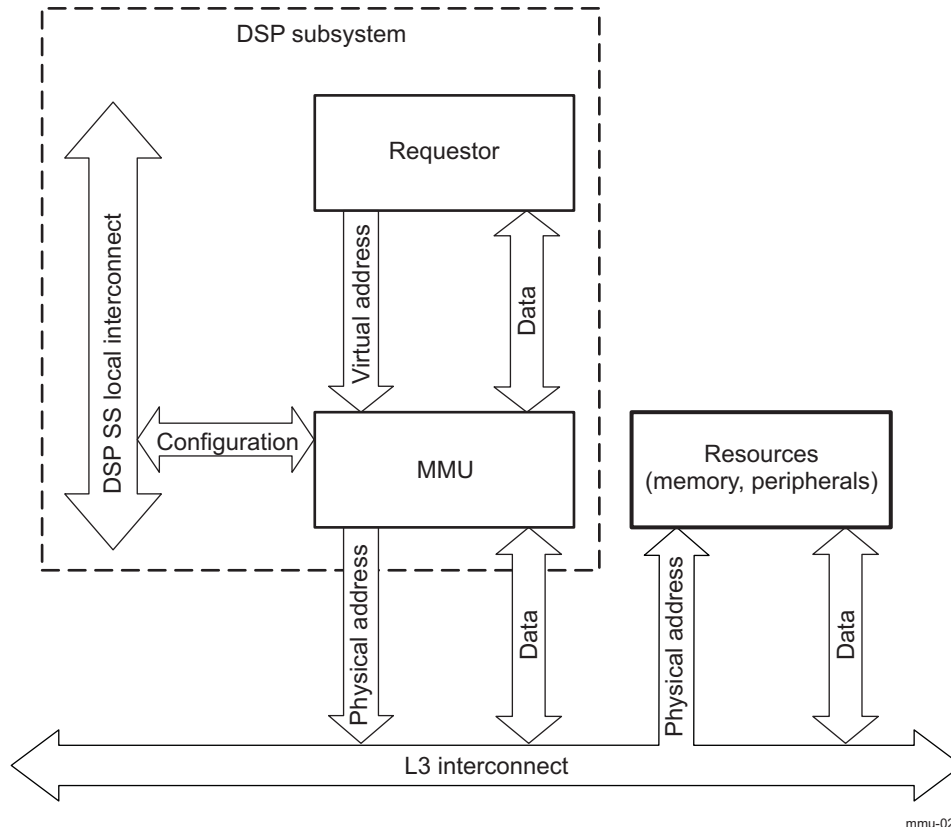

The MMU communicates accesses from the requestor (DSP, Cortex-M3 microprocessor unit (MPU), or Cortex-A9 MPU) to the L3 main interconnect, performing virtual to physical address translation. Although all MMUs are programmed (configured) through the L3 interconnect, the DSP MMU can be programmed both through the L3 interconnect or through the DSP local interconnect. DSP MMU and Cortex-M3 MMU error conditions are signaled as interrupts to the system main processor Cortex-A9 MPU.

Figure 20-2 shows typical MMU integration.

**Figure 20-2. MMU Integration**

**NOTE:** All MMUs are programmed through the L3 interconnect.

**Figure 20-3. DSP MMU Integration**

**NOTE:** The DSP MMU can be programmed from both the DSP local interconnect and from the L3 interconnect.

Table 20-1 through Table 20-3 summarize the MMU integration in the various modules of the device.

**Table 20-1. Integration Attributes**

Module Instance	Power Domain
CORTEXM3_L2MMU and CORTEXM3_SCACHE_MMU	PD_CORE
CORTEXA9_MMU	PD_MPU

**Table 20-2. Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
CORTEXA9_MMU	ARM_FCLK	MPU_DPLL_CLK	MPU DPLL	Internal clock in the Cortex-A9 MPU subsystem; supplies the MMU in Cortex-A9.
CORTEXM3_L2MMU and CORTEXM3_SCACHE_MMU	MPU_M3_CLK	MPU_M3_CLK	PRCM	External clock from the power, reset, and clock management (PRCM) module; supplies the shared cache MMU and L2 MMU in Cortex-M3.
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
CORTEXM3_L2MMU	CORTEXM3_PWRON_RST	CORTEXM3_PWRON_RST	PRCM	Power-on reset signal for the Cortex-M3 MPU subsystem
	CORTEXM3_RST3	CORTEXM3_RST3	PRCM	Reset signal to the L2 MMU

**Table 20-2. Clocks and Resets (continued)**

CORTEXM3_SCACHE_MMU	CORTEXM3_RST3	CORTEXM3_RST3	PRCM	Reset signal for the shared cache MMU
	CORTEXM3_RET_RST	CORTEXM3_RET_RST	PRCM	Retention reset signal for the Cortex-M3 MPU subsystem
CORTEXA9_MMU	MPU_PWRON_RST	MPU_PWRON_RST	PRCM	Power-on reset signal to the MMU and the rest of the Cortex-A9 MPU subsystem
	MPU_RST	MPU_RST	PRCM	Reset signal to the MMU and the rest of the Cortex-A9 MPU subsystem

**Table 20-3. Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
CORTEXM3_L2MMU	CORTEXM3_MMU_IRQ	MA_IRQ_100	MPU_INT_C	Cortex-M3 MPU L2MMU interrupt to the main MPU subsystem
	XLATE_MMU_FAULT	MM_IRQ_0	CortexM3_INT_C	Internal interrupt from the L2MMU to the Cortex-M3 interrupt controller (INTC)
CORTEXM3_SCACHE_MMU	SHARED_CACHE_MMU_C PU_INT	MM_IRQ_1	CortexM3_INT_C	Internal interrupt from the shared cache MMU to the CortexM3 INTC

**NOTE:**

- For a description of the interrupt source, see [Section 20.3.5, Interrupt Requests](#).

There are 5 MMU modules in the device:

- Shared cache MMU – there are two Share cache MMUs, one in the Cortex-M3 MPU and other in DSP subsystem. Refer to the corresponding chapters for more information.
- L2 MMUs – there are two L2 MMUs, one in the Cortex-M3 MPU and other in DSP subsystem. The L2 MMUs are directly operating with the L3 interconnect (shared device memory space). These L2 MMUs are described in this chapter.
- Cortex-A9 MMU – this MMU is located in the ARM Cortex-A9 processor. For information about this MMU, see the *ARM® Cortex™-A9 MPCore Technical Reference Manual* (available at [infocenter.arm.com/help/index.jsp](http://infocenter.arm.com/help/index.jsp)).

**NOTE:** There is PAT module in the Dynamic Memory Manager, which has similar to the MMU functionality. Refer to the DMM chapter, for more information.

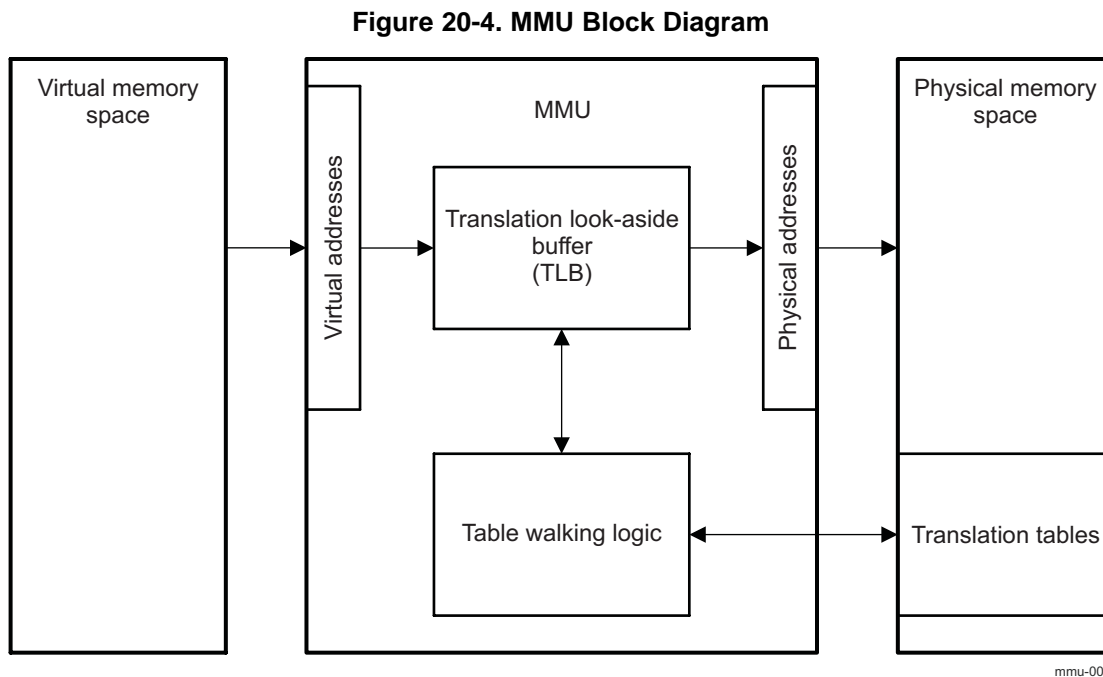

## 20.3 MMU Functional Description

### 20.3.1 MMU Block Diagram

The MMU manages the virtual to physical address translation for external addresses, as well as endianness conversion. The MMU can be programmed through the L3 interconnect. MMU programming is expected to be accomplished by the Cortex-A9 MPU, except for the DSP MMU, of which the configuration can be accomplished through the DSP local interconnect.

Figure 20-4 is the MMU block diagram.

Each table entry describes the translation of one contiguous memory region. For a description of the structure of these tables, see [Section 20.3.1.2, Translation Tables](#).

Two major functional units exist in the MMU to provide address translation automatically based on the table entries:

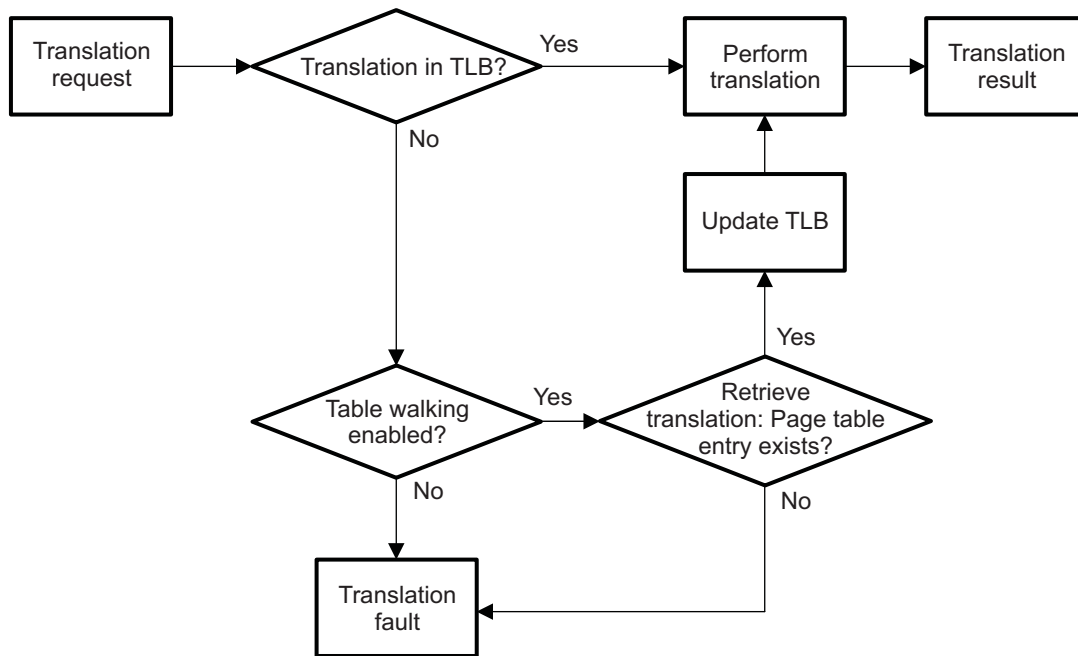

- The table walker automatically retrieves the correct translation table entry for a requested translation. If two-level translation is used (for the translation of small memory pages), the table walker also automatically reads the required second-level translation table entry. The two-level translation is described later in the chapter.
- The translation look-aside buffer (TLB) stores recently used translation entries, acting like a cache of the translation table.

#### 20.3.1.1 MMU Address Translation Process

Whenever an address translation is requested (that is, for every access with the MMU enabled), the MMU first checks whether the translation is contained in the TLB, which acts like a cache storing recent translations. The TLB can also be programmed manually to ensure that time-critical data can be translated without delay.

If the requested translation is not in the TLB, the table-walking logic retrieves this translation from the translation table(s), and then updates the TLB. The address translation is then performed. [Figure 20-5](#) summarizes the process.

Figure 20-5. Translation Process

mmu-007

### 20.3.1.2 Translation Tables

The translation of virtual to physical addresses is based on entries in translation tables that define the following properties:

- Address translation, that is, the correspondence between virtual and physical addresses
- Size of the memory region the entry translates
- Endianness, data access size, and the mixed property of this memory region

The virtual addresses index the translation tables. Each virtual address corresponds to exactly one entry in the translation table.

#### 20.3.1.2.1 Translation Table Hierarchy

When developing a table-based address translation scheme, one of the most important design parameters is the memory page size described by each translation table entry. MMU instances support 4KB and 64KB pages, a 1MB section, and a 16MB supersection. Using bigger page sizes means a smaller translation table.

Using a smaller page size greatly increases the efficiency of dynamic memory allocation and defragmentation. That is why many operating systems (OSs) can operate on memory blocks as small as 4KB; however, the smaller size implies a more complex table structure.

A quick calculation shows that using 4KB memory pages with one translation table would require one million entries to span the entire 4GB address range. The table itself would be 32MB, a size that is not feasible.

However, using bigger pages greatly reduces the functionality of the OS memory management. Implementing a two-level hierarchy reconciles these two requirements. Within this hierarchy, one first-level translation table describes the translation properties based on 1MB memory regions.

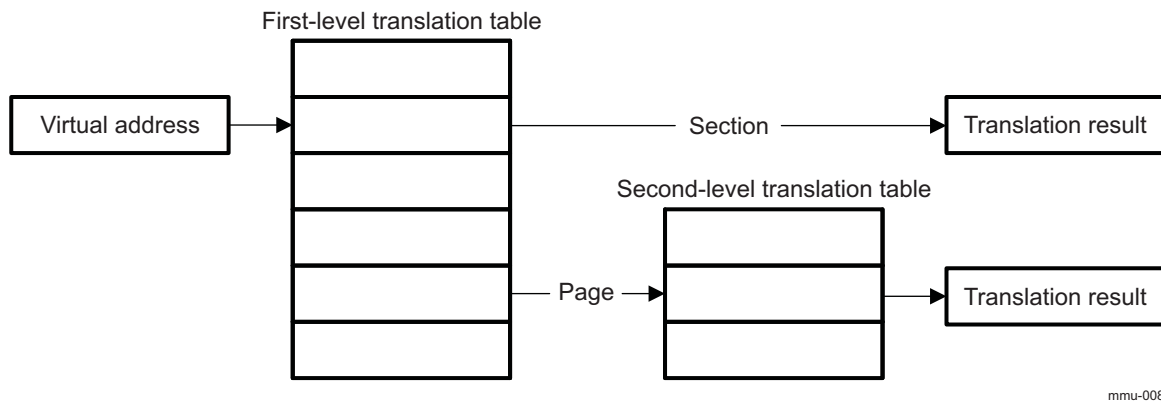

Each of the entries in this first-level translation table can specify the following:

- The translation properties for a big memory section. This memory section can be either 1MB (section) or 16MB (supersection). In this case, all translation parameters are specified in the first-level translation table entry.

- A pointer to a second-level translation table that specifies individual translation properties based on smaller pages within the 1MB page of memory. These pages can be either 64KB (large page) or 4KB (small page). In this case, the actual translation parameters are specified in the second-level translation table entry. The first-level translation table entry specifies only the base address of the second-level translation table.

This hierarchical approach means that additional translation information for smaller pages must be provided only when the pages are actually used. [Figure 20-6](#) shows the hierarchy.

**Figure 20-6. Translation Hierarchy**

The structure of the first and second-level translation tables and their entries are described in more detail in [Section 20.3.1.2.2](#), *First-Level Translation Table*, and [Section 20.3.1.2.3](#), *Two-Level Translation*.

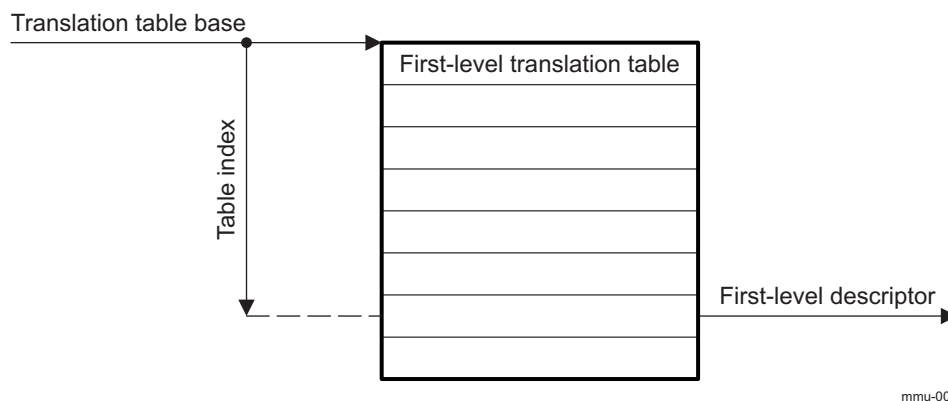

### 20.3.1.2.2 First-Level Translation Table

The first-level translation table describes the translation properties for 1MB sections. To describe a 4GB address range requires 4096 32-bit entries (so-called first-level descriptors).

The first-level translation table start address must be aligned on a multiple of the table size with a 128-byte minimum. Consequently, an alignment of at least 16K bytes is required for a complete 4096-entry table; that is, at least the last fourteen address bits must be zero.

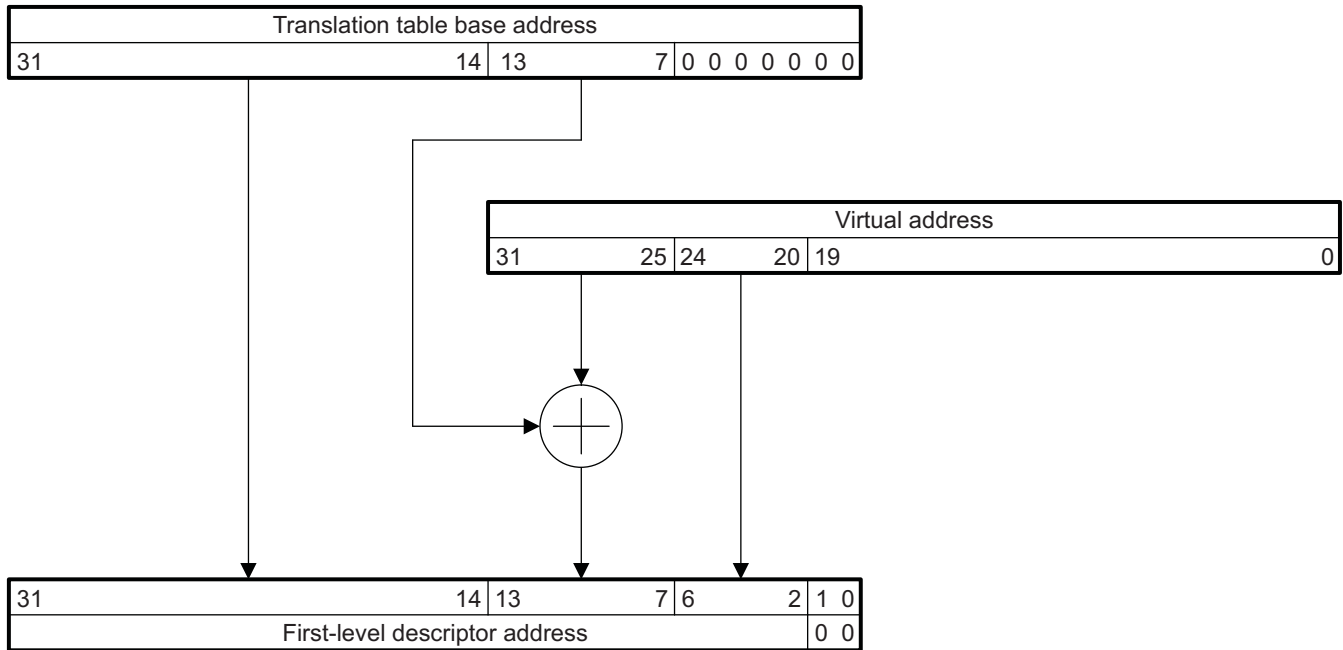

The start address of the first-level translation table is specified by the so-called translation table base. The table is indexed by the upper 12-bits of the virtual address. [Figure 20-7](#) shows this mechanism.

**Figure 20-7. First-level Descriptor Address Calculation**

To summarize, the translation table base and the translation table index together define the first-level descriptor address. [Figure 20-8](#) outlines the precise mechanism used to calculate this address.

Figure 20-8. Detailed First-Level Descriptor Address Calculation

mmu-010

As an example of this mechanism, consider a translation table base address of 0x8000:0000 and a virtual address of 0x1234:5678. In this case, the first-level descriptor address is  $0x8000:0000 + (0x1234 \ll 2) = 0x8000:048C$ .

20.3.1.2.2.1 First-Level Descriptor Format

Each first-level descriptor provides either the complete address translation for 1MB or 16MB sections or provides a pointer to a second-level translation table for 4KB or 64KB pages. Table 20-4 shows the first-level descriptor format.

Table 20-4. First-Level Descriptor Format

First-Level Descriptor Format												
31:24	23:20	19	18	17	16	15	14:12	11:10	9:2	1	0	
X										0	0	Fault
Second-Level Translation Table Base Address									X	0	1	Page
Section Base Address		X	0	M	X	E <sup>(1)</sup>	X	ES	X	1	0	Section
Supersection Base Address		X	1	M	X	E	X	ES	X	1	0	Supersection
X										1	1	Fault

<sup>(1)</sup> See for endianness limitations.

- M = Mixed region: 0 = Page-based endianness, 1 = Access-based endianness
- E = Endianness: 0 = Little endian, 1 = Big endian (endianness is locked on little endian)
- ES = Element Size: 00 = 8-bit, 01 = 16-bit, 10 = 32-bit, 11 = No endianness conversion
- X = Don't care

20.3.1.2.2.2 First-Level Page Descriptor Format

If a translation granularity smaller than 1MB is required, a two-level translation process is used. In this case, the first-level block descriptor specifies only the start address of a second-level translation table. The second-level translation table entries specify the actual translation properties.

### 20.3.1.2.2.3 First-Level Section Descriptor Format

Each section descriptor in the first-level translation table specifies the complete translation properties for a 1MB section or a 16MB supersection.

**NOTE:** Supersection descriptors must be repeated 16 times, because each descriptor in the first-level translation table describes 1MB of memory. If an access points to a descriptor that is not initialized, the MMU will behave in an unpredictable way.

In addition to the address translation itself, three parameters are specified in the section descriptors:

- Endianness

The *endianness* parameter specifies whether the memory section uses a big- or little-endian data format. This parameter is locked to little endian. See for more information.

- Element size

The *element size* parameter can optionally specify the data access size (8, 16, or 32 bits) for all data items in the defined section.

- Mixed region

The *mixed region* parameter specifies whether the information about the data access size is detected from the access itself (access-based detection) or if the specified element size parameter is used (page-based detection). For example, the specified element size parameter can be used when several smaller sized accesses are packed into a bigger sized access, such as two 16-bit accesses packed into one 32-bit access. In this case, with no specified data access size, 32 bits would be the access size detected, leading to an incorrect result. To avoid this problem, specify the data access size for the memory section.

### 20.3.1.2.2.4 Section Translation Summary

Sections and supersections can be translated based solely on the information in the first-level translation table. [Figure 20-9](#) summarizes the address translation process for a section.

**Figure 20-9. Section Translation Summary**

mmu-011

**20.3.1.2.2.5 Supersection Translation Summary**

The translation of a supersection is similar to the translation of a section. The difference is that for a supersection only bits 31 to 24 index into the first-level translation table. The last four bits of the table index are implicitly assumed to be zero as there are 16 identical consecutive entries for a supersection.

Figure 20-10 shows the translation mechanism for a supersection.

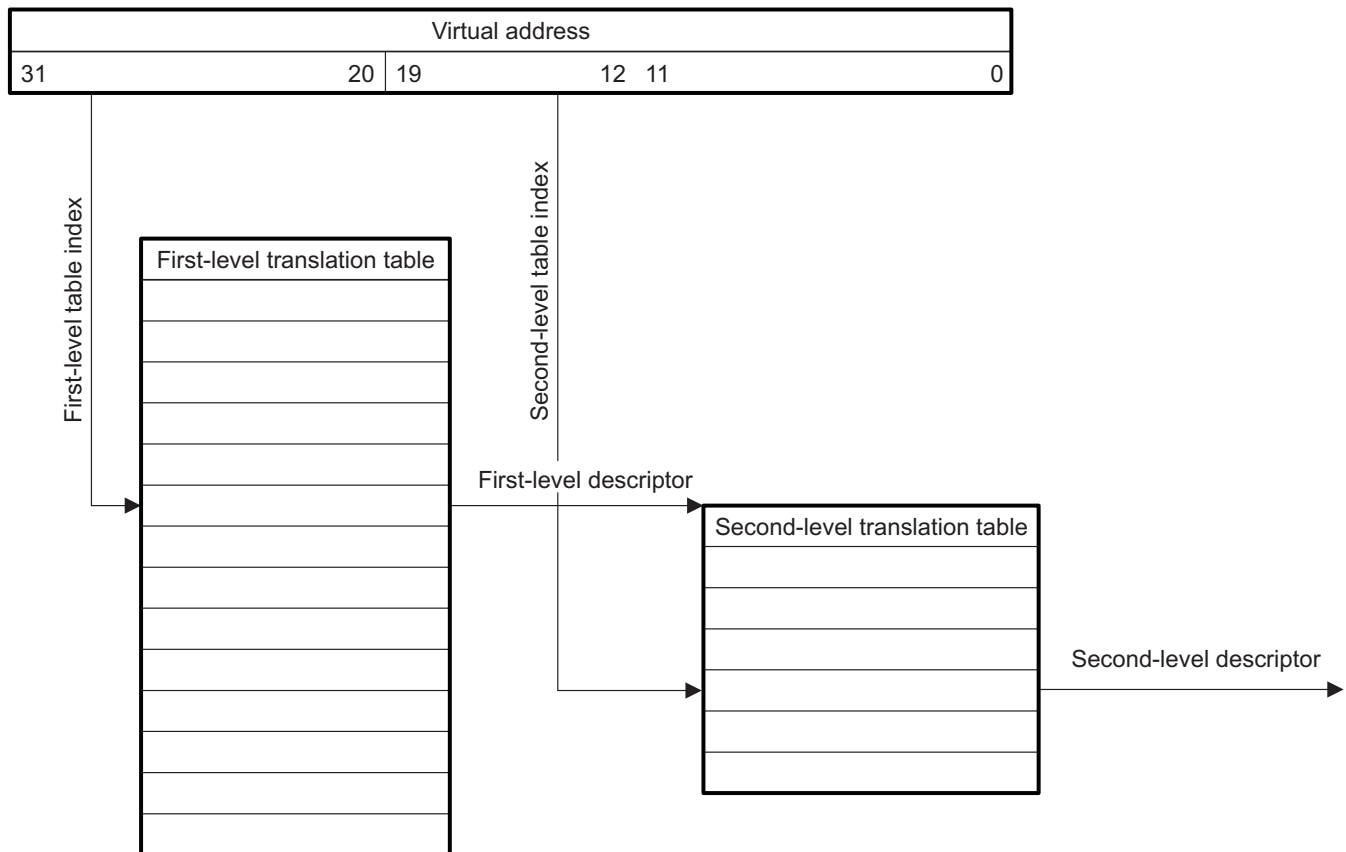

**Figure 20-10. Supersection Translation Summary**

mmu-012

**20.3.1.2.3 Two-Level Translation**

Two-level translation is used when fine-grain granularity is required, that is, when memory sections smaller than 1MB are needed. In this case, the first-level descriptor provides a pointer to the base address of a second-level translation table. This second-level table is indexed by bits 19 to 12 of the virtual address. Figure 20-11 shows this indexing mechanism.

**Figure 20-11. Two-Level Translation**

mmu-013

Each second-level translation table describes the translation of 1MB of address space in pages of 64KB (large page) or 4KB (small page). It consists of 256 second-level descriptors describing 4KB each.

**NOTE:** In the case of a large page, the same descriptor must be repeated 16 times. If an access points to a descriptor that is not initialized, the MMU will behave in an unpredictable way.

### 20.3.1.2.3.1 Second-Level Descriptor Format

Similar to first-level section descriptors, second-level descriptors provide all of the necessary information for the translation of a large or small page. Table 20-5 shows the format of second-level descriptors. The translation parameters (endianness, element size, and mixed region) have the same meaning as those for sections.

**Table 20-5. Second-Level Descriptor Format**

Second-Level Descriptor Format											
31:16	15:12	11	10	9	8:6	5:4	3:2	1	0		
X									0	0	Fault
Large Page Base Address	X	M	X	E <sup>(1)</sup>	X	ES	X	0	1	Large Page	
Small Page Base Address		M	X	E	X	ES	X	1	X	Small Page	

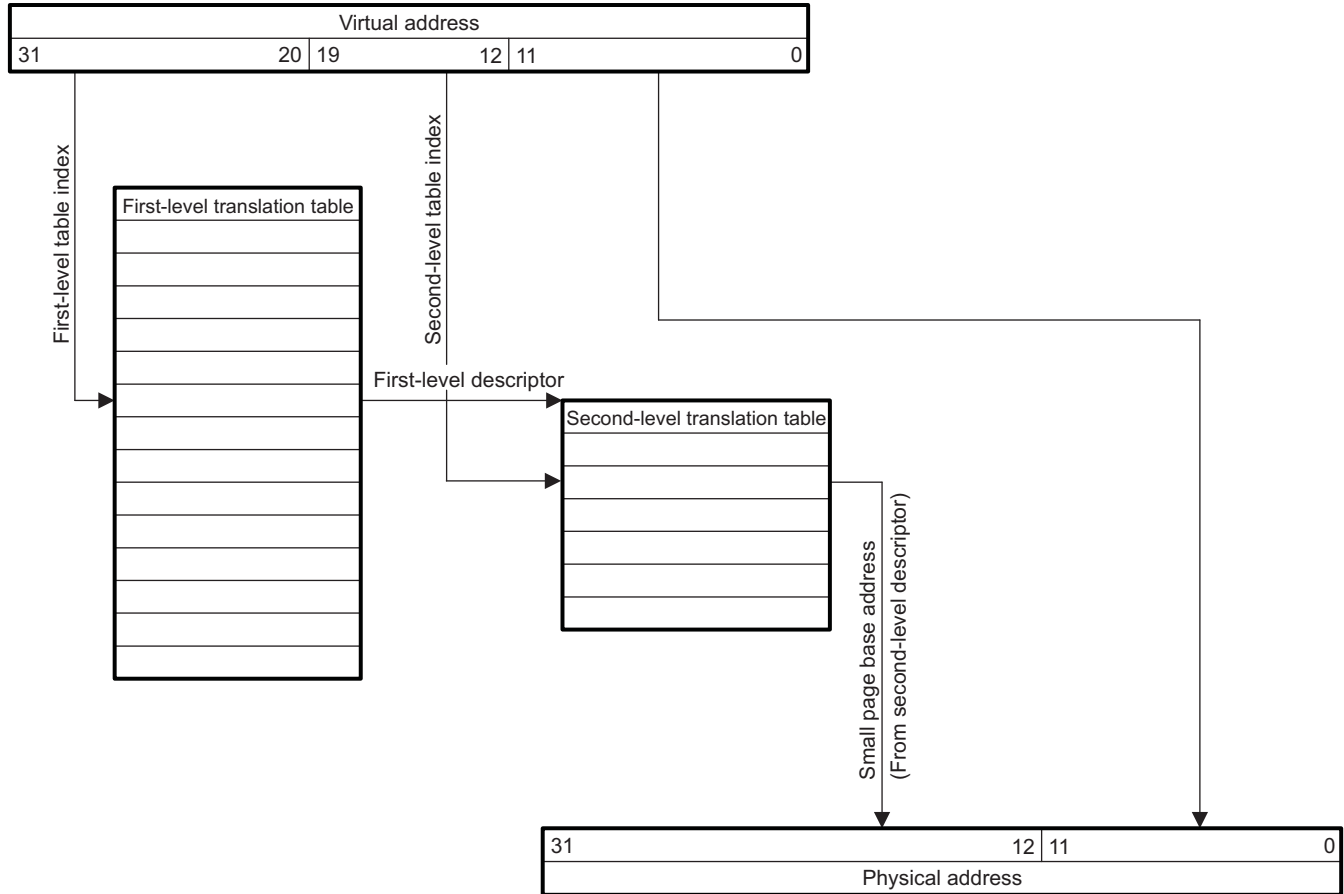

<sup>(1)</sup> See for endianness limitations.

M = Mixed region: 0 = Page-based endianness, 1 = Access-based endianness  
 E = Endianness: 0 = Little-endian, 1 = Big-endian (endianness is locked on little endian)  
 ES = Element Size: 00 = 8-bit, 01 = 16-bit, 10 = 32-bit, 11 = No endianness conversion  
 X = Don't care

**20.3.1.2.3.2 Small Page Translation Summary**

Figure 20-12 summarizes the translation process for small pages.

**Figure 20-12. Small Page Translation Summary**

mmu-014

**20.3.1.2.3.3 Large Page Translation Summary**

The translation of a large page is similar to the translation of a small page. The difference is that, for a large page, only bits 19 to 16 index into the second-level translation table. The last four bits of the table index are implicitly assumed to be zero as there are 16 identical consecutive entries for a large page. This is shown in Figure 20-13.

**Figure 20-13. Large Page Translation Summary**

mmu-015

### 20.3.1.3 Translation Lookaside Buffer

Translating virtual addresses to physical addresses is required for each memory access in systems using an MMU. To accelerate this translation process, a cache, or TLB, holds the result of recent translations.

For every translation, the MMU internal logic first checks whether the requested translation is already cached in the TLB. If the translation is cached, this translation is used; otherwise the translation is retrieved from the translation tables and the TLB is updated. If the TLB is full, one of its entries must be replaced. This entry is selected on a random basis.

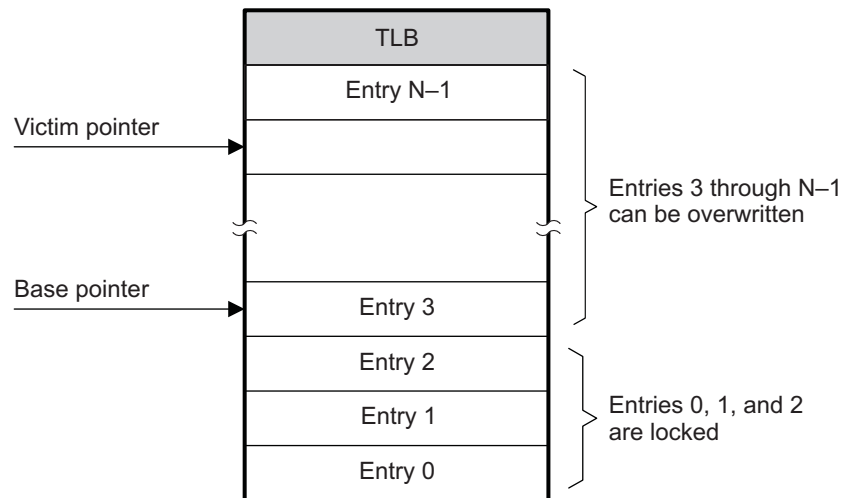

The first  $n$  TLB entries, where  $n < Total\ Number\ N\ of\ TLB\ Entries$ , can be protected (locked) against being overwritten by setting the TLB base pointer to  $n$ . When this mechanism is used, only unprotected entries can be overwritten. The victim pointer indicates the next TLB entry to be written. Figure 20-14 shows an example of the TLB with  $N$  TLB entries (ranging from 0 to  $N-1$ ). The base pointer contains the value "3" protecting Entry 0, Entry 1, and Entry 2 and the victim pointer points to the next TLB entry to be updated.

---

**NOTE:** The last TLB entry (Entry  $N-1$ ) always remains unprotected.

---

Figure 20-14. TLB Entry Lock Mechanism

mmu-016

The table walking logic automatically writes the TLB entries. The entries can also be manually written, which is done typically to ensure that the translation of time-critical data accesses is already present in the TLB so that they execute as fast as possible. The entries must be locked to prevent them from being overwritten.

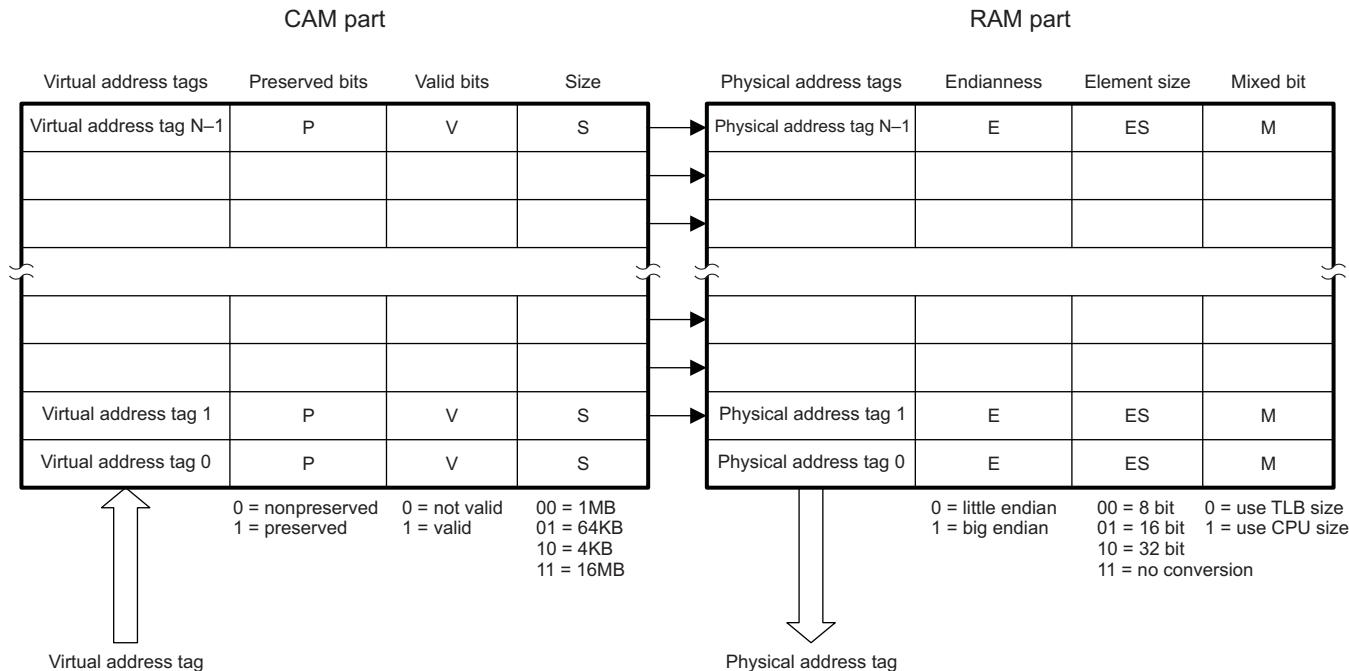

### 20.3.1.3.1 TLB Entry Format

TLB entries consist of two parts:

- The CAM part contains the virtual address tag used to determine if a virtual address translation is in the TLB. The TLB acts like a fully associative cache addressed by the virtual address tag. The CAM part also contains the section/page size, as well as the preserved and the valid parameters. See the [MMU\\_CAM](#) register table for more details.
- The RAM part contains the address translation that belongs to the virtual address tag as well as the endianness, element size, and mixed parameters described in [Section 20.3.1.2.2, First-Level Translation Table](#). See the [MMU\\_RAM](#) register table for more details.

The valid parameter specifies whether an entry is valid or not. The preserved parameter determines the behavior of an entry in the event of a TLB flush. If an entry is set as preserved, it is not deleted when a TLB is flushed, that is, when [MMU\\_GFLUSH\[0\] GLOBALFLUSH](#) is set to 1. Preserved entries must be deleted manually. [Section 20.3.1.2.2](#) describes the procedure to delete TLB entries.

[Figure 20-16](#) shows the TLB entry structure.

**Figure 20-15. TLB Entry Structure**

mmu-017

### 20.3.2 MMU Clock Configuration

There are two clock domains: The functional clock domain for the MMU, which is synchronous to the clock for the interconnect slave and master access ports; and the clock domain for the interconnect slave configuration port. As these clocks are matched, there is a single input clock with enables for each of the clock domains. If a clock domain should run at the same frequency as the input clock, that enable can be tied high.

Two clock enable signals exist, one to enable the interconnect data master and slave ports, and the other to enable the clock on the configuration L3 interconnect port. The clock signals are configured through the [MMU\\_SYSCONFIG](#) register. This is a system configuration register that controls the various parameters of the L3 interface.

### 20.3.3 MMU Software Reset

This section describes the software reset feature of the module. The MMU instances are reset together with their respective reset domains. See [Table 20-2](#) for information about the reset domains of the different MMU instances.

To perform a software reset, write 1 in the [MMU\\_SYSCONFIG\[1\]](#) SOFTRESET bit. The [MMU\\_SYSSTATUS\[0\]](#) RESETDONE bit indicates that the software reset is complete when its value is 1. When the software reset completes, the [MMU\\_SYSCONFIG\[1\]](#) SOFTRESET bit is automatically reset. The software must ensure that the software reset completes before doing MMU operations. When an MMU instance is released from reset, its TLB is empty and the MMU is disabled.

### 20.3.4 MMU Power Management

As part of the device system-wide power management scheme, each MMU instance supports a communication protocol with the PRCM module that allows the PRCM module to request an MMU instance to enter a low-power state. When the MMU instance acknowledges a low-power mode request from the PRCM module, the clock to the instance is gated off at the PRCM clock generator. Because the clock is disabled at the source, the low-power mode offers lower power consumption than the internal clock gating method in the local power management.

[Table 20-6](#) describes the power-management features available for the MMU modules.

**NOTE:**

- For information about source clock gating and sleep/wake-up transitions description, see [Section 3.1.1.1, Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).
- For descriptions of EnaWakeUp, IdleMode, ClockActivity, and StandbyMode features, see [Section 3.1.1.1.2, Module Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

**Table 20-6. MMU Local Power Management Features**

Feature	Register
Idle modes	MMU_SYSCONFIG[4:3] IDLEMODE
Clock activity	MMU_SYSCONFIG[9:8] CLOCKACTIVITY
Clock autogating	MMU_SYSCONFIG[0] AUTOIDLE

**NOTE:** The MMU\_SYSCONFIG[9:8] CLOCKACTIVITY bits are read only.

### 20.3.5 MMU Interrupt Requests

Table 20-7 lists the event flags and their masks that can cause module interrupts.

**Table 20-7. Events**

Event Flag	Event Mask	Synchrono us	Sensitivit y	Map to	Description
MMU_IRQSTATUS[4] MULTIHITFAULT	MMU_IRQENABLE[4] MULTIHITFAULT	Yes	Level	M3_IRQ_0	Error in the L2 MMU due to multiple matches in the TLB
MMU_IRQSTATUS[3] TABLEWALKFAULT	MMU_IRQENABLE[3] TABLEWALKFAULT	Yes	Level	M3_IRQ_0	Error in the L2 MMU due to error response received during a Table Walk
MMU_IRQSTATUS[2] EMUMISS	MMU_IRQENABLE[2] EMUMISS				For more information about emulation and debug features, see <a href="#">Chapter 28, On-Chip Debug Support</a> .
MMU_IRQSTATUS[1] TRANSLATIONFAULT	MMU_IRQENABLE[1] TRANSLATIONFAULT	Yes	Level	M3_IRQ_0	Error in the L2 MMU due to invalid descriptor in the translation tables (translation fault)
MMU_IRQSTATUS[0] TLBMISS	MMU_IRQENABLE[0] TLBMISS	Yes	Level	M3_IRQ_0	Error in L2 MMU due to unrecoverable TLB miss (hardware TWL disabled)

### 20.3.6 MMU Error Handling

Table 20-8 summarizes the intended operation for real and potential error conditions.

**Table 20-8. Error Handling**

Item	Condition	Action
1	Table-walk read has an error response.	Treat generally the same as a translation fault, but set the TableWalkFault interrupt status bit to aid in diagnosis
2	MMU is disabled during table-walk.	Not permitted; can result in loss of the current transaction but must not deadlock the MMU.  Avoid this condition by first disabling the table-walk logic and then polling the TWLRunning bit to ensure that no table walk is pending
3	MMU is disabled during an address translation.	Not permitted; can result in access to an unintended location, but must not deadlock MMU.  This condition should be avoided by ensuring that no accesses are pending.

**Table 20-8. Error Handling (continued)**

Item	Condition	Action
4	TLB is accessed during an address translation or a table walk.	Reading permitted; write should be done with care to ensure that the TLB is self-consistent at all times that a translation can occur.
5	TLB is flushed during address translation or a table walk.	Permitted; the flush is processed first, followed by the TWL update.
6	MMU is disabled while an interrupt is pending.	Not permitted; all pending interrupts should be processed before disabling the MMU.

L3 Interconnect configuration port: Accesses to undecoded register addresses must not give an error response.

To protect against changes to the address translation between a READEX and the corresponding write or during a burst the following configuration operations are protected against writes during these processes:

- TLB update
- Global flush
- Flush entry
- MMU disable

The protection is implemented by stalling the configuration interconnect transaction until the write can proceed safely.

## 20.4 MMU Low-level Programming Models

This section covers the low-level hardware programming sequences for configuration and usage of the module.

### 20.4.1 Global Initialization

#### 20.4.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the MMU module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the MMU. For more information, see Section [Section 20.2, MMU Module Integration](#).

**Table 20-9. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	Module interface and functional clocks must be enabled. For more information, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
(optional) MPU INTC or DSP INTC or Cortex-M3 INTC	MPU, DSP, and Cortex-M3 interrupt controller configuration must be done to enable the interrupts from module.
Interconnect	For more information about the L3 interconnect configuration, see <a href="#">Section 13.2, L3 Interconnect</a> .

---

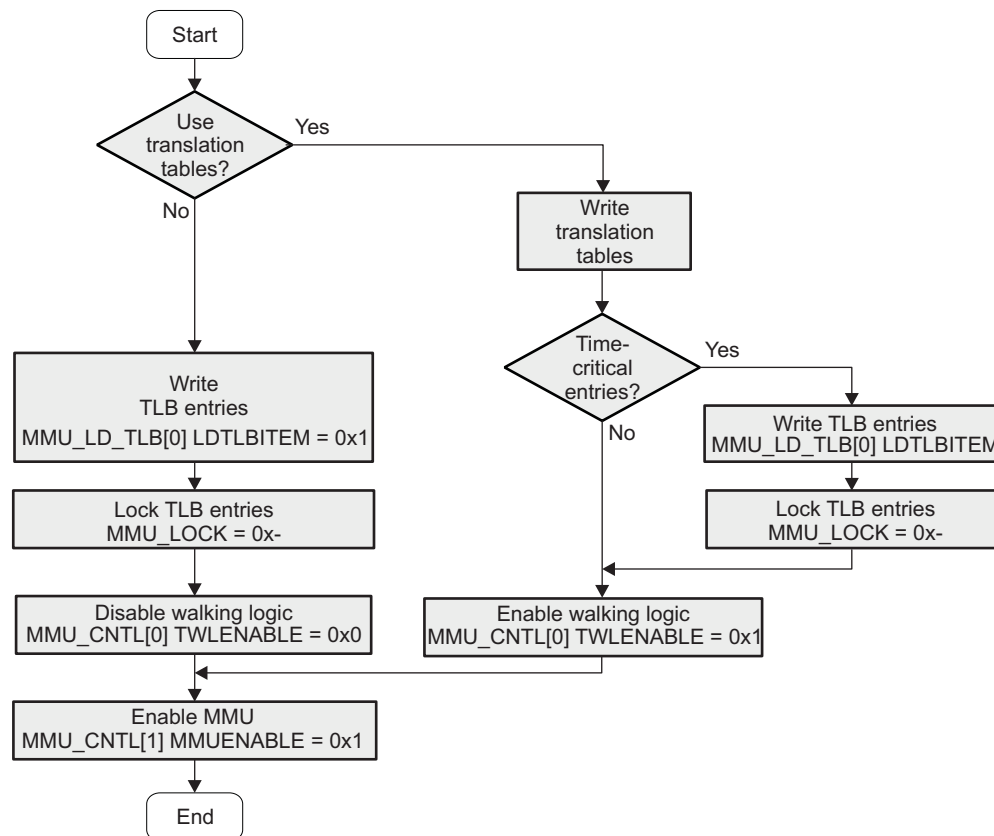

**NOTE:** If the interrupt-based communication mode is used, the MPU, DSP, and Cortex-M3 interrupt controllers configurations are required.

---

#### 20.4.1.2 MMU Global Initialization

##### 20.4.1.2.1 Main Sequence—MMU Global Initialization

[Figure 20-16](#) shows the procedure to initialize the MMU after a power-on or software reset.

**Figure 20-16. MMU Global Initialization**

mmu-018

**Table 20-10. Register Call Summary for Main Sequence—MMU Global Initialization**

Register Name	Register Name	Register Name
<a href="#">MMU_LD_TLB</a>	<a href="#">MMU_LOCK</a>	<a href="#">MMU_CNTL</a>

### 20.4.1.2.2 Subsequence—Configure a TLB entry

**Table 20-11. Configure a TLB Entry**

Step	Register / Bit Field / Programming Model	Value
Load the Virtual Address Tag	<a href="#">MMU_CAM</a> [31:12] VATAG	0x-
Protect the TLB entry against flush	<a href="#">MMU_CAM</a> [3] P	0x1
Validate the TLB entry	<a href="#">MMU_CAM</a> [2] V	0x1
Define the page size	<a href="#">MMU_CAM</a> [1:0] PAGESIZE	0x-

### 20.4.1.3 Operational Modes Configuration

#### 20.4.1.3.1 Main Sequence—Writing TLB Entries Statically

Writing TLB entries statically avoids the need to write translation tables in memory and is commonly used for relatively small address spaces. This method ensures that the translation of time-critical data accesses execute as fast as possible with entries already present in the TLB. These entries must be locked to prevent them from being overwritten.

**Table 20-12. MMU Writing TLB Entries Statically**

Step	Register/ Bit Field / Programming Model	Value
Execute software reset	MMU_SYSCONFIG[1] SOFTRESET	0x1
Wait for reset to complete	MMU_SYSSTATUS[0] RESETDONE	=0x1
Enable power saving via automatic interface clock gating	MMU_SYSCONFIG[0] AUTOIDLE	0x1
Configure TLB entries	See <a href="#">Table 20-11</a>	
Load the physical Address of the page	MMU_RAM[31:12] PHYSICALADDRESS	0x-
Define the endianness of the page (little endian or big endian)	MMU_RAM[9] ENDIANNES	0x-
Select the element size	MMU_RAM[8:7] ELEMENTSIZE	0x-
Define mixed page attribute	MMU_RAM[6] MIXED	0x-
Specify the TLB entry you want to write	MMU_LOCK[8:4] CURRENTVICTIM	0x-
Load the specified entry in the TLB	MMU_LD_TLB[0] LDTLBITEM	0x1
Enable multihit fault and TLB miss	MMU_IRQENABLE[4] MULTIHITFAULT	0x1
	MMU_IRQENABLE[0] TLBMISS	0x1
Enable memory translations	MMU_CNTL[1] MMUENABLE	0x1

#### 20.4.1.3.2 Main Sequence—Protecting TLB Entries

The first  $n$  TLB entries (with  $n <$  total number of TLB entries) can be protected from being overwritten with new translations. This is useful to ensure that certain commonly used or time-critical translations are always in the TLB and do not require retrieval using the table walking process.

**Table 20-13. Protecting TLB Entries**

Step	Register/Bit Field/Programming Model	Value
Locks the TLB entries	MMU_LOCK[14:10] BASEVALUE	0x-

#### 20.4.1.3.3 Main Sequence—Deleting TLB Entries

Two mechanisms exist to delete TLB entries. All unpreserved TLB entries, that is, TLB entries written with the preserved bit set to zero, can be deleted by invoking a TLB flush. The preserved bit should only be used on protected TLB entries, as it does not prevent replacement by the table walking logic.

**Table 20-14. Deleting TLB Entries**

Step	Register / Bit Field / Programming Model	Value
Flush all nonprotected TLB entries	MMU_GFLUSH[0] GLOBALFLUSH	0x1
Flush all TLB entries specified by the CAM register	MMU_FLUSH_ENTRY[0] FLUSHENTRY	0x1

#### 20.4.1.3.4 Main Sequence—Read TLB Entries

TLB entries can be read by the programmer to determine the TLB content at runtime.

**Table 20-15. Read TLB Entries**

Step	Register / Bit Field / Programming Model	Value
Set the current victim pointer	MMU_LOCK[8:4] CURRENTVICTIM	0x-
Read RAM parts of the TLB entry	MMU_READ_RAM	
Read CAM parts of the TLB entry	MMU_READ_CAM	

## 20.5 MMU Register Manual

### 20.5.1 MMU Instance Summary

<b>21.3 Spinlock Functional Description</b> .....	<b>4474</b>
<b>21.4 Spinlock Programming Guide</b> .....	<b>4477</b>
<b>21.5 Spinlock Register Manual</b> .....	<b>4480</b>

## 21.1 Spinlock Overview

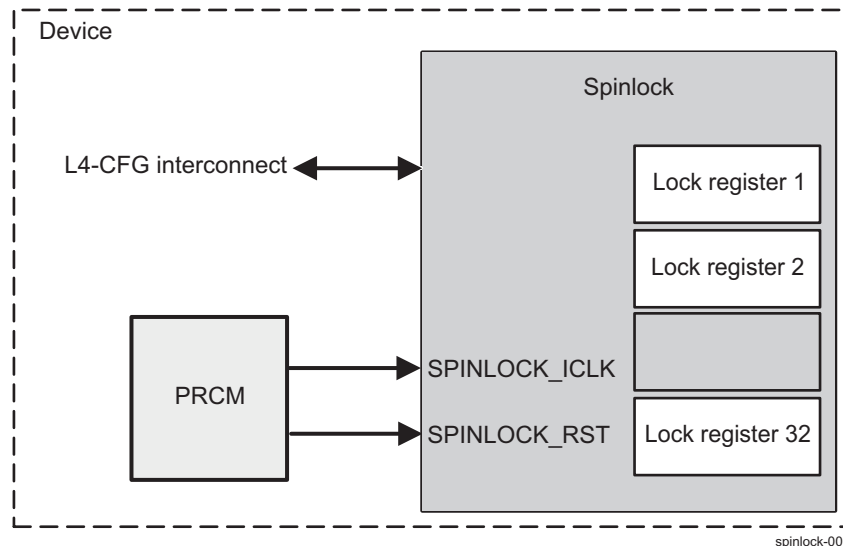

The Spinlock module provides hardware assistance for synchronizing the processes running on multiple processors in the device:

- Cortex-A9 microprocessor unit (MPU) subsystem
- Digital signal processor (DSP) subsystem
- Cortex-M3 MPU subsystem

The Spinlock module implements 32 spinlocks (or hardware semaphores), which provide an efficient way to perform a lock operation of a device resource using a single read-access, avoiding the need of a read-modify-write bus transfer that the programmable cores are not capable of.

Figure 21-1 shows the Spinlock module.

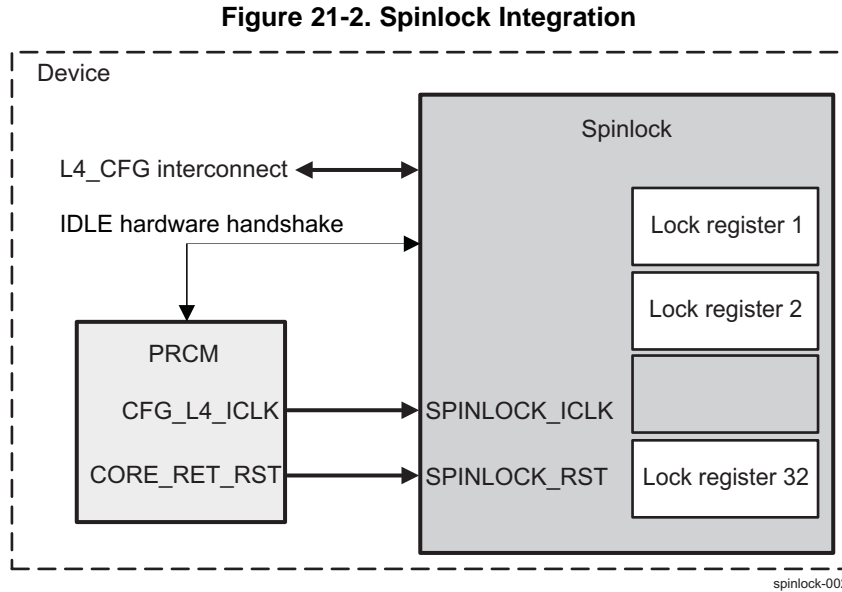

**Figure 21-1. Spinlock Module**

## 21.2 Spinlock Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

Figure 21-2 shows the Spinlock integration.

**NOTE:** For more information about the IDLE hardware handshake and the wake-up request, see [Section 3.1.1.1.2, Module Level Clock Management, Chapter 3, Power, Reset, and Clock Management](#).

Table 21-1 and Table 21-2 summarize the integration of the module in the device.

**Table 21-1. Integration Attributes**

Module Instance	Attributes	
	Power Domain	Interconnect
SPINLOCK	PD_CORE	L4_CFG

**Table 21-2. Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
SPINLOCK	SPINLOCK_ICLK	CFG_L4_ICLK	PRCM	Spinlock interface clock. This clock is used for all interface and functional operations.
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
SPINLOCK	SPINLOCK_RST	CORE_RET_RST	PRCM	Spinlock hardware reset. This reset is asynchronously applied to the Spinlock internal registers.

The Spinlock module does not support any interrupt and DMA requests.

## 21.3 Spinlock Functional Description

### 21.3.1 Spinlock Software Reset

The Spinlock module can be reset by software through the `SPINLOCK_SYSCONFIG[1]` `SOFTRESET` bit. Setting this bit to 1 enables an active software reset that is functionally equivalent to a hardware reset. The `SPINLOCK_SYSTATUS[0]` `RESETDONE` bit can be polled to check the reset status (reading 1 indicates that reset sequence is done; reading 0 indicates that reset sequence is in progress). The software must ensure that the software reset completes before doing Spinlock operations.

### 21.3.2 Spinlock Power Management

Table 21-3 describes power-management features available to the Spinlock module.

**NOTE:**

- For information about source clock gating and sleep/wake-up transitions description, see [Section 3.1.1.1.4, Clock Domain Level Clock Management, Chapter 3, Power, Reset, and Clock Management](#).
- For descriptions of `EnaWakeUp`, `IdleMode`, `ClockActivity`, and `StandbyMode` features, see [Section 3.1.1.1.2, Module Level Clock Management, Chapter 3, Power, Reset, and Clock Management](#).

**Table 21-3. Local Power Management Features**

Feature	Registers	Description
Clock auto gating	<code>SPINLOCK_SYSCONFIG[0]</code> <code>AUTOGATING</code> bit	This bit indicates that the module uses an automatic internal interface clock gating strategy, based on interface activity.
Slave idle modes	<code>SPINLOCK_SYSCONFIG[4:3]</code> <code>SIDLEMODE</code> bit field	This bit field indicates that the module uses smart-idle mode.
Clock activity	<code>SPINLOCK_SYSCONFIG[8]</code> <code>CLOCKACTIVITY</code> bit	This bit indicates that the interface clock is not required by the module during idle mode and may be switched off.
Global wake-up enable	<code>SPINLOCK_SYSCONFIG[2]</code> <code>ENAWAKEUP</code> bit	This bit indicates that the wake-up generation feature (at module level) is disabled.

**NOTE:** All the local power management features are non-configurable (that is, their respective bits or bit fields are read-only).

**CAUTION**

The PRCM module has no hardware means of reading `CLOCKACTIVITY` settings. Thus, software must ensure consistent programming between the `CLOCKACTIVITY` bit and Spinlock clock PRCM control bits.

The Spinlock module is normally idle, except when processing a request from its slave interface port. The smart-idle mode acknowledges idle requests from the PRCM only when the module is prepared to go idle. The Spinlock module is always ready to go idle if it does not have any request that it is processing.

The Spinlock module uses retention flops to retain state including the Taken state of each lock register. This means that the module can be placed in retention at any time when it is not processing a request and it is known that the system will not need to access the module.

Software must ensure to only power off the Spinlock module when no locks would be lost. In general, the steps to powering down the Spinlock module are:

- Check that all masters which might use the Spinlock module are either:
  - Already powered off, or
  - Notified that Spinlock is not available and the notification is acknowledged.

- If desired, check that no locks are currently held in the Spinlock module. The status of each bank of 32 locks can be read from the [SPINLOCK\\_SYSTATUS](#) register. If any locks are held, they are orphaned because they are not held by any master that is still active. Alternatively, you may decide to wait a timeout period to allow any active master to clean up its locks before powering down.
- The Spinlock module can now be powered off by writing the appropriate status to the PRCM.

In the case of powering off the whole system, these steps are unnecessary.

### 21.3.3 About Spinlocks

Spinlocks are present to solve the need for synchronization and mutual exclusion between heterogeneous processors and those not operating under a single, shared operating system. There is no alternative mechanism to accomplish these operations between processors in separate subsystems.

Spinlocks are not the best way to synchronize between tasks or threads on one CPU. Instead, spinlocks are for use in synchronization between different subsystems in the device that don't have any other means of hardware-based synchronization.

Spinlocks do not solve all system synchronization issues. They have limited applicability and should be used with care to implement higher level synchronization protocols.

A spinlock is appropriate for mutual exclusion for access to a shared data structure. It should be used only when:

1. The time to hold the lock is predictable and small (for example, a maximum hold time of less than 200 CPU cycles may be acceptable).
2. The locking task cannot be preempted, suspended, or interrupted while holding the lock (this would make the hold time large and unpredictable).
3. The lock is lightly contended, that is the chance of any other process (or processor) trying to acquire the lock while it is held is small.

If these conditions are met, then the locking code can retry a failed attempt to acquire the lock until success.

If the conditions are not met, then a spinlock is not a good candidate. One alternative is to use a spinlock for critical section control (engineered to meet the conditions) to implement a higher level semaphore that can support preemption, notification, timeout or other higher level properties.

### 21.3.4 Spinlock Functional Operation

The Spinlock module supports 32 spinlocks. It accepts only a single command at a time and processes the command fully before accepting the next command. A lock is requested by reading the [SPINLOCK\\_LOCK\\_REG\\_i\[0\]](#) TAKEN bit. There are two states: Taken ([SPINLOCK\\_LOCK\\_REG\\_i\[0\]](#) TAKEN = 1) or Not Taken ([SPINLOCK\\_LOCK\\_REG\\_i\[0\]](#) TAKEN = 0).

When the status of lock *i* (where *i* = 0 to 31) is Not Taken (free), a read from the [SPINLOCK\\_LOCK\\_REG\\_i](#) register returns 0 and sets the lock to Taken (locked). When the status of lock *i* is Taken, a read returns 1 and does not change the state of the lock.

A write to the [SPINLOCK\\_LOCK\\_REG\\_i](#) register does not change the state of lock, unless when writing 0 when the lock is in Taken state. By doing this, the requester frees the lock.

#### **CAUTION**

Only 32-bit reads and writes are supported.

Figure 21-3 shows the [SPINLOCK\\_LOCK\\_REG\\_i](#) register state diagram.

Figure 21-3. Lock Register State Diagram

**NOTE:**

- There is no support to ensure that a lock register is locked and unlocked by the same process. This must be ensured in software.
- There is no support to check that the same initiator that acquired the lock is the one that is freeing the lock.

## 21.4 Spinlock Programming Guide

### 21.4.1 Spinlock Low-level Programming Models

This section covers the low-level hardware programming sequences for configuration and usage of the module.

#### 21.4.1.1 Surrounding Modules Global Initialization

This procedure initializes the surrounding modules when the Spinlock module is used for the first time after a device reset.

**Table 21-4. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	Spinlock interface clock must be enabled. For more information, see <a href="#">Section 3.6.15</a> , <a href="#">CD_L4_CFG Clock Domain</a> , <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Interconnect	For more information about the L4-CFG interconnect configuration, see <a href="#">Section 13.3, L4 Interconnects</a> .

#### 21.4.1.2 Basic Spinlock Operations

The main spinlock operations are:

- Clear all the Taken spinlocks (only after a system bug recovery)
- Take a spinlock
- Release spinlock

##### 21.4.1.2.1 Spinlocks Clearing After a System Bug Recovery

Module initialization (after reset) is not needed, except after system bug recovery. The following table presents the Spinlock initialization after a system bug recovery. Software should store 0 into each of the [SPINLOCK\\_LOCK\\_REG\\_i](#) registers at system startup to insure that all locks are initialized to Not Taken.

**Table 21-5. Spinlock System Bug Recovery**

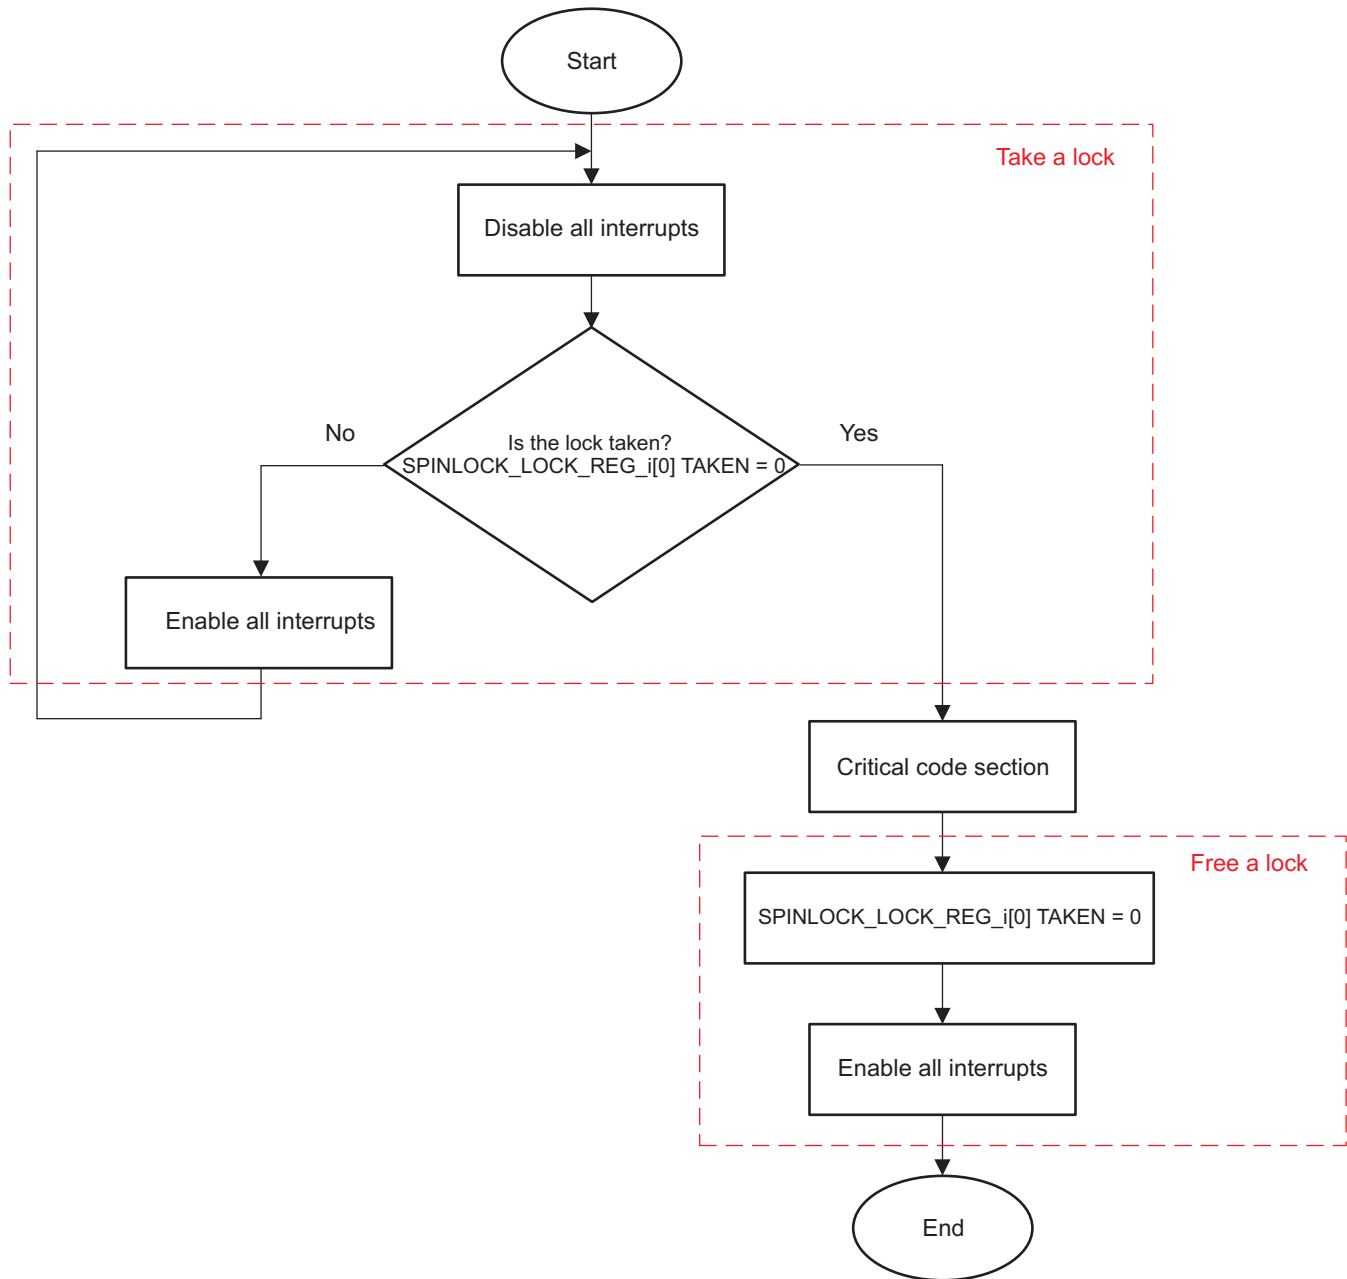

Step	Register	Value
IF: <a href="#">SPINLOCK_SYSTATUS[0]</a> IU0 = = 1?	<a href="#">SPINLOCK_SYSTATUS[0]</a> IU0	
Free the 32 locks	<a href="#">SPINLOCK_LOCK_REG_i[0]</a> TAKEN (i=0 to 31)	0x0
END		

##### 21.4.1.2.2 Take and Release Spinlock

This procedure configures the take and release (free) operations for the Spinlock module. A spinlock should only be held with interrupts disabled. So, before attempting to obtain the spinlock, software should disable interrupts. Then it should read the [SPINLOCK\\_LOCK\\_REG\\_i\[0\]](#) TAKEN bit to attempt to obtain the lock. If it succeeds, it should proceed directly through the critical section then unlock and re-enable interrupts. If the acquisition attempt fails, the acquisition should be reattempted. To prevent unknown interrupt disabled time, interrupts should be re-enabled and then disabled before reattempting to acquire the lock. [Figure 21-4](#) shows the described above procedure.

**Figure 21-4. Take and Release Spinlock**

# Timers

---

---

---

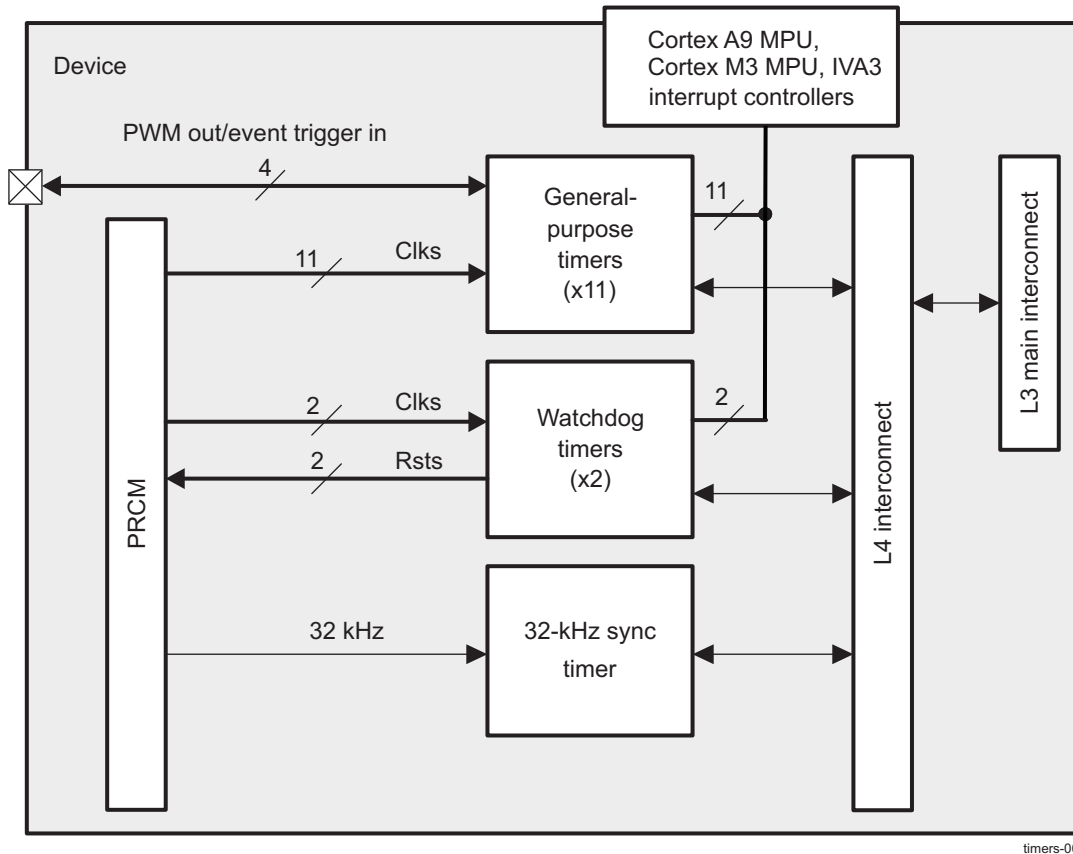

This chapter describes the timer modules for the device.

Topic	Page
<b>22.1 Timers Overview .....</b>	<b>4485</b>
<b>22.2 General-Purpose Timers .....</b>	<b>4486</b>
<b>22.3 Watchdog Timers .....</b>	<b>4541</b>
<b>22.4 32-kHz Synchronized Timer .....</b>	<b>4569</b>

## 22.1 Timers Overview

The device includes several types of timers used by the system software, including 11 general-purpose (GP) timers, two watchdog timers, and a 32-kHz synchronized timer (sync timer). Figure 22-1 is a high-level block diagram of the device timers.

Figure 22-1. Timers

The two watchdog timers are clocked with 32-kHz clocks. The 32-kHz sync timer, which is reset only at power up, provides the operating system (OS) with a stable timing source that stores the relative time since the last power cycle of the product. Finally, 11 GP timers, which are useful simply as basic timers, are included to generate time-stamp-based interrupts to the system software or to use as a source of pulse-width modulation (PWM) signals.

## 22.2 General-Purpose Timers

### 22.2.1 General-Purpose Timers Overview

The device has 11 general-purpose (GP) timers: GPTIMER1 through GPTIMER11.

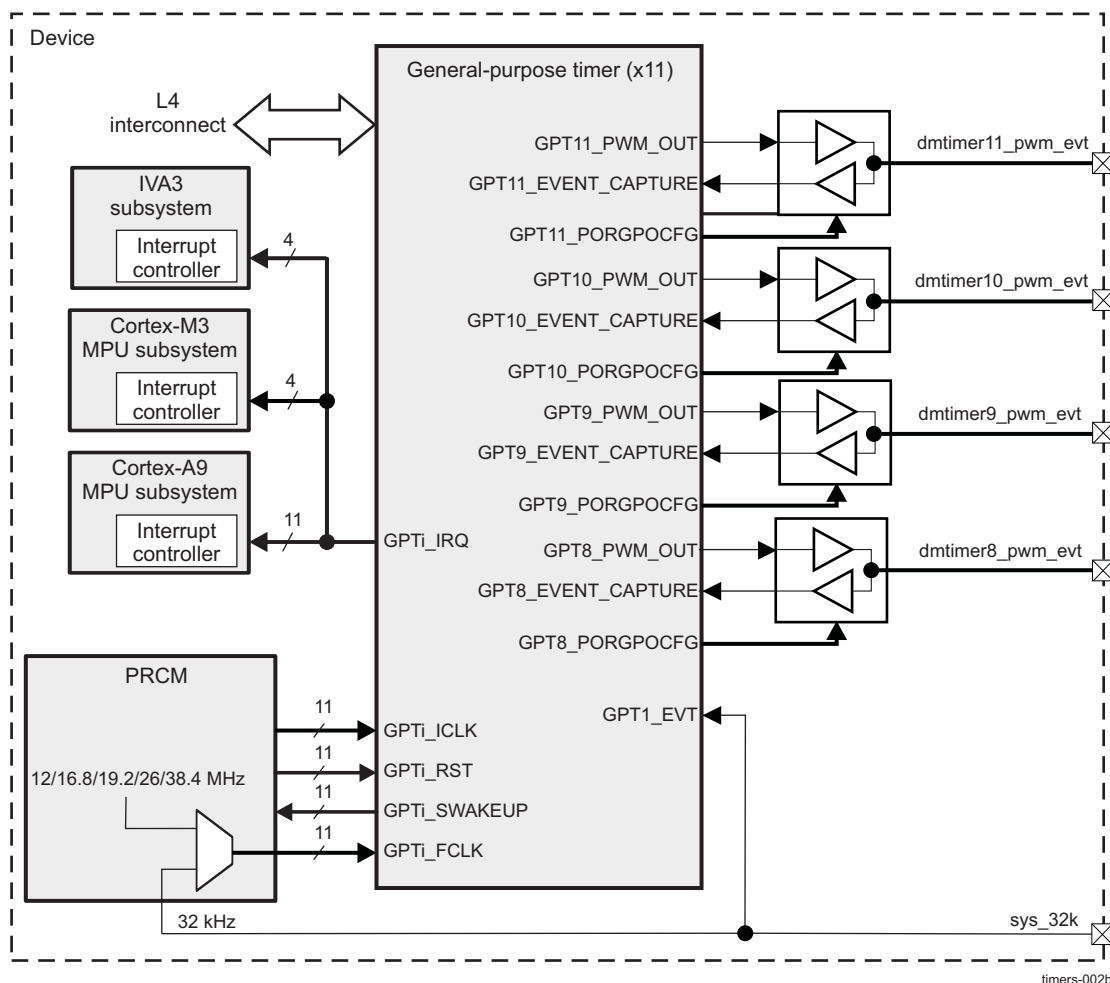

Each timer can be clocked from either the system clock (12, 16.8, 19.2, 26, or 38.4 MHz) or the 32-kHz clock. The selection of clock source is made at the power, reset, and clock management (PRCM) module level. For more information, see [Section 3.6.3.1, PRM Clock Source](#) in [Chapter 3, Power, Reset, and Clock Management](#).

GPTIMER1 has its GPT1\_EVENT\_CAPTURE pin tied to the 32-kHz clock and can be used to gauge the system clock input; it detects its frequency among 12, 16.8, 19.2, 26, or 38.4 MHz.

Each timer can provide an interrupt to the microprocessor unit (MPU) subsystem. In addition, GPTIMER5 through GPTIMER8 also have interrupts connected to the IVA3 subsystem.

GPTIMER1, GPTIMER2, and GPTIMER10 include specific functions to generate accurate tick interrupts to the operating system. GPTIMER8 through GPTIMER11 are connected to external pins by their PWM output or their event capture input pin (for external timer triggering). [Figure 22-2](#) is an overview of the GP timers.

**Figure 22-2. GP Timers Overview**

#### 22.2.1.1 GP Timer Features

The following are the main features of the GP timer controllers:

- L4 slave interface support:

- 32-bit data bus width
- 32-/16-bit access supported
- 8-bit access not supported
- 10-bit address bus width
- Burst mode not supported
- Software-selectable nonposted or posted write/read internal resynchronization modes
- Interrupts generated on overflow, compare, and capture
- Free-running 32-bit upward counter
- Compare and capture modes
- Autoreload mode
- Start/stop mode
- Programmable divider clock source ( $2^n$  where  $n = [0:8]$ )
- Dedicated input trigger for capture mode and dedicated output trigger/PWM signal
- Dedicated GP output signal for using the GPTi\_GPOCFG signal
- On-the-fly read/write register (while counting)
- 1-ms tick with 32,768-Hz functional clock generated (only GPTIMER1, GPTIMER2, and GPTIMER10)

## 22.2.2 GP Timer Environment

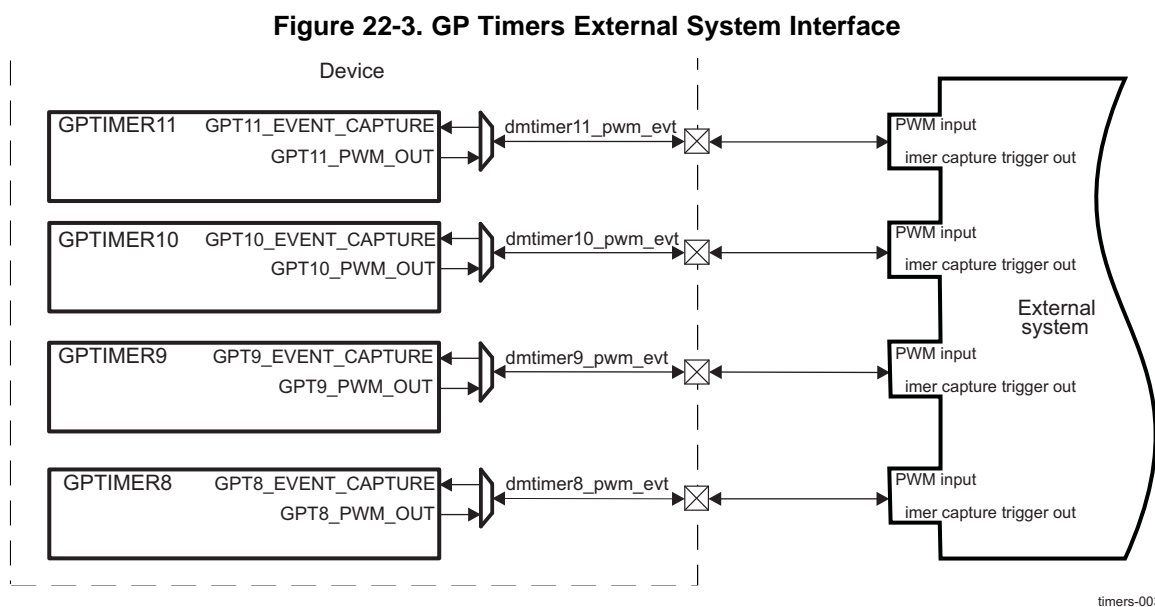

### 22.2.2.1 GP Timer External System Interface

Four of the 11 GP timers can send or receive stimulus to/from the external (off-chip) system. In the device; however, only GPTIMER8 through GPTIMER11 are configured to output a pulse-width modulation (PWM) pulse or receive an external event signal used as a trigger to capture the current timer count. GPTIMER1 is also configured to receive an event trigger input (GPT1\_EVENT\_CAPTURE) tied to the internal 32-kHz clock. This event signal gauges the system clock input; detecting its frequency among 12, 16.8, 19.2, 26, or 38.4 MHz.

Figure 22-3 shows the external system interface for the GP timers, and Table 22-1 describes the GP timer inputs and outputs.

**NOTE:** Software control must ensure that MUX mode is configured to select the `dmtimerx_pwm_evt` (where  $x = 8$  to  $11$ ) signal on only one pad. Other pads on which the same signal is multiplexed must be configured in safe mode or non-dmtimer mode to avoid two different pads driving the same signal.

For more information about the configuration of the `dmtimer8_pwm_evt` through `dmtimer11_pwm_evt` I/O pads, see Section 18.4.8, *PAD Functional Multiplexing and Configuration*.

**Table 22-1. Input/Output Description**

Pin Name	Type <sup>(1)</sup>	Reset Value	Signal Name	Description
<code>dmtimer8_pwm_evt</code>	I/O	0	GPT8_EVENT_CAPTURE GPT8_PWM_OUT	GPTIMER8 trigger input/ PWM output
<code>dmtimer9_pwm_evt</code>	I/O	0	GPT9_EVENT_CAPTURE GPT9_PWM_OUT	GPTIMER9 trigger input/ PWM output
<code>dmtimer10_pwm_evt</code>	I/O	0	GPT10_EVENT_CAPTURE GPT10_PWM_OUT	GPTIMER10 trigger input/ PWM output
<code>dmtimer11_pwm_evt</code>	I/O	0	GPT11_EVENT_CAPTURE GPT11_PWM_OUT	GPTIMER11 trigger input/ PWM output

<sup>(1)</sup> When configured for that function; I = input, O = output

---

**NOTE:** The event trigger input (GPTi\_EVENT\_CAPTURE) for GPTIMER2 through GPTIMER7 is internally tied low, and the PWM output (GPTi\_PWM\_OUT) is not connected.

---

---

**NOTE:** For GPTIMER8 through GPTIMER11, the GPTi\_PORGPOCFG signal selects to connect the GPT pwm output or the GPT capture input to the dmtimerx\_pwm\_evt (where x = 8 to 11) pad at the top level. When the TCLR[14] GPO\_CFG bit = 0b1, the dmtimerx\_pwm\_evt functions as a capture input. When the TCLR[14] GPO\_CFG bit = 0b0, the dmtimerx\_pwm\_evt functions as a pwm output (GPO\_CFG = 0b0).

---

### 22.2.3 GP Timer Integration

Figure 22-4 shows the integration of the GP timer in the device.

Figure 22-4. GP Timer Integration

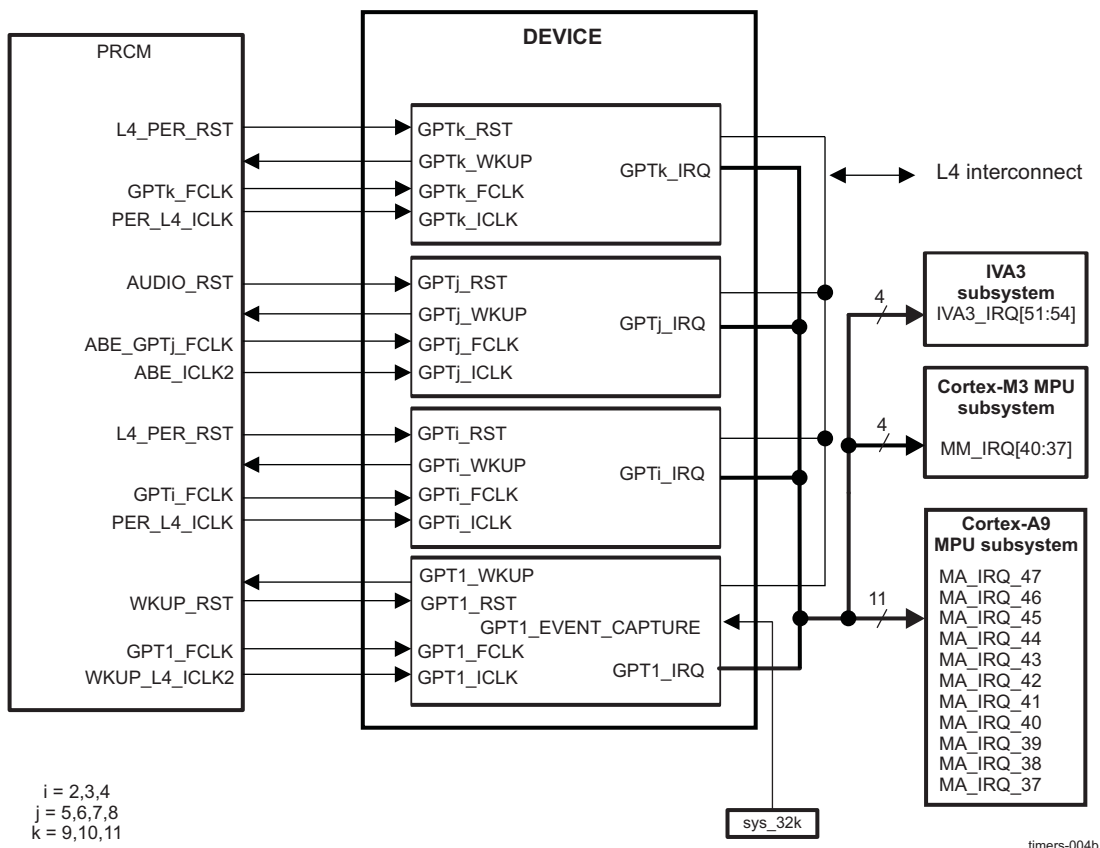

Table 22-2 through Table 22-4 summarize the integration of the module in the device.

Table 22-2. Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect

---

## 22.2.4 GP Timer Functional Description

Each GP timer contains a free-running upward counter with autoreload capability on overflow. The timer counter can be read and written on-the-fly (while counting). Each GP timer includes compare logic to allow an interrupt event on a programmable counter matching value. A dedicated output signal can be pulsed or toggled on either an overflow or a match event. This offers time-stamp trigger signaling or PWM signal sources. A dedicated input signal can be used to trigger an automatic timer counter capture or an interrupt event on a programmable input signal transition. A programmable clock divider (prescaler) allows reduction of the timer input clock frequency. All internal timer interrupt sources are merged into one module interrupt line and one wake-up line.

Each internal interrupt source can be independently enabled/disabled with a dedicated bit of the [GPT\\_TIER](#) register for the interrupt features, and a dedicated bit of the [GPT\\_TWER](#) register for the wake-up of GPTIMER1, GPTIMER2, and GPTIMER10. In addition, these timers have a mechanism implemented to generate an accurate tick interrupt.

For the other GP Timers, each internal interrupt source can be independently enabled/disabled through the [GPT\\_IRQENABLE\\_SET](#) and [GPT\\_IRQENABLE\\_CLR](#) register bit fields.

For each GP timer implemented in the device, there are two possible clock sources:

- 32-kHz clock
- System clock

Selection of the input clock source is done in the registers in the PRCM configuration (see [Section 22.2.1, GP Timer Overview](#)).

Each GP timer supports three functional modes:

- Timer mode
- Capture mode
- Compare mode

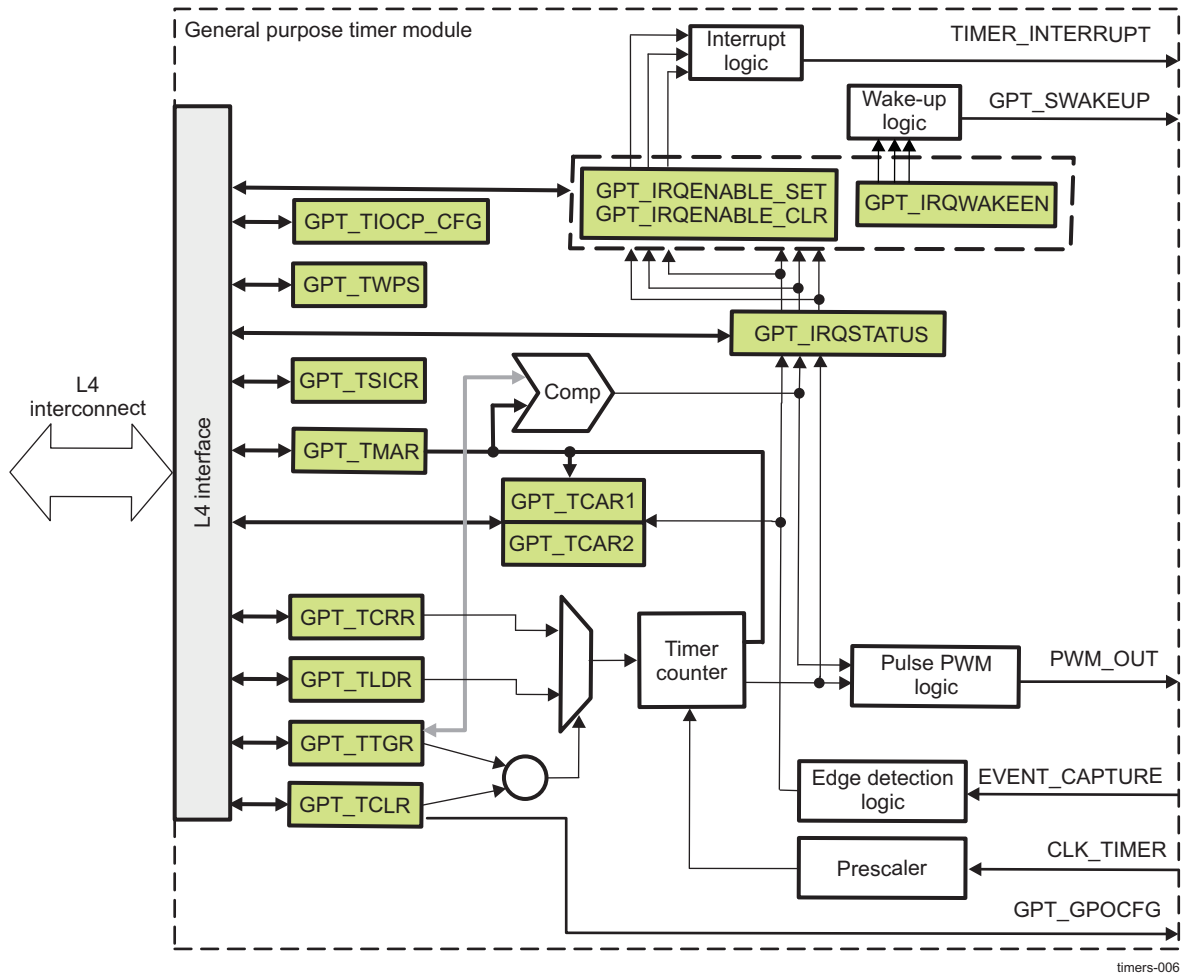

The capture and compare modes are disabled by default after core reset.

### 22.2.4.1 GP Timer Block Diagram

[Figure 22-5](#) is a block diagram of the common GP timers, and [Figure 22-6](#) is a block diagram of the GP timers with 1-ms tick generation module.

Figure 22-6. Block Diagram of GPTIMER1, GPTIMER2, and GPTIMER10

timers-007

### 22.2.4.2 GPTIMER1, GPTIMER2, and GPTIMER10 Power Management

The GP timer modules have an internal bit, `GPT1MS_TIOCP_CFG[0]` AUTOIDLE, that is used to apply an internal interface clock gating strategy.

At the PRCM module level, when all conditions to shut off the PRCM module functional or interface output clocks are met (see [Section 3.1.1.1.4, Clock Domain-Level Clock Management](#)), the PRCM module automatically launches a hardware handshake protocol to ensure the GP timer is ready to have its clocks switched off. Namely, the PRCM module asserts an IDLE request to the GP timer.

Although this handshake is a hardware function and is out of software control, the way the GP timer acknowledges the PRCM IDLE request is configurable through the `GPT1MS_TIOCP_CFG[4:3]` IDLEMODE bit field.

[Table 22-7](#) lists the IDLEMODE settings and the related acknowledgment modes.

**Table 22-5. IDLEMODE Settings**

IDLEMODE Value	Selected Mode	Description
00	Force-idle	The GP timer unconditionally acknowledges the IDLE request from the PRCM module, regardless of its internal operations. This mode must be used carefully, because it does not prevent the loss of data when the clock is switched off.
01	No-idle	The GP timer never acknowledges an IDLE request from the PRCM module. This mode is safe from a module point of view, because it ensures that the clocks remain active. It is not efficient from a power-saving perspective, because it does not allow the PRCM output clock to be shut off and thus the power domain to be set to a lower power state.
10	Smart-idle	The GP timer acknowledges the IDLE request, basing its decision on its internal activity. The acknowledge signal is asserted only when all pending transactions and IRQ requests are treated. This is the best approach to efficient system power management.
11	Reserved	

When configured in smart-idle mode, the GP timer also offers an additional granularity on `GPTi_FCLK` and `GPTi_ICLK` gating. The `GPT1MS_TIOCP_CFG[9:8]` CLOCKACTIVITY bit field is used to determine which clock is shut down (`GPTi_FCLK`, `GPTi_ICLK`, neither, or both clocks).

The CLOCKACTIVITY setting is used internally to the GP timer to determine the part of the module on which the conditions to acknowledge the PRCM IDLE request are tested. For example, if `GPTi_FCLK` is not to be shut down on a PRCM IDLE request, the GP timer considers only `GPTi_ICLK` and associated pending activities before acknowledging the request.

Some GP timer features are associated with `GPTi_ICLK` and others are associated with `GPTi_FCLK`. Using the CLOCKACTIVITY setting along with the smart-idle mode ensures that the features associated with the clock that remains active are always enabled, even if the GP timer acknowledges an IDLE request.

[Table 22-6](#) lists the CLOCKACTIVITY settings and associated features.

**Table 22-6. CLOCKACTIVITY Settings**

CLOCKACTIVITY Value	GPTi_ICLK Effects	GPTi_FCLK Effects	Description	Associated Features
00	OFF	OFF	<code>GPTi_ICLK</code> and <code>GPTi_FCLK</code> are considered for generating the acknowledge. This setting also means <code>GPTi_FCLK</code> and <code>GPTi_ICLK</code> are likely to be shut down on PRCM IDLE request.	The idle acknowledge signal is asserted when there are no pending activities on the functional clock domain (improved latency in assertion of idle acknowledge). The wake-up capability of the GP timer is disabled.
01	ON	OFF	<code>GPTi_ICLK</code> is not shut down on PRCM IDLE request; only <code>GPTi_FCLK</code> is affected.	

**Table 22-6. CLOCKACTIVITY Settings (continued)**

CLOCKACTIVITY Value	GPTi_ICLK Effects	GPTi_FCLK Effects	Description	Associated Features
10	OFF	ON	GPTi_FCLK is not shut down on PRCM IDLE request; only GPTi_ICLK is affected.	The idle acknowledge signal is asserted when there are no pending activities on the interface clock domain, without evaluating the pending activities on the functional clock domain (the GP timer enters into sleep mode, and if a pending interrupt event is completed during idle mode, the wake-up signal is asserted). The wake-up signal is enabled.
11	ON	ON	None of the clocks are shut down. Therefore, the GP timer can potentially acknowledge the IDLE request without checking the internal functionalities linked to its clocks.	

**CAUTION**

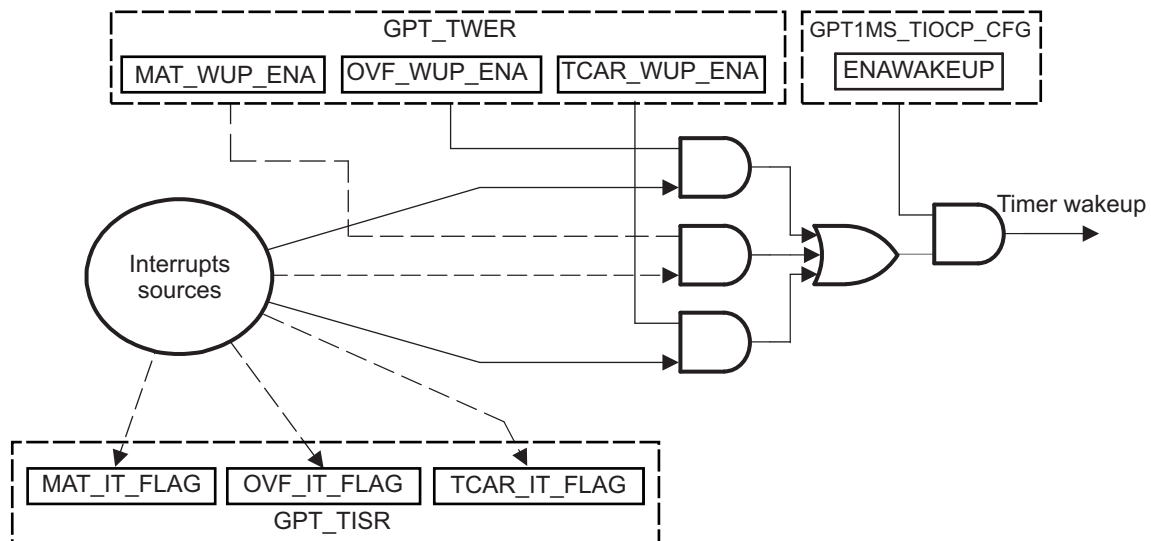

The PRCM module does not have any hardware means to read the CLOCKACTIVITY settings. The software must ensure consistent programming between the GP timer CLOCKACTIVITY and the PRCM module functional clock and interface clock control bits. If the GP timer is disabled in the CM\_FCLKEN and CM\_ICLKEN PRCM registers while CLOCKACTIVITY is set to 11, nothing prevents the PRCM module from asserting its IDLE request, which is acknowledged regardless of the features associated with the GP timer clocks. This can lead to unpredictable behavior.

**22.2.4.2.1 Wake-Up Capability**

If the `GPT1MS_TIOCP_CFG[4:3]` IDLEMODE bit field sets the smart-idle mode, the timer evaluates its internal capability to have the interface clock switched off. When there is no further internal activity (no pending interrupt sources: match, overflow, or timer capture events), the idle acknowledge signal is asserted and the timer enters sleep mode, ready to issue a wake-up request. This wake-up request is sent only if the `GPT1MS_TIOCP_CFG[2]` ENAWAKEUP bit enables the timer wake-up capability.

Figure 22-7 shows the wake-up request generation. For more information on the GP timer clock control, see Section 3.6, *Clock Management Functional Description* in Chapter 3, *Power, Reset and Clock Management*.

**Figure 22-7. Wake-Up Request Generation**

timers-005

For GPTIMER1, GPTIMER2, and GPTIMER10, the timer wake-up enable-register (**GPT\_TWER**) allows masking the expected source of the wake-up event that generates a wake-up request. The **GPT\_TWER** register is synchronously programmed with the interface clock before the PRCM module sends an idle mode request. The expected source of the wake-up event is an overflow (**GPT\_TCRR**), a timer match (the compare result of **GPT\_TCRR** and **GPT\_TMAR** matches the counter value), and a timer capture (detection of an external pulse transition of the correct polarity on the **GPT\_EVENT\_CAPTURE**).

When the wake-up event is issued, the associated interrupt status bit is set in the timer status register (**GPT\_TISR**). The pending wake-up event is reset when the set status bit is overwritten with 1.

---

**NOTE:** The status bit must be reset to re-enter idle mode.

---

### 22.2.4.3 Power Management of Other GP Timers

At the PRCM module level, when all conditions to shut off the PRCM module functional or interface output clocks are met (see [Section 3.1.1.1.4, Clock Domain Level Clock Management](#)), the PRCM module automatically launches a hardware handshake protocol to ensure the GP timer is ready to have its clocks switched off. Namely, the PRCM module asserts an IDLE request to the GP timer.

Although this handshake is a hardware function and is out of software control, the way the GP timer acknowledges the PRCM IDLE request is configurable through the **GPT\_TIOCP\_CFG[3:2]** IDLEMODE bit field.

[Table 22-7](#) lists the IDLEMODE settings and the related acknowledgment modes.

**Table 22-7. IDLEMODE Settings**

IDLEMODE Value	Selected Mode	Description
00	Force-idle	The GP timer unconditionally acknowledges the IDLE request from the PRCM module, regardless of its internal operations. This mode must be used carefully, because it does not prevent the loss of data when the clock is switched off.
01	No-idle	The GP timer never acknowledges an IDLE request from the PRCM module. This mode is safe from a module point of view, because it ensures that the clocks remain active. It is not efficient from a power-saving perspective, however, because it does not allow the PRCM output clock to be shut off and thus the power domain to be set to a lower power state.
10	Smart-idle	The GP timer acknowledges the IDLE request, basing its decision on its internal activity. The acknowledge signal is asserted only when all pending transactions and IRQ requests are treated. This is the best approach to efficient system power management.
11	Reserved	

#### 22.2.4.3.1 Wake-Up Capability

If the **GPT\_TIOCP\_CFG[3:2]** IDLEMODE bit field sets the smart-idle mode, the timer evaluates its internal capability to have the interface clock switched off. When there is no further internal activity (no pending interrupt sources: match, overflow, or timer capture events), the idle acknowledge signal is asserted and the timer enters sleep mode, ready to issue a wake-up request. This wake-up request is sent only if the **GPT\_IRQWAKEEN[2:0]** bit field enables the timer wake-up capability.

[Figure 22-8](#) shows the wake-up request generation. For more information on the GP timer clock control, see [Section 3.6, Clock Management Functional Description](#) in [Chapter 3, Power, Reset and Clock Management](#).

Figure 22-8. Wake-Up Request Generation

When the wake-up event is issued, the associated interrupt status bit is set in the timer status register ([GPT\\_IRQSTATUS](#)). The pending wake-up event is reset when the set status bit is overwritten with 1.

**NOTE:** The status bit must be reset to re-enter idle mode.

#### 22.2.4.4 Software Reset

Two bit fields can generate a software reset of the GP timer:

- [GPT1MS\\_TIOCP\\_CFG\[1\]](#) SOFTRESET for GPTIMER1, GPTIMER2, and GPTIMER10, and [GPT\\_TIOCP\\_CFG\[0\]](#) SOFTRESET for other timers
- [GPT\\_TSICR\[1\]](#) SFT for all timers

For both bits, all read accesses return 0.

The [GPT1MS\\_TIOCP\\_CFG\[1\]](#) SOFTRESET/[GPT\\_TIOCP\\_CFG\[0\]](#) SOFTRESET bit allows resetting the functional and interface domains. The [GPT\\_TSICR\[1\]](#) SFT bit allows resetting the functional part of the GP timer.

Before accessing or using the GP timer, the local host must ensure that both internal resets are released by reading the [GPT\\_TISTAT\[0\]](#) RESETDONE (for GPTIMER1, GPTIMER2, and GPTIMER10), or the [GPT\\_TIOCP\\_CFG\[0\]](#) SOFTRESET bit (for other timers). This bit monitors the internal reset status.

#### 22.2.4.5 GP Timer Interrupts

The timer can issue an overflow interrupt, a timer match interrupt, and a timer capture interrupt. Each internal interrupt source can be independently enabled/disabled in the interrupt-enable register ([GPT\\_TIER](#) for GPTIMER1, GPTIMER2, and GPTIMER10), or, for other timers, enable in the interrupt-enable register ([GPT\\_IRQENABLE\\_SET](#)) and disable in the interrupt disable register ([GPT\\_IRQENABLE\\_CLR](#)). When the interrupt event is issued, the associated interrupt status bit is set in the timer status register ([GPT\\_TISR](#) for GPTIMER1, GPTIMER2, and GPTIMER10, and [GPT\\_IRQSTATUS](#) for other timers).

### 22.2.4.6 Timer Mode Functionality

The timer is an upward counter that can be started and stopped at any time through the timer control register (`GPT_TCLR[0]` ST bit). The timer counter register (`GPT_TCRR`) can be loaded when stopped or on-the-fly (while counting). `GPT_TCRR` can be loaded directly by a `GPT_TCRR` write access with a new timer value. The `GPT_TCRR` register can also be loaded with the value held in the timer-load register `GPT_TLDR` by a trigger register (`GPT_TTGR`) write access. Loading of `GPT_TCRR` is done regardless of the `GPT_TTGR` written value. The timer counter register `GPT_TCRR` value can be read when stopped, or captured on-the-fly by a `GPT_TCRR` read access. The timer is stopped and the counter value is set to 0 when the module reset is asserted. The timer is maintained at stop after the reset is released.

In one-shot mode (the `GPT_TCLR[1]` AR bit set to 0), the counter is stopped after counting overflow occurs (the counter value remains at 0).

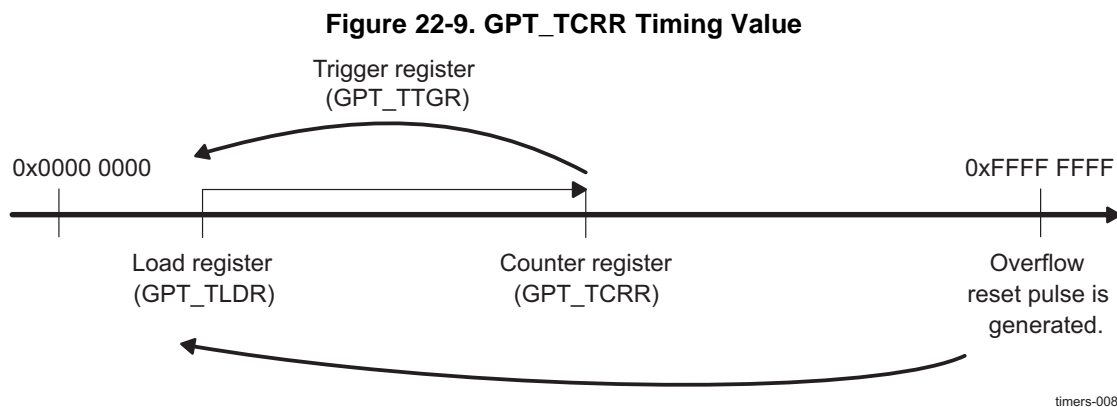

When the autoreload mode is enabled (the `GPT_TCLR[1]` AR bit set to 1), the `GPT_TCRR` register is reloaded with the timer-load register (`GPT_TLDR`) value after a counting overflow occurs.

#### CAUTION

Do not put the overflow value (0xFFFF FFFF) in the `GPT_TLDR` register because it can lead to undesirable results.

An interrupt can be issued on overflow if the overflow interrupt-enable bit is set in the timer interrupt-enable register (`GPT_TIER[1]` OVF\_IT\_ENA bit set to 1 for GPTIMER1, GPTIMER2, and GPTIMER10, or `GPT_IRQENABLE_SET[1]` OVF\_IT\_FLAG bit set to 1 for other timers). A dedicated output pin (timer PWM) can be programmed in `GPT_TCLR[12]` through `GPT_TCLR[11:10]` (PT and TRG bits) to generate one positive pulse (prescaler duration) or to invert the current value (toggle mode) when an overflow occurs. The `GPT_TCLR[12]` PT bit selects pulse/toggle modulation (`GPT_TCLR[11:10]` TRG bit field selects trigger mode).

Figure 22-9 shows the `GPT_TCRR` timing value.

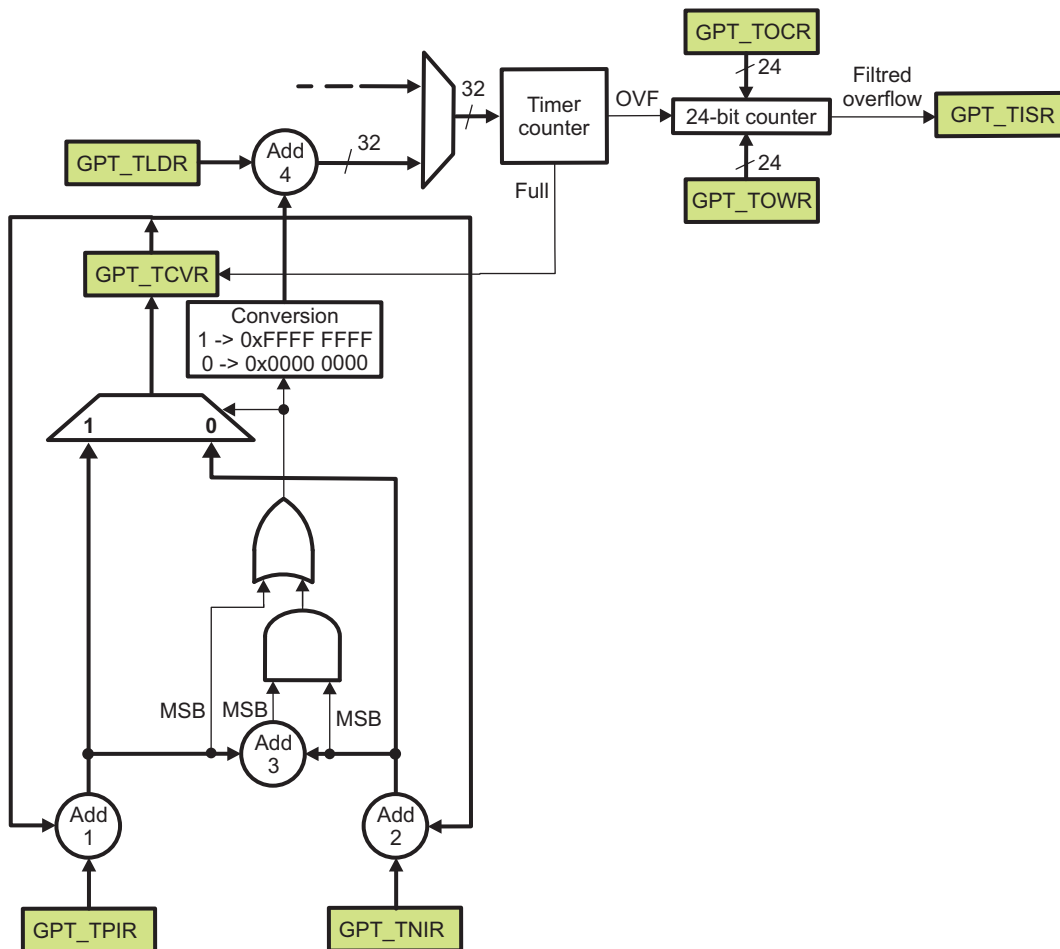

#### 22.2.4.6.1 1-ms Tick Generation (Only GPTIMER1, GPTIMER2, and GPTIMER10)

The interrupt period is not exactly 1 ms because the timer input clock is 32,768 Hz. If the clock counts up to 32, it obtains a 0.977-ms period; if it counts up to 33, it obtains a 1.007-ms period. For large granularity, the error is cumulative and can generate important deviations from the standard value.

To minimize the error between a true 1-ms tick and the tick generated by the 32,768 Hz timer, the sequencing of periods less than 1 ms and periods greater than 1 ms must be shuffled. An additional 1-ms block is used to correct this error. See Figure 22-10.

In this implementation, the increment sequencing is automatically managed by the timer to minimize the error. The user must define only the value of the timer positive increment register (`GPT_TPIR[31:0]` POSITIVE\_INC\_VALUE bit field) and the timer negative increment register (`GPT_TNIR[31:0]` NEGATIVE\_INC\_VALUE bit field). An automatic adaptation mechanism is used to simplify the programming model.

Figure 22-10. Block Diagram of the 1-ms Tick Module

timers-009

The **GPT\_TPIR**, **GPT\_TNIR**, and **GPT\_TCCR** registers and adders Add1, Add2, and Add3 are used to define whether the next value loaded in the timer counter register (**GPT\_TCCR**[31:0] **TIMER\_COUNTER** bit field) is the value of the **GPT\_TLDR**[31:0] **LOAD\_VALUE** bit field (period less than 1 ms) or the value of **GPT\_TLDR**[31:0] **LOAD\_VALUE** - 1 (period greater than 1 ms).

Table 22-8 lists the value loaded in the **GPT\_TCCR** register according to the sign of the result of Add1, Add2, and Add3.

MSB = 0: Positive value, MSB = 1: Negative value

Table 22-8. Value Loaded in **GPT\_TCCR** to Generate 1-ms Tick

Add1 MSB	Add2 MSB	Add3 MSB	Value of <b>GPT_TCCR</b> Register
0	0	0	<b>GPT_TLDR</b> [31:0] <b>LOAD_VALUE</b> bit field
0	0	1	<b>GPT_TLDR</b> [31:0] <b>LOAD_VALUE</b> bit field
0	1	0	<b>GPT_TLDR</b> [31:0] <b>LOAD_VALUE</b> bit field
0	1	1	<b>GPT_TLDR</b> [31:0] <b>LOAD_VALUE</b> - 1
1	0	0	N/A
1	0	1	N/A
1	1	0	<b>GPT_TLDR</b> [31:0] <b>LOAD_VALUE</b> - 1
1	1	1	<b>GPT_TLDR</b> [31:0] <b>LOAD_VALUE</b> - 1

The values of the [GPT\\_TPIR](#) and [GPT\\_TNIR](#) registers are calculated using the following formula:

- Positive increment value =  $(\text{INTEGER}[F_{\text{clk}} * T_{\text{tick}}] + 1) * 1\text{e}6) - (F_{\text{clk}} * T_{\text{tick}} * 1\text{e}6)$
- Negative increment value =  $(\text{INTEGER}[F_{\text{clk}} * T_{\text{tick}}] * 1\text{e}6) - (F_{\text{clk}} * T_{\text{tick}} * 1\text{e}6)$

---

**NOTE:** Fclk clock frequency (kHz)

Ttick tick period (ms)

---

The timer overflow counter register ([GPT\\_TOCR](#)) and the timer overflow wrapping register [GPT\\_TOWR](#)) are used to filter interrupts. When the timer overflows, it increments the 24-bit [GPT\\_TOCR](#) register. When the 24-bit [GPT\\_TOCR](#) register values match the value in the 24-bit [GPT\\_TOWR](#) register and the timer overflow is asserted, the [GPT\\_TOCR](#) register is reset and an interrupt is generated to the [GPT\\_TISR](#) register.

With the conversion block in reset state (the positive increment register, negative increment register, and counter value register are zeroed), the programming model and the behavior of GPTIMER1, GPTIMER2, and GPTIMER10 remain unchanged.

For 1-ms tick with a 32,768-Hz clock:

- [GPT\\_TPIR](#)[31:0] POSITIVE\_INC\_VALUE = 232000
- [GPT\\_TNIR](#)[31:0] NEGATIVE\_INC\_VALUE = -768000
- [GPT\\_TLDR](#)[31:0] LOAD\_VALUE = 0xFFFF FFE0

---

**NOTE:** Any value of the tick period can be generated with the appropriate value of the [GPT\\_TPIR](#), [GPT\\_TNIR](#), and [GPT\\_TLDR](#) registers.

By default, the [GPT\\_TPIR](#), [GPT\\_TNIR](#), [GPT\\_TCVR](#), [GPT\\_TOCR](#), and [GPT\\_TOWR](#) registers and the associated logic are in reset mode (all 0s) and have no action on the programming model.

---

#### 22.2.4.7 Capture Mode Functionality

When a transition is detected on the module input pin (EVENT\_CAPTURE), the timer value in the [GPT\\_TCRR](#) register can be captured and saved in the [GPT\\_TCAR1](#) or [TCAR2](#) register function of the mode selected in the [GPT\\_TCLR](#)[13] CAPT\_MODE bit. The edge detection circuitry monitors transitions on the input pin (EVENT\_CAPTURE).

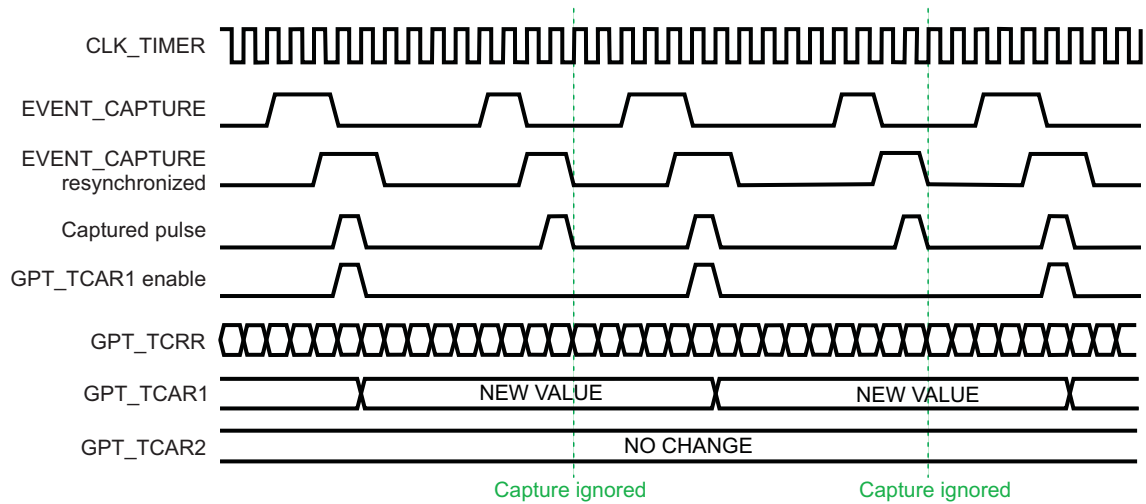

The rising edge, falling edge, or both, can be selected in the [GPT\\_TCLR](#)[9:8] TCM bit field to trigger the timer counter capture. The module sets the [GPT\\_TISR](#)[2] TCAR\_IT\_FLAG bit for GPTIMER1, GPTIMER2, or GPTIMER10, and the [GPT\\_IRQSTATUS](#)[2] TCAR\_IT\_FLAG bit for other timers, when an active edge is detected, and at the same time, the counter value [GPT\\_TCRR](#) is stored in timer capture register [GPT\\_TCAR1](#) or [GPT\\_TCAR2](#), as follows:

- If the [GPT\\_TCLR](#)[13] CAPT\_MODE bit is 0, on the first enabled capture event, the value of the counter register is saved in the [GPT\\_TCAR1](#) register, and all the next events are ignored (no update on the [GPT\\_TCAR1](#) register and no interrupt triggering) until the detection logic is reset or the [GPT\\_TISR](#)[2] TCAR\_IT\_FLAG bit (or [GPT\\_IRQSTATUS](#)[2] TCAR\_IT\_FLAG, depending on the timer) is cleared by writing 1 to it.
- If the [GPT\\_TCLR](#)[13] CAPT\_MODE bit is 1, on the first enabled capture event, the value of the counter register is saved in the [GPT\\_TCAR1](#) register, and on the second enabled capture event, the value of the counter register is saved in the [GPT\\_TCAR2](#) register. If a capture interrupt is enabled, the interrupt triggers on the second event capture. All other events are ignored (no update on [GPT\\_TCAR1](#)/[GPT\\_TCAR2](#) and no interrupt triggering) until the detection logic is reset or [GPT\\_TISR](#)[2] TCAR\_IT\_FLAG bit (or [GPT\\_IRQSTATUS](#)[2] TCAR\_IT\_FLAG, depending on the timer) is cleared by writing 1 to it. This mechanism is useful for period calculation of a clock, if that clock is connected to the EVENT\_CAPTURE input pin.

The edge detection logic is reset (a new capture is enabled) when the active capture interrupt is served. The `GPT_TISR[2]` `TCAR_IT_FLAG` bit or the `GPT_IRQSTATUS[2]` `TCAR_IT_FLAG` (previously 1) is cleared by writing 1 to it or when the edge detection mode bits (the `GPT_TCLR[9:8]` `TCM` bit field) are changed from no-capture mode detection to any other mode. The timer functional clock (input to prescaler) is used to sample the input pin (`EVENT_CAPTURE`). A negative or positive pulse input can be detected when the pulse time is greater than the functional clock period. An interrupt is issued on edge detection if the capture interrupt-enable bit is set in the `GPT_TIER[2]` `TCAR_IT_ENA` bit (for `GPTIMER1`, `GPTIMER2`, or `GPTIMER10`), or in the `GPT_IRQENABLE_SET[2]` `TCAR_EN_FLAG` bit (for other timers). See the examples in [Figure 22-11](#) and [Figure 22-12](#).

In [Figure 22-11](#), the `GPT_TCLR[9:8]` `TCM` bit field value is `0b01`, and `GPT_TCLR[13]` `CAPT_MODE` bit is 0. Only the rising edge of `EVENT_CAPTURE` triggers a capture in the `GPT_TCAR1` and `GPT_TCAR2` registers, and only the `GPT_TCAR1` register updates.

**Figure 22-11. Capture Wave Example for `GPT_TCLR[13]` `CAPT_MODE` = 0**

In [Figure 22-12](#), the value of the `GPT_TCLR[9:8]` `TCM` bit field is `0b01`, and the `GPT_TCLR[13]` `CAPT_MODE` bit is 1. Only the rising edge of `EVENT_CAPTURE` triggers a capture in the `GPT_TCAR1` register on the first enabled event, and the `GPT_TCAR2` register updates on the second enabled event.

**Figure 22-12. Capture Wave Example for `GPT_TCLR[13]` `CAPT_MODE` = 1**

### 22.2.4.8 Compare Mode Functionality

When compare enable-register [GPT\\_TCLR\[6\]](#) CE bit is set to 1, the timer value ([GPT\\_TCR\[31:0\]](#) TIMER\_COUNTER bit field) is continuously compared to the value held in the timer match register ([GPT\\_TMAR](#)). The [GPT\\_TMAR\[31:0\]](#) COMPARE\_VALUE bit field value can be loaded at any time (timer counting or stopped). When the [GPT\\_TCR](#) and the [GPT\\_TMAR](#) values match, an interrupt is issued, if the [GPT\\_TIER\[0\]](#) MAT\_IT\_ENA (for GPTIMER1, GPTIMER2, and GPTIMER10), or [GPT\\_IRQSTATUS\\_SET\[0\]](#) MAT\_EN\_FLAG bit (for other timers) is set.

The right programming way is to write a compare value to the [GPT\\_TMAR](#) register before setting the [GPT\\_TCLR\[6\]](#) CE bit to prevent any unwanted interrupts due to a reset value matching effect.

The dedicated output pin (timer PWM) can be programmed in the [GPT\\_TCLR\[12\]](#) PT bit through the [GPT\\_TCLR\[11:10\]](#) TRG bit field to generate one positive pulse (timer clock duration) or to invert the current value (toggle mode) when an overflow or a match occurs.

### 22.2.4.9 Prescaler Functionality

A prescaler can be used to divide the timer counter input clock frequency. The prescaler is enabled when the [GPT\\_TCLR\[5\]](#) PRE bit is set. The [GPT\\_TCLR\[4:2\]](#) PTV bit field sets the second prescaler ratio. The prescaler counter is reset when the timer counter is stopped or reloaded on-the-fly.

[Table 22-9](#) lists the prescaler/timer reload values versus contexts.

**Table 22-9. Prescaler/Timer Reload Values Versus Contexts**

Context	Prescaler	Timer Counter
Overflow (when autoreload is on)	Reset	<a href="#">GPT_TLDR[31:0]</a>
<a href="#">GPT_TCR</a> write	Reset	<a href="#">GPT_TCR[31:0]</a>
<a href="#">GPT_TTGR</a> write	Reset	<a href="#">GPT_TLDR[31:0]</a>
Stop	Reset	Frozen

### 22.2.4.10 Pulse-Width Modulation

The timer can be configured to provide a programmable PWM output. The timer PWM output pin can be configured to toggle on an event. The [GPT\\_TCLR\[11:10\]](#) TRG bit field determines on which register value the PWM pin toggles. Either overflow alone or both overflow and match can be selected to toggle the timer PWM pin when a compare condition occurs.

#### CAUTION

In toggle mode, when [GPT\\_TCLR\[11:10\]](#) TRG = 0x2 (overflow and match), the first event that toggles the PWM line is an overflow event. If a match event occurs first; it does not toggle the PWM line (see [Figure 22-14](#)).

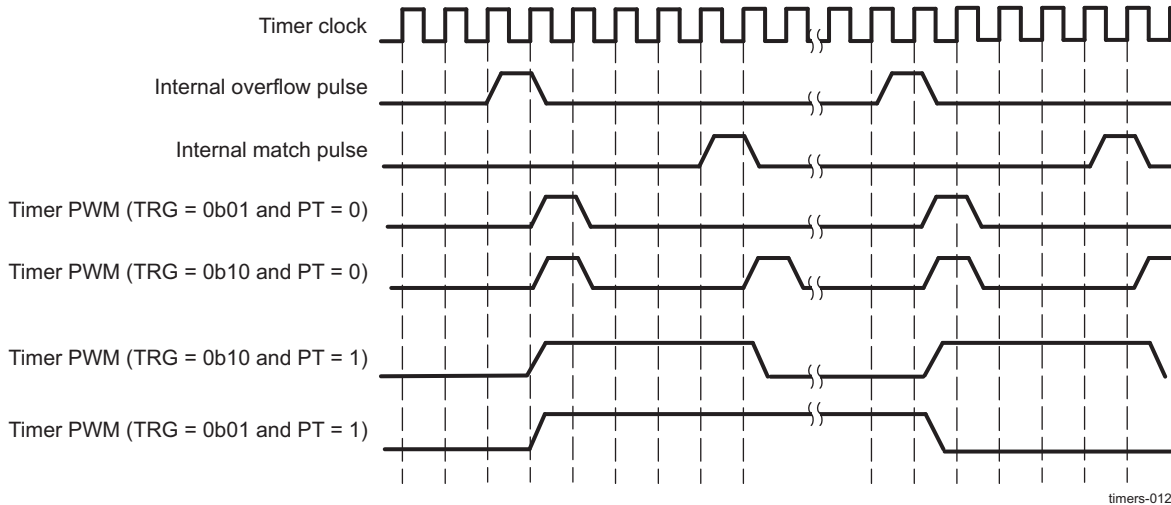

The [GPT\\_TCLR\[7\]](#) SCPWM bit can be programmed to set or clear the timer PWM output signal only while the counter is stopped or the trigger is off. This allows setting the output pin to a known state before modulation starts. Modulation synchronously stops when the [GPT\\_TCLR\[11:10\]](#) TRG bit field is cleared and overflow occurs. This allows fixing a deterministic state of the output pin when modulation stops.

In [Figure 22-13](#), the internal overflow pulse is set each time (0xFFFF FFFF - [GPT\\_TLDR\[31:0\]](#) LOAD\_VALUE + 1) the value is reached, and the internal match pulse is set when the counter reaches the [GPT\\_TMAR](#) register value. Depending on the value of the [GPT\\_TCLR\[12\]](#) PT bit and [GPT\\_TCLR\[11:10\]](#) TRG bit field, the timer provides pulse or PWM event on the output pin (timer PWM).

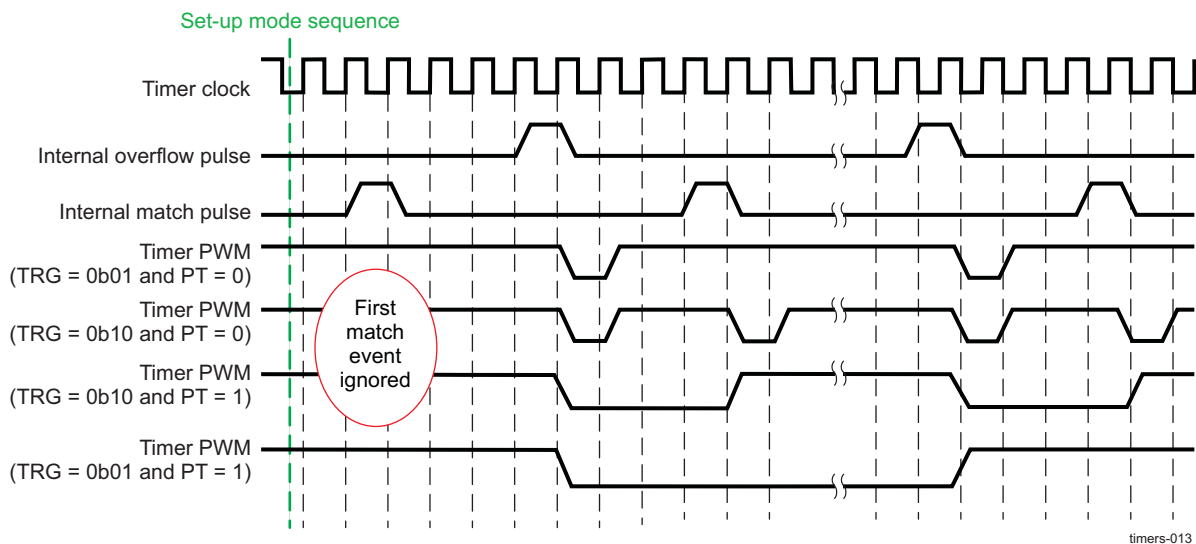

The [GPT\\_TLDR](#) and [GPT\\_TMAR](#) registers must keep values below the overflow value (0xFFFF FFFF) by at least two units. In case the PWM trigger events are both overflow and match, the difference between the values kept in the [GPT\\_TMAR](#) register and the value in the [GPT\\_TLDR](#) register must be at least two units. When match event is used, the compare mode [GPT\\_TCLR\[6\]](#) CE bit must be set.

In Figure 22-13, the `GPT_TCLR[7]` SCPWM bit is set to 0. In Figure 22-14, the `GPT_TCLR[7]` SCPWM bit is set to 1. To obtain the desired wave form, start the counter at `0xFFFF FFFE` value (to ensure an overflow first) or adjust the line polarity (`GPT_TCLR[7]` SCPWM bit).

**Figure 22-13. Timing Diagram of PWM With `GPT_TCLR[7]` SCPWM Bit = 0**

**Figure 22-14. Timing Diagram of PWM With `GPT_TCLR[7]` SCPWM Bit = 1**

**22.2.4.11 Timer Counting Rate**

The timer rate is defined by the following values:

- Value of the prescaler fields (the `GPT_TCLR[5]` PRE bit and the `GPT_TCLR[4:2]` PTV bit field)
- Value loaded into the timer-load register (`GPT_TLDR`)

Table 22-10 lists the prescaler clock ratio values.

**Table 22-10. Prescaler Clock Ratio Values**

<code>GPT_TCLR[5]</code> PRE	<code>GPT_TCLR[4:2]</code> PTV	Divisor (PS)
0	X	1
1	0	2
1	1	4

**Table 22-10. Prescaler Clock Ratio Values (continued)**

<b>GPT_TCLR[5] PRE</b>	<b>GPT_TCLR[4:2] PTV</b>	<b>Divisor (PS)</b>
1	2	8
1	3	16
1	4	32
1	5	64
1	6	128
1	7	256

Thus, the timer overflow rate is expressed as:

$$\text{OVF\_Rate} = (0xFFFF\ FFFF - \text{GPT\_TLDR} + 1) * (\text{timer-functional clock period}) * \text{PS}$$

With (timer-functional clock period) = 1/(timer-functional clock frequency) and PS =  $2^{(\text{PTV} + 1)}$  if prescaler is enabled, or PS = 1 if prescaler is disabled.

**CAUTION**

Internal resynchronization causes any write to the [GPT\\_TCLR\[1\] ST](#) bit to have some latency before the register is updated:

2.5 \* functional clock cycles write\_GPT\_TCLR\_latency 3.5 \* functional clock cycles

Remember to consider this latency whenever the timer must be started or stopped by a software change to the [GPT\\_TCLR\[1\] ST](#) bit.

**CAUTION**

- In the non-PWM mode, [GPT\\_TLDR](#) must be maintained at less than or equal to 0xFFFF FFFE.
- In the PWM mode, [GPT\\_TLDR](#) must be maintained at less than or equal to 0xFFFF FFFD.

For example, with a timer clock input of 32 kHz and the [GPT\\_TCLR\[5\] PRE](#) bit set to 0, the timer output period is as listed in [Table 22-11](#).

**Table 22-11. Value and Corresponding Interrupt Period**

<b>GPT_TLDR[31:0] LOAD_VALUE</b>	<b>Interrupt Period</b>
0x0000 0000	39 h
0xFFFF 0000	2.1 s
0xFFFF FFF0	524 $\mu$ s
0xFFFF FFFE	65.5 $\mu$ s

**22.2.4.12 Timer Under Emulation**

During emulation mode, the timer continues to run according to the value of the [GPT1MS\\_TIOCP\\_CFG\[5\]/GPT\\_TIOCP\\_CFG\[1\] EMUFREE](#) bit.

If the [GPT1MS\\_TIOCP\\_CFG\[5\]/GPT\\_TIOCP\\_CFG\[1\] EMUFREE](#) bit is set to 1, timer execution is not stopped in emulation mode and the interrupt is still generated when overflow or match is reached.

If the [GPT1MS\\_TIOCP\\_CFG\[5\]/GPT\\_TIOCP\\_CFG\[1\] EMUFREE](#) bit is set to 0, the prescaler and timer are frozen and both resume on exit from emulation mode. The asynchronous external input pin (dmtimer\_i\_pwm\_evt, with i=[8:11]) is internally synchronized on two timer-clock rising edges.

### 22.2.4.13 Accessing GP Timer Registers

All accesses are nonposted until software reconfiguration. All registers are 32 bits wide, accessible through the L4 interface with 16-bit or 32-bit access (read/write).

Any 16-bit write access must be least-significant bit (LSB) first, and the second write access must be most-significant bit (MSB) first. Write operations to the following GP timer registers can skip the MSB access if it is not necessary to update the 16 MSBs of the register:

- [GPT\\_TIDR](#)
- [GPT\\_TIOCP\\_CFG](#)
- [GPT1MS\\_TIOCP\\_CFG](#)
- [GPT\\_IRQSTATUS\\_RAW](#)
- [GPT\\_IRQSTATUS](#)
- [GPT\\_IRQENABLE\\_SET](#)
- [GPT\\_IRQENABLE\\_CLR](#)
- [GPT\\_IRQWAKEEN](#)
- [GPT\\_TISR](#)
- [GPT\\_TIER](#)
- [GPT\\_TWER](#)
- [GPT\\_TSICR](#)

Write operations to the following functional registers must be complete (the MSB must be written even if the MSB data is not used):

- [GPT\\_TCLR](#)
- [GPT\\_TCRR](#)
- [GPT\\_TLDR](#)
- [GPT\\_TTGR](#)
- [GPT\\_TMAR](#)
- [GPT\\_TPIR](#)
- [GPT\\_TNIR](#)
- [GPT\\_TCVR](#)
- [GPT\\_TOCR](#)
- [GPT\\_TOWR](#)

The following L4 synchronous registers are not affected by the posted/nonposted mode selection; the write/read operation is effective and acknowledged (command accepted) after one L4 clock cycle from command assertion:

- [GPT\\_TIDR](#)
- [GPT\\_TIOCP\\_CFG](#)
- [GPT1MS\\_TIOCP\\_CFG](#)
- [GPT\\_TISTAT](#)
- [GPT\\_IRQSTATUS](#)
- [GPT\\_IRQSTATUS\\_RAW](#)
- [GPT\\_IRQENABLE\\_SET](#)
- [GPT\\_IRQENABLE\\_CLR](#)
- [GPT\\_IRQWAKEEN](#)
- [GPT\\_TWPS](#)
- [GPT\\_TSICR](#)

### 22.2.4.13.1 Writing to Timer Registers

The host uses the L4 interface to write to the following registers synchronously with the timer interface clock:

- [GPT\\_TLDR](#)
- [GPT\\_TCRR](#)
- [GPT\\_TCLR](#)
- [GPT\\_TIOCP\\_CFG](#)
- [GPT1MS\\_TIOCP\\_CFG](#)
- [GPT\\_IRQSTATUS](#)
- [GPT\\_IRQENABLE\\_SET](#)
- [GPT\\_IRQENABLE\\_CLR](#)
- [GPT\\_IRQWAKEEN](#)
- [GPT\\_TTGR](#)
- [GPT\\_TSICR](#)
- [GPT\\_TMAR](#)

GPTIMER1, GPTIMER2, and GPTIMER10 also have the following registers:

- [GPT\\_TPIR](#)
- [GPT\\_TNIR](#)
- [GPT\\_TCVR](#)
- [GPT\\_TOCR](#)
- [GPT\\_TOWR](#)
- [GPT\\_TIER](#)
- [GPT\\_TISR](#)
- [GPT\\_TWER](#)

In 16-bit access mode, the 16 LSBs must be written before writing to the 16 MSBs.

#### 22.2.4.13.1.1 Write Posting Synchronization Mode

This mode is used if the [GPT\\_TSICR\[2\] POSTED](#) bit is set to 1.

This mode uses a posted write scheme to update any internal register ([GPT\\_TCLR](#), [GPT\\_TCRR](#), [GPT\\_TLDR](#), [GPT\\_TTGR](#), [GPT\\_TMAR](#), and [GPT\\_TPIR](#), [GPT\\_TNIR](#), [GPT\\_TCVR](#), [GPT\\_TOCR](#), and [GPT\\_TOWR](#) for GPTIMER1, GPTIMER2, and GPTIMER10). Therefore, the write transaction is immediately acknowledged on the L4 interface, although the effective write operation occurs later due to a resynchronization in the timer clock domain. The advantage is that neither the interconnect nor the device that requested the write transaction are stalled.

For each register, a status bit is provided in the timer write-posted status register [GPT\\_TWPS](#). In this mode, it is mandatory that the software checks this status bit prior to any write access. In case a write is attempted to a register with a previous access pending, the previous access is discarded without notice.

The timer module updates the timer counter register value synchronously with the L4 clock. Consequently, any read access to the timer counter register [GPT\\_TCRR](#) does not add any resynchronization latency; the current value is always available.

---

**NOTE:** Since the overflow IRQ is generated, when the TCRR value reaches 0xFFFF FFFF, and not when it changes its value to the value after overflow, one must wait a delay of (1 \* PS \* timer-functional clock period) before any read access to the timer counter register [GPT\\_TCRR](#) to ensure a correct reading of its content.

---

If a write access is pending for a register, reading from this register does not yield a correct result. Software synchronization must be used to avoid incorrect results.

The drawback of this automatic update mechanism is that it assumes a given relationship between the timer interface frequency and the timer clock frequency.

Functional frequency range:  $\text{freq}(\text{timer clock}) < \text{freq}(\text{L4 interface clock})/4$ .

### 22.2.4.13.1.2 Write Nonposting Synchronization Mode

This mode is used if the `GPT_TSICR[2]` POSTED bit is set to 0. It uses a nonposted write scheme to update any internal register. Therefore, the write transaction is not acknowledged on the L4 interface until the effective write operation occurs after the resynchronization in the timer functional clock domain. The drawback is that both the interconnect and the device that requested the write transaction are stalled during this period.

The same full resynchronization scheme is used for a read transaction, and the same stall period applies. A register read following a write to the same register is always coherent.

This mode is functional regardless of the ratio between the L4 interface frequency and the timer clock frequency.

### 22.2.4.13.2 Reading From Timer Counter Registers

In 16-bit access mode, reading the 16 LSBs from the timer counter registers (`GPT_TCRR`, `GPT_TCAR1`, and `GPT_TCAR2`) captures the current timer counter value. This must be followed by reading the 16 MSBs.

IVA3 subsystem 16-bit accesses can be interleaved with MPU subsystem 32-bit accesses.

---

**NOTE:** LSB/MSB accesses cannot be interleaved (that is, the sequence LSB register 1, LSB register 2, MSB register 1, MSB register 2 is not supported).

---

## 22.2.5 GP Timer Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and usage of the module.

### 22.2.5.1 Global Initialization

#### 22.2.5.1.1 Global Initialization of Surrounding Modules

This section identifies the requirements for initializing the surrounding modules when the GP timer module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the GP timer. For more information, see [Section 22.2.3 GP Timers Integration](#) and [Section 22.2.2, GP Timers Environment](#).

**Table 22-12. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	The module interface and functional clocks must be enabled. For more information about the module configuration, see <a href="#">Section 3.1.1.1.2, Module Level Clock Management</a> , in <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Control Module	The module specific pad muxing must be set in the control module. For more information about the module configuration, see <a href="#">Section 18.4.8 PAD Functional Multiplexing and Configuration</a> , in <a href="#">Chapter 18, Control Module</a> .
MPU INTC	The MPU INTC configuration must be done to enable the interrupts from the GP timer module. See <a href="#">Section 4.4.3, Interrupt Controller Registers</a> , in <a href="#">Chapter 4, Cortex-A9 MPU Subsystem</a> .
DSP INTC	The DSP INTC configuration must be done to enable the interrupts from GP timer module. See <a href="#">Section 5.3.2.6, INTC</a> , in <a href="#">Chapter 5, DSP Subsystem</a> .

### 22.2.5.1.2 GP Timer Module Global Initialization

#### 22.2.5.1.2.1 Main Sequence – GP Timer Module Global Initialization

This section identifies the main steps for initializing the GP timer module when the module is to be used for the first time.

**Table 22-13. GP Timer Module Global Initialization**

Step	Register/Bit Field/Programming Model	Value
Execute software reset.	<a href="#">GPT_TIOCP_CFG[0]</a> SOFTRESET <sup>(1)</sup> or <a href="#">GPT1MS_TIOCP_CFG[0]</a> SOFTRESET <sup>(2)</sup>	0x1
Wait until reset release?	<a href="#">GPT_TIOCP_CFG[0]</a> SOFTRESET <sup>(1)</sup> or <a href="#">GPT1MS_TIOCP_CFG[0]</a> SOFTRESET <sup>(2)</sup>	0x0
Configure Idle mode.	<a href="#">GPT_TIOCP_CFG[3:2]</a> IDLEMODE <sup>(1)</sup> or <a href="#">GPT1MS_TIOCP_CFG[4:3]</a> IDLEMODE <sup>(2)</sup>	xx
Configure clock activity.	<a href="#">GPT1MS_TIOCP_CFG[9:8]</a> CLOCKACTIVITY <sup>(2)</sup>	xx
Configure wake-up feature.	<a href="#">GPT1MS_TIOCP_CFG[2]</a> ENAWAKEUP <sup>(2)</sup>	x
Enable wake-up interrupt events.	<a href="#">GPT_IRQWAKEEN[2:0]</a> <sup>(1)</sup> or <a href="#">GPT_TWER[2:0]</a> <sup>(2)</sup>	x
Select posted mode.	<a href="#">GPT_TSICR[2]</a> POSTED	x

<sup>(1)</sup> Applies only to GPTIMER3 through GPTIMER9, and GPTIMER11

<sup>(2)</sup> Applies only to GPTIMER1, GPTIMER2, and GPTIMER10

### 22.2.5.2 Operational Mode Configuration

#### 22.2.5.2.1 GP Timer Mode

##### 22.2.5.2.1.1 Main Sequence – GP Timer Mode Configuration

**Table 22-14. GP Timer Mode Configuration**

Step	Register/Bit Field/Programming Model	Value
Select autoreload mode	<a href="#">GPT_TCLR[1]</a> AR	x
Set prescale timer value.	<a href="#">GPT_TCLR[4:2]</a> PTV	xxx
Enable prescaler.	<a href="#">GPT_TCLR[5]</a> PRE	0x1
Enable overflow interrupt.	<a href="#">GPT_TIER[1]</a> OVF_IT_ENA <sup>(1)</sup> or <a href="#">GPT_IRQENABLE_SET[1]</a> OVF_EN_FLAG <sup>(2)</sup>	0x1
Load timer counter value.	<a href="#">GPT_TCRR</a>	xxx
Load timer load value.	<a href="#">GPT_TLDR</a>	xxx
Start the timer.	<a href="#">GPT_TCLR[0]</a> ST	0x1

<sup>(1)</sup> Applies only to GPTIMER1, GPTIMER2, and GPTIMER10.

<sup>(2)</sup> Applies only to GPTIMER3 through GPTIMER 9, and GPTIMER11.

#### 22.2.5.2.2 GP Timer Compare Mode

##### 22.2.5.2.2.1 Main Sequence – GP Timer Compare Mode Configuration

**Table 22-15. GP Timer Compare Mode Configuration**

Step	Register/Bit Field/Programming Model	Value
Select autoreload mode.	<a href="#">GPT_TCLR[1]</a> AR	x
Set prescale timer value.	<a href="#">GPT_TCLR[4:2]</a> PTV	xxx
Enable prescaler.	<a href="#">GPT_TCLR[5]</a> PRE	0x1

**Table 22-15. GP Timer Compare Mode Configuration (continued)**

Step	Register/Bit Field/Programming Model	Value
Enable match interrupt.	<a href="#">GPT_TIER[0] MAT_IT_ENA<sup>(1)</sup></a> or <a href="#">GPT_IRQENABLE_SET[0] MAT_EN_FLAG<sup>(2)</sup></a>	0x1
Load timer counter value.	<a href="#">GPT_TCRR</a>	xxx
Load timer compare value.	<a href="#">GPT_TMAR</a>	xxx
Enable Compare mode.	<a href="#">GPT_TCLR[6] CE</a>	0x1
Start the timer.	<a href="#">GPT_TCLR[0] ST</a>	0x1

<sup>(1)</sup> Applies only to GPTIMER1, GPTIMER2, and GPTIMER10.

<sup>(2)</sup> Applies only to GPTIMER3 through GPTIMER9, and GPTIMER11.

### 22.2.5.2.3 GP Timer Capture Mode

#### 22.2.5.2.3.1 Main Sequence – GP Timer Capture Mode Configuration

**Table 22-16. GP Timer Capture Mode Configuration**

Step	Register/Bit Field/Programming Model	Value
Initialize capture mode.	See <a href="#">Section 22.2.5.2.3.2</a> .	
Enable capture interrupt.	<a href="#">GPT_TIER[2] TCAR_IT_ENA<sup>(1)</sup></a> or <a href="#">GPT_IRQENABLE_SET[2] TCAR_EN_FLAG<sup>(2)</sup></a>	0x1
Start the timer.	<a href="#">GPT_TCLR[0] ST</a>	0x1
Detect event.	See <a href="#">Section 22.2.5.2.3.3</a> .	

<sup>(1)</sup> Applies only to GPTIMER1, GPTIMER2, and GPTIMER10.

<sup>(2)</sup> Applies only to GPTIMER3 through GPTIMER9, and GPTIMER11.

#### 22.2.5.2.3.2 Subsequence – Initialize Capture Mode

**Table 22-17. Initialize Capture Mode**

Step	Register/Bit Field/Programming Model	Value
Select autoreload mode.	<a href="#">GPT_TCLR[1] AR</a>	x
Set prescale timer value.	<a href="#">GPT_TCLR[4:2] PTV</a>	xxx
Enable prescaler.	<a href="#">GPT_TCLR[5] PRE</a>	0x1
Select GPTx (where x = 8 to 11). Capture input at device pin dmtimerx_pwm_evt.	<a href="#">GPT_TCLR[14] GPO_CFG<sup>(1)</sup></a>	0x1
Select single or second event capture.	<a href="#">GPT_TCLR[13] CAPT_MODE</a>	x
Select transition capture mode.	<a href="#">GPT_TCLR[9:8] TCM</a>	xx

<sup>(1)</sup> Applies only to GPTIMER8 through GPTIMER11

#### 22.2.5.2.3.3 Subsequence – Detect Event

**Table 22-18. Detect Event**

Step	Register/Bit Field/Programming Model	Value
Wait until event detected?	<a href="#">GPT_TISR[2] TCAR_IT_FLAG<sup>(1)</sup></a> or <a href="#">GPT_IRQSTATUS[2] TCAR_IT_FLAG<sup>(2)</sup></a>	= 0x1
Read Timer capture value.	<a href="#">GPT_TCAR1</a> and/or <a href="#">GPT_TCAR2</a>	

<sup>(1)</sup> Applies only to GPTIMER1, GPTIMER2, and GPTIMER10.

<sup>(2)</sup> Applies only to GPTIMER3 through GPTIMER9, and GPTIMER11.

**Table 22-18. Detect Event (continued)**

Step	Register/Bit Field/Programming Model	Value
Clear capture interrupt request.	<a href="#">GPT_TISR</a> [2] TCAR_IT_FLAG <sup>(1)</sup> or <a href="#">GPT_IRQSTATUS</a> [2] TCAR_IT_FLAG <sup>(2)</sup>	0x1

#### 22.2.5.2.4 GP Timer PWM Mode

##### 22.2.5.2.4.1 Main Sequence – GP Timer PWM Mode Configuration

**Table 22-19. GP Timer PWM Mode Configuration**

Step	Register/Bit Field/Programming Model	Value
Select autoreload mode.	<a href="#">GPT_TCLR</a> [1] AR	x
Set prescale timer value.	<a href="#">GPT_TCLR</a> [4:2] PTV	xxx
Enable prescaler.	<a href="#">GPT_TCLR</a> [5] PRE	0x1
Select trigger output mode.	<a href="#">GPT_TCLR</a> [11:10]TRG	xx
Select pulse or toggle modulation PWM mode.	<a href="#">GPT_TCLR</a> [12] PT	x
Select GPTx (where x = 8 to 11) pwm output at device pin dmtimerx_pwm_evt.	<a href="#">GPT_TCLR</a> [14] GPO_CFG <sup>(1)</sup>	0x0
Configure PWM output pin default value.	<a href="#">GPT_TCLR</a> [7] SCPWM	x

Load timer compare value.	<a href="#">GPT_TMAR</a>	xxx
Enable compare.	<a href="#">GPT_TCLR</a> [6] CE	0x1
Start the timer.	<a href="#">GPT_TCLR</a> [0] ST	0x1

<sup>(1)</sup> Applies only to GPTIMER8 through GPTIMER11

## 22.2.6 GP Timer Register Manual

### 22.2.6.1 GP Timer Instance Summary

[Table 22-20](#) lists the base address and block size for the GP timer module instances.

**Table 22-20. GP Timer Instance Summary**

Module Name	Base Address L4 Interconnect	Base Address L3 Interconnect	Base Address Cortex-A9 Private Access	Base Address DSP Private Access	Size
GPTIMER2	0x4803 2000	-	-	-	4 KB
GPTIMER3	0x4803 4000	-	-	-	4 KB
GPTIMER4	0x4803 6000	-	-	-	4 KB
GPTIMER9	0x4803 E000	-	-	-	4 KB
GPTIMER10	0x4808 6000	-	-	-	4 KB
GPTIMER11	0x4808 8000	-	-	-	4 KB
GPTIMER5	-	0x4903 8000	0x4013 8000	0x01D3 8000	4 KB
GPTIMER6	-	0x4903 A000	0x4013 A000	0x01D3 A000	4 KB
GPTIMER7	-	0x4903 C000	0x4013 C000	0x01D3 C000	4 KB
GPTIMER8	-	0x4903 E000	0x4013 E000	0x01D3 E000	4 KB
GPTIMER1	0x4A31 8000	-	-	-	4 KB

**NOTE:** Private Access is an access which is not using the L3/L4 interconnects.

### 22.2.6.2 GP Timer Registers

#### 22.2.6.2.1 GP Timer Register Summary

**CAUTION**

The GP timer registers are limited to 32-bit and 16-bit data accesses; 8-bit access is not allowed and can corrupt the register content.

[Table 22-21](#) through [Table 22-27](#) provide the register summary and associated offset addresses for the 11 GP timer internal registers.

**Table 22-21. GPTIMER1, GPTIMER2, and GPTIMER10 Register Mapping Summary**

Register Name	Type	Register Width (Bits)	Address Offset	GPTIMER1 Physical Address L4 Interconnect	GPTIMER2 Physical Address L4 Interconnect	GPTIMER10 Physical Address L4 Interconnect
GPT_TIDR	R	32	0x0000 0000	0x4A31 8000	0x4803 2000	0x4808 6000
GPT1MS_TIOCP_CFG	RW	32	0x0000 0010	0x4A31 8010	0x4803 2010	0x4808 6010
GPT_TISTAT	R	32	0x0000 0014	0x4A31 8014	0x4803 2014	0x4808 6014

<b>Description</b>	This register controls the various parameters of the L4 interface.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																IDLEMODE		EMUFREE	SOFTRESET												

Bits	Field Name	Description	Type	Reset
31:4	RESERVED	Reserved	R	0x00000000
3:2	IDLEMODE	Power management, req/ack control  0x0: Force-idle mode: local target idle state follows (acknowledges) the system idle requests unconditionally, that is, regardless of the IP module internal requirements. Back-up mode, for debug only.  0x1: No-idle mode: local target never enters idle state. Back-up mode, for debug only.  0x2: Smart-idle mode: local target idle state eventually follows (acknowledges) the system idle requests, depending on the IP module internal requirements. IP module should not generate (IRQ- or DMA-request-related) wake-up events.  0x3: Smart-idle wake-up-capable mode: local target idle state eventually follows (acknowledges) the system idle requests, depending on the IP module internal requirements. IP module may generate (IRQ- or DMA-request-related) wake-up events when in idle state. Mode is only relevant if the appropriate IP module <i>swake-up</i> output(s) is (are) implemented.	RW	0x0
1	EMUFREE	Emulation mode  0x0: The timer is frozen in emulation mode (PINSUSPENDN signal active).  0x1: The timer runs free, regardless of PINSUSPENDN value.	RW	0

Bits	Field Name	Description	Type	Reset
0	SOFTRESET	Software reset  0x0: Read 0: reset done, no pending action Write 0: No action  0x1: Read 1: initiate software reset Write 1: Reset ongoing	RW	0

<b>Description</b>	This register controls optional features specific to the timer functionality.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																GPO_CFG	CAPT_MODE	PT	TRG	TCM	SCPWM	CE	PRE	PTV	AR	ST					

Bits	Field Name	Description	Type	Reset
31:15	RESERVED	Reserved	R	0x00000
14	GPO_CFG	General-purpose output - this register directly drives the GPTi_PORGPOCFG output pin. For specific use of the GPO_CFG bit, see <a href="#">Section 22.2.2.1, GP Timer External System Interface</a> .  0x0: GPTi_PORGPOCFG drives 0. 0x1: GPTi_PORGPOCFG drives 1.	RW	0
13	CAPT_MODE	Capture mode select bit (first/second)  0x0: Single capture: Capture the first enabled capture event in TCAR1.  0x1: Capture on second event: Capture the second enabled capture event in TCAR2.	RW	0
12	PT	Pulse or toggle mode on GPTi_PWM_out output pin  0x0: Pulse modulation 0x1: Toggle modulation	RW	0
11:10	TRG	Trigger output mode on GPTi_PWM_out output pin  0x0: No trigger 0x1: Trigger on overflow. 0x2: Trigger on overflow and match. 0x3: Reserved	RW	0x0

Bits	Field Name	Description	Type	Reset
9:8	TCM	Transition capture mode on GPTi_EVENT_CAPTURE input pin (When the TCM field passed from (00) to any other combination, the TCAR_IT_FLAG and the edge detection logic are cleared.) 0x0: No capture 0x1: Capture on rising edges of GPTi_EVENT_CAPTURE pin 0x2: Capture on falling edges of GPTi_EVENT_CAPTURE pin 0x3: Capture on both edges of GPTi_EVENT_CAPTURE pin	RW	0x0
7	SCPWM	Pulse width modulation output pin default setting This bit must be set or clear while the timer is stopped or the trigger is off. 0x0: Clear the GPTi_PWM_out output pin and select positive pulse for pulse mode. 0x1: Set the GPTi_PWM_out output pin and select negative pulse for pulse mode.	RW	0
6	CE	Compare enable 0x0: Compare mode is disable. 0x1: Compare mode is enable.	RW	0
5	PRE	Prescaler enable 0x0: The TIMER clock input pin clocks the counter. 0x1: The divided input pin clocks the counter.	RW	0
4:2	PTV	Prescale clock timer value The timer counter is prescaled with the value $2^{(PTV+1)}$ . Example: PTV = 3, counter increases value (if started) after 16 functional clock periods.	RW	0x0
1	AR	Autoreload mode 0x0: One shot timer 0x1: Autoreload timer	RW	0
0	ST	Start/stop timer control 0x0: Stop timer: Only the counter is frozen. If one-shot mode selected (AR =0), this bit is automatically reset by internal logic when the counter is overflowed. 0x1: Start timer	RW	0

## 22.3 Watchdog Timers

### 22.3.1 Watchdog Timers Overview

The device includes two instances of the 32-bit watchdog timer: WDT2 and WDT3. Figure 22-15 shows how each timer is connected in the device.

**NOTE:** WDT<sub>i</sub> (where *i* is the watchdog timer instance: *i* = 2 or 3) stands for the following:

- WDT2: Watchdog timer 2, also called MPU watchdog timer
- WDT3: Watchdog timer 3, also called IVA3 watchdog timer

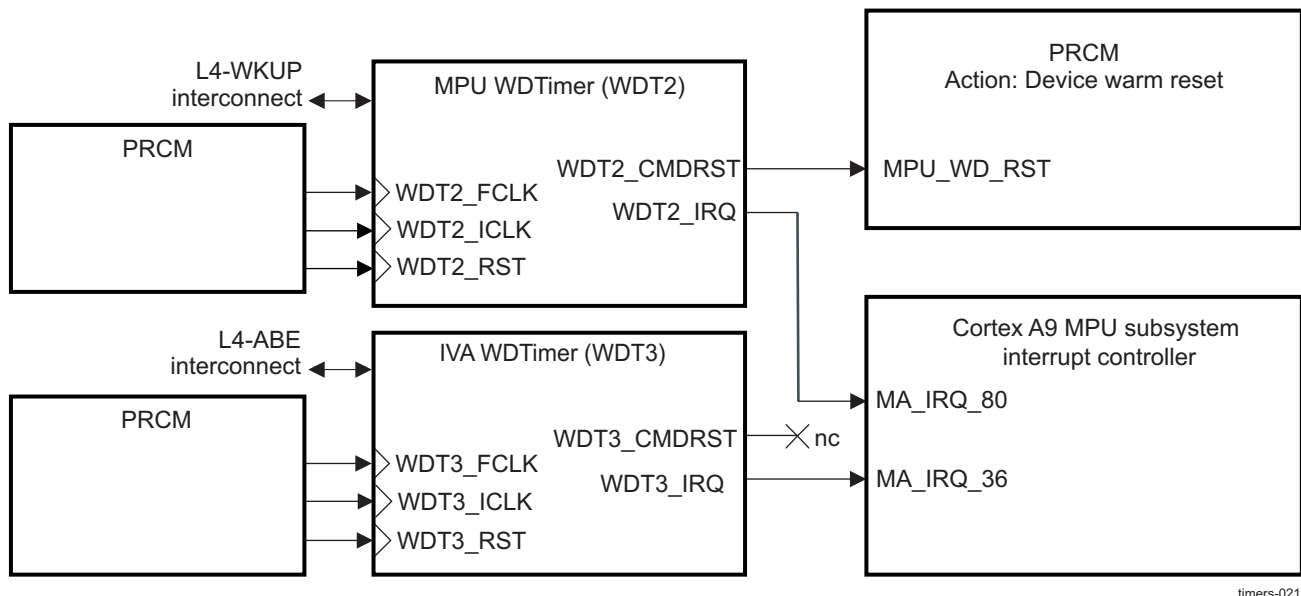

Each watchdog timer is an upward counter capable of generating a pulse on the reset pin and an interrupt to the device system modules following an overflow condition. The MPU watchdog timer serves a reset to the PRCM module and an interrupt to the MPU. The IVA3 watchdog timer serves a watchdog interrupt to the MPU, and its reset outputs are unused.

The watchdog timers can be accessed, loaded, and cleared by registers through the L4 interface. The MPU and IVA3 watchdog timers have the 32-kHz clock for their timer clock input.

The MPU watchdog timer directly generates a warm reset condition on overflow. The IVA3 watchdog timer generates an MPU interrupt condition on overflow, which can be used by the application software through the PRCM module to indirectly trigger a reset condition (that is, to the IVA3 subsystem).

The MPU watchdog timer connects to a single target agent port on the L4 interconnect.

**Figure 22-15. Watchdog Timers Block Diagram**

timers-021

Table 22-80 lists the default state of the watchdog timers in the device.

**Table 22-80. Watchdog Timers Default State**

Timer	Default State	
MPU WDT2	Enabled	Not running
IVA3 WDT3	Enabled	Not running

---

**NOTE:** The default state of the watchdog timers described in [Table 22-80](#) is considered to be their state immediately after ROM code execution. For more information, see [Chapter 27, Initialization](#).

---

### 22.3.1.1 Watchdog Timers Features

The main features of the watchdog timer controllers are:

- L4 slave interface support:
  - 32-bit data bus width
  - 32-/16-bit access supported
  - 8-bit access not supported
  - 11-bit address bus width
  - Burst mode not supported
  - Only posted write/read internal resynchronization mode supported
- Free-running 32-bit upward counter
- Programmable divider clock source ( $2^n$  where  $n = [0:7]$ )
- On-the-fly read/write register (while counting)
- Subset programming model of the GP timer
- The watchdog timers are reset either on power-on or after a warm reset before they start counting.
- Reset or interrupt actions when a timer overflow condition occurs
- The watchdog timer generates a reset or an interrupt in its hardware integration (WDT2 or WDT3).

### 22.3.2 Watchdog Timer Environment

The watchdog timers are accessible through the L4 interface.

### 22.3.3 Watchdog Timer Integration

Figure 22-16 shows the integration of the watchdog timers in the device.

Figure 22-16. Watchdog Timers Integration

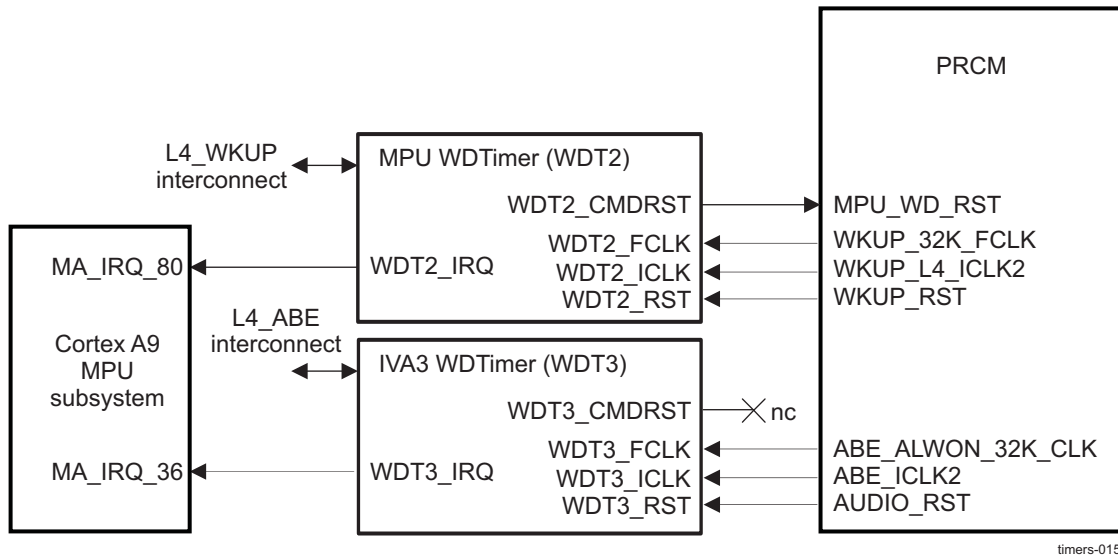

Table 22-81 through Table 22-83 summarize the integration of the module in the device.

Table 22-81. Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
WDT2	PD_WKUP	Yes	L4_WKUP
WDT3	PD_AUDIO	Yes	L4_ABE

Table 22-82. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
WDT2	WDT2_FCLK	WKUP_32K_FCLK	PRCM	WDT2 functional clock
WDT2	WDT2_ICLK	WKUP_L4_ICLK2	PRCM	WDT2 interface clock
WDT3	WDT3_FCLK	ABE_ALWON_32K_CLK	PRCM	WDT3 functional clock
WDT3	WDT3_ICLK	ABE_ICLK2	PRCM	WDT3 interface clock
Resets

---

**No DMA Requests**

---

**NOTE:**

- See [Section 22.3.4.2, Interrupts](#), for interrupt source description.
-

## 22.3.4 Watchdog Timers Functional Description

### 22.3.4.1 Power Management

There are two clock domains in the watchdog timers:

- Functional clock domain: WDTi\_FCLK is the watchdog timer functional clock. It is used to clock the watchdog timer internal logic.
- Interface clock domain: WDTi\_ICLK is the watchdog timer interface clock. It is used to synchronize the watchdog timer L4 port to the L4 interconnect. All accesses from the interconnect are synchronous to WDTi\_ICLK.

Table 22-82 lists the source clocks for each watchdog timer in the device. For more information about clock control and domains, see Section 3.1.1.1, *Clock Management* in Chapter 3, *Power, Reset, and Clock Management*.

From a global system power-management perspective, when one or both of the watchdog timer clocks is no longer required, the watchdog timers can be deactivated at the PRCM module level in the corresponding registers.

At the PRCM module level, when the conditions to shut off the PRCM module functional or interface output clocks are met (for more information, see the , *Clock Domain Level Clock Management*), the PRCM module automatically launches a hardware handshake protocol to ensure the watchdog timer is ready to have its clocks switched off. Namely, the PRCM module asserts an IDLE request to the watchdog timer.

Although this handshake is a hardware function and out of software control, the way the watchdog timer acknowledges the PRCM IDLE request is configurable through the WDT\_WDSC[4:3] IDLEMODE bit field. Table 22-84 lists the settings and related acknowledgment modes of the IDLEMODE bit field.

**Table 22-84. IDLEMODE Settings**

IDLEMODE Value	Selected Mode	Description
00	Force-idle	The watchdog timer unconditionally acknowledges the IDLE request from the PRCM module, regardless of its internal operations. This mode must be used carefully, because it does not prevent loss of data when the clock is switched off.
01	No-idle	The watchdog timer never acknowledges an IDLE request from the PRCM module. This mode is safe from a module point of view, because it ensures that the clocks remain active. It is not efficient from a power-saving perspective, however, because it does not allow the PRCM module output clock to be shut off and thus the power domain to be set to a lower power state.
10	Smart-idle	The watchdog timer acknowledges the IDLE request, basing its decision on its internal activity. The acknowledge signal is asserted only when all pending transactions and IRQ requests are treated. This is the best approach for efficient system power management.
11	Smart-idle wakeup-capable mode	The watchdog timer acknowledges the IDLE request, basing its decision on its internal activity. The timer generates (IRQ-request-related) wake-up events when in IDLE state if the WDT_WIRQWAKEEN[1:0] bits are set to 1.

#### 22.3.4.1.1 Wake-Up Capability

If the WDT\_WDSC[4:3] IDLEMODE bit field sets smart-idle wakeup-capable mode (= 0 × 3), the timer evaluates its internal capability to have the interface clock switched off. When there is no more internal activity (no pending interrupt sources: match, overflow, or timer capture events), the idle acknowledge signal is asserted and the timer enters into sleep mode, ready to issue a wake-up request. This wake-up request is sent only if the WDT\_WIRQWAKEEN[0] OVF\_WK\_ENA and/or the WDT\_WIRQWAKEEN[1] DLY\_WK\_ENA bits enable the overflow and/or the delay wake-up capability.

#### 22.3.4.2 Interrupts

Table 22-85 list the event flags, and their masks, that cause module interrupts.

**Table 22-85. Watchdog Timer Events**

Event Flag	Event Mask	Mapping	Comments
WDT_WIRQSTAT[0] EVENT_OVF	WDT_WIRQENSET/WDT_WIRQENCLR[0] OVF_IT_ENA	WDTi_IRQ	Watchdog timer overflow
WDT_WIRQSTAT[1] EVENT_DLY	WDT_WIRQENSET/WDT_WIRQENCLR[1] DLY_IT_ENA	WDTi_IRQ	Watchdog delay value reached

### 22.3.4.3 General Watchdog Timer Operation

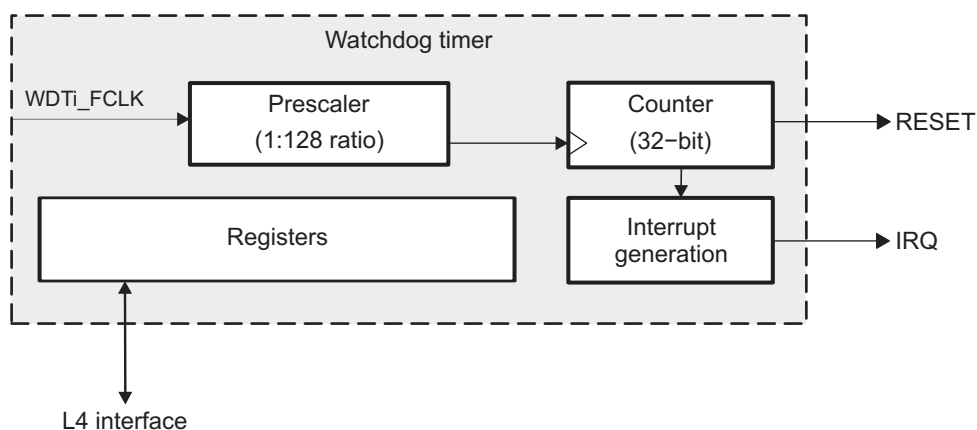

The watchdog timers are based on an upward 32-bit counter coupled with a prescaler. The counter overflow is signaled through two independent signals: a simple reset signal and an interrupt signal, both active low. The use of these signals depends on whether they are connected or not. For this information, see [Figure 22-15](#). The interrupt generation mechanism is controlled through the [WDT\\_WIRQENSET/WDT\\_WIRQENCLR](#) and [WDT\\_WIRQSTAT](#) registers.

The prescaler ratio can be set from 1 to 128 by accessing the

[WDT\\_WCLR\[4:2\]](#) PTV bit field and the [WDT\\_WCLR\[5\]](#) PRE bit of the watchdog control register ([WDT\\_WCLR](#)).

The current timer value can be accessed on-the-fly by reading the watchdog timer counter register ([WDT\\_WCRR](#)), modified by accessing the watchdog timer load register ([WDT\\_WLDR](#)) (no on-the-fly update), or reloaded by following a specific reload sequence on the watchdog timer trigger register ([WDT\\_WTGR](#)). A start/stop sequence applied to the watchdog timer start/stop register ([WDT\\_WSPR](#)) can start and stop the watchdog timers.

[Figure 22-17](#) is a functional block diagram of the watchdog timer.

**Figure 22-17. 32-Bit Watchdog Timer Functional Block Diagram**

timers-016

### 22.3.4.4 Reset Context

The watchdog timers are enabled after reset. [Table 22-86](#) lists the default reset values of the two watchdog timer load registers (the [WDT\\_WLDR](#)) and prescaler ratios (the [WDT\\_WCLR\[4:2\]](#) PTV bit field). To get these values, software must read the corresponding [WDT\\_WCLR\[4:2\]](#) PTV bit field and the 32-bit register to retrieve the static configuration of the module.

**Table 22-86. Count and Prescaler Default Reset Values**

Timer	WDT_WLDR Reset Value	PTV Reset Value
MPU WDT (WDT2)	0xFFFB 0000	0
IVA3 WDT (WDT3)	0xFFFB 0000	0

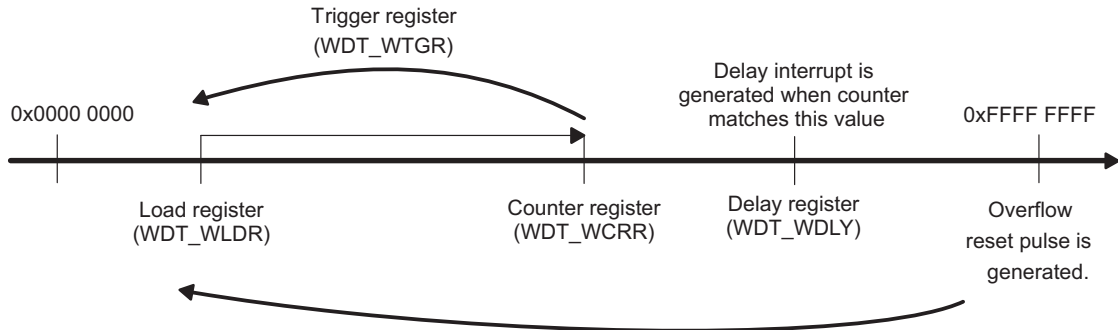

### 22.3.4.5 Overflow/Reset Generation

When the watchdog timer counter register ([WDT\\_WCRR](#)) overflows, an active-low reset pulse is generated to the PRCM module. This pulse is one prescaled timer clock cycle wide and occurs at the same time as the timer counter overflow.

After reset generation, the counter is automatically reloaded with the value stored in the watchdog load register ([WDT\\_WLDR](#)) and the prescaler is reset (the prescaler ratio remains unchanged). When the reset pulse output is generated, the timer counter begins incrementing again.

Figure 22-18 shows a general functional view of the watchdog timers.

Figure 22-18. Watchdog Timers General Functional View

timers-017

### 22.3.4.6 Prescaler Value/Timer Reset Frequency

Each watchdog timer is composed of a prescaler stage and a timer counter.

The timer rate is defined by the following values:

- Value of the prescaler fields (the [WDT\\_WCLR\[5\]](#) PRE bit and the [WDT\\_WCLR\[4:2\]](#) PTV bit field)
- Value loaded into the timer load register ([WDT\\_WLDR](#))

The prescaler stage is clocked with the timer clock and acts as a clock divider for the timer counter stage. The ratio is managed by accessing the ratio definition field (the [WDT\\_WCLR\[4:2\]](#) PTV bit field) and is enabled with the [WDT\\_WCLR\[5\]](#) PRE bit.

Table 22-87 lists the prescaler clock ratio values.

Table 22-87. Prescaler Clock Ratio Values

<a href="#">WDT_WCLR[5]</a> PRE	<a href="#">WDT_WCLR[4:2]</a> PTV	Clock Divider (PS)
0	X	1
1	0	1
1	1	2
1	2	4
1	3	8
1	4	16
1	5	32
1	6	64
1	7	128

Thus the watchdog timer overflow rate is expressed as:

$$\text{OVF\_Rate} = (0\text{x}\text{FFFF FFFF} - \text{WDT\_WLDR} + 1) \times (\text{wd-functional clock period}) \times \text{PS}$$

where wd-functional clock period =  $1/(\text{wd-functional clock frequency})$  and  $\text{PS} = 2^{(\text{PTV})}$

### CAUTION

Internal resynchronization causes some latency in any software write to [WDT\\_WSPR](#) before [WDT\\_WSPR](#) is updated with the programmed value:

$1.5 \times \text{functional clock cycles} \leq \text{write\_WDT\_WSPR\_latency} \leq 2.5 \times \text{functional clock cycles}$

Remember to consider this latency whenever the watchdog timer must be started or stopped.

For example, for a timer clock input of 32 kHz with a prescaler ratio value of 0x1 (clock divided by 2) and [WDT\\_WCLR](#)[5] PRE = 1 (clock divider enabled), the reset period is as listed in [Table 22-88](#).

**Table 22-88. Reset Period Examples**

<a href="#">WDT_WLDR</a> Value	Reset Period
0x0000 0000	74 h 56 min
0xFFFF 0000	4 s
0xFFFF FFF0	1 ms
0xFFFF FFFF	62.5 us

### CAUTION

- Ensure that the reloaded value allows the correct operation of the application. When a watchdog timer is enabled, software must periodically trigger a reload before the counter overflows. Hence, the value of the [WDT\\_WLDR](#)[31:0] bit field must be chosen according to the ongoing activity preceding the watchdog reload.
- Due to design reasons, [WDT\\_WLDR](#)[31:0] = 0xFFFF FFFF is a special case, although such a value of [WDT\\_WLDR](#) is meaningless. When [WDT\\_WLDR](#) is programmed with the overflow value, a triggering event generates a reset/interrupt one functional clock cycle later, even if the watchdog timer is stopped.

[Table 22-89](#) lists the default reset periods for the watchdog timers.

**Table 22-89. Default Watchdog Timer Reset Periods**

Watchdog Timers	Clock Source	Default Reset Period
MPU/IVA3 WDTs	32 kHz	10 s

#### 22.3.4.7 Triggering a Timer Reload

To reload the timer counter and reset the prescaler before reaching overflow, a reload command is executed by accessing the watchdog timer trigger register ([WDT\\_WTGR](#)) using a specific reload sequence.

The specific reload sequence is performed whenever the written value on the [WDT\\_WTGR](#) register differs from its previous value. In this case, reload is executed in the same way as an overflow autoreload, but without the generation of a reset pulse.

The timer counter is loaded with the value of the watchdog timer load register (the [WDT\\_WLDR\[31:0\] TIMER\\_LOAD](#) bit field), and the prescaler is reset.

#### 22.3.4.8 Start/Stop Sequence for Watchdog Timers (Using the WDT\_WSPR Register)

To start and stop a watchdog timer, access must be made through the start/stop register ([WDT\\_WSPR](#)) using a specific sequence.

To disable the timer, follow this sequence:

1. Write 0xFFFF AAAA in [WDT\\_WSPR](#).
2. Write 0xFFFF 5555 in [WDT\\_WSPR](#).

To enable the timer, follow this sequence:

1. Write 0xFFFF BBBB in [WDT\\_WSPR](#).
2. Write 0xFFFF 4444 in [WDT\\_WSPR](#).

All other write sequences on the [WDT\\_WSPR](#) register have no effect on the start/stop feature of the module.

#### 22.3.4.9 Modifying Timer Count/Load Values and Prescaler Setting

To modify the timer counter value (the [WDT\\_WCRR](#) register), prescaler ratio (the [WDT\\_WCLR\[4:2\] PTV](#) bit field), delay configuration value (the [WDT\\_WDLY\[31:0\] DLY\\_VALUE](#) bit field), or the load value (the [WDT\\_WLDR\[31:0\] TIMER\\_LOAD](#) bit field), the watchdog timer must be disabled by using the start/stop sequence (the [WDT\\_WSPR](#) register).

After a write access, the load register value and prescaler ratio registers are updated immediately, but new values are considered only after the next consecutive counter overflow or after a new trigger command (the [WDT\\_WTGR](#) register).

#### 22.3.4.10 Watchdog Counter Register Access Restriction (WDT\_WCRR Register)

A 32-bit shadow register is implemented to read a coherent value of the [WDT\\_WCRR](#) register because the [WDT\\_WCRR](#) register is directly related to the timer counter value and is updated on the timer clock ([WDT\\_FCLK](#)). The shadow register is updated by a 16-bit LSB read command.

---

**NOTE:** Although the L4 clock ([WDT\\_ICLK](#)) is completely asynchronous with the timer clock ([WDT\\_FCLK](#)), some synchronization is performed to ensure that the value of the [WDT\\_WCRR](#) register is not read while it is being incremented.

---

When 32-bit read access is performed, the shadow register is not updated. Read access is performed directly from the accessed register.

To ensure that a coherent value is read inside [WDT\\_WCRR](#), the first read access is to the lower 16 bits (offset = 0x08), followed by read access to the upper 16 bits (offset = 0x0A).

#### 22.3.4.11 Watchdog Timer Interrupt Generation

When an interrupt source occurs, the interrupt status bit (the [WDT\\_WIRQSTAT\[0\] EVENT\\_OVF](#) or [WDT\\_WIRQSTAT\[1\] EVENT\\_DLY](#) bit) is set to 1. The output interrupt line ([WDTi\\_IRQ](#)) is asserted (active low) when status (the [EVENT\\_xxx](#) bit) and enable (the [xxx\\_IT\\_ENA](#) bit) flags are set to 1; the order is not relevant. Writing 1 to the enable bit (the status is already set at 1) also triggers the interrupt in the normal order (enable first, status next). The pending interrupt event is cleared when the set status bit is overwritten by a value of 1 by a write command in the [WDT\\_WIRQSTAT](#) register. Reading the [WDT\\_WIRQSTAT](#) register and writing the value back allows a fast interrupt acknowledge process.

The watchdog timer issues an overflow interrupt if this interrupt is enabled in the watchdog interrupt enable register ([WDT\\_WIRQENSET\[0\] OVF\\_IT\\_ENA = 1](#)). When the overflow occurs, the interrupt status bit (the [WDT\\_WIRQSTAT\[0\] EVENT\\_OVF](#) bit) is set to 1. The output interrupt line ([WDT\\_IRQ](#)) is asserted (active low) when status ([EVENT\\_OVF](#)) and enable ([OVF\\_IT\\_ENA](#)) flags are set to 1; the order is not relevant. This interrupt can be disabled by setting the [WDT\\_WIRQENCLR\[0\] OVF\\_IT\\_ENA](#) bit to 1.

The watchdog can issue the delay interrupt if this interrupt is enabled in the interrupt enable register ([WDT\\_WIRQENSET\[1\] DLY\\_IT\\_ENA = 1](#)). When the counter is running and the counter value matches the value stored in the delay configuration register ([WDT\\_WDLY](#)), the corresponding interrupt status bit is set in the watchdog status register ([WDT\\_WIRQSTAT](#)) and the output interrupt line is asserted (active low) when the flag ([EVENT\\_DLY](#)) and enable ([DLY\\_IT\\_ENA](#)) bits are 1 in the [WDT\\_WIRQSTAT](#) and [WDT\\_WIRQENSET](#) registers, respectively; the order (normally enable, then flag), is not relevant. This interrupt can be disabled by setting the [WDT\\_WIRQENCLR\[1\] DLY\\_IT\\_ENA](#) bit to 1.

---

**NOTE:** Writing 0 to the [WDT\\_WIRQSTAT\[0\] EVENT\\_OVF](#) bit or the [WDT\\_WIRQSTAT\[1\] EVENT\\_DLY](#) bit has no effect.

---

The two clock domains are resynchronized because the interrupt event is generated on the functional clock domain ([WDTi\\_FCLK](#)) during the updating of the interrupt status register ([WDT\\_WIRQSTAT](#)).

The [WDT\\_WDLY](#) register is used to specify the value of the delay configuration register. The delay time to interrupt is the difference between the reload value stored in the counter load register ([WDT\\_WLDR](#)) and the programmed value in this register ([WDT\\_WDLY](#)).

Use the following formula to estimate the delay time:

Delay time period = ([WDT\\_WDLY](#) – [WDT\\_WLDR](#) + 1) × Timer clock period × Clock divider

Where:

- Timer clock period = 1/(Timer clock frequency)
- Clock divider = 2PTV

If the counter value ([WDT\\_WCRR](#)) reaches the programmed value ([WDT\\_WDLY](#)), the status bit ([EVENT\\_DLY](#)) gets set in the interrupt status register ([WDT\\_WIRQSTAT](#)), and an interrupt occurs if the corresponding enable bit is set in the interrupt enable register ([WDT\\_WIRQENSET](#)).

#### CAUTION

If the reload event occurs (after a triggering sequence or after a reset sequence) before reaching the programmed value ([WDT\\_WDLY\[31:0\] WDLY\\_VALUE](#)), no interrupt is generated.

Also, no interrupt is generated if the value programmed in the delay configuration register ([WDT\\_WDLY](#)) is less than the value stored in the counter load register ([WDT\\_WLDR](#)).

#### 22.3.4.12 Watchdog Timers Under Emulation

During emulation mode, the watchdog timer can/cannot continue running, according to the value of the [WDT\\_WDSC\[5\] EMUFREE](#) bit of the system configuration register ([WDT\\_WDSC](#)).

- When [EMUFREE](#) is 1, watchdog timer execution is not stopped and a reset pulse is still generated when overflow is reached.
- When [EMUFREE](#) is 0, the counters (prescaler/timer) are frozen and incrementation restarts after exiting from emulation mode.

#### 22.3.4.13 Accessing Watchdog Timer Registers

Posted/nonposted selection applies only to functional registers that require synchronization on/from the timer functional clock domain ([WDTi\\_FCLK](#)). For write/read operation, the following registers are affected:

- [WDT\\_WCLR](#)
- [WDT\\_WCRR](#)
- [WDT\\_WLDR](#)
- [WDT\\_WTGR](#)
- [WDT\\_WDLY](#)

- [WDT\\_WSPR](#)

---

**NOTE:** To ensure completion of successive writes in a WDT2 or WDT3 functional clock domain register, user software must poll the appropriate WDT\_WWPS status bit.

---

---

**NOTE:** To ensure coherent reading when a read transaction immediately follows a write access to a WDT2 or WDT3 functional clock domain register, user software must check the appropriate WDT\_WWPS status bit.

---

The timer interface clock domain synchronous registers are not affected by the posted mode mechanism; the write/read operation is effective and acknowledged (command accepted) after one WDT\_ICLK cycle from the command assertion. The timer interface clock domain synchronous registers are:

- [WDT\\_WIDR](#)
- [WDT\\_WDSC](#)
- [WDT\\_WDST](#)
- [WDT\\_WIRQSTATRAW](#)
- [WDT\\_WIRQSTAT](#)
- [WDT\\_WIRQENSET](#)
- [WDT\\_WIRQENCLR](#)
- [WDT\\_WIRQWAKEEN](#)
- [WDT\\_WWPS](#)

---

**NOTE:** Accesses to WDT2 and WDT3 functional clock domain synchronous registers are posted.

---

### 22.3.5 Watchdog Timer Low-Level Programming Model

This section covers the low-level hardware programming sequences for configuration and use of the module.

#### 22.3.5.1 Global Initialization

##### 22.3.5.1.1 Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the watchdog timer is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the watchdog timer (see [Table 22-90](#)). For more information, see [Section 22.3.2](#), *Watchdog Timer Environment*, and [Section 22.3.3](#), *Watchdog Timer Integration*.

**Table 22-90. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	The module interface and functional clocks must be enabled. For more information about the module configuration, see <a href="#">Section 3.1.1.1.2</a> , <i>Module Level Clock Management</i> , in <a href="#">Chapter 3</a> , <i>Power, Reset, and Clock Management</i> .
Control module	Module-specific pad muxing must be set in the control module. For more information about the module configuration, see <a href="#">Section 18.4.8</a> , <i>PAD Functional Multiplexing and Configuration</i> in <a href="#">Chapter 18</a> , <i>Control Module</i> .
MPU INTC	The MPU INTC configuration must be performed to enable the interrupts from the watchdog timer. See <a href="#">Section 4.4.3</a> , <i>Interrupt Controller Registers</i> in <a href="#">Chapter 4</a> , <i>Cortex-A9 MPU Subsystem</i> .

### 22.3.5.1.2 Watchdog Timer Module Global Initialization

#### 22.3.5.1.2.1 Main Sequence – Watchdog Timer Module Global Initialization

Table 22-91 lists the steps for initializing the watchdog timer module when the module is to be used for the first time.

**Table 22-91. Watchdog Timer Module Global Initialization**

Step	Register/Bit Field/Programming Model	Value
Execute software reset.	WDT_WDSC[1] SOFTRESET	0x1
Wait until reset release?	WDT_WDSC[1] SOFTRESET	0x0
Configure idle mode.	WDT_WDSC[4:3] IDLEMODE	xx
Enable delay wakeup.	WDT_WIRQWAKEEN[1] DLY_WK_ENA	0x1
Enable overflow wakeup.	WDT_WIRQWAKEEN[0] OVF_WK_ENA	0x1
Enable delay interrupt.	WDT_WIRQENSET[1] ENABLE_DLY	0x1
Enable overflow interrupt.	WDT_WIRQENSET[0] ENABLE_OVF	0x1

### 22.3.5.2 Operational Mode Configuration

#### 22.3.5.2.1 Watchdog Timer Basic Configuration

##### 22.3.5.2.1.1 Main Sequence – Watchdog Timer Basic Configuration

Table 22-92 lists the steps for the basic configuration of the watchdog timer.

**Table 22-92. Watchdog Timer Basic Configuration**

Step	Register/Bit Field/Programming Model	Value
Disable the watchdog timer.	See Section 22.3.5.2.1.2.	
Set prescaler value.	WDT_WCLR[4:2] PTV	xxx
Enable prescaler.	WDT_WCLR[5] PRE	0x1
Load delay configuration value.	WDT_WDLY	xxx
Load timer counter value.	WDT_WCRR	xxx
Enable the watchdog timer.	See Section 22.3.5.2.1.3.	

##### 22.3.5.2.1.2 Subsequence – Disable the Watchdog Timer

Table 22-93 lists the steps to disable the watchdog timer.

**Table 22-93. Disable the Watchdog Timer**

Step	Register/Bit Field/Programming Model	Value
Write disable sequence Data1.	WDT_WSPR	0xXXXX AAAA
Write disable sequence Data2.	WDT_WSPR	0xXXXX 5555

##### 22.3.5.2.1.3 Subsequence – Enable the Watchdog Timer

Table 22-94 lists the steps to enable the watchdog timer.

**Table 22-94. Enable the Watchdog Timer**

Step	Register/Bit Field/Programming Model	Value
Write enable sequence Data1.	WDT_WSPR	0xXXXX BBBB
Write enable sequence Data2.	WDT_WSPR	0xXXXX 4444

## 22.3.6 Watchdog Timer Register Manual

### 22.3.6.1 Watchdog Timer Instance Summary

Table 22-95 lists the base address and address space for the watchdog timer module instances.

**Table 22-95. Watchdog Timer Instance Summary**

Module Name	Base Address L4 Interconnect	Base Address L3 Interconnect	Base Address Cortex-A9 Private Access	Base Address DSP Private Access	Size
WDTIMER2	0x4A31 4000	-	-	-	4KB
WDTIMER3	-	0x4903 0000	0x4013 0000	0x01D3 0000	4KB

**NOTE:** Private access is an access which is not using the L3/L4 interconnects.

### 22.3.6.2 Watchdog Timer Registers

#### 22.3.6.2.1 Watchdog Timer Register Summary

#### CAUTION

The watchdog timers registers are limited to 32-bit and 16-bit data accesses; 8-bit access is not allowed and can corrupt register content.

Table 22-96 lists the WDTIMER2 registers.

**Table 22-96. WDTIMER2 Register Mapping Summary**

Register Name	Type	Register Width (Bits)	Address Offset	Physical Address L4 Interconnect
WDT_WIDR	R	32	0x0000 0000	0x4A31 4000

## 22.4 32-kHz Synchronized Timer

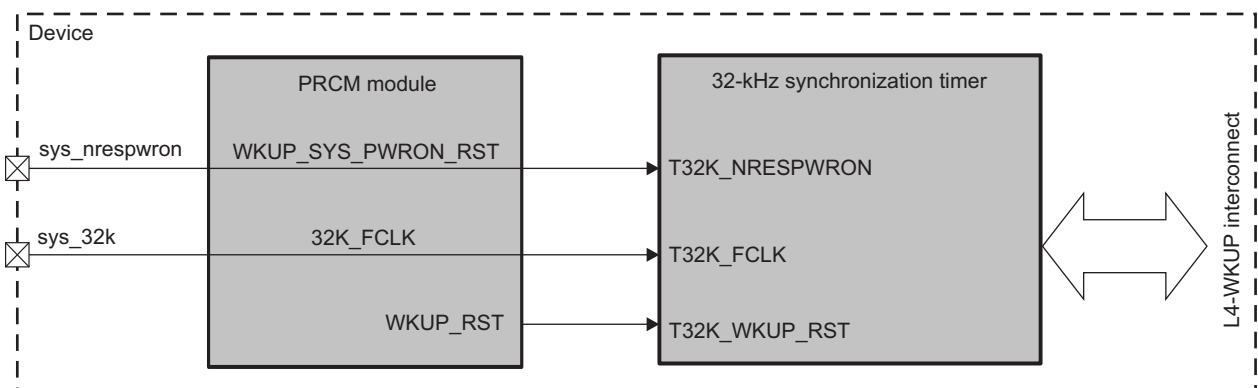

### 22.4.1 32-kHz Synchronized Timer Overview

The 32-kHz synchronized timer is a 32-bit counter clocked by the falling edge of the 32-kHz system clock. It is reset while the external asynchronous power-up reset (sys\_nrespwron) primary input/output (I/O) is active (main device reset). When sys\_nrespwron is released (on the rising edge of sys\_nrespwron), after three 32-kHz clock periods, the counter starts counting up from the reset value of the counter register on the falling edge of the 32-kHz system clock. After reaching its highest value, the counter wraps back to 0 and starts counting again.

Figure 22-19 is the block diagram of the 32-kHz synchronized timer.

**NOTE:** sys\_nrespwron is an active-low I/O.

**Figure 22-19. 32-kHz Synchronized Timer Block Diagram**

timers-018

#### 22.4.1.1 32-kHz Synchronized Timer Features

The main features of the 32-kHz synchronized timer controller are:

- L4 slave interface support:
  - 32-bit data bus width
  - 32-/16-bit access supported
  - 8-bit access not supported
  - 5-bit address bus width
  - Burst mode not supported
- Only read operations are supported on the module registers; no write operation is supported (no error/no action on write).
- Free-running 32-bit upward counter
- Start and keep counting after power-on reset
- Automatic roll over to 0; highest value reached: 0xFFFF FFFF
- On-the-fly read (while counting)

#### 22.4.2 32-kHz Synchronized Timer Environment

The synchronized timer is accessible only through the L4 interface.

#### 22.4.3 32-kHz Synchronized Timer Integration

Table 22-134 through Table 22-136 summarize the integration of the module in the device.

**Table 22-134. Integration Attributes**

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
32KTIMER	PD_WKUP	No	L4_WKUP

**Table 22-135. Clocks and Resets**

32KTIMER	T32K_WKUP_RST	WKUP_RST	PRM	Reset to 32KTIMER

**Table 22-136. Hardware Requests**

No Interrupt Requests
No DMA Requests

#### 22.4.4 32-kHz Synchronized Timer Functional Description

The synchronized timer is a counter that starts on the rising edge of an external asynchronous signal (`sys_nrespwron`). When `sys_nrespwron` is released (on the rising edge of `sys_nrespwron`), the counter starts counting up from the reset value of the counter register on the falling edge of the 32-kHz system clock after three inverted 32-kHz clock periods. After reaching its highest value, the counter wraps back to 0 and starts counting again with no additional delay. When `sys_nrespwron` is released (on the rising edge of `sys_nrespwron`), after three inverted 32-kHz clock periods, the counter starts counting up from the reset value of the counter register on the falling edge of the 32-kHz system clock.

Figure 22-20 shows the reset synchronization timing diagram. After reaching its highest value, the counter wraps back to 0 and starts counting again without any extra delay.

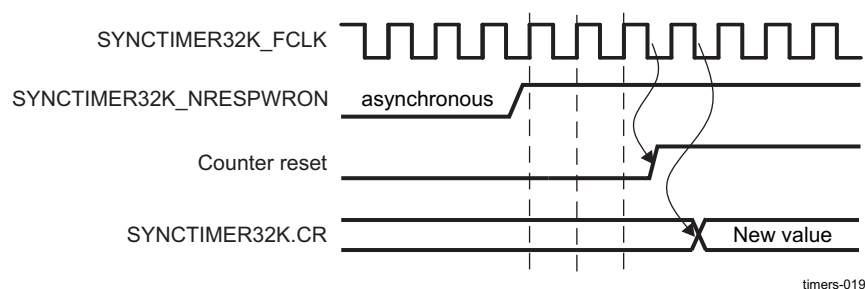

**Figure 22-20. Reset Resynchronization Timing Diagram**

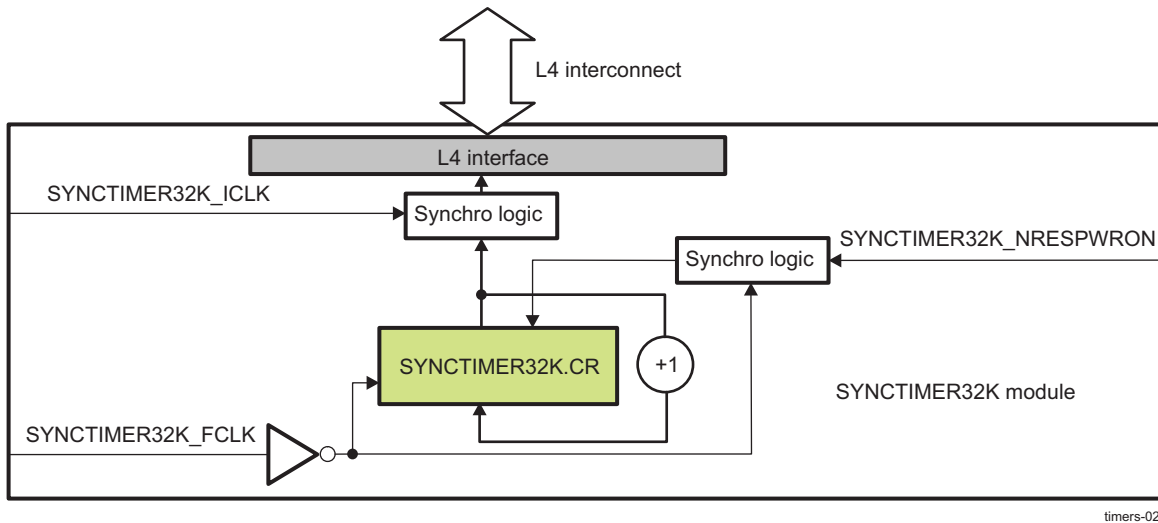

Figure 22-21 is the block diagram of the synchronized timer.

---

**NOTE:** `sys_nrespwron` is an active-low input.

---

Figure 22-21. SYNCTIMER32K Block Diagram

The sync logic ensures the read transaction correctness by synchronizing the counter register read access on 32KSYNCNT\_ICLK because the 32KSYNCNT\_ICLK clock signal is completely asynchronous with S32KSYNCNT\_FCLK. The sys\_nrespwron input resets the counter register (32KSYNCNT\_CR). The inverted 32KSYNCNT\_FCLK clocks the sys\_nrespwron reset signal.

#### 22.4.4.1 Reading the 32-kHz Synchronized Timer

The counter register (32KSYNCNT\_CR) is 32 bits wide and can be read using 32-bit and 16-bit access. For correct count capture using 16-bit access, it must be accessed as 16-bit LSB access first and 16-bit MSB access next. The internal logic ensures the integrity and correctness of the read data from 32KSYNCNT\_CR when it is split into 16-bit data. The read data corresponds to the data when the read command is issued. Internal synchronization logic allows reading of the counter value with 32KSYNCNT\_ICLK while the counter is running. There is a read latency, which is a synchronization delay and is one 32KSYNCNT\_ICLK clock cycle. The time latency to read the synchronized counter register is minimum one read cycle for 32-bit access and two read cycles for 16-bit access, where each read cycle is equal to three 32KSYNCNT\_ICLK clock cycles.

### 22.4.5 32KTimer Register Manual

Table 22-137 lists the base address and block size for the 32-kHz synchronized timer. It is memory mapped to the L4 peripheral bus memory space.

**Table 22-137. 32KTimer Instance Summary**

Module Name	Base Address L4 Interconnect	Size
32KTimer	0x4A30 4000	4KB

#### 22.4.5.1 32KTimer Register Mapping Summary

##### CAUTION

The 32-kHz synchronized timer registers are limited to 32-bit and 16-bit data accesses; 8-bit access is not allowed and can corrupt the register content.

Table 22-138 lists the 32-kHz synchronized timer registers. through describe the register bits.

## 23.1 Multimaster High-Speed I<sup>2</sup>C Controller

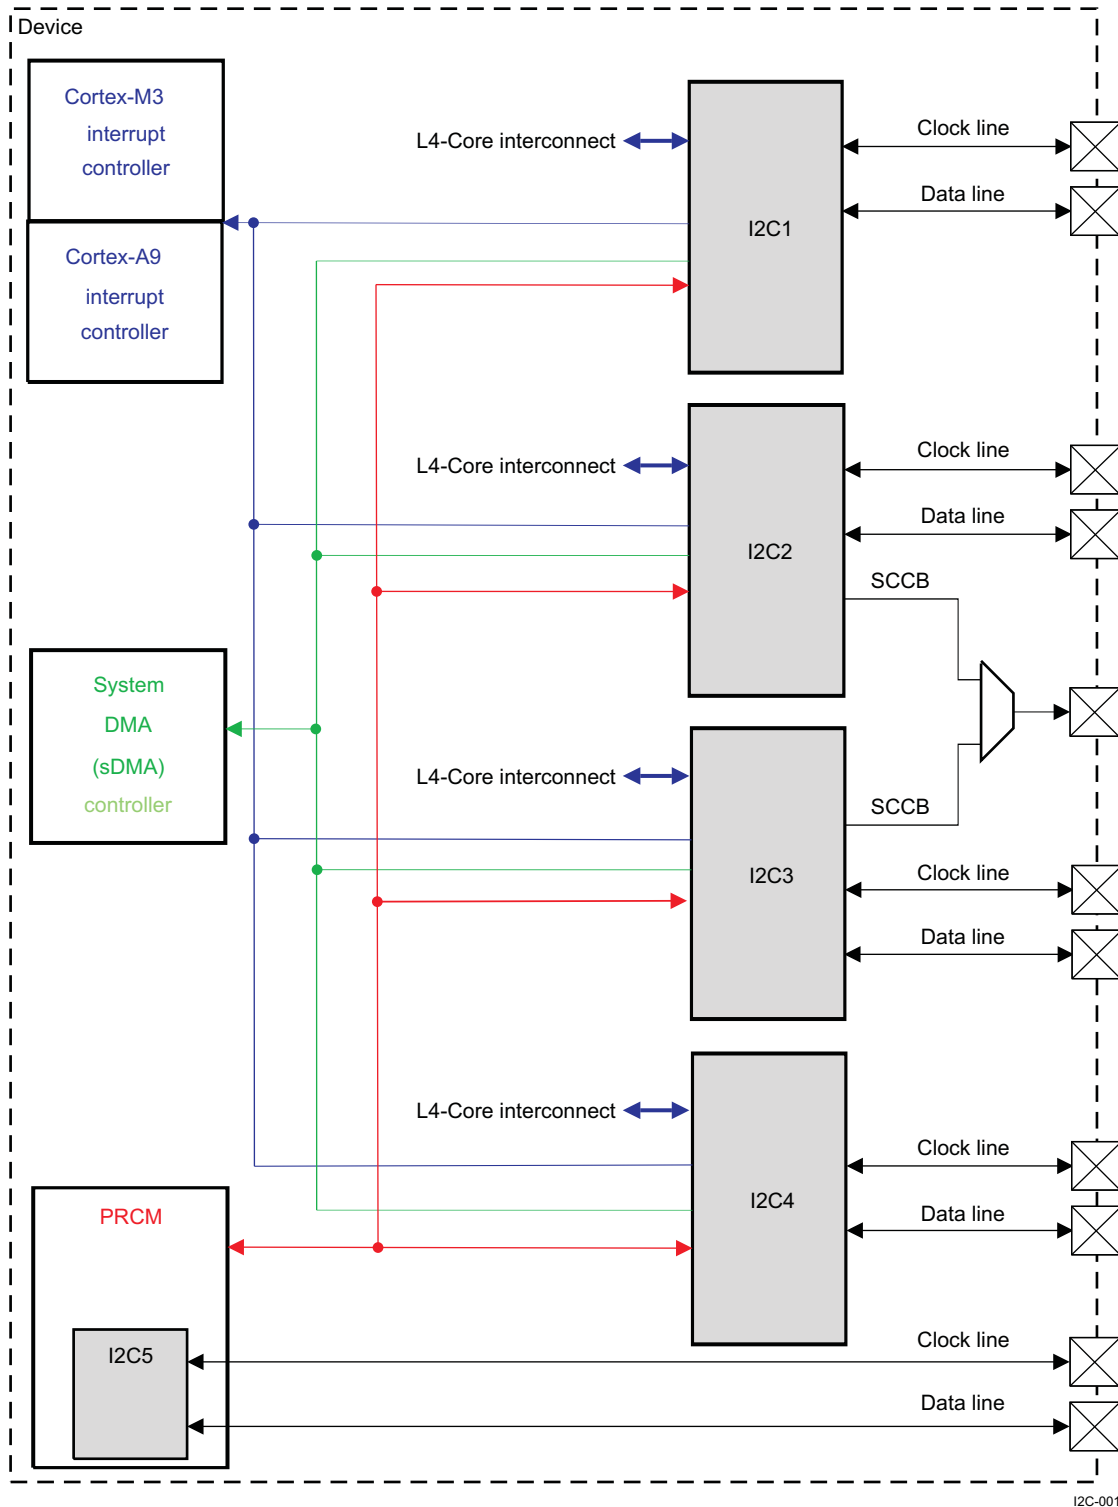

### 23.1.1 HS I<sup>2</sup>C Overview

The device contains four multimaster high-speed (HS) inter-integrated circuit (I<sup>2</sup>C™) controllers (I2Ci modules, where i = 1, 2, 3, 4), each of which provides an interface between a local host (LH), such as a digital signal processor (DSP), and any I<sup>2</sup>C-bus-compatible device that connects through the I<sup>2</sup>C serial bus. External components attached to the I<sup>2</sup>C bus can serially transmit and receive up to 8 bits of data to and from the LH device through the 2-wire I<sup>2</sup>C interface.

Each multimaster HS I<sup>2</sup>C controller can be configured to act like a slave or master I<sup>2</sup>C-compatible device. Moreover, each multimaster HS I<sup>2</sup>C controller can be configured in serial camera control bus (SCCB) mode (the SCCB is a serial bus developed by Omnivision Technologies, Inc.) to act as a master on a 2-wire SCCB bus. Only multimaster HS I<sup>2</sup>C controllers I2C2 and I2C3 can be configured in SCCB mode to act as a master device on a 3-wire SCCB bus.

The device contains a fifth master transmitter HS I<sup>2</sup>C interface (I2C5) in the power, reset, and clock management (PRCM) module to perform dynamic voltage control and power sequencing with an external power integrated circuit (IC).

[Figure 23-1](#) shows the HS I<sup>2</sup>C controllers.

Figure 23-1. HS I<sup>2</sup>C Controllers

The four multimaster HS I<sup>2</sup>C controllers have the following features:

- Compliant with Philips I<sup>2</sup>C specification version 2.1
- Supports standard mode (up to 100 Kbps) and fast mode (up to 400 Kbps)
- Supports HS mode for transfer up to 3.4 Mbps

- Support for 3-wire/2-wire SCCB master mode for I2C2 and I2C3 modules, 2-wire SCCB master mode for I2C1 and I2C4 modules, up to 100 Kbps
- 7-bit and 10-bit device addressing modes
- General call
- Start/restart/stop
- Multimaster transmitter/slave receiver mode
- Multimaster receiver/slave transmitter mode
- Combined master transmit/receive and receive/transmit mode
- Built-in configurable FIFOs (8, 16, 32, 64 bytes) for buffered read or write
- Module enable/disable capability
- Programmable multislave channel (responds to four separate addresses)
- Programmable clock generation
- 8-bit-wide data access
- Open-core protocol (OCP) interface with LH application (OCP-IP 2.0 compliant)
- Designed for low power consumption
- Implement Auto Idle mechanism
- Implement Idle Request/Idle Acknowledge handshake mechanism
- Support for asynchronous wake-up mechanism
- Two direct memory access (DMA) channels
- Wide interrupt capability
- Supports OmniVision SCCB protocol
- Compliant with Highlander 0.8

The master transmitter HS I<sup>2</sup>C controller I2C5 has the following features:

- Support of HS and fast modes
- 7-bit addressing mode only
- Master transmitter mode only
- Start/restart/stop

---

**NOTE:** Before using HS I<sup>2</sup>C mode, determine that the target device supports this mode.

---

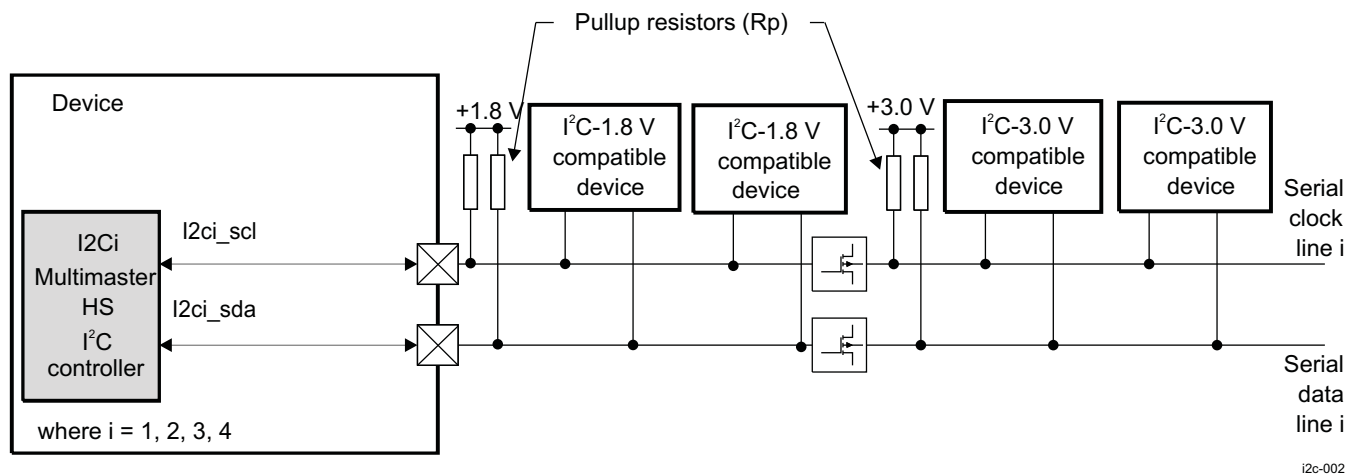

### 23.1.2 HS I<sup>2</sup>C Environment

This section describes the HS I<sup>2</sup>C application fields from an environment point of view (external connections). It describes HS I<sup>2</sup>C connectivity options, lists all possible interfaces, and describes the protocol and data format used in each case.

#### 23.1.2.1 HS I<sup>2</sup>C in I<sup>2</sup>C Mode

Figure 23-2 shows the multimaster HS I<sup>2</sup>C controllers and their related connections with I<sup>2</sup>C-compliant devices in I<sup>2</sup>C mode.

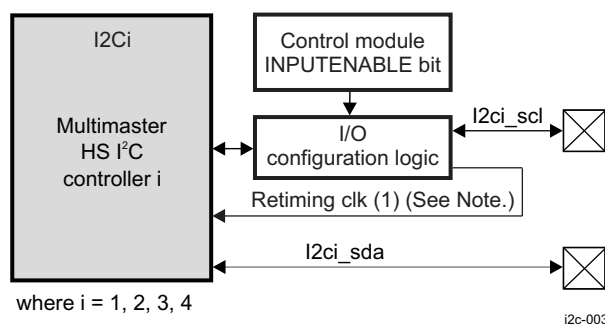

Figure 23-2. HS I<sup>2</sup>C and Typical Connections to I<sup>2</sup>C Devices

##### 23.1.2.1.1 HS I<sup>2</sup>C Pins for Typical Connections in I<sup>2</sup>C Mode

Figure 23-3 shows the multimaster HS I<sup>2</sup>C controller pins used for typical connections with I<sup>2</sup>C devices.

Figure 23-3. HS I<sup>2</sup>C Interface Signals in I<sup>2</sup>C Mode

NOTE: In master mode, the clock signal (IP clk configured as output) is also used as retiming input (the INPUTENABLE bit in the corresponding pad configuration register must be set to 1).

##### 23.1.2.1.2 HS I<sup>2</sup>C Interface Typical Connections

Table 23-1 lists the pins associated with the I<sup>2</sup>C interface.

Table 23-1. HS I<sup>2</sup>C Input/Output

Signal	I/O <sup>(1)</sup>	Description	Reset Value
i2ci_scl	I/O	I <sup>2</sup> C serial clock line <sup>(2)</sup> . Open-drain output buffer. Requires external pullup resistor (Rp).	1

<sup>(1)</sup> I = Input; O = Output

<sup>(2)</sup> This output signal is also used as retiming input (the INPUTENABLE bit in the corresponding pad configuration register must be set to 1).

**Table 23-1. HS I<sup>2</sup>C Input/Output (continued)**

Signal	I/O <sup>(1)</sup>	Description	Reset Value
i2ci_sda	I/O	I <sup>2</sup> C serial data line. Open-drain output buffer. Requires external Rp.	1

**23.1.2.1.3 HS I<sup>2</sup>C Typical Connection Protocol and Data Format**

**23.1.2.1.3.1 HS I<sup>2</sup>C Serial Data Format**

The I<sup>2</sup>C controller operates in 8-bit word data format (byte write access supported for the last access). Each byte transmitted or received on the serial data line is 8 bits long. The number of bytes that can be transmitted or received is not restricted. The data is transferred with the most-significant bit (MSB) first. In receiver mode, each byte is followed by an acknowledge bit from the I<sup>2</sup>C. Figure 23-4 shows a typical I<sup>2</sup>C communication format.

**Figure 23-4. HS I<sup>2</sup>C Data Transfer**

**23.1.2.1.3.2 HS I<sup>2</sup>C Data Validity**

The data on the serial data line (SDA) must be stable during the high period of the serial clock line. The high and low states of the data line can change only when the clock signal on the serial clock line (SCL) is low.

Figure 23-5 is an example of data validity requirements.

**Figure 23-5. HS I<sup>2</sup>C Bit Transfer on the I<sup>2</sup>C Bus**

**23.1.2.1.3.3 HS I<sup>2</sup>C Start and Stop Conditions**

The I<sup>2</sup>C module generates start (S) and stop (P) conditions when it is configured as a master.

- An S condition is a high-to-low transition on the serial data line while serial clock line is high.
- A P condition is a low-to-high transition on the serial data line while serial clock line is high.

The bus is considered busy after the S condition (the I2Ci.I2C\_STAT[12] BB bit is 1 to indicate that the bus is busy) and free after the P condition (the I2Ci.I2C\_STAT[12] BB bit is 0 to indicate that the bus is free).

Figure 23-6 shows the waveforms that occur during an S and a P condition.

**Figure 23-6. HS I<sup>2</sup>C S and P Condition Events**

#### 23.1.2.1.3.4 HS I<sup>2</sup>C Addressing

The I<sup>2</sup>C module supports two data formats in fast/standard (F/S) and HS modes:

- 7-bit/10-bit addressing format
- 7-bit/10-bit addressing format with repeated start (Sr) condition

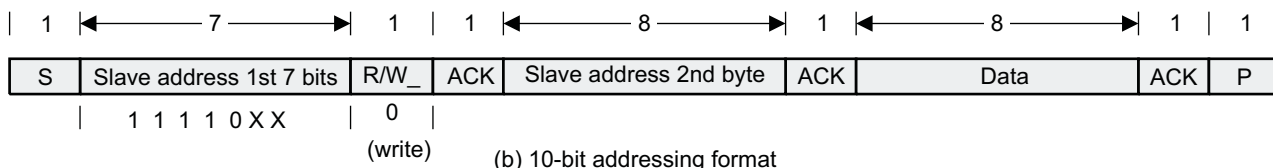

##### 23.1.2.1.3.4.1 Data Transfer Formats in F/S Mode

Figure 23-7 shows the I<sup>2</sup>C data transfer formats in F/S mode.

**Figure 23-7. HS I<sup>2</sup>C Data Transfer Formats in F/S Mode**

(a) 7-bit addressing format

(b) 10-bit addressing format

(c) Addressing format with repeated start condition

i2c-007

The first word after an S condition consists of 8 bits. In acknowledge mode, an extra dedicated acknowledgment bit is inserted after each byte.

In addressing formats with 7-bit addresses, the first byte is composed of 7 MSB slave address bits and 1 least-significant bit (LSB) R/W\_ bit.

The LSB R/W\_ bit of the address byte indicates the transmission direction of the data bytes that follow it. If R/W\_ is 0, the master writes data to the selected slave; if it is 1, the master reads data from the slave.

In addressing formats with 10-bit addresses, the structure of the first byte is 11110XXY, where XX is the 2 MSBs of the 10-bit addresses, and Y is the R/W\_ bit. If the R/W\_ bit is 0, the next byte contains the last 8 bits of the slave address. If the R/W\_ bit is 1, the next byte contains data transmitted from the slave to the master.

**23.1.2.1.3.4.2 Data Transfer Format in HS Mode**

Figure 23-8 shows the I<sup>2</sup>C data transfer format in HS mode.

**Figure 23-8. HS I<sup>2</sup>C Data Transfer in HS Mode**

S = Start; Sr = repeated start; P = Stop; F/S = Fast/standard mode; HS = High-speed mode

i2c-008

Each multimaster HS I<sup>2</sup>C controller can also operate in HS mode. In this case, after the S condition, the module, which is in F/S mode, writes the master code address (000001XXX, where XXX is the variable portion of the master code) on the bus. No device connected on the same bus acknowledges this address. The module switches the clock to the HS clock and after an Sr condition, and sends the slave address and the data, as shown in Figure 23-8.

**23.1.2.1.3.5 HS I<sup>2</sup>C Master Transmitter**

In master transmitter mode, data assembled in one of the previously described data formats is shifted out on the serial data line SDA in sync with the self-generated clock pulses on the serial clock line SCL. The clock pulses are inhibited and SCL is held low when the intervention of the processor is required (XUDF) after a byte is transmitted.

**23.1.2.1.3.6 HS I<sup>2</sup>C Master Receiver**

Master receiver mode can be entered only from master transmitter mode. With any of the address formats (a), (b), or (c) (see Figure 23-7), if R/W\_ is high, the module enters master receiver mode after the slave address byte and bit R/W\_ are transmitted. Serial data bits received on bus line SDA are shifted in synchronization with the self-generated clock pulses on SCL.

**23.1.2.1.3.7 HS I<sup>2</sup>C Slave Transmitter**

Slave transmitter mode can be entered only from slave receiver mode. With any of the address formats (a), (b), or (c) (see Figure 23-7), the slave transmitter is entered if the slave address byte is the same as its own address and bit R/W\_ is transmitted, if R/W\_ is high. The slave transmitter shifts the serial data out on the data line SDA in sync with the clock pulses that are generated by the master device. It does not generate the clock but it can hold clock line SCL low while intervention of the LH is required (XUDF).

**23.1.2.1.3.8 HS I<sup>2</sup>C Slave Receiver**

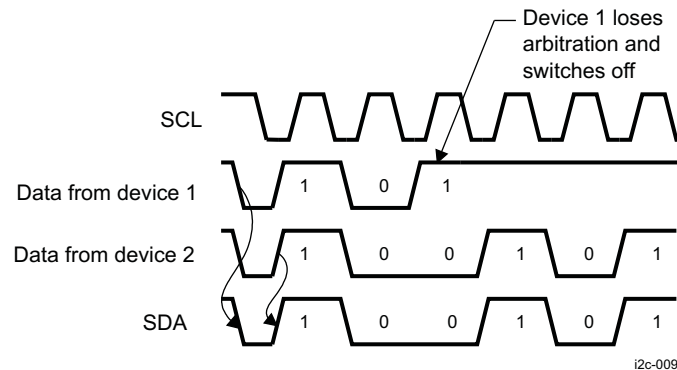

In this mode, serial data bits received on the bus line SDA are shifted-in in sync with the clock pulses on SCL that are generated by the master device. It does not generate the clock but it can hold clock line SCL low while intervention of the LH is required (ROVR) after a byte is received.

### 23.1.2.1.3.9 HS I<sup>2</sup>C Bus Arbitration

If two or more master transmitters start a transmission on the same bus almost simultaneously, an arbitration procedure is invoked. The arbitration procedure uses the data presented on the serial bus by the competing transmitters. When a transmitter senses that a high signal it has presented on the bus has been overruled by a low signal, it switches to the slave receiver mode, sets the arbitration lost (AL) flag, and generates the arbitration lost interrupt. Figure 23-9 shows the arbitration procedure between two devices. The arbitration procedure gives priority to the device that transmits the serial data stream with the lowest binary value. If two or more devices send identical first bytes, arbitration continues on the subsequent bytes.

**Figure 23-9. HS I<sup>2</sup>C Arbitration Between Master Transmitters**

### 23.1.2.1.3.10 HS I<sup>2</sup>C Clock Generation and Synchronization

Under normal conditions, only one master device generates the clock signal, SCL. During the arbitration procedure, however, there are two or more master devices and the clock must be synchronized so that the data output can be compared. The wired-AND property of the clock line means that a device that first generates a low period of the clock line overrules the other devices. At this high/low transition, the clock generators of the other devices are forced to start generating their own low period. The clock line is then held low by the device with the longest low period, while the other devices that finish their low periods must wait for the clock line to be released before starting their high periods. A synchronized signal on the clock line is thus obtained, where the slowest device determines the length of the low period and the fastest device determines the length of the high period. If a device pulls down the clock line for a longer time, the result is that all clock generators must enter the WAIT-state. In this way a slave can slow down a fast master and the slow device can create enough time to store a received byte or prepare a byte to be transmitted (Clock Stretching).

---

**NOTE:** In case the SCL or SDA lines are stuck low, the Bus Clear operation is supported.

If the clock line (SCL) is stuck low, the preferred procedure is to reset the bus using the hardware reset signal if your I<sup>2</sup>C devices have hardware reset inputs. If the I<sup>2</sup>C devices do not have hardware reset inputs, cycle power to the devices to activate the mandatory internal power-on reset (POR) circuit.

If the data line (SDA) is stuck low, the master should send nine clock pulses. The device that held the bus low should release it sometime within those nine clocks. If not, then use the hardware reset or cycle power to clear the bus.

---

Figure 23-10 shows clock synchronization.

Figure 23-10. HS I<sup>2</sup>C Clock Generators Synchronization

### 23.1.2.1.3.11 HS I<sup>2</sup>C External Clock Configuration

Each multimaster HS I<sup>2</sup>C controller is clocked with an independent functional clock (I2Ci\_FCLK) and an interface clock (I2Ci\_ICLK) for interfacing with the L4\_PER interconnect. These clocks are provided by the APE PRCM module for I2Ci (where i = 1, 2, 3, 4).

The SYS\_CLK clock provided by the clock generator of the PRCM module is connected to the functional and interface clocks of the HS I<sup>2</sup>C controller I2C5. For detailed information about the module clocking, see [Chapter 3, Power, Reset, and Clock Management](#).

The functional clock is processed by a prescaler block to produce the internal sampling clock. This clock is generated by the I<sup>2</sup>C prescaler block. The prescaler block consists of the I2Ci.I2C\_PSC[7:0] PSC bit field (where i = 1, 2, 3, 4) that is used to divide down the functional clock to obtain an internal sampling clock with a frequency value of I2Ci\_FCLK/(I2Ci.I2C\_PSC[7:0] PSC bit field value + 1, where i = 1, 2, 3, 4).

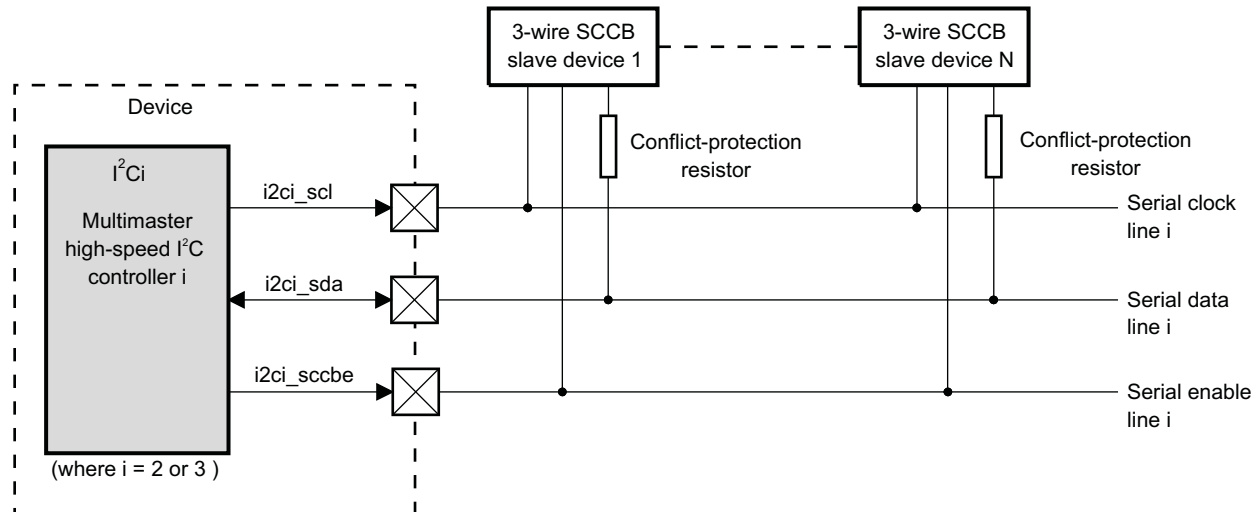

---

**NOTE:** The I2Ci.I2C\_PSC[7:0] PSC bit field (where i = 5) of I2C5 is not accessible by software.

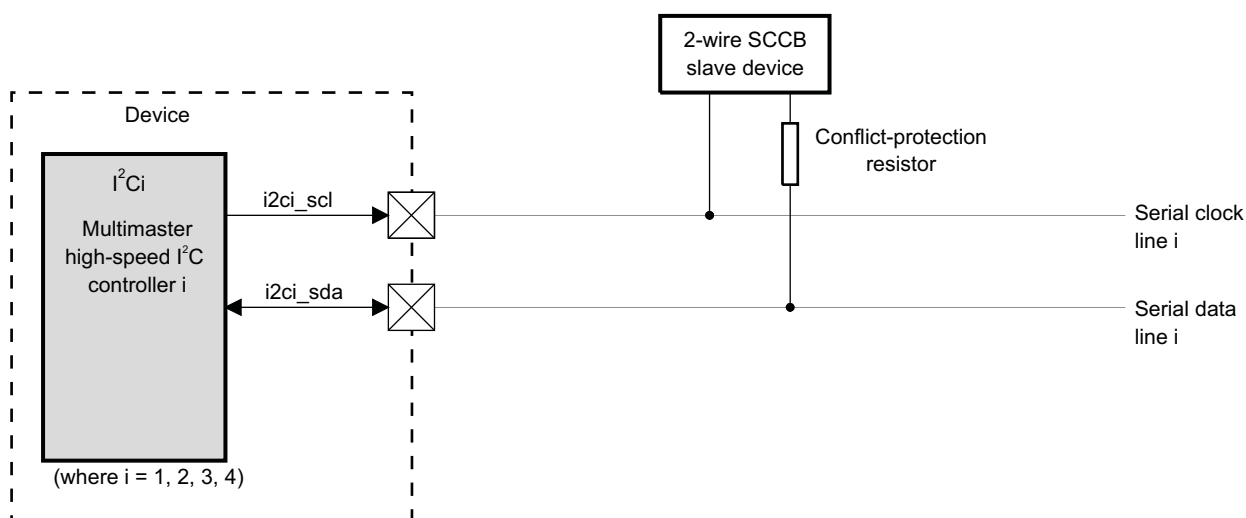

---

### 23.1.2.2 HS I<sup>2</sup>C in SCCB Mode

The multimaster HS I<sup>2</sup>C controllers support the 2-wire SCCB protocol in master mode as listed in [Figure 23-11](#). Only I2C2 and I2C3 support the 3-wire SCCB protocol in master mode.

**Figure 23-11. HS I<sup>2</sup>C and Typical Connections to SCCB Devices**

(a) Typical connection with 3-wire SCCB devices

(b) Typical connection with 2-wire SCCB devices

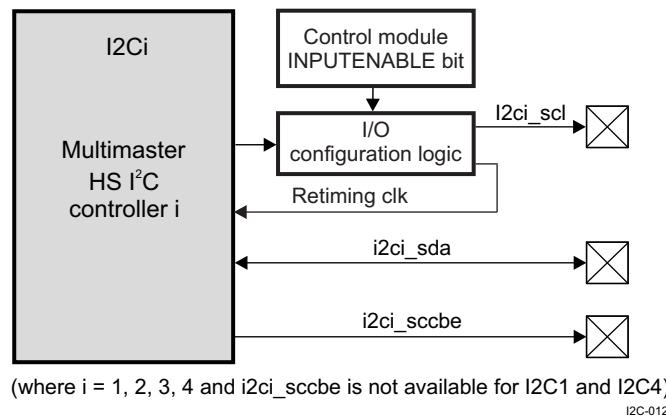

I2C-011

**NOTE:** Only one 2-wire SCCB slave device can be connected to the 2-wire SCCB bus.

### 23.1.2.2.1 HS I<sup>2</sup>C Pins for Typical Connections in SCCB Mode

Figure 23-12 shows the multimaster HS I<sup>2</sup>C controller pins used for typical connections with 3-wire or 2-wire SCCB devices.

Figure 23-12. HS I<sup>2</sup>C Interface Signals in SCCB Mode

23.1.2.2.2 HS I<sup>2</sup>C SCCB Interface Typical Connections

Table 23-2 lists the pins associated with the SCCB interface.

Table 23-2. HS I<sup>2</sup>C Input/Output

Signal	I/O <sup>(1)</sup>	Description	Reset Value <sup>(2)</sup>	I2Ci.I2C_CON[15] I2C_EN bit = 0
i2ci_scl	O	SCCB serial clock line <sup>(3)</sup> . Standard CMOS output buffer.	Hi-Z	High
i2ci_sda	I/O(OD)	SCCB serial data line. Standard CMOS 3-state output buffer. Requires external conflict-protection resistor for each slave device connected to the bus.	Hi-Z	Hi-Z
i2ci_sccb_e <sup>(4)</sup>	O	SCCB enable line. Standard CMOS output buffer.	High	High

<sup>(1)</sup> I = Input; O = Output; OD = Open Drain

<sup>(2)</sup> Hi-Z = High Impedance

<sup>(3)</sup> This output signal is also used as retiming input (the INPUTENABLE bit in the corresponding pad configuration register must be set to 1).

<sup>(4)</sup> This signal is used for the 3-wire SCCB protocol only.

**NOTE:** Because they share the same ball, the i2c2\_sccb\_e and i2c3\_sccb\_e signals are not available at the same time. For detailed information about pin configuration, see Chapter 18, Control Module.

I2C1 and I2C4 do not provide any i2c1\_sccb\_e signal at the chip boundary of the device; thus, these modules do not support the 3-wire SCCB protocol.

### 23.1.2.2.3 HS I<sup>2</sup>C SCCB Typical Connection Protocol and Data Format

#### 23.1.2.2.3.1 HS I<sup>2</sup>C SCCB Data Format

If the module is configured in SCCB mode of operation, the data format of transmissions appears as shown in Figure 23-13. For SCCB protocol compatibility I<sup>2</sup>C provides one more signal, SCCB\_E, which acts like a transaction enable signal.

**Figure 23-13. HS I<sup>2</sup>C 3-wire SCCB Transmission Timing Diagram**

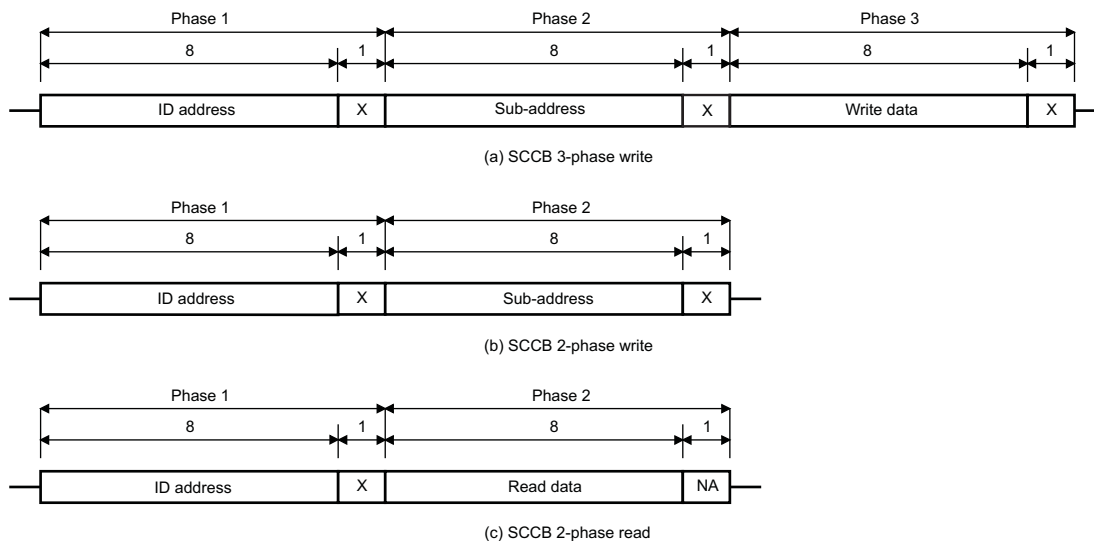

i2c-013

**NOTE:** When operating in 2-wire SCCB mode, the i2ci\_sccb\_e signal is not used by the 2-wire SCCB-compliant slave device attached to the 2-wire SCCB bus.

#### 23.1.2.2.3.2 HS I<sup>2</sup>C SCCB Transmission Data Formats

Figure 23-14 describes the data format of the three kinds of transmission.

**Figure 23-14. HS I<sup>2</sup>C SCCB Transmission Data Formats**

R/W: 0 = Write, 1 = Read

X: don't care

NA: ninth bit of a read phase. This bit must be set to 1 by the master device.

i2c-014

The basic element of a data transmission is a phase. A phase contains 9 bits, which consist of an 8-bit sequential data transmission followed by a ninth bit. The ninth bit is a don't-care bit (X) or an NA bit, depending on whether the data transmission is a write or a read. The maximum number of phases that can be included in a transmission is three. The MSB is always asserted first for each phase.

A data transmission is one of three types:

- 3-phase write transmission:

The 3-phase write transmission cycle (see (a) of [Figure 23-14](#)) is a full write operation in which the master can write 1 byte of data to a specific slave(s). The 7-bit slave address in the ID value identifies the specific slave that the master intends to access. The subaddress identifies the register location of the specified slave. The write data contains 8-bit data that the master intends to write over the content of this specific address. The ninth bit of each of the three phases is a don't-care bit (X bit).

- 2-phase write transmission:

The 2-phase write transmission cycle is followed by a 2-phase read transmission cycle (see the following bullet). The purpose of issuing a 2-phase write transmission cycle (see (b) of [Figure 23-14](#)) is to identify the subaddress of some specific slave from which the master intends to read data for the following 2-phase read transmission cycle. The ninth bit of each phase is a don't-care bit (X bit).

- 2-phase read transmission:

Either a 3-phase or a 2-phase write transmission cycle must be asserted ahead of a 2-phase read transmission cycle. The 2-phase read transmission cycle (see (c) of [Figure 23-14](#)) cannot identify the subaddress. The 2-phase write transmission cycle contains read data of 8 bits and a ninth don't-care bit or NA bit. The master must drive the NA bit at logical 1.

In each transmission type, phase 1 (the 7-bit slave address of the ID value) is asserted by the master to identify the selected slave to which the data is read or written. Each slave has a unique 7-bit slave address. The 7-bit slave address of the ID value comprises 7 bits, from bit 7 to bit 1, that can identify up to 128 slaves. The eighth bit, bit 0, is the read/write selector bit that specifies the transmission direction of the current cycle. A logical 0 represents a write cycle and a logical 1 represents a read cycle. The ninth bit of phase 1 is a don't-care bit (X bit).

Phase 2 (subaddress/read data) is asserted by the master (subaddress) or the slave(s) (read data). A phase 2 transmission asserted by the master identifies the subaddress of the slave(s) the master intends to access. A phase 2 transmission asserted by the slave(s) indicates the read data that the master will receive. The slave(s) recognize the subaddress of this read data according to the previous 3-phase or 2-phase write transmission cycle. The ninth bit is defined as a don't-care bit (X bit) when the master asserts phase 2. The ninth bit is defined as an NA bit when the slave(s) asserts the phase 2 transmission. The master is responsible for a logical 1 during the period of the NA bit.

Phase 3 (write data) is asserted only by the master. This phase contains the data the master intends to write to the slave(s). Because the master asserts the transmission, the ninth bit of the phase 3 transmission is defined as a don't-care bit (X bit).

---

**NOTE:** A multimaster HS I<sup>2</sup>C controller configured in SCCB mode can perform two operations:

- Write a single byte to an SCCB slave device by using the 3-phase write transmission cycle
  - Read a single byte from an SCCB slave device by using the 2-phase write transmission cycle followed by the 2-phase read transmission cycle
- 

### **23.1.2.2.3.3 HS I<sup>2</sup>C Data Validity**

The data validity is the same as described in [Section 23.1.2.1.3.2, HS I<sup>2</sup>C Data Validity](#).

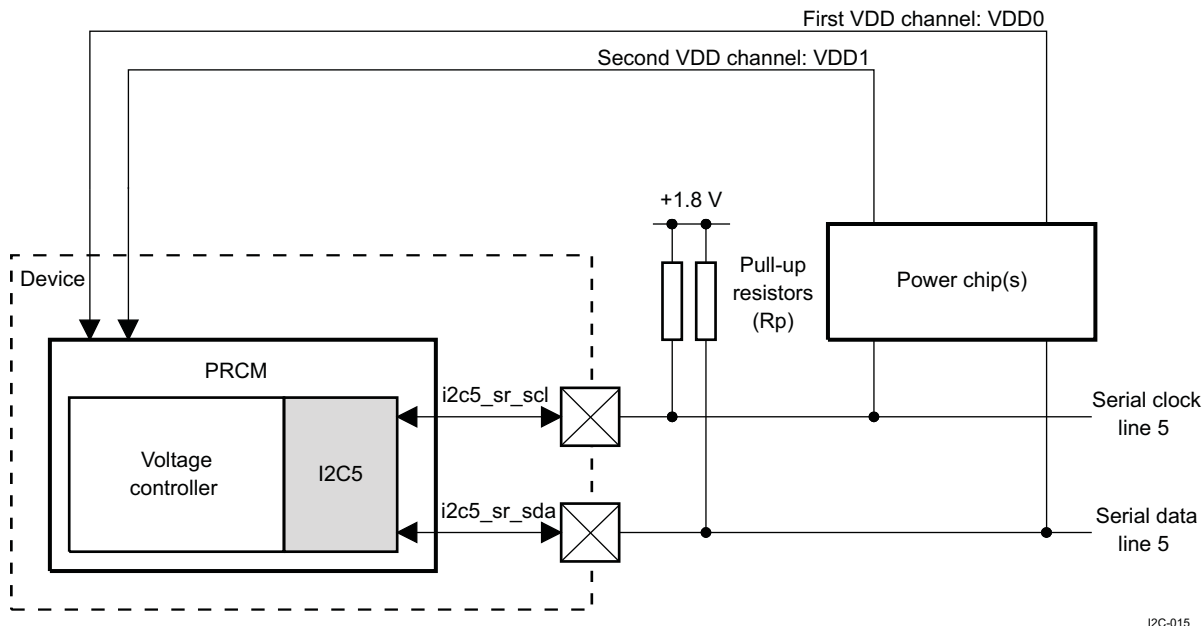

### **23.1.2.2.3.4 HS I<sup>2</sup>C S and P Conditions**

The S and P conditions are the same as described in [Section 23.1.2.1.3.3, HS I<sup>2</sup>C Start and Stop Conditions](#).

### 23.1.2.3 HS I<sup>2</sup>C for Communication With Power Chip(s)

Figure 23-15 shows a typical connection between the master transmitter HS I<sup>2</sup>C controller I2C5 of the device and external power chip(s).

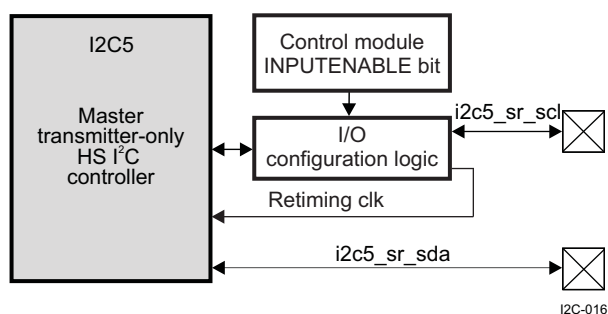

**Figure 23-15. HS I<sup>2</sup>C and Typical Connection Between the HS I<sup>2</sup>C and Power Chip(s)**

#### 23.1.2.3.1 HS I<sup>2</sup>C I2C5 Pins for Typical Connections

Figure 23-16 shows the HS I<sup>2</sup>C controller I2C5 pins used for typical connections with power chips.

**Figure 23-16. HS I<sup>2</sup>C I2C5 Interface Signals**

#### 23.1.2.3.2 HS I<sup>2</sup>C I2C5 Interface Typical Connections

The master transmitter HS I<sup>2</sup>C controller I2C5 interfaces between the device and external power chip(s) for voltage control. This module is always configured as an I<sup>2</sup>C master transmitter; it does not support the SCCB protocol.

Table 23-3 lists the pins associated with the I<sup>2</sup>C interface of the HS I<sup>2</sup>C controller I2C5 of the device.

**Table 23-3. HS I<sup>2</sup>C Input/Output Description**

Signal	I/O <sup>(1)</sup>	Description	Reset Value
i2c5_sr_scl	I/O(OD)	I <sup>2</sup> C serial clock line <sup>(2)</sup> . Open-drain output buffer. Requires external Rp.	1

<sup>(1)</sup> I = Input; O = Output; OD = Open Drain

<sup>(2)</sup> This signal is also used as retiming input (the INPUTENABLE bit in the corresponding pad configuration register must be set to 1).

**Table 23-3. HS I<sup>2</sup>C Input/Output Description (continued)**

Signal	I/O <sup>(1)</sup>	Description	Reset Value
i2c5_sr_sda	I/O(OD)	I <sup>2</sup> C serial data line. Open-drain output buffer. Requires external Rp.	1

### 23.1.2.3.3 HS I<sup>2</sup>C Typical Connections Protocol and Data Format for I2C5

#### 23.1.2.3.3.1 HS I<sup>2</sup>C Serial Data Format for I2C5

The serial data format is the same as described in [Section 23.1.2.1.3.1](#), *HS I<sup>2</sup>C Serial Data Format*.

#### 23.1.2.3.3.2 HS I<sup>2</sup>C Data Validity for I2C5

The data validity is the same as described in [Section 23.1.2.1.3.2](#), *HS I<sup>2</sup>C Data Validity*.

#### 23.1.2.3.3.3 HS I<sup>2</sup>C S and P Conditions for I2C5

The S and P conditions are the same as described in [Section 23.1.2.1.3.3](#), *HS I<sup>2</sup>C Start and Stop Conditions*.

#### 23.1.2.3.3.4 HS I<sup>2</sup>C Addressing for I2C5

The master transmitter HS I<sup>2</sup>C controller I2C5 supports only the 7-bit addressing mode. For each frame, the master writes the 8-bit value (DATA) in the register specified by the 8-bit register address (RA) of the slave addressed by the slave address (SA).

23.1.2.3.3.4.1 HS I<sup>2</sup>C Data Transfer Format in F/S Mode

Figure 23-17 shows the I<sup>2</sup>C data transfer format in F/S mode for I2C5.

Figure 23-17. HS I<sup>2</sup>C Data Transfer Format in F/S Mode for I2C5

(a) 7-bit slave address F/S mode without repeated start

(b) 7-bit address F/S mode with repeated start

W: write = 0

S: start condition

Sr: repeated start condition

P: stop condition

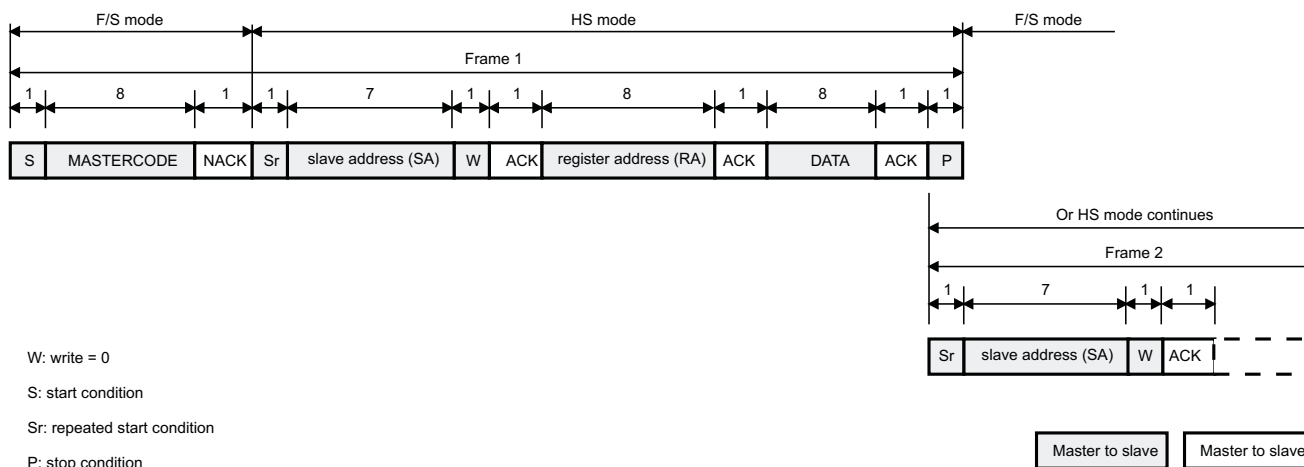

I2C-017

23.1.2.3.3.4.2 Data Transfer Format in HS Mode

Figure 23-18 shows the I<sup>2</sup>C data transfer format in HS mode for I2C5.

Figure 23-18. HS I<sup>2</sup>C Data Transfer Format in HS Mode for I2C5

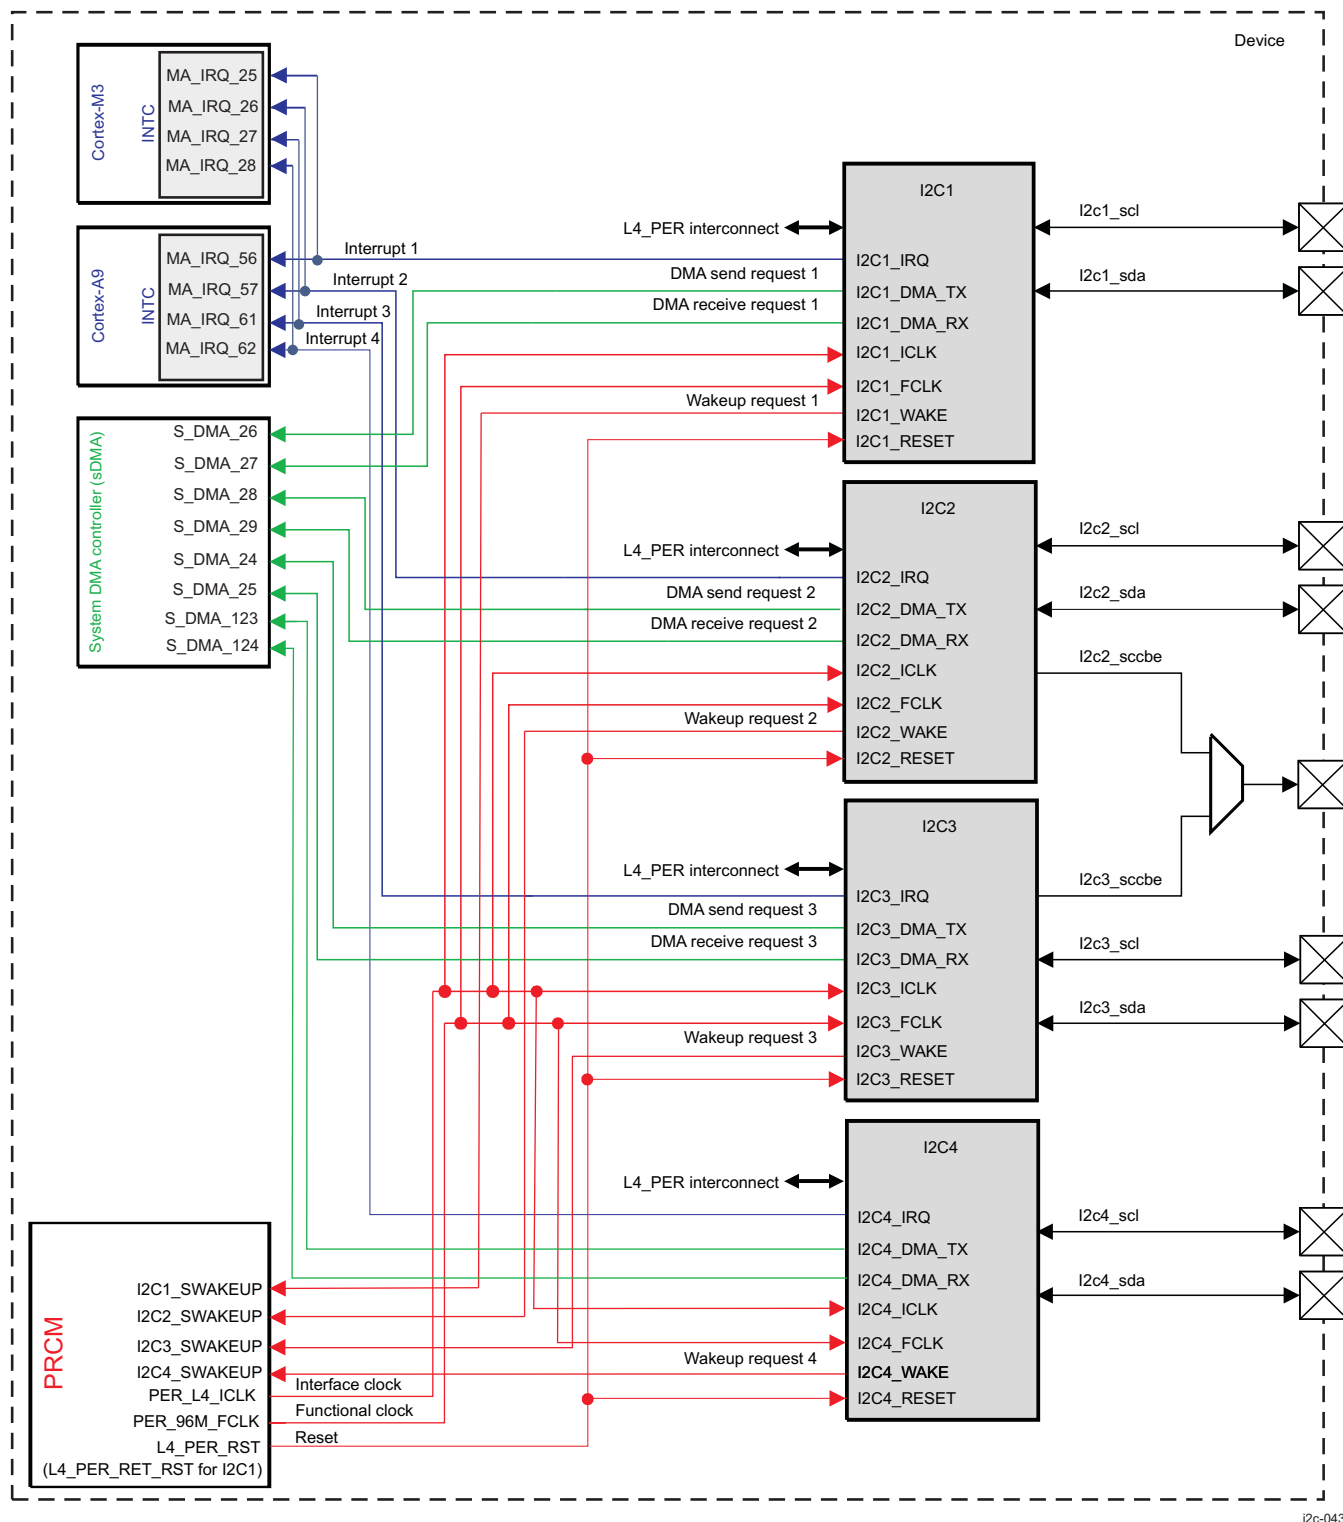

I2C-018

### 23.1.3 HS I<sup>2</sup>C Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

Figure 23-19 shows the integration of the four HS I<sup>2</sup>C controllers in the device.

Figure 23-19. HS I<sup>2</sup>C Integration

i2c-043

Figure 23-20 shows HS I<sup>2</sup>C integration of I2C5 inside the PRCM module.

Figure 23-20. HS I<sup>2</sup>C I2C5 Integration

**NOTE:** For more information about the IDLE hardware handshake and the wake-up request, see , *Power Management Functional Description*, in [Chapter 3, Power, Reset, and Clock Management](#).

Table 23-4 through Table 23-6 summarize the integration of the module in the device.

Table 23-4. HS I<sup>2</sup>C Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
I2C1	PD_L4_PER	L4_PER
I2C2	PD_L4_PER	L4_PER
I2C3	PD_L4_PER	L4_PER
I2C4	PD_L4_PER	L4_PER

Table 23-5. HS I<sup>2</sup>C Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
I2C1	I2C1_ICLK	PER_L4_ICLK	PRCM	I2C1 interface clock
	I2C1_FCLK	PER_96M_FCLK	PRCM	I2C1 functional clock
I2C2	I2C2_ICLK	PER_L4_ICLK	PRCM	I2C2 interface clock
	I2C2_FCLK	PER_96M_FCLK	PRCM	I2C2 functional clock
I2C3	I2C3_ICLK	PER_L4_ICLK	PRCM	I2C3 interface clock
	I2C3_FCLK	PER_96M_FCLK	PRCM	I2C3 functional clock

**Table 23-5. HS I<sup>2</sup>C Clocks and Resets (continued)**

I2C4	I2C4_ICLK	PER_L4_ICLK	PRCM	I2C4 interface clock
	I2C4_FCLK	PER_96M_FCLK	PRCM	I2C4 functional clock
<b>Resets</b>				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
I2C1	I2C1_RESET	L4_PER_RET_RST	PRCM	I2C1 reset
I2C2	I2C2_RESET	L4_PER_RST	PRCM	I2C2 reset
I2C3	I2C3_RESET	L4_PER_RST	PRCM	I2C3 reset
I2C4	I2C4_RESET	L4_PER_RST	PRCM	I2C4 reset

**Table 23-6. HS I<sup>2</sup>C Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
I2C1	I2C1_IRQ	MA_IRQ_56	Cortex™-A9 INTC	I2C1 interrupt request
	I2C1_IRQ	MM_IRQ_25	Cortex™-M3 INTC	I2C1 interrupt request
I2C2	I2C2_IRQ	MA_IRQ_57	Cortex-A9 INTC	I2C2 interrupt request
	I2C2_IRQ	MM_IRQ_26	Cortex-M3 INTC	I2C2 interrupt request
I2C3	I2C3_IRQ	MA_IRQ_61	Cortex-A9 INTC	I2C3 interrupt request
	I2C3_IRQ	MM_IRQ_27	Cortex-M3 INTC	I2C3 interrupt request
I2C4	I2C4_IRQ	MA_IRQ_62	Cortex-A9 INTC	I2C4 interrupt request
	I2C4_IRQ	MM_IRQ_28	Cortex-M3 INTC	I2C4 interrupt request
DMA Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
I2C1	I2C1_DMA_TX	S_DMA_26	sDMA	I2C1 DMA transmit request
	I2C1_DMA_RX	S_DMA_27	sDMA	I2C1 DMA receive request
I2C2	I2C2_DMA_TX	S_DMA_28	sDMA	I2C2 DMA transmit request
	I2C2_DMA_RX	S_DMA_29	sDMA	I2C2 DMA receive request
I2C3	I2C3_DMA_TX	S_DMA_24	sDMA	I2C3 DMA transmit request
	I2C3_DMA_RX	S_DMA_25	sDMA	I2C3 DMA receive request
I2C4	I2C4_DMA_TX	S_DMA_123	sDMA	I2C4 DMA transmit request
	I2C4_DMA_RX	S_DMA_124	sDMA	I2C4 DMA receive request

**NOTE:**

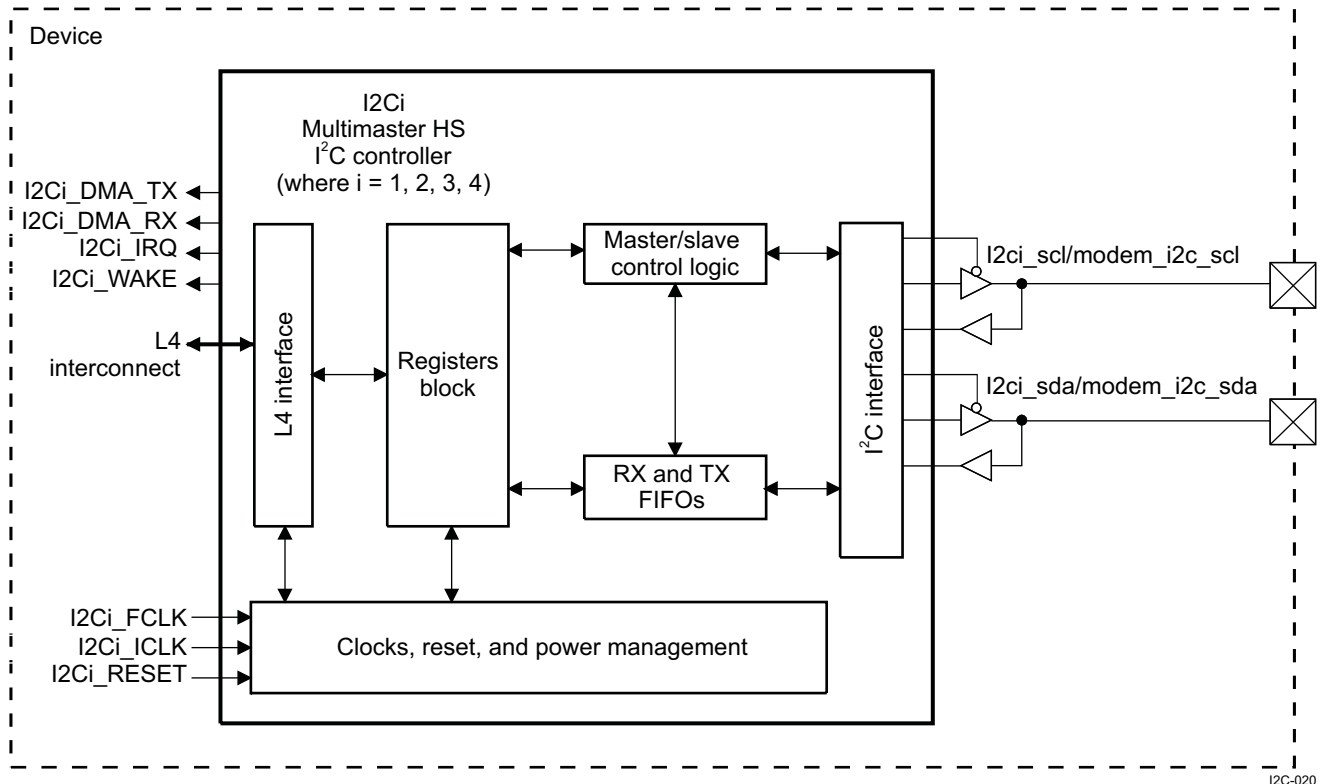

- For a description of interrupt source, see [Table 23-12](#).
- For a description of DMA source, see [Table 23-13](#).

### 23.1.4 HS I<sup>2</sup>C Functional Description

#### 23.1.4.1 HS I<sup>2</sup>C Block Diagram

Figure 23-21 is the multimaster I<sup>2</sup>C HS controller block diagram.

Figure 23-21. HS I<sup>2</sup>C Block Diagram

I2C-020

The five multimaster HS I<sup>2</sup>C controllers can be configured in F/S I<sup>2</sup>C mode, HS I<sup>2</sup>C mode, or SCCB mode. The operation mode is selected by configuring the I2Ci.I2C\_CON[13:12] OPMODE bit field. Table 23-7 lists the available operation modes.

**NOTE:** The fifth master transmitter HS I<sup>2</sup>C interface (I2C5) in the PRCM module can also be configured in HS mode.

Table 23-7. HS I<sup>2</sup>C Operation Mode Selection

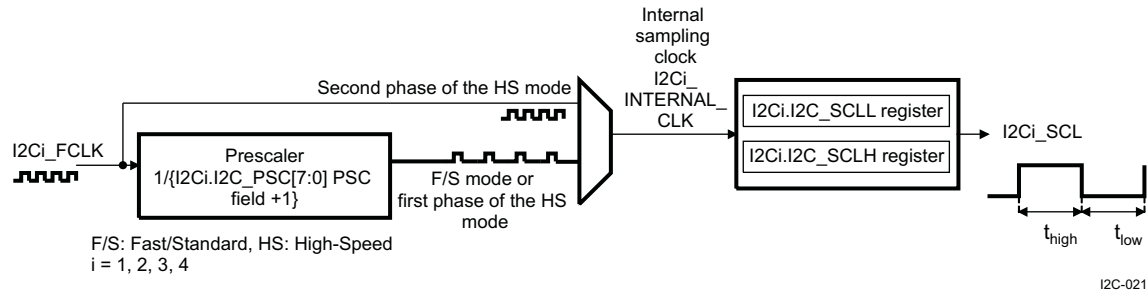

Operation Mode	Value of I2Ci.I2C_CON[13:12] OPMODE Bit Field
F/S I <sup>2</sup> C	0x0
HS I <sup>2</sup> C	0x1
SCCB	0x2
Reserved (not used)	0x3

### 23.1.4.2 HS I<sup>2</sup>C Clocks

#### 23.1.4.2.1 HS I<sup>2</sup>C Clocking

Figure 23-22 shows the I<sup>2</sup>C clock generation of the HS I<sup>2</sup>C controllers.

**Figure 23-22. HS I<sup>2</sup>C Clock Generation**

Each multimaster HS I<sup>2</sup>C controller uses the I2Ci\_FCLK functional clock in the PRCM module. The internal sampling clock I2Ci\_INTERNAL\_CLK is generated by dividing the functional clock by the I2Ci.I2C\_PSC[7:0] PSC bit field value + 1 in F/S mode, in SCCB mode, or in the first phase of HS mode; or by directly using the functional clock in the second phase of HS mode (prescaler is bypassed).

The low time of the I2Ci\_SCL signal is determined by the I2Ci.I2C\_SCLL[7:0] SCLL bit field in F/S mode, in SCCB mode, or in the first phase of HS mode; or by the I2Ci.I2C\_SCLL[15:8] HSSCLL bit field in the second phase of HS mode.

The high time of the I2Ci\_SCL signal is determined by the I2Ci.I2C\_SCLH[7:0] SCLH bit field in F/S mode, in SCCB mode, or in the first phase of HS mode; or by the I2Ci.I2C\_SCLH[15:8] HSSCLH bit field in the second phase of HS mode.

The low time of the I2C5 signal is determined by the PRM\_VC\_CFG\_I2C\_CLK[15:8] SCLL bit field in F/S mode or in the first phase of HS mode, or by the PRM\_VC\_CFG\_I2C\_CLK[31:24] HSSCLL bit field in the second phase of HS mode.

The high time of the I2C5 signal is determined by the PRM\_VC\_CFG\_I2C\_CLK[7:0] SCLH bit field in F/S mode or in the first phase of HS mode, or by the PRM\_VC\_CFG\_I2C\_CLK[23:16] HSSCLH bit field in the second phase of HS mode.

Table 23-8 lists the  $T_{LOW}$  and  $T_{HIGH}$  values in master mode only (in slave mode, the I<sup>2</sup>C controller does not generate the I<sup>2</sup>C clock).

**Table 23-8. HS I<sup>2</sup>C  $T_{LOW}$  and  $T_{HIGH}$  Values of the I<sup>2</sup>C Clock**

Mode	I <sup>2</sup> C Clock	$t_{LOW}$	$t_{HIGH}$	
			DFILTEREN bit = 0	DFILTEREN bit = 1
F/S, SCCB, or HS first phase	$I2Ci\_INTERNAL\_CLK = I2Ci\_FCLK / (I2Ci.I2C\_PSC[7:0] PSC \text{ bit field} + 1)$	$(I2Ci.I2C\_SCLL[7:0] SCLL \text{ bit field value} + 7) \times I2Ci\_INTERNAL\_CLK \text{ period}$	$(I2Ci.I2C\_SCLH[7:0] SCLH \text{ bit field value} + 5 + PROP\_DELAY0) \times I2Ci\_INTERNAL\_CLK \text{ period}$	$(I2Ci.I2C\_SCLH[7:0] SCLH \text{ bit field value} + 5 + PROP\_DELAY1) \times I2Ci\_INTERNAL\_CLK \text{ period}$
HS second phase	I2Ci_FCLK	$(I2Ci.I2C\_SCLL[15:8] HSSCLL \text{ bit field value} + 7) \times I2Ci\_FCLK \text{ period}$	$(I2Ci.I2C\_SCLH[15:8] HSSCLH \text{ bit field value} + 5 + PROP\_DELAY0) \times I2Ci\_FCLK \text{ period}$	$(I2Ci.I2C\_SCLH[15:8] HSSCLH \text{ bit field value} + 5 + PROP\_DELAY1) \times I2Ci\_FCLK \text{ period}$
F/S or HS first phase for I2C5	I2C5_FCLK	$(PRM\_VC\_CFG\_I2C\_CLK[15:8] SCLL + 1) \times I2C5\_FCLK \text{ period}$	$(PRM\_VC\_CFG\_I2C\_CLK[7:0] SCLH + 5 + PROP\_DELAY0) \times I2C5\_FCLK \text{ period}$	$(PRM\_VC\_CFG\_I2C\_CLK[7:0] SCLH + 5 + PROP\_DELAY1) \times I2C5\_FCLK \text{ period}$

**Table 23-8. HS I<sup>2</sup>C T<sub>LOW</sub> and T<sub>HIGH</sub> Values of the I<sup>2</sup>C Clock (continued)**

Mode	I <sup>2</sup> C Clock	t <sub>LOW</sub>	t <sub>HIGH</sub>	
			DFILTEREN bit = 0	DFILTEREN bit = 1
HS second phase for I2C5	I2C5_FCLK	(PRM_VC_CFG_I2C_CLK[31:24] HSSCLL + 1) x I2C5_FCLK period	(PRM_VC_CFG_I2C_CLK[23:16] HSSCLH + 5 + PROP_DELAY0) x I2C5_FCLK period	(PRM_VC_CFG_I2C_CLK[23:16] HSSCLH + 5 + PROP_DELAY1) x I2C5_FCLK period

**NOTE:** For HS mode, the I2Ci.I2C\_SCLL[15:8] HSSCLL and I2Ci.I2C\_SCLL[7:0] SCLL bit fields must be programmed (the first phase of an HS transaction is performed at F/S speed).

For HS mode, the I2Ci.I2C\_SCLH[15:8] HSSCLH and I2Ci.I2C\_SCLH[7:0] SCLH bit fields must be programmed (the first phase of an HS transaction is performed at F/S speed).

**NOTE:** The equations in Table 23-8 give the SCL timing values for SCLL/SCLH/HSSCLL/HSSCLH at HS I<sup>2</sup>C controller outputs. Actual T<sub>LOW</sub> and T<sub>HIGH</sub> periods may vary depending on the board (the load capacitance on the SCL signal). If necessary, any adjustments to the SCLL/SCLH/HSSCLL/HSSCLH values must be determined by measurements of actual SCL signal on the board

#### CAUTION

During active mode (the I2Ci.I2C\_CON[15] I2C\_EN bit is set to 1), make no changes to the I2Ci.I2C\_SCLL and I2Ci.I2C\_SCLH registers. Changes can result in unpredictable behavior.

**NOTE:** Each multimaster HS I<sup>2</sup>C controller can be used with an internal secondary pullup. This pullup is mandatory when the I<sup>2</sup>C controller is configured in HS mode for a bit rate of 3.4 Mbps, and the bus line capacitance exceeds 45 pF. Pullups can be programmed through:

- CONTROL\_I2C\_0[0] I2C1\_SCL\_PULLUPRESX bit or CONTROL\_I2C\_0[16] I2C1\_SDA\_PULLUPRESX bit for I2C1
- CONTROL\_I2C\_0[4] I2C2\_SCL\_PULLUPRESX bit or CONTROL\_I2C\_0[20] I2C2\_SDA\_PULLUPRESX bit for I2C2
- CONTROL\_I2C\_0[8] I2C3\_SCL\_PULLUPRESX bit or CONTROL\_I2C\_0[24] I2C3\_SDA\_PULLUPRESX bit for I2C3
- CONTROL\_I2C\_0[12] I2C4\_SCL\_PULLUPRESX bit or CONTROL\_I2C\_0[28] I2C4\_SDA\_PULLUPRESX bit for I2C4

The maximum bit rate specified by the SCCB specifications is 100 Kbps.

For more information see Section 18.4.12.9.8, *I2Cx I/Os Group Pullupresx Controls and Load Range Settings*.

Table 23-9 lists the register values for obtaining the maximum I<sup>2</sup>C bit rates and the maximum period of the filtered spikes in F/S mode and HS mode.

**Table 23-9. HS I<sup>2</sup>C Register Values for Maximum I<sup>2</sup>C Bit Rates in I<sup>2</sup>C F/S, I<sup>2</sup>C HS, and SCCB Modes<sup>(1)</sup>**

	I <sup>2</sup> C Mode for I2Ci, where i = 1, 2, 3, 4			Description	SCCB Mode for I2Ci, where i = 2, 3		I <sup>2</sup> C Mode for I2C5		
	Standard Mode	Fast Mode	High-Speed Mode				Fast and High-Speed Mode		
I2Ci_FCLK frequency (MHz)	96				96		38.4	SYS_CLK clock frequency	
<b>I2Ci.I2C_PSC[7:0] PSC bit field value</b>	<b>23</b>	<b>9</b>	<b>1</b>	Prescaler value for F/S and HS modes	<b>4</b>	Prescaler value for SCCB mode	Not accessible by software		
I2Ci_INTERNAL_CLK frequency (MHz)	4	9.6	96	19.2					
<b>I2Ci.I2C_SCLL[7:0] SCLL bit field value</b>	<b>13</b>	<b>7</b>	<b>113</b>	Value for F/S mode and first phase of HS mode	<b>89</b>	Value for SCCB mode	<b>PRM_VC_CFG_I2C_CLK[15:8] SCLL</b> (see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> )	43	Value for F/S mode and first phase of HS mode
<b>I2Ci.I2C_SCLH[7:0] SCLH bit field value</b>	<b>15</b>	<b>5</b>	<b>115</b>	Value for F/S mode and first phase of HS mode	<b>91</b>	Value for SCCB mode	<b>PRM_VC_CFG_I2C_CLK[7:0] SCLH</b> (see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> )	41	Value for F/S mode and first phase of HS mode
Maximum bit rate (Mbps)	0.1	0.4	0.4	F/S mode and first phase in HS mode maximum bit rate	0.1	SCCB mode maximum bit rate	Maximum bit rate (Mbps)	0.4	F/S mode and first phase in HS mode maximum bit rate
Maximum filter period (ns)	250	104	10		50		Maximum filter period (ns)	50	
<b>I2Ci.I2C_SCLL[15:8] HSSCLL bit field value</b>	<b>12</b>			Values for second phase of HS mode			<b>PRM_VC_CFG_I2C_CLK[31:24] HSSCLL</b> (see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> )	14	Values for second phase of HS mode
<b>I2Ci.I2C_SCLH[15:8] HSSCLH bit field value</b>	<b>5</b>			Values for second phase of HS mode			<b>PRM_VC_CFG_I2C_CLK[23:16] HSSCLH</b> (see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> )	0	Values for second phase of HS mode
HS mode maximum bit rate (Mbps)	3.31			HS mode maximum bit rate			HS mode maximum bit rate (Mbps)	3.2	HS mode maximum bit rate according to the corresponding SYS_CLK clock frequency
Maximum filter period (ns)	10							10	

<sup>(1)</sup> Programmable fields are in bold.

**NOTE:** This table presents informative values only for the configuration parameters and the I<sup>2</sup>C bus performance obtained according to these values. The delays added by the analog pads are not considered in these figures.

**NOTE:** For I2Ci (where i = 1, 2, 3, 4)

$$I2Ci\_INTERNAL\_CLK \text{ freq} = I2Ci\_FCLK / (PSC + 1)$$

$$FS \text{ filter period} = 1 / I2Ci\_INTERNAL\_CLK$$

$$HS \text{ filter period} = 1 / I2Ci\_FCLK \text{ freq}$$

- If the DFILTEREN bit = 0:
  - HS bit rate =  $I2Ci\_FCLK \text{ freq} / (HSSCLL + 7 + HSSCLH + 5 + PROP\_DELAY0)$
  - FS bit rate =  $I2Ci\_INTERNAL\_CLK / (SCLL + 7 + SCLH + 5 + PROP\_DELAY0)$
- If the DFILTEREN bit = 1:
  - HS bit rate =  $I2Ci\_FCLK \text{ freq} / (HSSCLL + 7 + HSSCLH + 5 + PROP\_DELAY1)$
  - FS bit rate =  $I2Ci\_INTERNAL\_CLK / (SCLL + 7 + SCLH + 5 + PROP\_DELAY1)$

For I2C5 (SR):

$$I2C5\_FCLK \text{ freq} = SYS\_CLK \text{ freq}$$

$$HS/FS \text{ filter period} = 1 / I2C5\_FCLK \text{ freq}$$

- If the DFILTEREN bit = 0:
  - HS bit rate =  $I2C5\_FCLK \text{ freq} / (HSSCLL + 1 + HSSCLH + 5 + PROP\_DELAY0)$
  - FS bit rate =  $I2C5\_FCLK \text{ freq} / (SCLL + 1 + SCLH + 5 + PROP\_DELAY0)$
- If the DFILTEREN bit = 1:
  - HS bit rate =  $I2C5\_FCLK \text{ freq} / (HSSCLL + 1 + HSSCLH + 5 + PROP\_DELAY1)$
  - FS bit rate =  $I2C5\_FCLK \text{ freq} / (SCLL + 1 + SCLH + 5 + PROP\_DELAY1)$

DFILTEREN refers to the VC\_CFG\_I2C\_MODE[6] DFILTEREN bit. PROP\_DELAYx (where x = 0 or 1) represents frequency-normalized I/O low-to-high propagation delay.

PROP\_DELAY0 = 0 or 3 (values for bit rate maximum/minimum range)

PROP\_DELAY1 = 1 or 4 (values for bit rate maximum/minimum range)

### 23.1.4.2.2 HS I<sup>2</sup>C Automatic Blocking of the I<sup>2</sup>C Clock Feature (I<sup>2</sup>C Mode Only)

This feature offers the possibility for the LH to command the blocking of the I<sup>2</sup>C clock after the slave addressing phase, when the I<sup>2</sup>C controller is addressed by an external master device using a certain Own Address.

The release of the I<sup>2</sup>C clock can be performed independently for each Own Address (I2Ci.I2C\_OA<sub>i</sub>, where i = 1, 2, 3, 4 and I2Ci.I2C\_OAx registers, where x = 1, 2, 3) by deasserting the corresponding bit in the I2Ci.I2C\_SBLOCK register.

### 23.1.4.3 HS I<sup>2</sup>C Software Reset

Each multimaster HS I<sup>2</sup>C controller supports the software reset by accessing the I2Ci.I2C\_SYSC[1] SRST bit (1: reset; 0: normal mode).

The software reset status can be checked by accessing the I2Ci.I2C\_SYSS[0] RDONE bit (1: reset is done; 0: reset is ongoing).

To perform a software reset:

1. Ensure that the module is disabled (clear the I2Ci.I2C\_CON[15] I2C\_EN bit to 0).
2. Set the I2Ci.I2C\_SYSC[1] SRST bit to 1.
3. Enable the module by setting I2Ci.I2C\_CON[15] I2C\_EN bit to 1.
4. Check the I2Ci.I2C\_SYSS[0] RDONE bit until it is set to 1 to indicate the software reset is complete.

---

**NOTE:** The I2Ci.I2C\_CON[15] I2C\_EN bit can hold the functional clock domain of the multimaster HS I<sup>2</sup>C controller in reset after the device reset has been released. When the system bus reset is removed, this bit remains cleared. The functional part of the I<sup>2</sup>C controller is held in reset state while this bit is 0, and all configuration registers can be accessed.

The I2Ci.I2C\_CON[15] I2C\_EN bit must be set to 1 to enable the functional part of the I<sup>2</sup>C controller.

The I2Ci.I2C\_SYSS[0] RDONE bit is asserted only after the module is enabled by setting the I2Ci.I2C\_CON[15] I2C\_EN bit to 1.

---

### 23.1.4.4 HS I<sup>2</sup>C Power Management

Table 23-10 describes power-management features available for the multimaster HS I<sup>2</sup>C controllers.

**NOTE:**

- For information about source clock gating and sleep/wake-up transitions description, see Section 3.1.1.1.2, *Module Level Clock Management*, in Chapter 3, *Power, Reset, and Clock Management*.
  - For descriptions of EnaWakeUp, IdleMode, ClockActivity, and StandbyMode features, see Section 3.1.1.1.2, *Module Level Clock Management*, in Chapter 3, *Power, Reset, and Clock Management*.
- 

**Table 23-10. HS I<sup>2</sup>C Local Power-Management Features**

Feature	Registers	Description
Clock auto gating	I2Ci.I2C_SYSC[0] AUTOIDLE	This bit allows a local power optimization inside the module
Slave idle modes	I2Ci.I2C_SYSC[4:3] IDLEMODE	Force-idle, no-idle, smart-idle, and smart-idle wake-up-capable modes are available.
Clock activity	I2Ci.I2C_SYSC[9:8] CLOCKACTIVITY	For configuration details, see Table 23-11.
Global wake-up enable	I2Ci.I2C_SYSC[2] ENAWAKEUP	This bit enables the wake-up feature at module level.

**NOTE:** The voltage controllers, in which the HS I<sup>2</sup>C controller I2C5 are implemented, have no idle request/acknowledge mechanism. The idle modes for the voltage controllers are directly managed by the PRCM module.

**Table 23-11. HS I<sup>2</sup>C Clock Activity Settings**

I2Ci.I2C_SYSC[9:8] CLOCKACTIVITY	Clock State When Module is in IDLE State		Features Available/Unavailable When Module is in IDLE State
	I2Ci_ICLK	I2C_FCLK	
00	OFF	OFF	Both clocks are disabled
10	OFF	ON	Interface clock is disabled; functional clock is enabled
01	ON	OFF	Functional clock is disabled; interface clock is enabled
11	ON	ON	Both clocks are enabled

### CAUTION

The PRCM module has no hardware means of reading the settings of CLOCKACTIVITY. Thus, software must ensure consistent programming between the I2C CLOCKACTIVITY and I2C clock PRCM control bits. For a description of the ClockActivity feature, see [Section 3.1.1.1.2, Module Level Clock Management](#) in [Chapter 3, Power, Reset, and Clock Management](#).

#### 23.1.4.5 HS I<sup>2</sup>C Interrupt Requests

[Table 23-12](#) lists the event flags, and their mask, that can cause module interrupts.

**Table 23-12. HS I<sup>2</sup>C Events**

Event Flag	Event Mask	Event Unmask	Map to	Description
I2Ci.I2C_IRQSTATUS[0] AL	I2Ci.I2C_IRQENABLE_SET[0] AL_IE	I2Ci.I2C_IRQENABLE_C LR[0] AL_IE	I2Ci_IRQ	Arbitration lost IRQ enabled status. This bit is automatically set by the hardware when it loses the Arbitration in master transmit mode, an interrupt is signaled to the MPU subsystem. During reads, it always returns 0.
I2Ci.I2C_IRQSTATUS[1] NACK	I2Ci.I2C_IRQENABLE_SET[1] NACK_IE	I2Ci.I2C_IRQENABLE_C LR[1] NACK_IE	I2Ci_IRQ	No acknowledgment IRQ enabled status. Bit is set when No Acknowledge has been received, an interrupt is signaled to MPU subsystem. Write 1 to clear this bit.
I2Ci.I2C_IRQSTATUS[2] ARDY	I2Ci.I2C_IRQENABLE_SET[2] ARDY_IE	I2Ci.I2C_IRQENABLE_C LR[2] ARDY_IE	I2Ci_IRQ	Register access ready IRQ enabled status. When set to 1 it indicates that previous access has been performed and registers are ready to be accessed again. An interrupt is signaled to MPU subsystem. Write 1 to clear.
I2Ci.I2C_IRQSTATUS[3] RRDY	I2Ci.I2C_IRQENABLE_SET[3] RRDY_IE	I2Ci.I2C_IRQENABLE_C LR[3] RRDY_IE	I2Ci_IRQ	Receive data ready IRQ enabled status. Set to 1 by core when receiver mode, a new data is able to be read. When set to 1 by core, an interrupt is signaled to MPU subsystem. Write 1 to clear.

**Table 23-12. HS I<sup>2</sup>C Events (continued)**

Event Flag	Event Mask	Event Unmask	Map to	Description
I2Ci.I2C_IRQSTATUS[4] XRDY	I2Ci.I2C_IRQENABLE_SET[4] XRDY_IE	I2Ci.I2C_IRQENABLE_C LR[4] XRDY_IE	I2Ci_IRQ	Transmit data ready IRQ enabled status. Set to 1 by core when transmitter and when new data is requested. When set to 1 by core, an interrupt is signaled to MPU subsystem. Write 1 to clear.
I2Ci.I2C_IRQSTATUS[5] GC	I2Ci.I2C_IRQENABLE_SET[5] GC_IE	I2Ci.I2C_IRQENABLE_C LR[5] GC_IE	I2Ci_IRQ	General call IRQ enabled status. Set to 1 by core when General call address detected and interrupt signaled to MPU subsystem. Write 1 to clear.
I2Ci.I2C_IRQSTATUS[6] STC	I2Ci.I2C_IRQENABLE_SET[6] STC_IE	I2Ci.I2C_IRQENABLE_C LR[6] STC_IE	I2Ci_IRQ	Start Condition IRQ enabled status.
I2Ci.I2C_IRQSTATUS[7] AERR	I2Ci.I2C_IRQENABLE_SET[7] AERR_IE	I2Ci.I2C_IRQENABLE_C LR[7] AERR_IE	I2Ci_IRQ	Access Error IRQ enabled status.
I2Ci.I2C_IRQSTATUS[8] BF	I2Ci.I2C_IRQENABLE_SET[8] BF_IE	I2Ci.I2C_IRQENABLE_C LR[8] BF_IE	I2Ci_IRQ	Access Error IRQ enabled status.
I2Ci.I2C_IRQSTATUS[9] AAS	I2Ci.I2C_IRQENABLE_SET[9] AAS_IE	I2Ci.I2C_IRQENABLE_C LR[9] AAS_IE	I2Ci_IRQ	Address recognized as slave IRQ enabled status.
I2Ci.I2C_IRQSTATUS[10] XUDF	I2Ci.I2C_IRQENABLE_SET[1 0] XUDF_IE	I2Ci.I2C_IRQENABLE_C LR[10] XUDF_IE	I2Ci_IRQ	Transmit underflow enabled status. Writing into this bit has no effect.
I2Ci.I2C_IRQSTATUS[11] ROVR	I2Ci.I2C_IRQENABLE_SET[1 1] ROVR_IE	I2Ci.I2C_IRQENABLE_C LR[11] ROVR_IE	I2Ci_IRQ	Receive overrun enabled status. Writing into this bit has no effect.
I2Ci.I2C_IRQSTATUS[12] BB	-	-	I2Ci_IRQ	Bus busy status.
I2Ci.I2C_IRQSTATUS[13] RDR	I2Ci.I2C_IRQENABLE_SET[1 3] RDR_IE	I2Ci.I2C_IRQENABLE_C LR[13] RDR_IE	I2Ci_IRQ	Receive draining IRQ enabled status.
I2Ci.I2C_IRQSTATUS[14] XDR	I2Ci.I2C_IRQENABLE_SET[1 4] XDR_IE	I2Ci.I2C_IRQENABLE_C LR[14] XDR_IE	I2Ci_IRQ	Transmit draining IRQ enabled status.

#### 23.1.4.6 HS I<sup>2</sup>C DMA Requests

Each multimaster HS I<sup>2</sup>C controller can generate two DMA requests to the system DMA (sDMA) controller. [Table 23-13](#) lists the DMA requests with mapping on the sDMA controller. For information about DMA generation, see [Section 23.1.4.8.3, HS I<sup>2</sup>C FIFO DMA Mode \(I<sup>2</sup>C Mode Only\)](#).

**Table 23-13. HS I<sup>2</sup>C DMA Requests**

Name	Source	Destination	Description
I2C1_DMA_TX	I2C1	S_DMA_26	I2C1 DMA write request to inform the sDMA to write new data in the I2C1.I2C_DATA[7:0] register
I2C1_DMA_RX	I2C1	S_DMA_27	I2C1 DMA read request to inform the sDMA to read the data in the I2C1.I2C_DATA[7:0] register
I2C2_DMA_TX	I2C2	S_DMA_28	I2C2 DMA write request to inform the sDMA to write new data in the I2C2.I2C_DATA[7:0] register
I2C2_DMA_RX	I2C2	S_DMA_29	I2C2 DMA read request to inform the sDMA to read the data in the I2C2.I2C_DATA[7:0] register
I2C3_DMA_TX	I2C3	S_DMA_24	I2C3 DMA write request to inform the sDMA to write new data in the I2C3.I2C_DATA[7:0] register
I2C3_DMA_RX	I2C3	S_DMA_25	I2C3 DMA read request to inform the sDMA to read the data in the I2C3.I2C_DATA[7:0] register

**Table 23-13. HS I<sup>2</sup>C DMA Requests (continued)**

Name	Source	Destination	Description
I2C4_DMA_TX	I2C4	S_DMA_123	I2C4 DMA write request to inform the sDMA to write new data in the I2C4.I2C_DATA[7:0] register
I2C4_DMA_RX	I2C4	S_DMA_124	I2C4 DMA read request to inform the sDMA to read the data in the I2C4.I2C_DATA[7:0] register

---

**NOTE:** The HS I<sup>2</sup>C controller I2C5 does not generate any DMA requests.

---

#### 23.1.4.7 HS I<sup>2</sup>C Programmable Multislave Channel Feature (I<sup>2</sup>C Mode Only)

This feature allows each multimaster HS I<sup>2</sup>C controller to be addressed using four separate Own Addresses configured in the I2Ci.I2C\_OA and I2Ci.I2C\_OAx registers (where x = 1, 2, 3). An additional register (I2Ci.I2C\_ACTOA) is used to indicate to the LH which address is used by the external master to communicate with the I<sup>2</sup>C controller.

Each Own Address can be independently configured in 7-bit or 10-bit mode by setting the corresponding bit (I2Ci.I2C\_CON[7] XOA, I2Ci.I2C\_CON[6] XOA1, I2Ci.I2C\_CON[5] XOA2, or I2Ci.I2C\_CON[4] XOA3).

#### 23.1.4.8 HS I<sup>2</sup>C FIFO Management

Each multimaster HS I<sup>2</sup>C controller implements two internal 8-bit FIFOs, the RX and TX FIFOs.

The depth of the RX and TX FIFOs is fixed at 16 bytes and can be checked by reading the I2Ci.I2C\_BUFSTAT[15:14] FIFODEPTH bit field (0x0: 8 bytes, 0x1: 16 bytes, 0x2: 32 bytes, and 0x3: 64 bytes).

---

**NOTE:** FIFO depth is configured at design time and cannot be modified by software. FIFO thresholds must not exceed configured FIFO depth.

---

##### 23.1.4.8.1 HS I<sup>2</sup>C FIFO Interrupt Mode

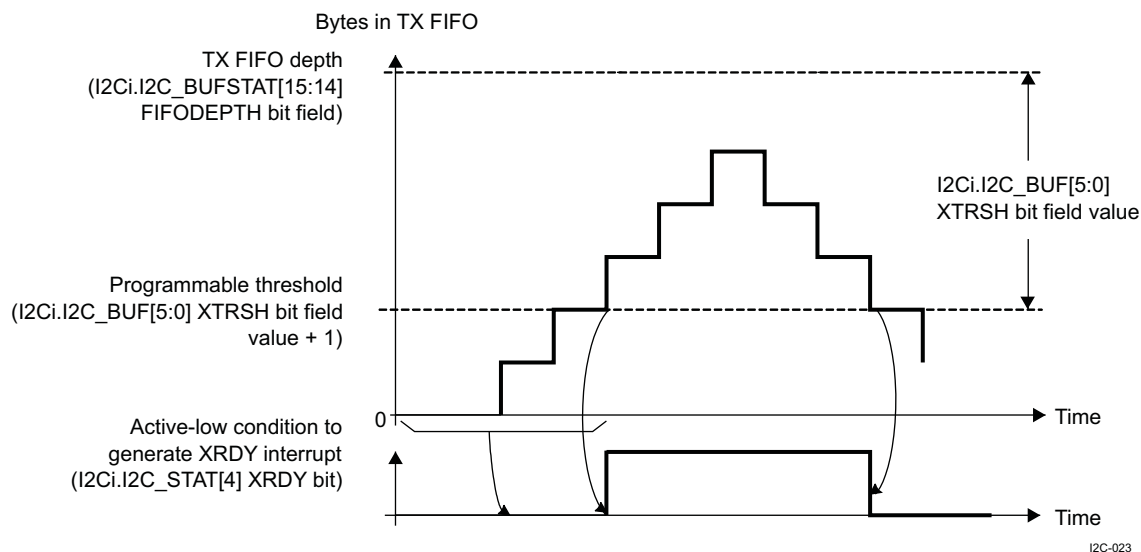

In first in first out (FIFO) interrupt mode (relevant interrupts enabled by the I2Ci.I2C\_IE register), an interrupt signal informs the processor of the receiver and transmitter status. These interrupts are raised when the RX/TX FIFO thresholds (defined by the I2Ci.I2C\_BUF[13:8] RTRSH bit field value + 1 for the RX FIFO or the I2Ci.I2C\_BUF[5:0] TXTRSH bit field value + 1 for the TX FIFO) are reached; the interrupt signals instruct the LH to transfer data to the destination (from the I<sup>2</sup>C controller in receive mode and/or from any source to the I<sup>2</sup>C controller FIFO in transmit mode).

Figure 23-23 and Figure 23-24 show receive and transmit operations, respectively, from a FIFO management point of view.

**Figure 23-23. HS I<sup>2</sup>C Receive FIFO Interrupt Request Generation**

In [Figure 23-23](#), the RRDY interrupt condition shows that the condition for generating an RRDY interrupt is achieved. The interrupt request is generated when this signal is active, and it can be cleared only by the LH by writing 1 in the I2Ci.I2C\_STAT[3] RRDY bit. If the condition is still present after clearing the previous interrupt, another interrupt request is generated.

In receive mode, an RRDY interrupt is generated as soon as the FIFO reaches its receive threshold (I2Ci.I2C\_BUF[13:8] RTRSH bit field value + 1). The interrupt can be deasserted only when the LH has handled enough bytes to make the number of bytes in the RX FIFO lower than the programmed threshold. For each interrupt, the LH can be configured to read a number of bytes equal to the value of the RX FIFO threshold.

**Figure 23-24. HS I<sup>2</sup>C Transmit FIFO Interrupt Request Generation**

In [Figure 23-24](#), the XRDY interrupt condition shows that the condition for generating an XRDY interrupt is achieved. The interrupt request is generated when TX FIFO is empty or when the TX FIFO threshold is not reached, and the LH can clear the XRDY status bit by setting the I2Ci.I2C\_STAT[4] XRDY bit to 1 after transmitting the configured number of bytes. If the condition is still present after clearing the previous interrupt, another interrupt request is generated.

In interrupt mode, the module offers two options for the LH application to handle the interrupts:

- When detecting an interrupt request (XRDY or RRDY type), the LH can write/read 1 data byte to/from the TX/RX FIFO and then clear the interrupt. The module reasserts the interrupt until the interrupt condition is not met.

- When detecting an interrupt request (XRDY or RRDY type), the LH can be programmed to write/read the amount of data bytes specified by the corresponding FIFO threshold ( $I2C\_BUF[5:0] TXTRSH + 1$  or  $I2C\_BUF[5:0] RXTRSH + 1$ ). In this case, the interrupt condition is cleared and the next interrupt is asserted again when the XRDY or RRDY condition is met again.

If the second-interrupt-serving approach is used, an additional mechanism (draining feature) is implemented for cases where the transfer length is not a multiple of the FIFO threshold value (see [Section 23.1.4.8.4, Draining Feature \[I<sup>2</sup>C Mode Only\]](#)).

**NOTE:** In slave transmit mode (the I2Ci.I2C\_CON[10] MST bit is cleared and the I2Ci.I2C\_CON[9] TRX bit is set to 1), the draining feature must not be used, because the transfer length is not known at configuration time, and the external master can end the transfer at any point by not acknowledging 1 data byte. If the draining feature is used in slave transmit mode, data can remain in the TX FIFO without being transmitted over the I<sup>2</sup>C bus. In this case, the TX FIFO must be cleared by setting the I2Ci.I2C\_BUF[6] TXFIFO\_CLR bit.

**NOTE:** In SCCB mode, the RX and TX threshold values must be set to 1 by setting the I2Ci.I2C\_BUF[13:8]RTRSH and I2Ci.I2C\_BUF[5:0] TXTRSH fields to 0x0.

### 23.1.4.8.2 HS I<sup>2</sup>C FIFO Polling Mode

In FIFO polling mode (the I2Ci.I2C\_IE[4] XRDY\_IE and I2Ci.I2C\_IE[3] RRDY\_IE bits are disabled, and the I2Ci.I2C\_BUF[15] RDMA\_EN and I2Ci.I2C\_BUF[7] XDMA\_EN bits are disabled), the status of the module (receiver or transmitter) can be checked by polling the I2Ci.I2C\_STAT[4] XRDY and the I2Ci.I2C\_STAT[3] RRDY bits (the I2Ci.I2C\_STAT[13] RDR and I2Ci.I2C\_STAT[14] XDR bits can also be polled if the draining feature is enabled). The I2Ci.I2C\_STAT[4] XRDY and I2Ci.I2C\_STAT[3] RRDY bits accurately reflect the interrupt conditions described in the discussion of FIFO interrupt mode.

### 23.1.4.8.3 HS I<sup>2</sup>C FIFO DMA Mode (I<sup>2</sup>C Mode Only)

In receive mode, a DMA request is generated by the I2Ci\_DMA\_RX signal as soon as the RX FIFO exceeds its threshold level (the I2Ci.I2C\_BUF[13:8] RTRSH bit field value + 1). This request is deasserted when the number of bytes defined by the threshold level is read by the DMA controller.

Figure 23-25 shows the DMA request generation in receive mode.

**Figure 23-25. HS I<sup>2</sup>C Receive FIFO DMA Request Generation**

I2C-024

In transmit mode, a DMA request is automatically asserted by the I2Ci\_DMA\_TX signal when the TX FIFO is empty. This request is deasserted when the number of bytes (the 2Ci.I2C\_BUF[5:0] TXTRSH bit field value + 1) is written in the FIFO by the DMA controller. If an insufficient number of bytes is written, the sDMA request remains active. Figure 23-26 and Figure 23-27 show the DMA TX transfers with different values for the I2Ci.I2C\_BUF[5:0] TXTRSH bit field.

**Figure 23-26. HS I<sup>2</sup>C Transmit FIFO Request Generation (High Threshold)**

**Figure 23-27. HS I<sup>2</sup>C Transmit FIFO Request Generation (Low Threshold)**

**NOTE:** In SCCB mode, the RX and TX threshold values must be set to 1 by setting the I2Ci.I2C\_BUF[13:8] RTRSH and I2Ci.I2C\_BUF[5:0] XTRSH bit fields to 0x0.

The I<sup>2</sup>C module allows the user to clear the RX or TX FIFO by setting the I2Ci.I2C\_BUF[14] RXFIFO\_CLR and I2Ci.I2C\_BUF[6] TXFIFO\_CLR registers, respectively, which act like software reset for the FIFOs. In DMA mode, these bits also reset the DMA state-machines. The FIFO clearing feature can be used when the following conditions are met:

- The module is configured as a transmitter.
- The external receiver responds with a NACK in the middle of the transfer.
- Data in the TX FIFO is waiting to be transferred.

#### **23.1.4.8.4 HS I<sup>2</sup>C Draining Feature (I<sup>2</sup>C Mode Only)**

The draining feature is implemented to handle the end of a transfer whose length is not a multiple of the FIFO threshold values (the I2Ci.I2C\_BUF[13:8] RTRSH bit field value + 1 for the RX threshold and I2Ci.I2C\_BUF[5:0] TXTRSH field value + 1 for the TX threshold). It can also transfer the remaining number of bytes (because the threshold is not reached).

This feature prevents the LH or the DMA controller from trying more FIFO accesses than necessary (for example, to generate at the end of a transfer a DMA RX request having fewer bytes in the FIFO than the configured DMA transfer length). Otherwise, an AERR interrupt is generated by the I2Ci.I2C\_STAT[7] AERR bit.

The draining mechanism generates an interrupt using the I2Ci.I2C\_STAT[13] RDR or I2Ci.I2C\_STAT[14] XDR bit at the end of the transfer, informing the LH that it must check the amount of data left to be transferred (the I2Ci.I2C\_BUFSTAT[13:8] RXSTAT or I2Ci.I2C\_BUFSTAT[5:0] TXSTAT bit fields) and enable the draining feature of the DMA controller by reconfiguring the DMA transfer length according to this value (when the DMA mode is enabled) or perform only the required number of data accesses (when the DMA mode is disabled).

In receive mode (master or slave), if the RX FIFO threshold (the I2Ci.I2C\_BUF[13:8] RTRSH bit field value + 1) is not reached, but the transfer ends on the I<sup>2</sup>C bus and data remains in the RX FIFO (less than the threshold), the receive draining interrupt (the I2Ci.I2C\_STAT[13] RDR bit) is asserted to inform the LH that it can read the amount of data in the RX FIFO (the I2Ci.I2C\_BUFSTAT[13:8] RXSTAT bit field). The LH performs a number of data read accesses equal to the I2Ci.I2C\_BUFSTAT[13:8] RXSTAT bit field (interrupt or polling mode), or reconfigures the sDMA controller with the required value to drain the FIFO.

In master transmit mode, if the TX FIFO threshold (I2Ci.I2C\_BUF[5:0] TXTRSH bit field value + 1) is not reached, but the amount of data remaining to be written in the TX FIFO is less than the threshold, the transmit draining interrupt (the I2Ci.I2C\_STAT[14] XDR bit) is asserted to inform the LH that it can read the amount of data remaining to be written in the TX FIFO (the I2Ci.I2C\_BUFSTAT[5:0] TXSTAT bit field). The LH must write the required number of data bytes specified by the I2Ci.I2C\_BUFSTAT[5:0] TXSTAT bit field value or reconfigure the sDMA controller with the value required to transfer the last bytes to the FIFO.

In master mode, the LH can alternately not check the values of the I2Ci.I2C\_BUFSTAT[5:0] TXSTAT and I2Ci.I2C\_BUFSTAT[13:8] RXSTAT bit fields, the LH can obtain this information internally (by computing the I2Ci.I2C\_CNT[15:0] DATACOUNT bit field value modulo I2Ci.I2C\_BUF[13:8] RTRSH or I2Ci.I2C\_BUF[5:0] TXTRSH).

By default, the draining feature is disabled; it can be enabled using the I2Ci.I2C\_IE[14] XDR\_IE or I2Ci.I2C\_IE[13] RDR\_IE bits (default disabled) only for transfers with lengths not equal to the threshold values (I2Ci.I2C\_BUF[5:0] TXTRSH bit field value + 1 for the TX threshold or I2Ci.I2C\_BUF[13:8] RTRSH bit field value + 1 for the RX threshold).

#### **23.1.4.9 HS I<sup>2</sup>C Noise Filter**

The noise filter is used to suppress any noise that is 50 ns or less in case of F/S operation modes and SCCB modes, and any noise that is 10 ns or less in case of HS mode operation. The noise filter is always one period of the I2Ci\_INTERNAL\_CLK clock. This way, for HS mode operation (prescaler bypassed), the filter suppresses spikes of less than 10.4 ns.

For SCCB modes (for example, I2Ci.I2C\_PSC[7:0] PSC bit field = 4), the maximum width of suppressed spikes is 52 ns.

To ensure correct filtering, the prescaler must be programmed accordingly by the I2Ci.I2C\_PSC[7:0] PSC bit field.

#### **23.1.4.10 HS I<sup>2</sup>C Write and Read Operations in SCCB Mode**

In SCCB mode, the multimaster HS I<sup>2</sup>C controller can write or read a single byte to or from the external SCCB device.

To write a single byte to the external SCCB device, the multimaster HS I<sup>2</sup>C controller must be configured in multimaster transmitter mode by setting the I2Ci.I2C\_CON[10] MST and I2Ci.I2C\_CON[9] TRX bits to 1. The external device slave address (7-bit address of the ID value) is set in the I2Ci.I2C\_SA register; the register address (8-bit subaddress in the external SCCB device) is set in the I2Ci.I2C\_OA0 register. The 8-bit data to be transmitted is written by the LH in the I2Ci.I2C\_DATA register.

To read a single byte from the external SCCB device, the multimaster HS I<sup>2</sup>C controller must be configured in multimaster receiver mode by setting the I2Ci.I2C\_CON[10] MST bit to 1 and by clearing the I2Ci.I2C\_CON[9] TRX bit to 0. The external device slave address (7-bit address of the ID value) is set in the I2Ci.I2C\_SA register; the register address (8-bit subaddress in the external SCCB device) is set in the I2Ci.I2C\_OA0 register. The 8-bit data received from the external SCCB device is read by the LH from the I2Ci.I2C\_DATA register.

---

**NOTE:** In SCCB mode, the RX and TX thresholds must be set to 1 by configuring the I2Ci.I2C\_BUF[13:8] RTRSH and I2Ci.I2C\_BUF[5:0]XTRSH fields to 0x0.

---

### 23.1.4.11 HS I<sup>2</sup>C System Test Mode

A system test mode is available for multimaster HS I<sup>2</sup>C controller module testing. This mode is enabled by setting the I2Ci.I2C\_SYSTEST[15] ST\_EN bit to 1. When this bit is cleared to 0, the I<sup>2</sup>C controller is configured in normal operation mode.

In system test mode, the I2Ci\_SYSTEST[13:12] TMODE bit field selects the type of test. Table 23-14 lists the tests available for the multimaster HS I<sup>2</sup>C controllers.

**Table 23-14. HS I<sup>2</sup>C List of Tests**

I2Ci.I2C_SYSTEST[13:12] TMODE	Test	Description
00	Functional mode	Normal operation mode
01	Reserved (not used)	
10	Test of i2ci_scl serial clock line	The i2ci_scl line is driven with a permanent clock as if mastered with the parameters set in the I2Ci.I2C_PSC, I2Ci.I2C_SCLL, and I2Ci.I2C_SCLH registers.
11	Loop-back mode + i2ci_scl/ i2ci_sda input/output	In master transmit mode only, data transmitted out of the I2Ci.I2C_DATA register (write action) is received in the same I2Ci.I2C_DATA register through an internal path through the FIFO buffers. The DMA and interrupt requests are normally generated if they are enabled. Moreover, the i2ci_scl, i2ci_sda, and i2ci_sccb lines are controlled with the I2Ci.I2C_SYSTEST[4:0] bits..

---

**NOTE:** When the I2Ci.I2C\_SYSTEST[13:12] TMODE bit field is set to 11, the I<sup>2</sup>C controller must be configured in I<sup>2</sup>C F/S (the I2Ci.I2C\_CON[13:12] OPMODE set to 00) or I<sup>2</sup>C HS mode (the I2Ci.I2C\_CON[13:12] OPMODE set to 01). The loop-back mode is not available in SCCB mode (the I2Ci.I2C\_CON[13:12] OPMODE = b10).

---

---

**NOTE:** In normal operation mode (I2Ci.I2C\_SYSTEST[15] ST\_EN clear to 0), the I2Ci.I2C\_SYSTEST[4:0] bits that control the i2ci\_scl, i2ci\_sda, and i2ci\_sccb lines in system test mode are read-only bits.

---

In system test mode (I2Ci.I2C\_SYSTEST[15] ST\_EN set to 1), the I2Ci.I2C\_STAT[5:0] status bits can be set to 1 when the I2Ci.I2C\_SYSTEST[11] SSB bit is set to 1. Clearing the I2Ci.I2C\_SYSTEST[11] SSB bit to 0 does not clear the I2Ci.I2C\_STAT[5:0] bits to 0. The I2Ci.I2C\_STAT[5:0] bit field can be cleared to 0 only by writing 1 in the corresponding bits.

## 23.1.5 HS I<sup>2</sup>C Programming Guide

### 23.1.5.1 HS I<sup>2</sup>C Low-Level Programming Models

#### 23.1.5.1.1 HS I<sup>2</sup>C Programming Model in I<sup>2</sup>C Mode

This section describes the programming model of the multimaster HS I<sup>2</sup>C controllers configured in I<sup>2</sup>C mode.

##### 23.1.5.1.1.1 Main Program

###### 23.1.5.1.1.1.1 Configure the Module Before Enabling the I<sup>2</sup>C Controller

Before enabling the I<sup>2</sup>C controller, perform the following:

1. Enable the functional and interface clocks.
2. Program the prescaler to obtain an approximately 12-MHz internal sampling clock by programming the corresponding value in the I2Ci.I2C\_PSC[7:0] PSC field. This value depends on the frequency of the functional clock (I2Ci\_FCLK).
3. Program the I2Ci.I2C\_SCLL[7:0] SCLL and I2Ci.I2C\_SCLH[7:0] SCLH bit fields to obtain a bit rate of 100 Kbps, 400 Kbps or 1Mbps. These values depend on the internal sampling clock frequency (see [Table 23-8](#)).
4. (Optional) Program the I2Ci.I2C\_SCLL[15:8] HSSCLL and I2Ci.I2C\_SCLH[15:8] HSSCLH bit fields to obtain a bit rate of 400 Kbps or 3.4 Mbps (for the second phase of HS mode). These values depend on the internal sampling clock frequency (see [Table 23-8](#)).
5. (Optional) If a bit rate of 3.4 Mbps is used and the bus line capacitance exceeds 45 pF, see [Section 18.4.8, PAD Functional Multiplexing and Configuration](#).
6. Configure the Own Address of the I2C controller by storing it in the I2Ci.I2C\_OA register. Up to four Own Addresses can be programmed in the I2Ci.I2C\_OAx registers (where x = 0, 1, 2, 3) for each I<sup>2</sup>C controller.

---

**NOTE:** For a 10-bit address, set the corresponding expand Own Address bit in the I2Ci.I2C\_CON register.

---

7. Set the TX threshold (in transmitter mode) and the RX threshold (in receiver mode) by setting the I2Ci.I2C\_BUF[5:0] TXTRSH bit field to (TX threshold to 1) and the I2Ci.I2C\_BUF[13:8]RTRSH bit field to (RX threshold to 1), where the TX and RX thresholds are greater than or equal to 1.
8. Take the I<sup>2</sup>C controller out of reset by setting the I2Ci.I2C\_CON[15] I2C\_EN bit to 1.

###### 23.1.5.1.1.1.2 Initialize the I<sup>2</sup>C Controller

To initialize the I<sup>2</sup>C controller, perform the following steps:

1. Configure the I2Ci.I2C\_CON register:
  - For master or slave mode, set the I2Ci.I2C\_CON[10] MST bit (0: slave; 1: master).
  - For transmitter or receiver mode, set the I2Ci.I2C\_CON[9] TRX bit (0: receiver; 1: transmitter).
2. If using an interrupt to transmit and receive data, set the corresponding bit in the I2Ci.I2C\_IE register to 1 (the I2Ci.I2C\_IE[4] XRDY\_IE bit for the transmit interrupt, the I2Ci.I2C\_IE[3] RRDY bit for the receive interrupt).
3. If using DMA to receive and transmit data, set the corresponding bit in the I2Ci.I2C\_BUF register to 1 (the I2Ci.I2C\_BUF[15] RDMA\_EN bit for the receive DMA channel, the I2Ci.I2C\_BUF[7] XDMA\_EN bit for the transmit DMA channel).

### 23.1.5.1.1.1.3 Configure Slave Address and the Data Control Register

In master mode, configure the slave address register by programming the I2Ci.I2C\_SA[9:0] SA bit field and the number of data bytes (I<sup>2</sup>C data payload) associated with the transfer by programming the I2Ci.I2C\_CNT[15:0] DCOUNT bit field.

---

**NOTE:** For a 10-bit address, set the I2Ci.I2C\_CON[8] XSA bit to 1.

---

### 23.1.5.1.1.1.4 Initiate a Transfer

Poll the I2Ci.I2C\_STAT[12] BB bit. If it is cleared to 0 (bus not busy), configure the I2Ci.I2C\_CON[0] STT and I2Ci.I2C\_CON[1] STP bits. To initiate a transfer, the I2Ci.I2C\_CON[0] STT bit must be set to 1, and it is not mandatory to set the I2Ci.I2C\_CON[1] STP bit to 1.

### 23.1.5.1.1.1.5 Receive Data

Poll the I2Ci.I2C\_STAT[3] RRDY bit, or use the RRDY interrupt (the I2Ci.I2C\_IE[3] RRDY\_IE bit must be set to 1) or the DMA RX channel (the I2Ci.I2C\_BUF[15] RDMA\_EN bit must be set to 1) to read the receive data in the I2Ci.I2C\_DATA register.

If the transfer length does not equal the RX FIFO threshold (I2Ci.I2C\_BUF[13:8] RTRSH field + 1), use the draining feature (enable the RDR interrupt by setting the I2Ci.I2C\_IE[13] RDR\_IE bit to 1).

---

**NOTE:** In receive mode only, the I2Ci.I2C\_STAT[11] ROVR (receive overrun) bit indicates whether the receiver has experienced overrun. An overrun condition occurs when the shift register and the RX FIFO are full. An overrun condition does not result in data loss; the I<sup>2</sup>C controller simply holds i2ci\_scl to low to prevent other bytes from being received.

The I2Ci.I2C\_STAT[7] AERR bit is set to 1 when a read access is performed in the I2Ci.I2C\_DATA register while the RX FIFO is empty. The corresponding interrupt can be enabled by setting the I2Ci.I2C\_IE[7] AERR\_IE bit to 1.

---

### 23.1.5.1.1.1.6 Transmit Data

Poll the I2Ci.I2C\_STAT[4] XRDY bit, or use the XRDY interrupt (the I2Ci.I2C\_IE[4] XRDY\_IE bit must be set to 1) or the DMA TX channel (the I2Ci.I2C\_BUF[7] XDMA\_EN bit must be set to 1) to write data to the I2Ci.I2C\_DATA register.

If the transfer length does not equal the TX FIFO threshold (I2Ci.I2C\_BUF[5:0] TXTRSH field + 1), use the draining feature (enable the XDR interrupt by setting the I2Ci.I2C\_IE[14] XDR\_IE bit to 1).

---

**NOTE:** In transmit mode only, the I2Ci.I2C\_STAT[10] XUDF bit indicates whether the transmitter has experienced underflow.

In master transmit mode, underflow occurs when the shift register and the TX FIFO are empty and there are still some bytes to transmit (the value of the I2Ci.I2C\_CNT[15:0] DCOUNT bit field is not 0).

In slave transmit mode, underflow occurs when the shift register and the TX FIFO are empty and the external I<sup>2</sup>C master device still requests data bytes to be read.

The I2Ci.I2C\_STAT[7] AERR bit is set to 1 when a write access is performed in the I2Ci.I2C\_DATA register while the TX FIFO is full. The corresponding interrupt can be enabled by setting the I2Ci.I2C\_IE[7] AERR\_IE bit to 1.

---

### 23.1.5.1.1.2 Interrupt Subroutine Sequence

1. Test for arbitration lost (the I2Ci.I2C\_STAT[0] AL bit) and resolve accordingly.
2. Test for no acknowledgment (the I2Ci.I2C\_STAT[1] NACK bit) and resolve accordingly.
3. Test for register access ready (the I2Ci.I2C\_STAT[2] ARDY bit) and resolve accordingly.

4. Test for receive data ready (the I2Ci.I2C\_STAT[3] RRDY bit) and resolve accordingly.
5. Test for transmit data ready (the I2Ci.I2C\_STAT[4] XRDY bit) and resolve accordingly.
6. Test for general call (the I2Ci.I2C\_STAT[5] GC bit) and resolve accordingly.
7. Test for start (S) condition (the I2Ci.I2C\_STAT[6] STC bit) and resolve accordingly. For this test, the functional clock must be inactive.
8. Test for access error (the I2Ci.I2C\_STAT[7] AERR bit) and resolve accordingly.
9. Test for bus free (the I2Ci.I2C\_STAT[8] BF bit) and resolve accordingly.

### 23.1.5.1.2 HS I<sup>2</sup>C (I2C5) Programming Model for Communication With Power Chips

This section describes the programming model of the master transmitter HS I<sup>2</sup>C controller (I2C5) for communication with one or more power chips. The HS I<sup>2</sup>C controller (I2C5) allows the two voltage Finite State Machines (FSMs) in the PRCM module of the device to be interfaced to external power chips through the I<sup>2</sup>C bus for dynamic voltage control of two power supplies and power sequencing. The primary programming tasks are to set up the configuration registers according to the external power supply chip(s) being used.

### 23.1.5.1.2.1 Configure the Voltage Controller Registers

To use the voltage control function, the LH must configure the following registers in the voltage controller of the APE and 3G modem SS PRCM modules:

- The voltage configuration register address for each VDD channel in the PRCM.PRM\_VC\_VAL\_SMPS\_RA\_VOL register
- The ON/ON-low-power-Retention/OFF command configuration register address for each VDD channel in the PRCM.PRM\_VC\_VAL\_SMPS\_RA\_CMD register
- The set of ON/ON-low-power/Retention/OFF voltage/mode values in the APE PRCM.PRM\_VC\_VAL\_CMD\_VDD\_CORE\_L, APE PRCM.PRM\_VC\_VAL\_CMD\_VDD\_IVA\_L, and APE PRCM.PRM\_VC\_VAL\_CMD\_VDD\_MPU\_L registers, and 3G modem SS PRCM.PRM\_VC\_VAL\_CMD\_VDD\_WGM\_L register.
- The VDD channels configuration selection in the PRCM.PRM\_VC\_CFG\_CHANNEL register

For more information about the voltage controller register configuration, see [Chapter 3, Power, Reset, and Clock Management](#).

### 23.1.5.1.2.2 Configure the HS I<sup>2</sup>C Controller I2C5

At POR, the I2C5 is in HS mode (PRCM.PRM\_VC\_CFG\_I2C\_MODE[3] HSMODEEN bit). In HS mode, the LH must configure the master code value for the preamble I<sup>2</sup>C high-speed transmission by configuring the PRCM.PRM\_VC\_CFG\_I2C\_MODE[2:0] HSMODE bit field. If the external power chips do not support the I<sup>2</sup>C HS mode, HS mode can be disabled and F/S mode enabled by clearing the PRCM.PRM\_VC\_CFG\_I2C\_MODE[3] HSMODEEN bit to 0.

By default, the Sr operation is enabled (PRCM.PRM\_VC\_CFG\_I2C\_MODE[4] SRMODEEN bit set to 1 at POR). In F/S mode, the Sr operation can be disabled by clearing the PRCM.PRM\_VC\_CFG\_I2C\_MODE[4] SRMODEEN bit to 0.

### 23.1.5.1.3 HS I<sup>2</sup>C Basic Programming Model in SCCB Mode

This section describes the programming model of the multimaster HS I<sup>2</sup>C controllers configured in SCCB mode.

#### 23.1.5.1.3.1 Main Program

##### 23.1.5.1.3.1.1 Configure the Module Before Enabling the I<sup>2</sup>C Controller

Before enabling the I<sup>2</sup>C controller, perform the following steps:

1. Enable the functional and interface clocks (see [Table 23-7](#)).
2. Program the prescaler to obtain an approximately 12-MHz internal sampling clock (I2Ci\_INTERNAL\_CLK) by programming the corresponding value in the I2Ci.I2C\_PSC[7:0] PSC field. This value depends on the frequency of the functional clock (I2Ci\_FCLK). Because this frequency is 96MHz, the I2Ci.I2C\_PSC[7:0] PSC field value is 0x7.
3. Program the I2Ci.I2C\_SCLL[7:0] SCLL and I2Ci.I2C\_SCLH[7:0] SCLH fields to obtain a bit rate of 100K bps (maximum authorized bit rate in SCCB mode). This value depends on the internal sampling clock frequency (see [Table 23-8](#)).
4. Configure the 7-bit slave address (ID value) by storing it in the I2Ci.I2C\_SA register.
5. Configure the 8-bit register address (subaddress) by storing it in the I2Ci.I2C\_OA0 register.
6. Configure the I2Ci.I2C\_BUF[13:8]RTRSH field to 0x0 (RX threshold to 1) and the I2Ci.I2C\_BUF[5:0]XTRSH field to 0x0 (TX threshold to 1).
7. Take the I<sup>2</sup>C controller out of reset by setting the I2Ci.I2C\_CON[15] I2C\_EN bit to 1.

##### 23.1.5.1.3.1.2 Initialize the I<sup>2</sup>C Controller

To initialize the I<sup>2</sup>C controller, perform the following steps:

1. Configure the I2Ci.I2C\_CON register:

- In SCCB mode, only the master mode is supported; set the I2Ci.I2C\_CON[10] MST bit to 1.
  - For transmitter mode (write to the external SCCB device register) or receiver mode (read from the external SCCB device register), set the I2Ci.I2C\_CON[9] TRX bit (0: receiver, 1: transmitter).
2. If using an interrupt to transmit/receive data, set to 1 the corresponding bit in the I2Ci.I2C\_IE register (the I2Ci.I2C\_IE[4] XRDY\_IE bit for the transmit interrupt, the I2Ci.I2C\_IE[3] RRDY bit for the receive interrupt).

#### **23.1.5.1.3.1.3 Initiate a Transfer**

Poll the I2Ci.I2C\_STAT[12] BB bit. If it is cleared to 0 (bus not busy), set the I2Ci.I2C\_CON[0] STT bit to 1. Because a transfer allows the LH to write or read only a single byte to or from the external SCCB device, the transmission automatically stops at the end of the transfer. When the transfer is complete, the I2Ci.I2C\_STAT[2] ARDY bit is set to 1. In SCCB mode, the I2Ci.I2C\_CON[1] STP bit is not used.

#### **23.1.5.1.3.1.4 Receive Data**

Poll the I2Ci.I2C\_STAT[3] RRDY bit, or use the RRDY interrupt (the I2Ci.I2C\_IE[3] RRDY\_IE bit must be set to 1) to read the receive data in the I2Ci.I2C\_DATA register.

---

**NOTE:** In SCCB mode, the I2Ci.I2C\_BUF[13:8] RTRSH field (RX threshold) must be set to a value of 0x0 (RX threshold = 1).

---

#### **23.1.5.1.3.1.5 Transmit Data**

Poll the I2Ci.I2C\_STAT[4] XRDY bit, or use the XRDY interrupt (the I2Ci.I2C\_IE[4] XRDY\_IE bit must be set to 1) to write the data to the I2Ci.I2C\_DATA register.

---

**NOTE:** In SCCB mode, the I2Ci.I2C\_BUF[5:0] TXTRSH field (TX threshold) must be set to a value of 0x0 (TX threshold = 1).

---

#### **23.1.5.1.3.2 Interrupt Subroutine Sequence**

1. Test for register access ready (I2Ci.I2C\_STAT[2] ARDY status bit) and resolve accordingly.
2. Test for receive data ready (I2Ci.I2C\_STAT[3] RRDY status bit) and resolve accordingly.
3. Test for transmit data ready (I2Ci.I2C\_STAT[4] XRDY status bit) and resolve accordingly.

#### **23.1.5.1.3.3 Programming Flow Diagrams**

Figure 23-37 through Figure 23-41 are procedure flowcharts for programming the SCCB mode.

<b>Physical Address</b>	<a href="#">0x4806 0024</a> <a href="#">0x4807 0024</a> <a href="#">0x4807 2024</a> <a href="#">0x4835 0024</a>
<b>Description</b>	Per-event raw interrupt status vector
<b>Type</b>	RW

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED	XDR	RDR	BB	ROVR	XUDF	AAS	BF	AERR	STC	GC	XRDY	RRDY	ARDY	NACK	AL

Bits	Field Name	Description	Type	Reset
15	RESERVED	Write 0s for future compatibility. Read returns 0.	RW	0
14	XDR	Transmit draining IRQ status. 0x0: Transmit draining inactive. 0x1: Transmit draining enabled.	RW	0
13	RDR	Receive draining IRQ status. 0x0: Receive draining inactive. 0x1: Receive draining enabled.	RW	0
12	BB	Bus busy status. Writing into this bit has no effect. Read 0x1: Bus is occupied. Read 0x0: Bus is free.	R	0
11	ROVR	Receive overrun status. Writing into this bit has no effect. Read 0x1: Receiver overrun. Read 0x0: Normal operation.	RW	0
10	XUDF	Transmit underflow status. Writing into this bit has no effect. Read 0x1: Transmit underflow. Read 0x0: Normal operation.	RW	0

Bits	Field Name	Description	Type	Reset
9	AAS	Address recognized as slave IRQ status. 0x0: No action. 0x1: Address recognized.	RW	0
8	BF	Bus Free IRQ status. 0x0: No action. 0x1: Bus Free.	RW	0
7	AERR	Access Error IRQ status. 0x0: No action. 0x1: Access Error.	RW	0
6	STC	Start Condition IRQ status. 0x0: No action. 0x1: Start Condition detected.	RW	0
5	GC	General call IRQ status. Set to 1 by core when General call address detected and interrupt signaled to MPUSS. (1) 0x0: No general call detected. 0x1: General call address detected.	RW	0
4	XRDY	Transmit data ready IRQ status. Set to 1 by core when transmitter and when new data is requested. When set to 1 by core, an interrupt is signaled to MPUSS. (1) 0x0: Transmission ongoing. 0x1: Transmit data ready.	RW	0
3	RRDY	Receive data ready IRQ status. Set to 1 by core when receiver mode, a new data is able to be read. When set to 1 by core, an interrupt is signaled to MPUSS. (1) 0x0: No data available. 0x1: Receive data available.	RW	0
2	ARDY	Register access ready IRQ status. When set to 1 it indicates that previous access has been performed and registers are ready to be accessed again. An interrupt is signaled to MPUSS. (1) 0x0: Module busy. 0x1: Access ready.	RW	0
1	NACK	No acknowledgement IRQ status. Bit is set when No Acknowledge has been received, an interrupt is signaled to MPUSS. (1) 0x0: Normal operation. 0x1: Not Acknowledge detected.	RW	0
0	AL	Arbitration lost IRQ status. This bit is automatically set by the hardware when it loses the Arbitration in master transmit mode, an interrupt is signaled to MPUSS. During reads, it always returns 0. 0x0: Normal operation. 0x1: Arbitration lost detected.	RW	0

**Table 23-40. Register Call Summary for Register I2C\_IRQSTATUS\_RAW**

Multimaster High-Speed I2C Controller

- [HS I2C Register Summary: \[0\] \[1\]](#)

1. Writing 1 in the bit field only sets the respective field to 1, used mainly for debug.

## 23.2 HDQ/1-Wire

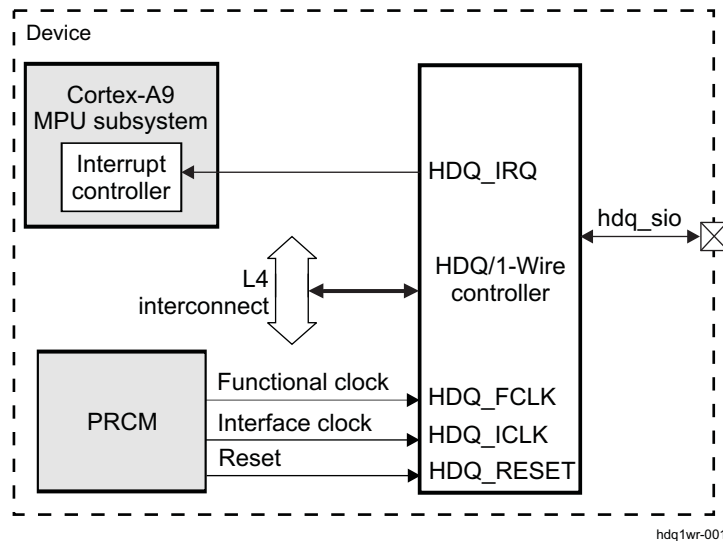

This section describes the HDQ™/ 1-Wire® interface for the device.

### 23.2.1 HDQ/1-Wire Overview

The HDQ/1-Wire module implements the hardware protocol of the master functions of the TI/Benchmark HDQ and the Dallas Semiconductor 1-Wire® protocols. These protocols use a single wire for communication between the master (HDQ/1-Wire controller) and the slaves (HDQ/1-Wire external compliant devices).

Figure 23-42 shows the HDQ/1-Wire.

Figure 23-42. HDQ/1-Wire Overview

The HDQ/1-Wire has a generic L4 interface and is intended to be used in an interrupt-driven fashion. The 1-pin interface is implemented as an open-drain output at the device level.

The main features supported by the HDQ/1-Wire are the following:

- Benchmark HDQ protocol
- Dallas Semiconductor 1-Wire protocol
- Power-down mode

The HDQ/1-Wire provides a communication rate of 5 Kbps over an address space of 128 bytes.

A typical application of the HDQ/1-Wire is the communication with battery monitor (gas gauge) integrated circuits.

## 23.2.2 HDQ/1-Wire Environment

### 23.2.2.1 HDQ/1-Wire Functional Modes

The HDQ/1-Wire has two main modes: HDQ and 1-Wire. Each of these modes includes idle, active, and power-down submodes. [Table 23-99](#) lists the HDQ/1-Wire functional modes, and [Figure 23-43](#) shows an overview of a typical application.

**Table 23-99. Functional Modes**

Functions	Description
HDQ	Benchmark HDQ protocol
1-Wire	Dallas Semiconductor 1-Wire protocol

**Figure 23-43. HDQ/1-Wire Typical Application System Overview**

An external pullup is required, because the two protocols use a return-to-1 mechanism (that is, after any command by any of the connected devices, the line is pulled to a logical high level).

The HDQ/1-Wire operates according to a command structure that is programmed into transmit command registers (as described in [Section 23.2.5.1.2, HDQ/1-Wire Low-level Programming Model](#)).

The 1-Wire mode runs at slower speeds than the capabilities of the mode.

[Table 23-100](#) describes the external signal of the HDQ/1-Wire compliant module.

**Table 23-100. I/O Description**

Signal	I/O <sup>(1)</sup>	Description	Value at Reset
hdq_sio	I/O	Serial data input/output. Output is open drain type.	hi-Z (pulled to 1 by pullup)

<sup>(1)</sup> I = Input; O = Output; I/O = Bidirectional; hi-Z = High impedance

### 23.2.2.2 HDQ and 1-Wire (SDQ) Protocols

#### 23.2.2.2.1 HDQ Protocol Initialization (Default)

In HDQ mode, the firmware does not require the host to create an initialization pulse to the slave. However, the slave can be reset by using an initialization pulse (also referred to as a break pulse). The initialization pulse is generated by setting the [HDQ\\_CTRL\\_STATUS\[2\] INITIALIZATION](#) bit and then setting the [HDQ\\_CTRL\\_STATUS\[4\] GO](#) bit. The slave does not respond with a presence pulse as it does in the 1-Wire protocol.

The HDQ is a command-based protocol in which the host sends a command byte to the slave. The command directs the slave either to store the next eight bits of data received to a register specified by the command byte (write operation) or to output the eight bits of data from a register specified by the command byte (read operation). The master implementation is a simple byte engine. Sending of the ID, command/address, and data is controlled by firmware. The master engine provides only a single HDQ.[HDQ\\_TX\\_DATA](#) register.

The command and data bytes consist of a stream of eight bits with a maximum transmission rate of 5 Kbps. The least-significant bit (LSB) of a command or data byte is transmitted first. If a communication time-out occurs between the host and the slave (for example, if the host waits longer than the specified time for the slave to respond, or if this is the first access command), then the host must send an initialization pulse (BREAK) before sending the command again.

The slave detects a break when the HDQ pin is driven to a logic-low state for a specified break time  $t_{(B)}$  or greater. The HDQ pin then returns to its normal ready-high logic state for a specified break-recovery time  $t_{(BR)}$ . The slave is then ready for a command from the host processor. Figure 23-44 shows this behavior.

An interrupt condition indicates a TX-complete, an RX-complete, or a time-out condition. Reading the interrupt status register clears all interrupt conditions. Only one interrupt signal is sent to the microcontroller, and only one overall mask bit can enable or disable the interrupt. The interrupt conditions cannot be individually masked.

Figure 23-44. HDQ Break-Pulse Timing Diagram

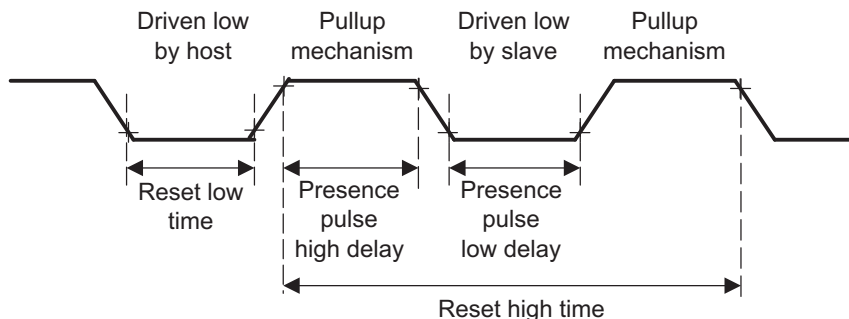

23.2.2.2.2 1-Wire (SDQ) Protocol Initialization

In 1-Wire (SDQ) protocol, the host first sends an initialization pulse (by pulling the line to a logic-low state) and then waits for the slave to respond with a presence pulse before enabling any communication sequence.

As for the initialization pulse, the presence pulse is a low-level pulse on the line initiated by the slave. The timing diagram in Figure 23-45 shows the 1-Wire (SDQ) reset sequence.

Figure 23-45. 1-Wire (SDQ) Reset Timing Diagram

The host drives the line to a logic-low state for a minimum of reset low time. Once the slave detects this pulse, it must drive the line to a logic-low state within the presence pulse high delay for a minimum period of presence pulse low time.

If the slave does not respond within this interval of time, a time-out event occurs and no transaction can be initiated. The host must initiate the reset sequence again before sending any command to the slave.

On the other hand, if the slave sends back its presence pulse within the specified time interval, the communication can be enabled after the reset high time.

23.2.2.2.3 Communication Sequence (HDQ and 1-Wire Protocols)

The description in this section applies to both protocols.

After a successful break pulse (HDQ mode) or initialization sequence (1-Wire protocol), the host and slave are ready for bit transmission. Each bit to transmit (either from the host to the slave or from the slave to the host) is preceded by a low-going edge on the line, as shown in [Figure 23-46](#).

**Figure 23-46. HDQ/1-Wire Transmitted Bit Timing**

hdq1wr-005

The return-to-1 data-bit frame consists of three distinct sections. The first section starts the transmission when either the slave or the host takes the line to a logic-low state. The next section is the actual data transmission in which the data must be valid during a specified period of time after the negative edge that starts the communication. The final section stops the transmission by returning the HDQ/1-Wire line to a logic-high state. Communication with an HDQ/1-Wire slave always occurs with the LSB being transmitted first.

The command byte of the HDQ/1-Wire protocols consists of eight contiguous valid command bits. The command byte contains two fields: R/W command and address. The R/W bit of the command byte determines whether the command is a read or a write, and the address field containing bits AD6-AD0 indicates the address to be read or written. [Table 23-101](#) lists the command byte values.

**Table 23-101. HDQ/1-Wire Command Byte**

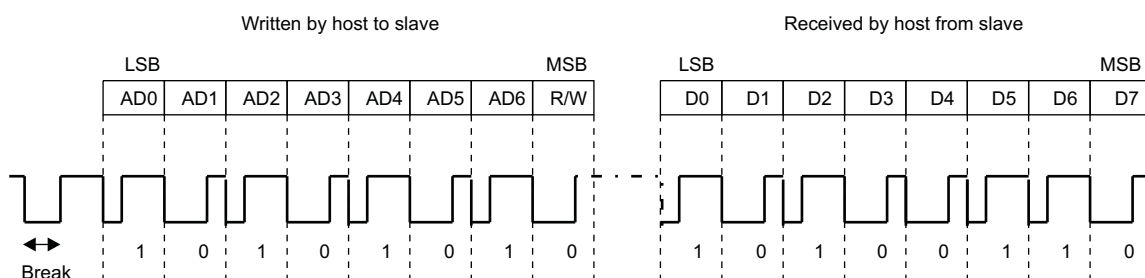

7	6	5	4	3	2	1	0
R/W	AD6	AD5	AD4	AD3	AD2	AD1	AD0

**R/W** Indicates whether the command byte is a read or a write. A 1 indicates a write command; the following eight bits must be written to the register specified by the address field of the command byte. A 0 indicates that the command is a read. On a read command, the slave outputs the requested register contents.

**AD6-AD0** Represent the seven bits labeled AD6-AD0 containing the address portion of the register to be accessed.

The communication sequence example in [Figure 23-47](#) shows a read command at address 0x55; the received data is 0x65.

**Figure 23-47. HDQ/1-Wire Communication Sequence**

hdq1wr-006

### 23.2.3 HDQ/1-Wire Integration

Figure 23-48 shows HDQ/1-Wire integration in the device.

Figure 23-48. HDQ/1-Wire Integration

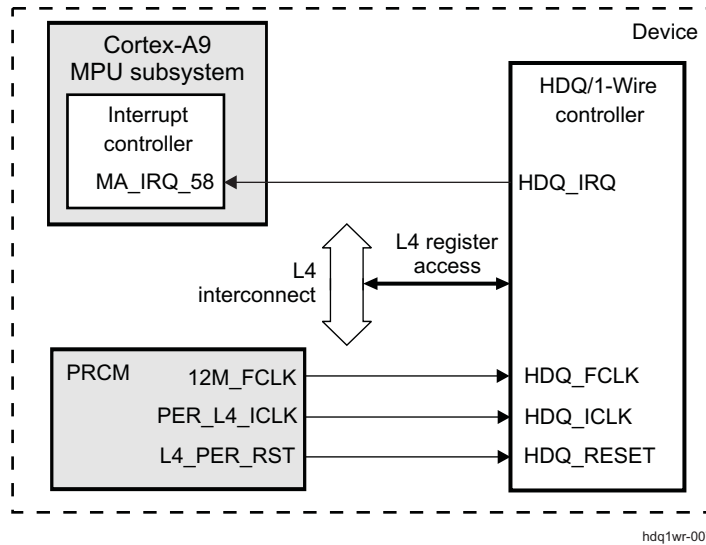

Table 23-102 through Table 23-104 summarize the integration of the module in the device.

**NOTE:** For the description of the interrupt source, see Section 17.4.1, Cortex-A9 MPU INTC Functional Description, in Chapter 17, Interrupt Controllers.

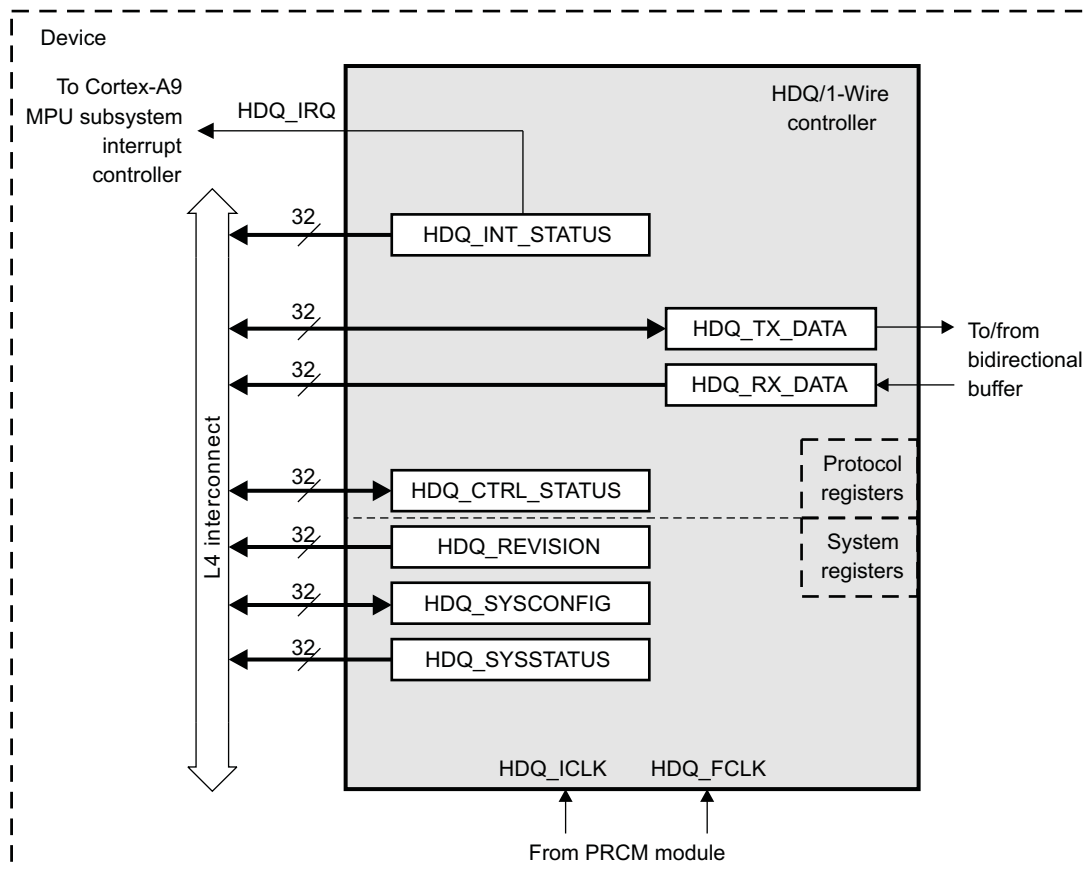

### 23.2.4 HDQ/1-Wire Functional Description

The HDQ/1-Wire works with HDQ and 1-Wire protocols. The protocols use a single wire to establish communication between the master and the slave. Both protocols use a return-to-1 mechanism; that is, after any command is driven, the line is pulled to a high level. This mechanism requires an external pullup.

#### 23.2.4.1 HDQ/1-Wire Block Diagram

Figure 23-49 is the HDQ/1-Wire block diagram.

Figure 23-49. HDQ/1-Wire Block Diagram

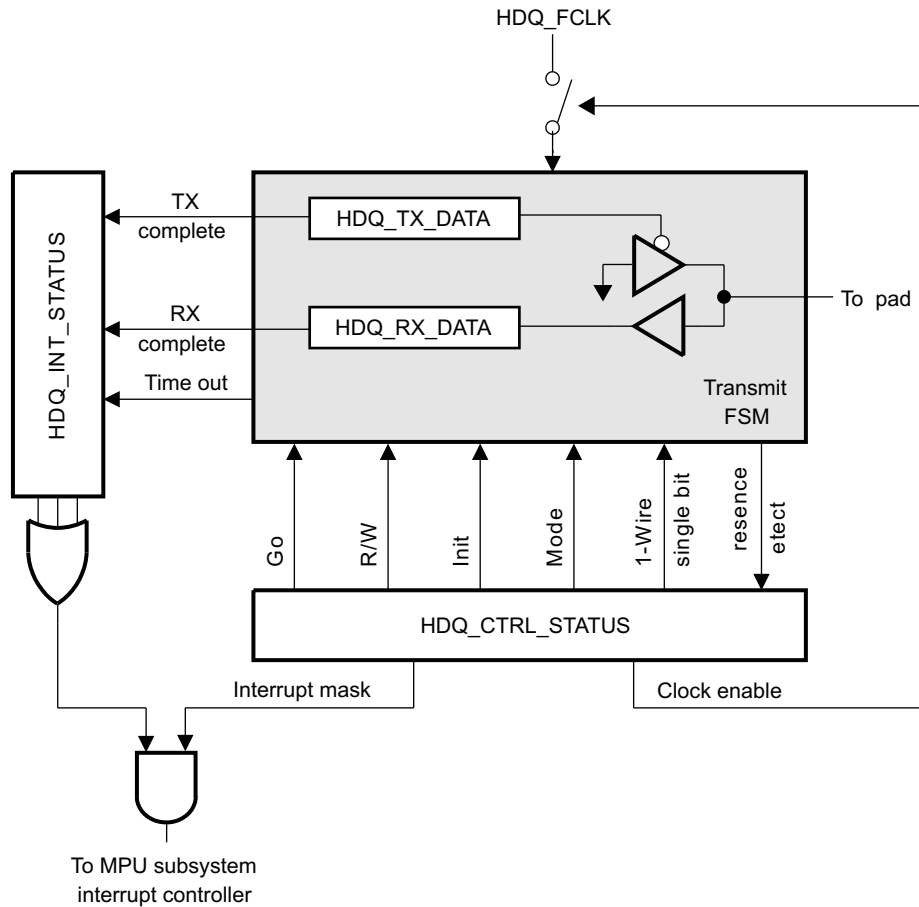

hdq1wr-008

The HDQ.HDQ\_CTRL\_STATUS[0] MODE bit allows selection between the HDQ and 1-Wire protocols. This bit is assumed static for design purposes. The configuration is in HDQ mode by default.

Figure 23-50 shows the protocol-dedicated register scheme.

Figure 23-50. Protocol Registers Description

hdq1wr-009

The receive and transmit operations of the HDQ/1-Wire module are performed with respect to the timing of the slower HDQ protocol. When the 1-Wire protocol is used, it runs at lower speed than its full capabilities, but is still able to meet the timing requirements and practical considerations.

### 23.2.4.2 HDQ/1-Wire Clocking Configuration

#### 23.2.4.2.1 HDQ/1-Wire Clocks

The HDQ/1-Wire subsystem operates from two clocks: a functional clock (HDQ\_FCLK) and an interface clock (HDQ\_ICLK). When these clocks are set in the PRCM module, the following rule must be observed:  $HDQ\_ICLK \geq HDQ\_FCLK$ .

- The HDQ\_FCLK functional clock is a fixed clock provided by the PRCM module. It is used to clock the internal module logic.

For more information about the clock, see [Section 3.6.8, CD\\_L4\\_PER Clock Domain](#), in [Chapter 3, Power, Reset, and Clock Management](#).

When the HDQ/1-Wire no longer requires the HDQ\_FCLK, the software can disable it at the PRCM level. The clock is effectively cut, provided the other modules that receive it do not require it either.

For details about the PRCM register settings and clock configuration, see [Section 3.6.8, CD\\_L4\\_PER Clock Domain](#), in [Chapter 3, Power, Reset, and Clock Management](#).

- The HDQ\_ICLK interface clock runs at L4 interconnect clock speed and is used to trigger access to the HDQ/1-Wire L4 interface.

When the HDQ/1-Wire no longer requires the HDQ\_ICLK (no transfer is in progress), the software can disable it at the PRCM level. The clock is effectively cut, provided the other modules that receive it do

not require it either.

For more information, see [Section 3.6.8, CD\\_L4\\_PER Clock Domain](#).

### 23.2.4.3 HDQ/1-Wire Hardware and Software Reset

Global reset of the module is done at the power, reset, and clock management (PRCM) module level (for more information, see [Section 3.6.8, CD\\_L4\\_PER Clock Domain](#)) or by setting the HDQ.HDQ\_SYSCONFIG[1] SOFTRESET bit to 1. Setting this bit enables an active software reset functionality equivalent to a hardware reset. The HDQ\_FCLK functional clock must be enabled from the PRCM level and locally through the HDQ\_CTRL\_STATUS[5] CLOCKENABLE bit (set to 1) for the software reset to complete.

### 23.2.4.4 HDQ/1-Wire Power Management

[Table 23-105](#) describes power-management features available to the HDQ/1-Wire.

**Table 23-105. Local Power-Management Features**

Feature	Registers	Description
Clock auto gating	HDQ_SYSCONFIG [0] AUTOIDLE bit	Auto-idle mode
Slave idle modes	N/A	N/A
Clock enable	HDQ.HDQ_CTRL_STATUS[5] CLOCKENABLE bit	Power-down mode
Master standby modes	N/A	N/A
Global wake-up enable	N/A	N/A
Wake-up sources enable	N/A	N/A

#### 23.2.4.4.1 Auto-Idle Mode

The HDQ/1-Wire provides an auto-idle function in its interconnect clock domain.

The interconnect clock auto-idle power-saving mode is enabled or disabled through the HDQ.HDQ\_SYSCONFIG[0] AUTOIDLE bit. When this mode is enabled and there is no activity on the interconnect interface, the interconnect clock (HDQ\_ICLK) is disabled inside the module, thereby reducing power consumption. When there is new activity on the interconnect interface, the interconnect clock is restarted with no latency penalty. This mode is disabled by default after a reset.

The auto-idle mode can be enabled in order to reduce power consumption.

#### 23.2.4.4.2 Power-Down Mode

The HDQ/1-Wire also provides a power-saving function in its functional clock domain.

Setting the CLOCKENABLE bit in the control and status register (HDQ.HDQ\_CTRL\_STATUS[5] CLOCKENABLE bit) to 0 shuts off the functional clock (HDQ\_FCLK) to the state-machine. The state-machine is reset when the functional clock is disabled; if any transaction is ongoing, it is aborted into the reset state.

Before shutting off the functional clock, the software must wait for transaction-complete interrupt. In write operation the software must check whether the interrupt was generated after address/command byte was sent or after data byte was sent. The functional clock must not be shut off after address/command byte is sent; otherwise, the data is not written to the slave.

The register values are not affected by disabling the functional clock.

#### CAUTION

There is no hardware mechanism to prevent cutting off the HDQ/1-Wire clocks while the module is performing a transfer. This would result in loss of data being transferred.

### 23.2.4.5 HDQ Interrupt Requests

The HDQ/1-Wire can generate one interrupt:

- HDQ\_IRQ: This is an interrupt to the MPU subsystem INTC. It is mapped on MA\_IRQ\_58. [Table 23-106](#) lists the events that can generate this interrupt.

**Table 23-106. Events**

Event Flag	Event Mask	Sync	Sensitivity	Map to	Description
HDQ_INT_STATUS[2] TXCOMPLETE	HDQ_CTRL_STATUS[31] INTERRUPTMASK	Yes	Level	HDQ_IRQ	A write operation of one byte was completed.
HDQ_INT_STATUS[1] RXCOMPLETE	HDQ_CTRL_STATUS[31] INTERRUPTMASK	Yes	Level	HDQ_IRQ	A byte has been successfully read.
HDQ_INT_STATUS[0] TIMEOUT	HDQ_CTRL_STATUS[31] INTERRUPTMASK	Yes	Level	HDQ_IRQ	After a read command initiated by the host, the slave did not pull the line low within the specified time.

### 23.2.4.6 HDQ Mode (Default)

#### 23.2.4.6.1 HDQ Mode Features

The HDQ mode supports the following:

- Benchmarq HDQ protocol
- Power-down mode

#### 23.2.4.6.2 Description

In the HDQ mode, there is no need for the host to create an initialization pulse to the slave. However, the host can reset the slave by using an initialization pulse (also known as a break pulse). Setting the HDQ.HDQ\_CTRL\_STATUS[2] INITIALIZATION bit and then setting the HDQ\_CTRL\_STATUS[4] GO bit creates this pulse by pulling the line down for a defined duration. When the slave receives the pulse, it is ready for communication but does not respond with a presence pulse.

In a typical write operation, two bytes are sent to the slave. The first byte corresponds to the command/address byte, and the second byte corresponds to the data to be written.

In a typical read operation, the host sends a command/address byte and the slave returns a byte of data.

The master is implemented to send and receive bytes. Sending the command/address and data is controlled by the firmware. The master provides only a single data TX register.

The HDQ protocol is a return-to-1 protocol. Consequently, after a byte is sent to the slave (either command/address + data for a write, or just command/address for a read), the host pulls the line up. The line is set to the high-impedance state in the device and an external pullup brings it to a logical high level.

In the case of a read operation, the slave also drives the line to a logic-low state before sending the requested data.

If the host initiates a read and does not receive data within a specified interval of time (that is, the slave does not drive the line low within this interval), the HDQ.HDQ\_INT\_STATUS[0] TIMEOUT bit is set, thereby indicating a read failure. The TIMEOUT bit remains set until the host reads the interrupt status register (HDQ.HDQ\_INT\_STATUS).

An interrupt condition indicates either a TX-complete, an RX-complete, or a time-out on a transaction. The corresponding bit is set in the interrupt status register (HDQ.HDQ\_INT\_STATUS). This register is cleared as soon as it is read.

Only one interrupt signal is sent to the MPU, and only an overall mask can enable or disable the interrupts. These interrupts cannot be individually masked.

### 23.2.4.6.3 Single-Bit Mode

In HDQ mode, the single-bit mode (HDQ.HDQ\_CTRL\_STATUS[7] ONE\_WIRE\_SINGLE\_BIT bit set to 1) has no effect because the HDQ protocol supports only byte transfers.

### 23.2.4.6.4 Interrupt Conditions

The HDQ/1-Wire provides the following interrupt status:

- **Transmission complete:**  
A write operation of one byte was completed. Successful or failed completion is not indicated, because there is no acknowledgment from the slave in HDQ protocol. This interrupt condition is cleared by reading the interrupt status register (HDQ.HDQ\_INT\_STATUS).
- **Read complete:**  
In HDQ mode, the interrupt status indicates that a byte has been successfully read. This interrupt condition is cleared by reading the interrupt status register (HDQ.HDQ\_INT\_STATUS).
- **Presence detect/time-out:**  
In HDQ mode, the interrupt status indicates that after a read command initiated by the host, the slave did not pull the line low within the specified time. This interrupt condition is cleared by reading the interrupt status register (HDQ.HDQ\_INT\_STATUS).  
In HDQ mode, a time-out condition is also used to indicate the successful completion of a break pulse. That is, if the master has sent the break pulse, it is indicated with a time-out instead of a TX-complete.

Only one interrupt is generated to the MPU based on any of these interrupt conditions. A read operation on the interrupt status register clears all the interrupt status bits that were previously set.

### 23.2.4.7 1-Wire Mode

#### 23.2.4.7.1 1-Wire Mode Features

The 1-Wire mode supports the following:

- Dallas Semiconductor 1-Wire protocol
- Power-down mode
- Single-bit mode

#### 23.2.4.7.2 Description

The 1-Wire mode requires an initialization pulse to be sent to the slave(s) connected on the interface. If a slave is present, it responds with a presence pulse.

The initialization pulse is sent when the HDQ.HDQ\_CTRL\_STATUS[2] INITIALIZATION bit is set and the HDQ\_CTRL\_STATUS[4] GO bit is set afterwards.

When the slave receives the initialization pulse, it sends back its presence pulse by pulling down the line for a defined duration. The module detects this low-level pulse and sets the HDQ.HDQ\_CTRL\_STATUS[3] PRESENCEDETECT bit.

In a similar way, if a presence pulse is not received from the slave after an initialization pulse is sent, the PRESENCEDETECT bit remains cleared.

Whether or not a presence pulse is detected after an initialization pulse is sent, the HDQ.HDQ\_INT\_STATUS[0] TIMEOUT bit is set and an interrupt condition is generated.

In 1-Wire mode, the generated interrupt condition means the maximum time allowed for receiving the response has elapsed and the software must check the PRESENCEDETECT bit to determine whether or not there was a presence pulse.

The INITIALIZATION bit is cleared at the end of the initialization pulse at the same time as the TIMEOUT bit is set. The TIMEOUT bit is cleared when the interrupt status register (HDQ.HDQ\_INT\_STATUS) is read.

For read operations, 1-Wire is a bit-by-bit protocol, which means the slave must be clocked by the host for each bit of the byte to read.

The line is pulled up at the end of the command/address byte. On the first read, the host creates a low-going edge to initiate a bit read. The line is then pulled up (pulled to the high-impedance state by the host and set to a high logical level by the external pullup) and the slave either drives the line low to transmit a 0, or does not drive the line to transmit a 1. This sequence is repeated for each bit to read.

The first bit the host receives is the LSB, and the last bit is the most-significant bit (MSB) in the receive data register (HDQ.HDQ\_RX\_DATA).

An interrupt condition indicates either a TX-complete, an RX-complete, or a time-out condition (that is, the time allowed for the slave to indicate its presence has elapsed). A read operation on the interrupt status register clears the interrupt conditions previously set. As in the HDQ mode, only one interrupt signal is sent to the MPU. Only an overall mask bit can enable or disable the interrupt (the interrupt conditions cannot be masked individually).

#### 23.2.4.7.3 1-Wire Single-Bit Mode Operation

A single-bit mode can be entered by setting the appropriate bit in the control and status register (ONE\_WIRE\_SINGLE\_BIT bit HDQ.HDQ\_CTRL\_STATUS[7]). In this mode, only one bit of data at a time is transferred between the master and the slave. After the bit is transferred, an interrupt is generated (that is, there is an RX-complete for a read operation and a TX-complete for a write operation). The ONE\_WIRE\_SINGLE\_BIT bit is cleared by hardware after every single bit is received. Software must set this bit to re-enable reception in single-bit mode. Bit 0 of the RX register (HDQ.HDQ\_RX\_DATA) is updated each time a bit is received from the slave; bit 0 of the TX register (HDQ.HDQ\_TX\_DATA) contains the bit to be sent.

#### 23.2.4.7.4 Interrupt Conditions

The HDQ/1-Wire provides the following interrupt status:

- **Transmission complete:**  
A write operation of one byte was completed. Successful or failed completion is not indicated, because there is no acknowledgment from the slave in 1-Wire protocol. This interrupt condition is cleared by reading the interrupt status register (HDQ.HDQ\_INT\_STATUS).
- **Read complete:**  
In 1-Wire mode, the interrupt status indicates that a byte has been successfully read. This interrupt condition is cleared by reading the interrupt status register (HDQ.HDQ\_INT\_STATUS).
- **Presence detect/time-out:**  
In 1-Wire mode, the interrupt status indicates that it is now valid to check the PRESENCEDETECT bit. This interrupt condition is cleared by reading the interrupt status register (HDQ.HDQ\_INT\_STATUS).

Only one interrupt is generated to the MPU based on any of these interrupt conditions. A read operation on the interrupt status register clears all interrupt status bits that were previously set.

#### 23.2.4.7.5 Status Flags

The presence-condition-detected status flag is contained in the HDQ.HDQ\_CTRL\_STATUS[3] PRESENCEDETECT bit. This is valid only in 1-Wire mode. The flag is updated when the HDQ.HDQ\_INT\_STATUS[0] TIMEOUT bit is set. Therefore, its correct value shows only after the interrupt is generated. The firmware must wait for the time-out condition; otherwise, the flag keeps its previous value and is undefined.

## 23.2.5 HDQ/1-Wire Programming Models

This section describes the low-level hardware programming sequences for configuration and usage of the module. The basic protocol functions, such as slave initialization (reset), read-byte, and write-byte operations, are described. For a description of the functions, see the HDQ/1-Wire protocol documentation.

### 23.2.5.1 Global Initialization

#### 23.2.5.1.1 Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the HDQ/1-Wire module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the HDQ/1-Wire. Refer to the HDQ/1-Wire Module Integration and Environment Sections for further information.

**Table 23-107. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	Module interface and functional clocks must be enabled. The interface clock must not be slower than the functional clock ( $HDQ\_ICLK \geq HDQ\_FCLK$ ). For more information about the module configuration, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Control Module	Module specific pad muxing and pullup must be set in the control module. For more information about the module configuration, see <a href="#">Chapter 18, Control Module</a> .
MPU INTC	MPU INTC configuration must be done to enable the interrupts from HDQ/1-Wire module. See <a href="#">Section 17.4.1, Cortex-A9 MPU INTC Functional Description</a> , in <a href="#">Chapter 17, Interrupt Controllers</a> .

Step	Register/Bit Field/ Programming Model	Value
Write ID/command or data value.	<a href="#">HDQ_TX_DATA</a> [7:0]	0x-
Select write operation.	<a href="#">HDQ_CTRL_STATUS</a> [1] DIR	0x0
Start operation.	<a href="#">HDQ_CTRL_STATUS</a> [4] GO	0x1
Wait for interrupt.		
Reading <a href="#">HDQ_INT_STATUS</a> clears interrupt conditions.	<a href="#">HDQ_INT_STATUS</a> [2] TXCOMPLETE	0x1

**23.2.5.3.2 Main Sequence - 1-Wire Read Operation Mode**
**Table 23-115. 1-Wire Read Operation Mode**

Step	Register/Bit Field/Programming Model	Value
Select read operation.	<a href="#">HDQ_CTRL_STATUS[1]</a> DIR	0x1
Start operation.	<a href="#">HDQ_CTRL_STATUS[4]</a> GO	0x1
Wait for interrupt.		
Read and store <a href="#">HDQ_INT_STATUS</a> . Reading <a href="#">HDQ_INT_STATUS</a> clears interrupt conditions.	<a href="#">HDQ_INT_STATUS</a>	0x–
IF: Read operation successful?	<a href="#">HDQ_INT_STATUS[1]</a> RXCOMPLETE	= 0x1
Get received data.	<a href="#">HDQ_RX_DATA[7:0]</a>	0x–
ENDIF		

**23.2.5.3.3 Sub-sequence - Initialize 1-Wire Slave**
**Table 23-116. Initialize 1-Wire Slave**

Step	Register/Bit Field/Programming Model	Value
Select sending initialization pulse operation.	<a href="#">HDQ_CTRL_STATUS[2]</a> INITIALIZATION	0x1
Start operation.	<a href="#">HDQ_CTRL_STATUS[4]</a> GO	0x1
Wait for interrupt.		
IF: Presence pulse detected?	<a href="#">HDQ_INT_STATUS[0]</a> TIMEOUT	= 0x1
	<a href="#">HDQ_CTRL_STATUS[3]</a> PRESENCEDETECT	= 0x1
Slave is present and initialized.		
ELSE		
Repeat initialization subsequence.		
ENDIF		

## 23.2.6 HDQ/1-Wire Register Manual

### 23.2.6.1 HDQ/1-Wire Instance Summary

**Table 23-117. HDQ/1-Wire Instance Summary**

Module Name	Base Address	Size
HDQ/1-Wire	0x480B 2000	4KB

### 23.2.6.2 HDQ/1-Wire Registers

#### CAUTION

The following rules must be observed when accessing the module registers:

- A read from the [HDQ\\_INT\\_STATUS](#) register or the [HDQ\\_RX\\_DATA](#) register is not allowed unless the processor has been interrupted by the module.
- After the release of the GO bit in the [HDQ\\_CTRL\\_STATUS](#) register, no access to the [HDQ\\_TX\\_DATA](#) or [HDQ\\_CTRL\\_STATUS](#) register is allowed until the processor has been interrupted by the module.
- Polling of the [HDQ\\_INT\\_STATUS](#) register by software to determine whether an interrupt was generated is not allowed.

#### CAUTION

The HDQ/1-Wire registers are limited to 32-bit data accesses; 16-bit and 8-bit data accesses are not allowed and can corrupt register content.

#### 23.2.6.2.1 HDQ/1-Wire Register Summary

**Table 23-118. HDQ/1-Wire Registers Mapping Summary**

## 23.3 UART/IrDA/CIR

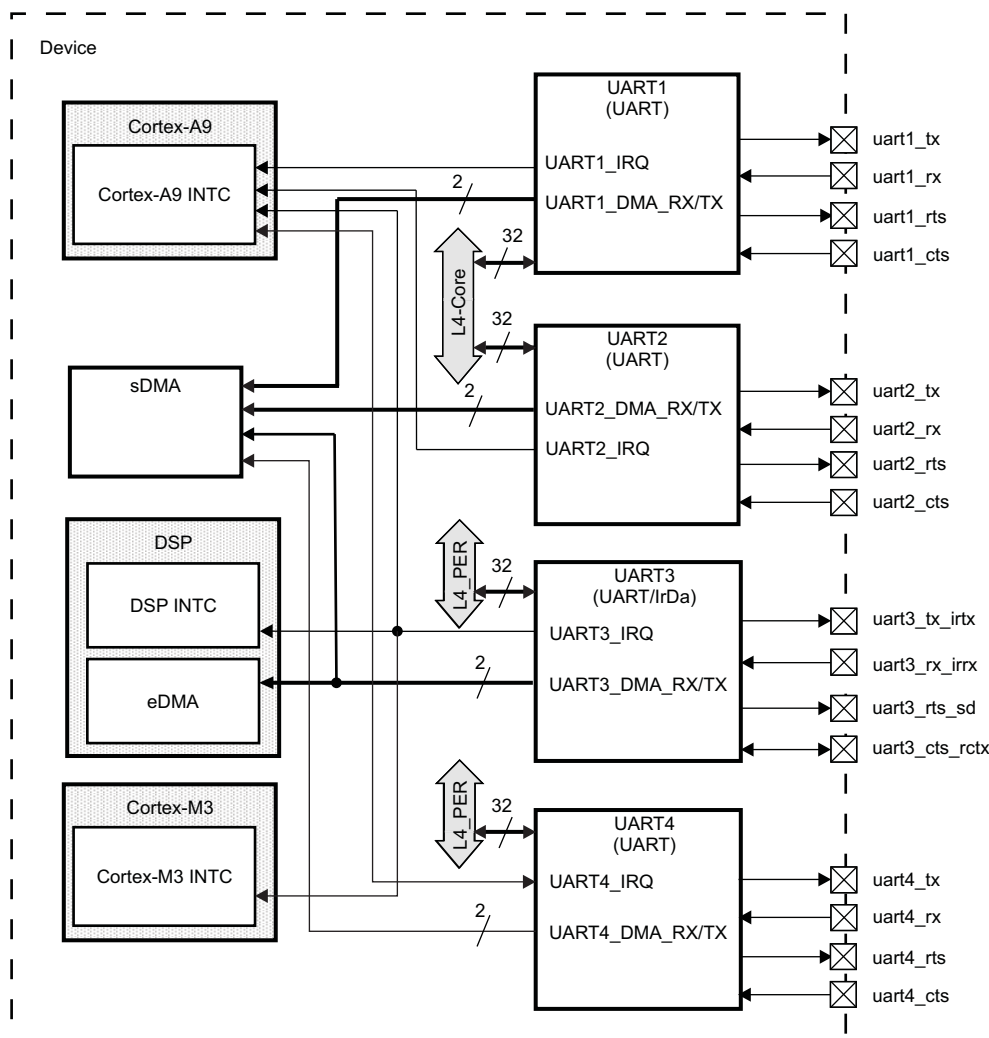

This chapter describes the function, operation, and configuration of the universal asynchronous receiver/transmitter (UART)/infrared data association (IrDA)/consumer infrared (CIR) module in the device.

### 23.3.1 UART/IrDA/CIR Overview

The device contains four UART devices controlled by the MPU (see [Figure 23-51](#)):

- Three UART-only modules (UART1, UART2, and UART4) are pinned out for use as UART devices only.
- UART3, which adds infrared communication support, is pinned out for use as a UART, IrDA, or CIR device, and can be programmed to any available operating mode.

**Figure 23-51. UART Module**

uart-001

#### 23.3.1.1 UART Features

The UARTs (UART1, UART2, UART3 when in UART mode, and UART4) include the following key features:

- 16C750 compatibility
- 64-byte FIFO buffer for receiver and 64-byte FIFO for transmitter
- Programmable interrupt trigger levels for FIFOs

- Baud generation based on programmable divisors N (N = 1...16,384) operating from a fixed functional clock of 48 MHz

Oversampling is programmed by software as 16 or 13; thus, the baud rate computation is one of two options:

- Baud rate = (functional clock/16)/N
- Baud rate = (functional clock/13)/N

This software programming mode enables higher baud rates with the same error amount without changing the clock source:

- Break character detection and generation
- Configurable data format:
  - Data bit: 5, 6, 7, or 8 bits
  - Parity bit: Even, odd, none
  - Stop-bit: 1, 1.5, 2 bit(s)
- Flow control: Hardware (RTS/CTS) or software (XON/XOFF)

The UART clocks are connected to produce a baud rate of up to 3.6 Mbps. [Table 23-133](#) lists the supported baud rates, the requested divisor, and the corresponding error versus the standard baud rate.

**Table 23-133. UART Mode Baud Rates, Divisor Values, and Error Rates**

Baud Rate	Oversampling	Divisor	Error (%)
300	16	10,000	0
600	16	5000	0
1200	16	2500	0
2400	16	1250	0
4800	16	625	0
9600	16	312	0.16
14,400	16	208	0.16
19,200	16	156	0.16
28,800	16	704	0.16
38,400	16	78	0.16
57,600	16	52	0.16
115,200	16	26	0.16
230,400	16	13	0.16
460,800	13	8	0.16
921,600	13	4	0.16
1,843,200	13	2	0.16
3,000,000	16	1	0
3,686,400	13	1	0.16

### 23.3.1.2 IrDA Features

The IrDA (UART3 only) includes the following key features:

- Support of IrDA 1.4 slow infrared (SIR), medium infrared (MIR), and fast infrared (FIR) communications:
  - Frame formatting: Addition of variable beginning-of-frame (xBOF) characters and end-of-frame (EOF) characters
  - Uplink/downlink cyclic redundancy check (CRC) generation/detection
  - Asynchronous transparency (automatic insertion of break character)
  - Eight-entry status FIFO (with selectable trigger levels) to monitor frame length and frame errors
  - Framing error, CRC error, illegal symbol (FIR), and abort pattern (SIR, MIR) detection

Table 23-134 lists the supported baud rates, the requested divisor, and the corresponding error versus the standard baud rate.

**Table 23-134. UART IrDA Mode Baud Rates, Divisor Values, and Error Rates**

Baud Rate	IR Mode	Encoding	Divisor	Error (%)
2400	SIR	3/16	1250	0
9600	SIR	3/16	312	0.16
19,200	SIR	3/16	156	0.16
38,400	SIR	3/16	78	0.16
57,600	SIR	3/16	52	0.16
115,200	SIR	3/16	26	0.16
576,000	MIR	1/4	2	0
1,152,000	MIR	1/4	1	0
4,000,000	FIR	4 PPM <sup>(1)</sup>	1	0

<sup>(1)</sup> PPM = pulse-position modulation

### 23.3.1.3 CIR Features

The CIR mode uses a variable pulse-width modulation (PWM) technique (based on multiples of a programmable  $t$  period) to encompass the various formats of infrared encoding for remote-control applications. The CIR logic transmits data packets based on a user-definable frame structure and packet content.

The CIR (UART3 only) includes the following key features to provide CIR support for remote-control applications:

- Transmit mode only (Receive mode is not supported.)
- Free data format (supports any remote-control private standards)
- Selectable bit rate
- Configurable carrier frequency
- 1/2, 5/12, 1/3, or 1/4 carrier duty cycle

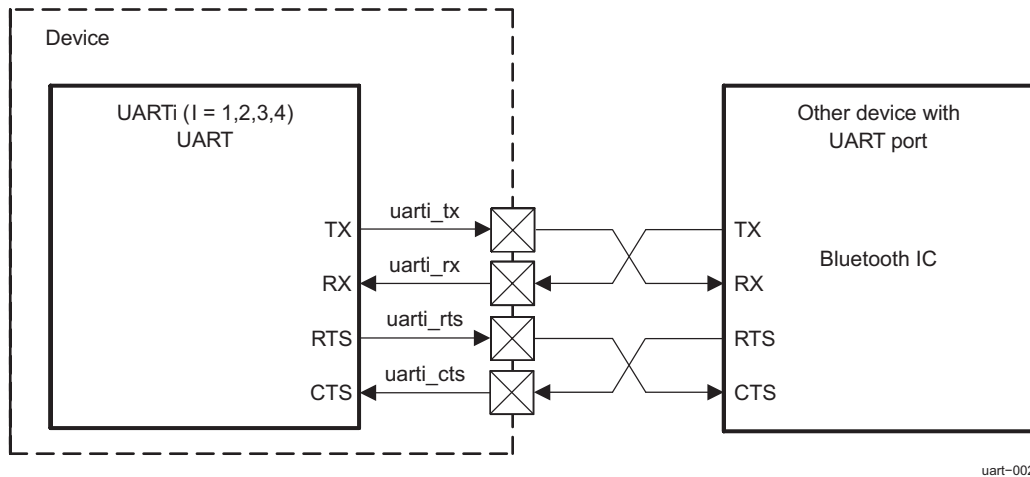

### 23.3.2 UART/IrDA/CIR Environment

This section describes the UART/IrDA/CIR connection with an external device.

#### 23.3.2.1 System Using UART Communication With Hardware Handshake

Each UART instance can be easily connected to the UART port of an external IC (see [Figure 23-52](#)).

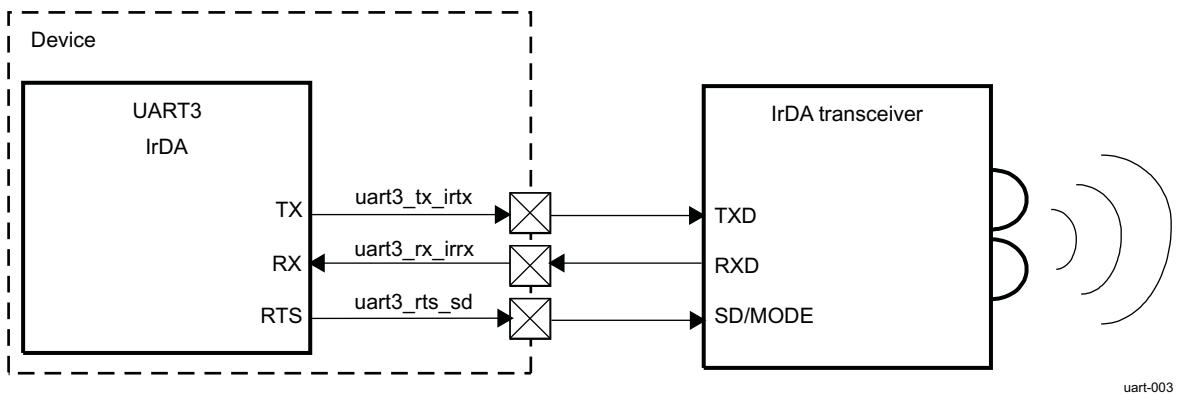

**Figure 23-52. UART Mode Bus System Overview**

#### 23.3.2.2 System Using IrDA Communication Protocol

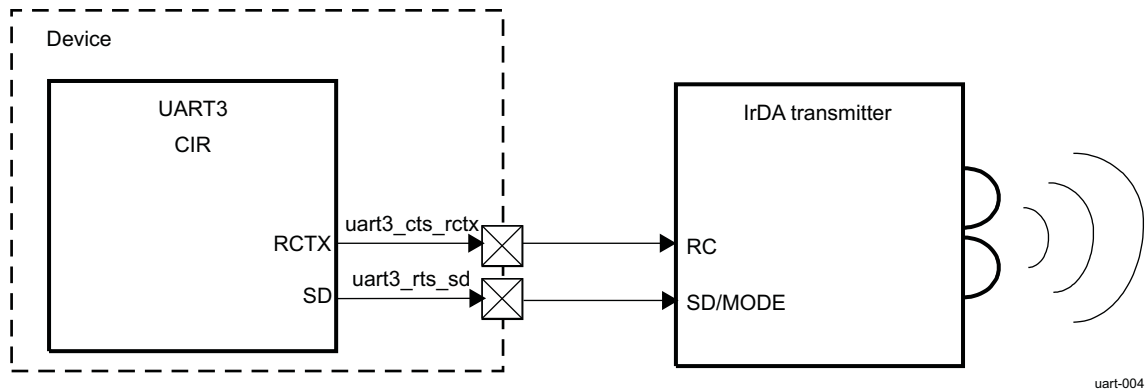

As [Figure 23-53](#) shows, UART3 can be connected to an external infrared transceiver in the IrDA modes (FIR, SIR, and MIR).

**Figure 23-53. IrDA System Overview**

#### 23.3.2.3 System Using CIR Communication Protocol With Remote Control

UART3 can be connected to an external infrared transceiver in CIR mode (see [Figure 23-54](#)).

**Figure 23-54. CIR System Overview**

### 23.3.2.4 UART Interface

#### 23.3.2.4.1 Description

Table 23-135 lists the UART interface input/output (I/O) signals.

**Table 23-135. UART I/O Pins**

Signal	I/O <sup>(1)</sup>	Description	Reset
<b>UART Modem Signals</b>			
uarti_rx	I	Serial data input	Unknown
uarti_tx	O	Serial data output	1
		Because this pin is active high in IrDA mode and the output is muxed, this pin is set to low on reset (when the UARTi.UART_MDR1[2:0] bit field is set to 0x7) and takes the defined inactive level of that signal corresponding to when and how the UARTi.UART_MDR1 register is programmed; that is, the output is 1 (inactive for UART modem modes) and 0 (inactive for IrDA modes).	
uarti_cts	I	Clear to send	Unknown
		Active-low modem status signal. Reading the UARTi.UART_MSR[4] NCTS_STS bit checks the condition of uarti_cts. Reading the UARTi.UART_MSR[0] CTS_STS bit checks a change of state of uarti_cts since the last read of the modem status register. The auto-nCTS mode uses uarti_cts to control the transmitter.	
uarti_rts	O	Request to send	1
		When active (low), the module is ready to receive data. Setting the UARTi.UART_MCR[1] RTS bit activates uarti_rts, which becomes inactive as the result of a module reset, loopback mode, or clearing the UARTi.UART_MCR[1] RTS bit. In auto-RTS mode, uarti_rts becomes inactive as a result of the receiver threshold logic.	

<sup>(1)</sup> I = Input; O = Output

#### 23.3.2.4.2 UART Protocol and Data Format

The UART device operates in three modes:

- UART 16x (<= 230.4 kbps)
- UART 16x with autobauding (>= 1200 bps and >= 115.2 kbps)
- UART 13x (>= 460.8 kbps)

**CAUTION**

To be used as a UART, the operating mode must be programmed appropriately in the UARTi.UART\_MDR1[2:0] MODE\_SELECT bit field to select UART, IrDA, or CIR mode.

The UART uses a wired interface for serial communication with a remote device.

The UART is functionally compatible with the TL16C750 UART and earlier designs such as the TL16C550.

Figure 23-55 shows the UART frame data format.

**Figure 23-55. UART Frame Data Format**

uart-005

### 23.3.2.5 IrDA Functional Interfaces

#### 23.3.2.5.1 UART3 Interface Description

Table 23-136 lists the UART3 interface I/O signals.

**Table 23-136. UART3 I/O Signals**

Signal	I/O <sup>(1)</sup>	Description	Reset
<b>IrDA Signals</b>			
uart3_rx_irrx	I	Serial data input	Unknown
uart3_tx_irtx	O	Serial data output in IrDA modes (SIR, MIR, and FIR). In other modes, this pin is set to the reset value (inactive state).	0
uart3_rts_sd	O	SD mode is used to configure the transceivers. The SD pinout is an inverted value of the UART3.UART_ACREG[6] SD_MOD bit.	1

<sup>(1)</sup> I = Input; O = Output

### 23.3.2.5.2 IrDA Protocol and Data Format

#### 23.3.2.5.2.1 SIR Mode

In SIR mode, data is transferred between the MPU and peripheral devices at speeds of up to 115,200 baud. A SIR transmit frame begins with start flags (a single 0xC0, a multiple 0xC0, or a single 0xC0 preceded by a number of 0xFF flags), is followed by frame data and a CRC-16, and ends with a stop flag (0xC1).

The bit format for a single word uses 1 start-bit, 8 data bits, and 1 stop-bit, and is unaffected by the use and settings of the UART3.UART\_LCR register.

The UART3.UART\_BLR[6] XBOF\_TYPE bit selects whether the 0xC0 or 0xFF start patterns are used when multiple start flags are required.

The SIR transmit state-machine attaches start flags, CRC-16, and stop flags, and checks the outgoing data to establish whether data transparency is required.

SIR transparency is carried out if the outgoing data between the start and stop flags contains 0xC0, 0xC1, or 0x7D. If one of these start flags is about to be transmitted, the SIR state-machine first sends an escape character (0x7D), then inverts the fifth bit of the real data to be sent and sends this data immediately after the 0x7D character.

The SIR receive state-machine recovers the receive clock, removes the start flags and any transparency from the incoming data, and determines the frame boundary with reception of the stop flag. The SIR state-machine also checks for errors such as a frame abort (0x7D character followed immediately by a 0xC1 stop flag without transparency), a CRC error, or a frame-length error. At the end of a frame reception, the MPU reads the line status register (UART3.UART\_LSR) to find possible errors of the received frame.

---

**NOTE:** The module can transmit and receive data, but when the device is transmitting, the IR RX circuitry is automatically disabled by hardware. See the description of the UART3.UART\_ACREG[5] DIS\_IR\_RX bit. This applies to all three modes: SIR, MIR, and FIR.

---

Infrared output in SIR mode can be 1.6- $\mu$ s or 3/16 encoding, selected by the UART3.UART\_ACREG[7] PULSE\_TYPE bit. In 1.6- $\mu$ s encoding, the infrared pulse width is 1.6  $\mu$ s; and in 3/16th encoding, the infrared pulse width is 3/16th of a bit duration (1/baud rate).

For back-to-back frames, the transmitting device must send at least two start flags at the start of each frame.

---

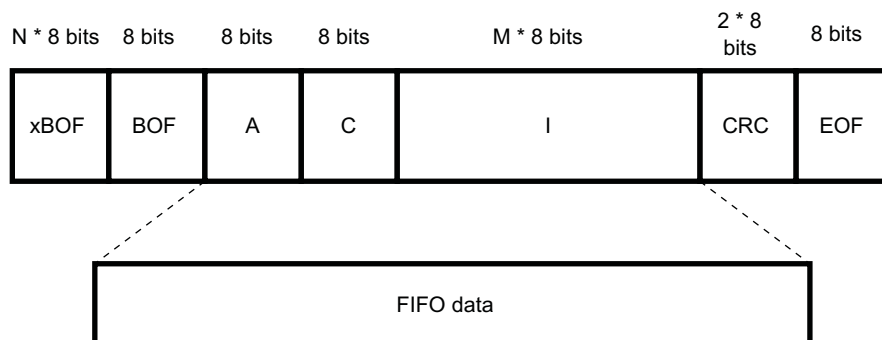

**NOTE:** Reception supports variable-length stop-bits.

---

#### 23.3.2.5.2.1.1 Frame Format

Figure 23-56 shows the IrDA SIR frame format.

**Figure 23-56. IrDA SIR Frame Format**

uart-006

The CRC is applied on the address (A), control (C), and information (I) bytes.

---

**NOTE:** The two words of CRC are written to the FIFO in reception.

---

### **23.3.2.5.2.1.2 Asynchronous Transparency**

Before transmitting a byte, the UART IrDA controller examines each byte of the payload and the CRC field (between BOF and EOF). For each byte equal to 0xC0 (BOF), 0xC1 (EOF), or 0x7D (control escape), the controller performs certain tasks:

- In transmission:
  - Inserts a control escape (CE) byte preceding the byte
  - Complements bit 5 of the byte (that is, exclusive ORs the byte with 0x20)

The byte sent for the CRC computation is the initial byte written in the TX FIFO (before the XOR with 0x20).
- In reception:
 

For the A, C, I, CRC field:

  - Compares the byte with the CE byte; if they are not equal, sends the byte to the CRC detector and stores it in the RX FIFO.
  - If the byte is equal to the CE byte, discards the CE byte
  - Complements bit 5 of the byte following the CE
  - Sends the complemented byte to the CRC detector and stores it in the RX FIFO

### **23.3.2.5.2.1.3 Abort Sequence**

The transmitter can prematurely close a frame (abort) by sending the sequence 0x7DC1. The abort pattern closes the frame without a CRC field or an ending flag.

When a 0x7D character that is followed immediately by a 0xC1 character is received without transparency, the receiver treats the frame as an aborted frame.

### **23.3.2.5.2.1.4 Pulse Shaping**

The SIR mode supports the 3/16 and the 1.6-us pulse duration methods in receive and transmit. The UART3.UART\_ACREG[7] PULSE\_TYPE bit selects the pulse-width method in transmit mode.

### **23.3.2.5.2.1.5 Encoder**

Serial data from the transmit state-machine are encoded to transmit data to the optoelectronics. While the TX FIFO output is high, the uart3\_tx\_irtx line is always low, and the counter used to form a pulse on uart3\_tx\_irtx is cleared continuously.

After the TX FIFO output resets to 0, uart3\_tx\_irtx rises on the falling edge of the seventh 16XCLK. On the falling edge of the tenth 16XCLK pulse, uart3\_tx\_irtx falls, creating a 3-clock-wide pulse. While the TX FIFO output stays low, a pulse is transmitted during the seventh to the tenth clock of each 16-clock bit cycle.

[Figure 23-57](#) shows the IrDA SIR encoding mechanism.

**Figure 23-57. IrDA SIR Encoding Mechanism****23.3.2.5.2.1.6 Decoder**

After reset, the RX FIFO input is high and the 4-bit counter is cleared. When a rising edge is detected on RX, the RX FIFO input falls on the next rising edge of 16XCLK with sufficient setup time. The RX FIFO input stays low for 16 cycles (16XCLK) and then returns to high as required by the IrDA specification. As long as no pulses (rising edges) are detected on the RX, the RX FIFO input remains high.

Figure 23-58 shows the IrDA SIR decoding mechanism.

**Figure 23-58. IrDA SIR Decoding Mechanism**

The module can transmit and receive data, but when the device is transmitting, the IR RX circuitry is automatically disabled by hardware. The operation of the `uart3_rx_irtx` input can be disabled using the `UART3.UART_ACREG[5] DIS_IR_RX` bit. The `UART3.UART_MDR2[6] IRRXINVERT` bit can invert the signal from the transceiver (RXD) pin to the IR RX logic in the UART. This inversion is performed by default.

**23.3.2.5.2.1.7 IR Address Checking**

In all IR modes, when address checking is enabled by setting the `UART_EFR[1:0]` bit field (see [Table 23-137](#)), only frames intended for the device are written to the RX FIFO. This is to avoid receiving frames not meant for this device in a multipoint infrared environment. To program two frame addresses that the UART3 receives in IrDA mode, use the `UART3.UART_XON1_ADDR1[7:0]` and `UART3.UART_XON2_ADDR2[7:0]` bit fields.

**Table 23-137. UART\_EFR[1:0] IR Address Checking Options**

UART_EFR[1]	UART_EFR[0]	IR Address Checking
0	0	All address-checking operations disabled
0	1	Only address 1 checking enabled
1	0	Only address 2 checking enabled
1	1	All address-checking operations enabled

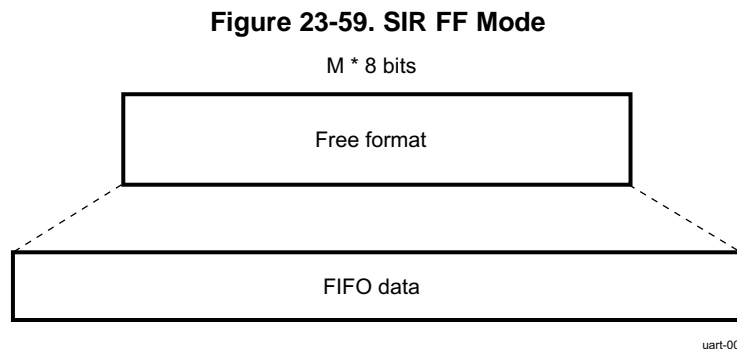

**23.3.2.5.2.2 SIR Free-Format Mode**

To allow complete software flexibility when transmitting and receiving infrared data packets, the SIR free-format (FF) mode is a subfunction of the existing SIR mode. In FF mode, all frames going to and from the FIFO buffers are untouched with respect to appending and removing control characters and CRC values.

The FF mode corresponds to a UART mode with a pulse modulation of 3/16 of baud rate pulse width.

For example, a normal SIR packet has BOF control and CRC error-checking data appended (transmitting) or removed (receiving) from the data going to and from the FIFOs.

Figure 23-59 shows SIR FF mode.

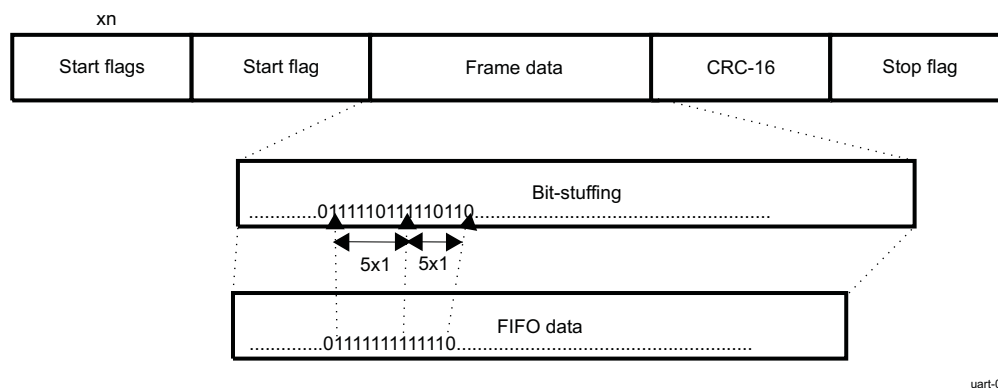

In SIR FF mode, the MPU software must construct (that is, encode and decode) the entire FIFO data packet.

**23.3.2.5.2.3 MIR Mode**

In MIR mode, data is transferred between the MPU and the peripheral devices at 0.576 or 1.152 Mbps speed. A MIR transmit frame starts with at least two start flags followed by a frame data and a CRC-16, and ends with a stop flag (see Figure 23-60).

**Figure 23-60. MIR Transmit Frame Format**

On transmit, the MIR state-machine attaches start flags, a CRC-16, and stop flags, as in SIR mode. All fields are transmitted LSB of each byte first.

In MIR mode:

- The state-machine looks for consecutive 1s in the frame data and automatically inserts 0 after five consecutive 1s (this is called bit-stuffing).
- 0x7E is used for start and stop flags (unambiguously, not data, because of bit-stuffing).
- An abort sequence requires a minimum of seven consecutive 1s (unambiguously, not data, because of bit-stuffing).
- Back-to-back frames are allowed with three or more stop flags between them. If two consecutive frames are not back to back, the gap between the last stop flag of the first frame and the start flag of the second frame must be separated by at least seven bit durations.

On receive, the MIR receive state-machine recovers the receive clock, removes the start flags, destuffs the incoming data, and determines the frame boundary with reception of the stop flag. The state-machine also checks for errors such as frame abort, CRC error, and frame-length error. At the end of a frame reception, the MPU reads the line status register (UART3.UART\_LSR) to detect errors of the received frame.

The module can transmit and receive data, but when the device is transmitting, the IR RX circuitry is automatically disabled by hardware.

### 23.3.2.5.2.3.1 MIR Encoder/Decoder

To meet the MIR baud rate tolerance of 0.1 percent with a 48-MHz clock input, a 42-41-42 encoding/decoding adjustment is performed. The reference start point is the first start flag, and the 42-41-42 cyclic pattern is repeated until the stop flag is sent or detected.

The jitter created this way is within MIR tolerances. The pulse width is not exactly 1/4, but it is within the tolerances defined by IrDA specifications.

Figure 23-61 shows the MIR baud rate adjustment mechanism.

**Figure 23-61. MIR Baud Rate Adjustment Mechanism**

### 23.3.2.5.2.3.2 SIP Generation

In the MIR and FIR operation modes, the transmitter must send a serial infrared interaction pulse (SIP) at least once every 500 ms. The SIP informs slow devices (operating in SIR mode) that the medium is occupied.

Figure 23-62 shows the SIP.

Figure 23-62. SIP

23.3.2.5.2.4 FIR Mode

In FIR mode, data is transferred between the MPU and the peripheral devices at 4 Mbps. A FIR transmit frame starts with a preamble that is followed by a start flag, frame data, CRC-32, and ends with a stop flag.

Figure 23-63 shows the FIR transmit frame format.

Figure 23-63. FIR Transmit Frame Format

Preamble (16x)	Start flag	Frame data	CRC-32	Stop flag
----------------	------------	------------	--------	-----------

On transmit, the FIR transmit state-machine attaches the preamble, start flag, CRC-32, and stop flag. An abort sequence requires at least two transmissions of 0000. Back-to-back frames are allowed, but each frame must be complete.

The state-machine also encodes the transmit data into 4-PPM format (see Table 23-138) and generates the SIP (see Section 23.3.2.5.2.3.2, SIP Generation).

Table 23-138. 4-PPM Format

Data Bit Pair (Bin)	4-PPM Data Symbol (Bin)
00	1000
01	0100
10	0010
11	0001

The four symbols described in Table 23-138 are the legal, encoded data symbols. All other combinations are illegal for encoding data. Some of these illegal symbols are used in the definition of the preamble, start flag, and stop flag because they are unambiguously not data (see Table 23-139).

Table 23-139. FIR Preamble, Start Flag, and Stop Flag

Frame Part	Transmitted Frame (Bin)
Preamble	1000 0000 1010 1000 (16 repeated transmissions)
Start flag	0000 1100 0000 1100 0110 0000 0110 0000
Stop flag	0000 1100 0000 1100 0000 0110 0000 0110

All fields are transmitted the LSBs of each byte first (see Table 23-140).

**Table 23-140. FIR Data Byte Transmission Order Example**

Data Byte (Hex)	Data Byte Pair (Bin)	4-PPM Data Symbol (Bin)	Transmission Order
0x0B	00	1000	4
	00	1000	3
	10	0010	2
	11	0001	1

On receive, the FIR receive state-machine recovers the receive clock, removes the preamble and the start flag, decodes the 4-PPM incoming data, and determines the frame boundary with reception of the stop flag. The state-machine also checks for errors such as illegal symbol, CRC error, and frame-length error. At the end of a frame reception, the MPU reads the line status register (UART3.UART\_LSR) to detect errors of the received frame.

The module can transmit and receive data, but when the device is transmitting, the IR RX circuitry is automatically disabled by hardware.

### 23.3.2.6 CIR Functional Interfaces

#### 23.3.2.6.1 CIR Interface Description

Table 23-141 lists the CIR interface I/O signals.

**Table 23-141. CIR I/O Signals**

Signal	I/O <sup>(1)</sup>	Description	Reset
<b>CIR Signals</b>			
uart3_rx_irrx	I	Serial data input	Unknown
uart3_cts_rctx	O	Serial data output in CIR mode. In other modes, this pin is set to the reset value (inactive state).	0
uart3_rts_sd	O	SD mode is used to configure the transceivers. The SD pinout is an inverted value of the UART3.UART_ACREG[6] SD_MOD bit.	1

<sup>(1)</sup> I = Input; O = Output

#### 23.3.2.6.2 CIR Protocol and Data Format

In CIR mode, the infrared operation functions as a programmable (universal) remote control.

CIR mode uses a variable PWM technique (based on multiples of a programmable  $t$  period) to encompass the various formats of infrared encoding for remote-control applications. The CIR logic transmits data packets based on user-defined frame structure and packet content.

##### 23.3.2.6.2.1 Carrier Modulation

Each modulated pulse that constitutes a digit is a train of on/off pulses (see Figure 23-64).

Figure 23-64. CIR Pulse Modulation

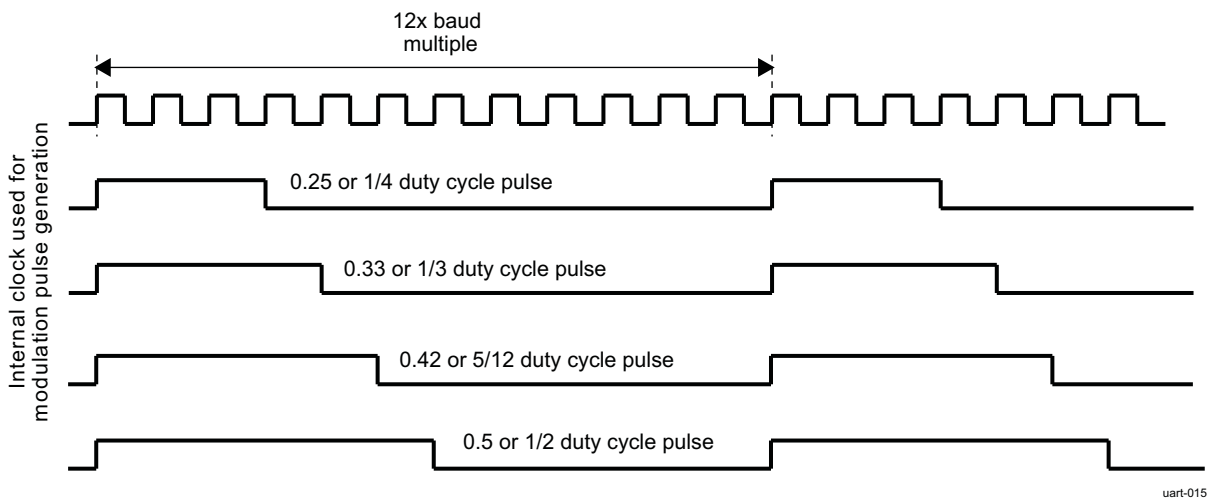

23.3.2.6.2.2 Pulse Duty Cycle

The programmer can choose one of four duty cycles for modulation pulses by setting the appropriate value in the UART3.UART\_MDR2[5:4] CIR\_PULSE\_MODE bit field (1/4, 1/3, 5/12, or 1/2).

Figure 23-65 shows the CIR modulation duty cycles.

Figure 23-65. CIR Modulation Duty Cycle

The transmission logic ensures that all pulses are transmitted completely (no cutoff during transmission). While transmitting continuous bytes back-to-back, no delay is inserted between 2 transmitted bytes. Thus, software must handle the delay between consecutively transmitted bytes if the receiving end requires it.

### 23.3.2.6.2.3 Consumer IR Encoding/Decoding

There are two methods of encoding for remote-control applications:

- Pulse duration encoding (time-extended bit forms): A variable pulse distance, or duration, in which the difference between logic 1 and logic 0 is the length of the pulse width
- Biphase encoding: The encoding of logic 0 and logic 1 is in the change of signal level from 1 to 0 or 0 to 1, respectively.

Japanese manufacturers favor pulse duration encoding; European manufacturers favor biphase encoding.

The CIR mode uses a completely flexible free-format encoding in which 1 is transmitted from the TX FIFO as a modulated pulse with duration  $t$ .

Similarly, 0 is transmitted as a blank duration  $T$ . The MPU constructs and decipheres the protocol of the data. For example, the RC-5 protocol using Manchester encoding can be emulated as using a 01 pair for 1 and a 10 pair for 0 (see [Figure 23-66](#)).

**Figure 23-66. RC-5 Bit Encoding**

Because CIR mode logic does not impose a fixed format for infrared packets of data, the MPU software can define the format using simple data structures that are then modulated into an industry standard, such as RC-5 or SIRC. To send a sequence of 0101 in RC-5, the MPU software must write an 8-bit binary character of 10011001 to the data FIFO of the UART.

For SIRC, the modulation length (multiples of  $t$ ) is used to distinguish between 1 and 0. The subsequent SIRC digits show the difference in encoding between this and, for example, RC-5. The pulse width is extended for one digit.

[Figure 23-67](#) shows SIRC bit encoding.

**Figure 23-67. SIRC Bit Encoding**

To construct comprehensive packets constituting remote-control commands, the MPU software must combine a number of 8-bit data characters in a sequence that follows one of the universally accepted formats.

Figure 23-68 shows a standard RC-5 frame as detected by UART3 in CIR mode (the SIRC format follows this). Each field in RC-5 can be considered as two  $t$  pulses (digital bits) from the TX FIFO.

**Figure 23-68. RC-5 Standard Packet Format**

Where:

- S1, S2: Start-bits (always 1)
- T: Toggle bit
- A4..A0: Address (or system) bits
- C5..C0: Command bits

The toggle bit T changes when a new command is transmitted to detect when the same key is pressed twice (effectively receiving the same data from the host consecutively). A brief delay in the transmission of the same command is detected by the use of the toggle bit because a code is sent while the MPU transmits characters to the UART for transmission. The address bits define the machine or device for which the infrared transmission is intended, and the command defines the operation.

To accommodate an extended RC-5 format, the S2 bit is replaced by an additional command bit (C6) that lets the command range increase to 7 bits. This format is known as the extended RC-5 format.

SIRC encoding uses the duration of modulation for mark and space; therefore, the duration of data bits in the standard frame length varies.

Figure 23-69 shows the packet format and bit encoding. As Figure 23-70 shows, 1 start-bit of 2.4 ms and control codes are followed by data that constitute the entire frame.

**Figure 23-69. SIRC Packet Format**

**NOTE:** The encoding must take a standard duration, but the contents of the data can vary. This implies that the control software for sending and receiving data packets must exercise a scheme of interpacket delay, where successive packets can be sent only after a real-time delay expires.

**Figure 23-70. SIRC Bit Transmission Example**

uart-020

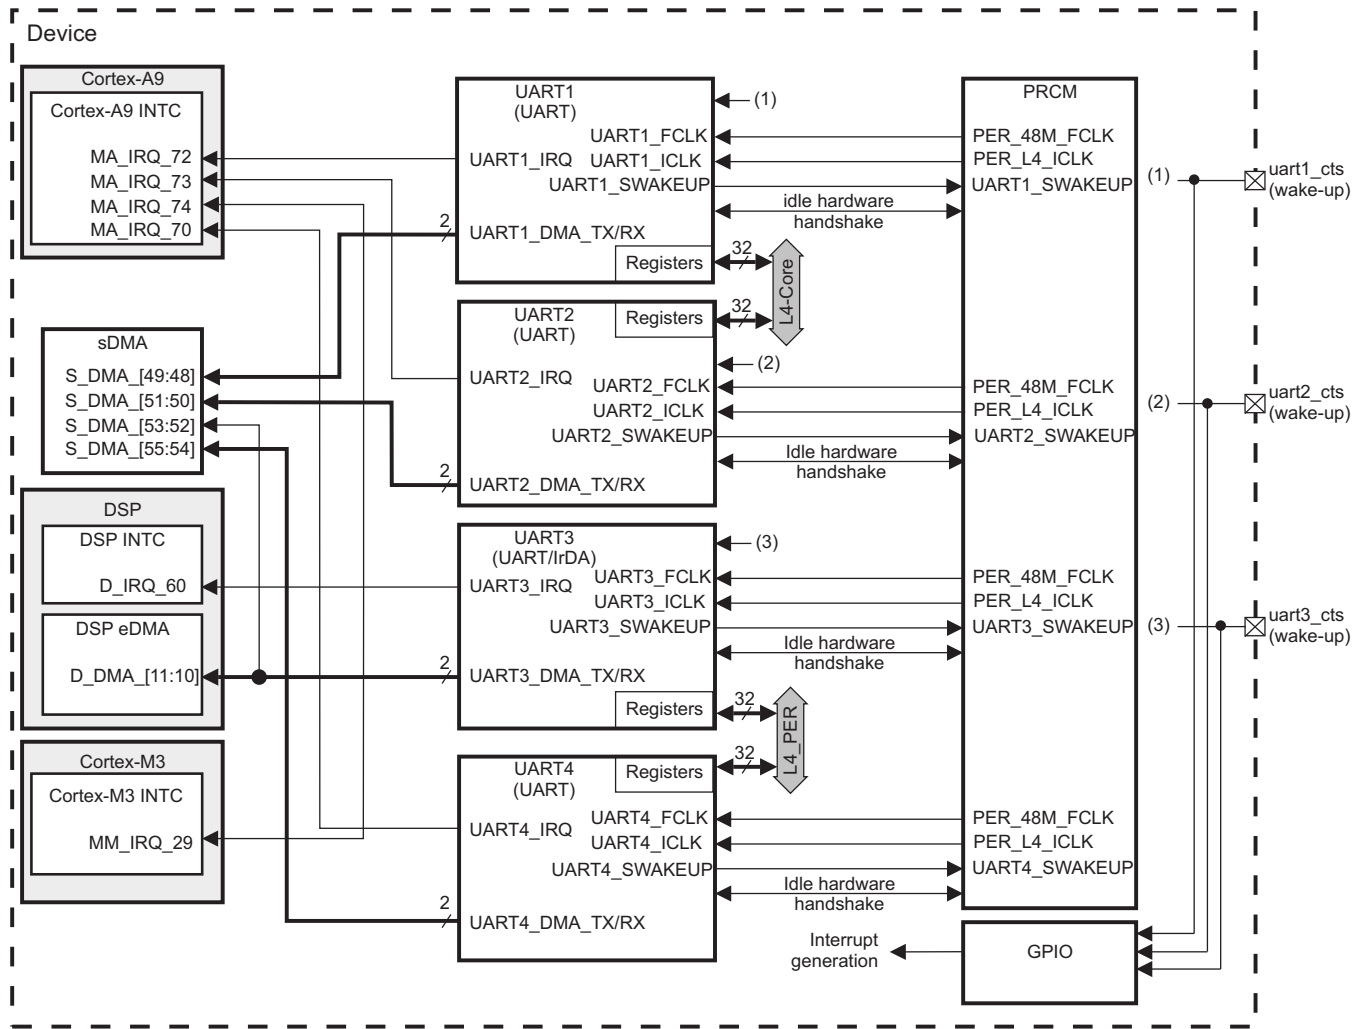

This document does not describe all encoding methods and techniques; the previous information discusses the considerations required to employ different encoding methods for different industry-standard protocols. See industry-standard documentation for specific methods of encoding and protocol use.

### 23.3.3 UART/IrDA/CIR Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

Figure 23-71 shows the device internal connections with related modules for UART functions.

Figure 23-71. UART/IrDA/CIR Integration

uart-021

**NOTE:** For more information about the idle and standby hardware handshakes and the wake-up request, see Section 3.1.1.1.4, *Clock Domain-Level Clock Management*, in Chapter 3, *Power, Reset, and Clock Management*.

Table 23-142 through Table 23-144 summarize the integration of the module in the device.

Table 23-142. Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
UART1	PD_L4_PER	Yes	L4_PER
UART2	PD_L4_PER	Yes	L4_PER
UART3	PD_L4_PER	Yes	L4_PER
UART4	PD_L4_PER	Yes	L4_PER

**Table 23-143. Clocks and Resets**

Clocks				
Module Instance	Destination Signal	Source Signal	Source	Description
UART1	UART1_ICLK	PER_L4_ICLK	PRCM	UART1 interface clock
	UART1_FCLK	PER_48M_FCLK	PRCM	UART1 functional clock
UART2	UART2_ICLK	PER_L4_ICLK	PRCM	UART2 interface clock
	UART2_FCLK	PER_48M_FCLK	PRCM	UART2 functional clock
UART3	UART3_ICLK	PER_L4_ICLK	PRCM	UART3 interface clock
	UART3_FCLK	PER_48M_FCLK	PRCM	UART3 functional clock
UART4	UART4_ICLK	PER_L4_ICLK	PRCM	UART4 interface clock
	UART4_FCLK	PER_48M_FCLK	PRCM	UART4 functional clock
Resets				
Module Instance	Destination Signal	Source Signal	Source	Description
UART1	UART1_RST	L4_PER_RST	PRCM	UART1 reset signal
UART2	UART2_RST	L4_PER_RST	PRCM	UART2 reset signal
UART3	UART3_RST	L4_PER_RST	PRCM	UART3 interface reset
UART4	UART4_RST	L4_PER_RST	PRCM	UART4 reset

**Table 23-144. Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal	Destination Signal	Destination	Description
UART1	UART1_IRQ	MA_IRQ_72	Cortex-A9	UART module 1
UART2	UART2_IRQ	MA_IRQ_73	Cortex-A9	UART module 2

	UART3_IRQ	MA_IRQ_74	Cortex-A9	UART module 3 (also infrared)
	UART3_IRQ	MM_IRQ_29	Cortex-M3	UART module 3 (also infrared)
UART4	UART4_IRQ	MA_IRQ_70	Cortex-A9	UART module 4
Direct Memory Access (DMA) Requests				
Module Instance	Source Signal	Destination Signal	Destination	Description
UART1	UART1_DMA_TX	S_DMA_48	sDMA	UART module 1 – transmit request
	UART1_DMA_RX	S_DMA_49	sDMA	UART module 1 – receive request
UART2	UART2_DMA_TX	S_DMA_50	sDMA	UART module 2 – transmit request
	UART2_DMA_RX	S_DMA_51	sDMA	UART module 2 – receive request
UART3	UART3_DMA_TX	S_DMA_52	sDMA	UART module 3 – transmit request (also infrared)
	UART3_DMA_RX	S_DMA_53	sDMA	UART module 3 – receive request (also infrared)
	UART3_DMA_TX	D_DMA_10	dDMA	UART module 3 – transmit request [0]
	UART3_DMA_RX	D_DMA_11	dDMA	UART module 3 – receive request [0]
UART4	UART4_DMA_TX	S_DMA_54	sDMA	UART module 4 – transmit request
	UART4_DMA_RX	S_DMA_55	sDMA	UART module 4 – receive request

## 23.3.4 UART/IrDA/CIR Functional Description

### 23.3.4.1 Block Diagram

The UART/IrDA/CIR module can be divided into three main blocks:

- FIFO management
- Mode selection
- Protocol formatting

FIFO management is common to all functions and enables the transmission and reception of data from the host processor point of view.

There are two modes:

- Function mode: Routes the data to the chosen function (UART, IrDA, or CIR) and enables the mechanism corresponding to the chosen function
- Register mode: Enables conditional access to registers

For more information about mode configuration, see [Section 23.3.4.7, Mode Selection](#).

Protocol formatting has three subcategories:

- Clock generation: The 48-MHz input clock generates all necessary clocks.
  - Data formatting: Each function uses its own state-machine that is responsible for the transition between FIFO data and frame data associated with it.
  - Interrupt management: Different interrupt types are generated depending on the chosen function:
    - UART mode interrupts: Seven interrupts prioritized in six different levels
    - IrDA mode interrupts: Eight interrupts. The interrupt line is activated when any interrupt is generated (there is no priority).
    - CIR mode interrupts: A subset of existing IrDA mode interrupts is used.
- In each mode, when an interrupt is generated, the [UART\\_IIR](#) register indicates the interrupt type.

In parallel with these functional blocks, a power-saving strategy exists for each function.

[Figure 23-72](#) is the UART/IrDA/CIR block diagram.

Figure 23-72. UART/IrDA/CIR Functional Specification Block Diagram

uart-022

### 23.3.4.2 Clock Configuration

Each UART uses a 48-MHz functional clock for its logic and to generate external interface signals. Each UART uses an interface clock for register accesses. The PRCM module generates and controls all these clocks (for more information, see [Section 3.6.4.4, Clock Domain Module Attributes](#), in [Chapter 3, Power, Reset, and Clock Management](#)).

The idle and wake-up processes use a handshake protocol between the PRCM and the UART (for a description of the protocol, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#)). The `UARTi.UART_SYSC[4:3]` IDLEMODE bit field controls UART idle mode.

### 23.3.4.3 Software Reset

The `UARTi.UART_SYSC[1]` SOFTRESET bit controls the software reset; setting this bit to 1 triggers a software reset functionally equivalent to hardware reset.

### 23.3.4.4 Power Management

#### 23.3.4.4.1 UART Mode Power Management

##### 23.3.4.4.1.1 Module Power Saving

In UART modes, sleep mode is enabled by setting the `UARTi.UART_IER[4]` SLEEP\_MODE bit to 1 (when the `UARTi.UART_EFR[4]` ENHANCED\_EN bit is set to 1).

Sleep mode is entered when all the following conditions exist:

- The serial data input line, `uarti_rx`, is idle.
- The TX FIFO and TX shift register are empty.
- The RX FIFO is empty.
- The only pending interrupts are THR interrupts.

Sleep mode is a good way to lower UART power consumption, but this state can be achieved only when the UART is set to modem mode. Therefore, even if the UART has no key role functionally, it must be initialized in a functional mode to take advantage of sleep mode.

In sleep mode, the module clock and baud rate clock are stopped internally. Because most registers are clocked by these clocks, this greatly reduces power consumption. The module wakes up when a change is detected on the `uart_rx` line, when data is written to the TX FIFO, and when there is a change in the state of the modem input pins.

An interrupt can be generated on a wake-up event by setting the `UARTi.UART_SCR[4] RX_CTS_WU_EN` bit to 1. To understand how to manage the interrupt, see [Section 23.3.4.5.1.2, Wake-Up Interrupt](#).

---

**NOTE:** There must be no writing to the divisor latches, `UARTi.UART_DLL` and `UARTi.UART_DLH`, to set the baud clock (BCLK) while in sleep mode. It is advisable to disable sleep mode using the `UARTi.UART_IER[4] SLEEP_MODE` bit before writing to the `UARTi.UART_DLL` register or the `UARTi.UART_DLH` register.

---

#### **23.3.4.4.1.2 System Power Saving**

Sleep and auto-idle modes are embedded power-saving features. Power-reduction techniques can be applied at the system level by shutting down certain internal clock and power domains of the device.

The UART supports an idle req/idle ack handshaking protocol used at the system level to shut down the UART clocks in a clean and controlled manner and to switch the UART from interrupt-generation mode to wake-up generation mode for unmasked events (see the `UARTi.UART_SYSC[2] ENAWAKEUP` bit and the `UARTi.UART_WER` register).

For more information, see [Section 3.1.1.1.2, Module Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

#### **23.3.4.4.2 IrDA Mode Power Management (UART3 Only)**

##### **23.3.4.4.2.1 Module Power Saving**

In IrDA modes, sleep mode is enabled by setting the `UART3.MDR[3] IR_SLEEP` bit to 1.

Sleep mode is entered when all the following conditions exist:

- The serial data input line, `uart3.rx_irrx`, is idle.
- The TX FIFO and TX shift register are empty.
- The RX FIFO is empty.
- No interrupts are pending except THR interrupts.

The module wakes up when a change is detected on the `uart3_rx_irrx` line or when data is written to the TX FIFO.

##### **23.3.4.4.2.2 System Power Saving**

System power saving for the IrDA mode has the same function as for the UART mode (see [Section 23.3.4.4.1.2, System Power Saving](#)).

#### **23.3.4.4.3 CIR Mode Power Management (UART3 Only)**

##### **23.3.4.4.3.1 Module Power Saving**

Module power saving for the CIR mode has the same function as for the IrDA mode (see [Section 23.3.4.4.2.1, Module Power Saving](#)).

### 23.3.4.4.3.2 System Power Saving

System power saving for the CIR mode has the same function as for the UART mode (see [Section 23.3.4.4.1.2, System Power Saving](#)).

### 23.3.4.4.4 Local Power Management

[Table 23-145](#) describes power-management features available for the UART.

**NOTE:** For information about source clock gating and sleep/wake-up transitions description, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

**Table 23-145. Local Power-Management Features**

Feature	Registers	Description
Clock autogating	<a href="#">UART_SYSC</a> [0] AUTOIDLE	This bit allows local power optimization in the module by gating the <a href="#">UARTi_ICLK</a> clock on interface activity or gating the <a href="#">UARTi_FCLK</a> clock on internal activity.
Slave idle modes	<a href="#">UART_SYSC</a> [4:3] IDLEMODE	Force-idle, no-idle, smart-idle, and smart-idle wakeup-capable modes are available
Clock activity	N/A	Feature not available
Master standby modes	N/A	Feature not available
Global wake-up enable	<a href="#">UART_SYSC</a> [2] ENAWAKEUP	This bit enables the wake-up feature at module level.
Wake-Up sources enable	N/A	Feature not available

### 23.3.4.5 Interrupt Requests

#### 23.3.4.5.1 UART Mode Interrupt Management

##### 23.3.4.5.1.1 UART Interrupts

UART mode includes seven possible interrupts prioritized to six levels.

When an interrupt is generated, the interrupt identification register ([UARTi.UART\\_IIR](#)) sets the [UARTi.UART\\_IIR](#)[0] [IT\\_PENDING](#) bit to 0 to indicate that an interrupt is pending, and indicates the type of interrupt through the [UARTi.UART\\_IIR](#)[5:1] bit field. [Table 23-146](#) summarizes the interrupt control functions.

**Table 23-146. UART Mode Interrupts**

<a href="#">UART_IIR</a> [5:0]	Priority Level	Interrupt Type	Interrupt Source	Interrupt Reset Method
000001	None	None	None	None
000110	1	Receiver line status	OE, FE, PE, or BI errors occur in characters in the RX FIFO.	FE, PE, BI: Read the <a href="#">UART_RHR</a> register. OE: Read the <a href="#">UART_LSR</a> register.
001100	2	RX time-out	Stale data in RX FIFO	Read the <a href="#">UART_RHR</a> register.
000100	2	RHR interrupt	DRDY (data ready) (FIFO disable) RX FIFO above trigger level (FIFO enable)	Read the <a href="#">UART_RHR</a> register until the interrupt condition disappears.
000010	3	THR interrupt	TFE ( <a href="#">UART_THR</a> empty) (FIFO disable) TX FIFO below trigger level (FIFO enable)	Write to the <a href="#">UART_THR</a> until the interrupt condition disappears.

**Table 23-146. UART Mode Interrupts (continued)**

<b>UART_IIR[5:0]</b>	<b>Priority Level</b>	<b>Interrupt Type</b>	<b>Interrupt Source</b>	<b>Interrupt Reset Method</b>
000000	4	Modem status	See the <a href="#">UART_MSR</a> register.	Read the <a href="#">UART_MSR</a> register.
010000	5	XOFF interrupt/special character interrupt	Receive XOFF characters/special character	Receive XON character(s), if XOFF interrupt/read of the <a href="#">UART_IIR</a> register, if special character interrupt.
100000	6	CTS, RTS	RTS pin or CTS pin change state from active (low) to inactive (high).	Read the <a href="#">UART_IIR</a> register.

For the receiver-line status interrupt, the RX\_FIFO\_STS bit (UARTi.UART\_LSR[7]) generates the interrupt.

For the XOFF interrupt, if an XOFF flow character detection caused the interrupt, the interrupt is cleared by an XON flow character detection. If special character detection caused the interrupt, the interrupt is cleared by a read of the UARTi.UART\_IIR register.

#### 23.3.4.5.1.2 Wake-Up Interrupt

Wake-up interrupt is a special interrupt that works differently from other interrupts. This interrupt is enabled when the UARTi.UART\_SCR[4] RX\_CTS\_WU\_EN bit is set to 1. The UARTi.UART\_IIR register is not modified when this occurs; the UART3.UART\_SSR[1] RX\_CTS\_WU\_STS bit must be checked to detect a wake-up event.

When a wake-up interrupt occurs, it can be cleared only by resetting the UARTi.UART\_SCR[4] RX\_CTS\_WU\_EN bit. This bit must be reenabled (set to 1) after the current wake-up interrupt event is processed to detect the next incoming wake-up event.

#### 23.3.4.5.2 IrDA Mode Interrupt Management

##### 23.3.4.5.2.1 IrDA Interrupts

The IrDA function generates interrupts. All interrupts can be enabled and disabled by writing to the appropriate bit in the interrupt enable register (UART3.UART\_IER). The interrupt status of the device can be checked by reading the interrupt identification register (UART3.UART\_IIR).

UART, IrDA, and CIR modes have different interrupts in the UART/IrDA/CIR module and, therefore, different UART3.UART\_IER and UART3.UART\_IIR mappings, depending on the selected mode.

IrDA modes have eight possible interrupts (see [Table 23-147](#)). The interrupt line is activated when any interrupt is generated (there is no priority).

**Table 23-147. IrDA Mode Interrupts**

<b>UART_IIR Bit</b>	<b>Interrupt Type</b>	<b>Interrupt Source</b>	<b>Interrupt Reset Method</b>
0	RHR interrupt	DRDY (data ready) (FIFO disable) RX FIFO above trigger level (FIFO enable)	Read the <a href="#">UART_RHR</a> register until the interrupt condition disappears.
1	THR interrupt	TFE ( <a href="#">UART_THR</a> empty) (FIFO disable) TX FIFO below trigger level (FIFO enable)	Write to the <a href="#">UART_THR</a> until the interrupt condition disappears.
2	Last byte in RX FIFO	Last byte of frame in RX FIFO is available to be read at the RHR port.	Read the <a href="#">UART_RHR</a> register.
3	RX overrun	Write to the <a href="#">UART_RHR</a> register when the RX FIFO is full.	Read <a href="#">UART_RESUME</a> register.

**Table 23-147. IrDA Mode Interrupts (continued)**

UART_IIR Bit	Interrupt Type	Interrupt Source	Interrupt Reset Method
4	Status FIFO interrupt	Status FIFO triggers level reached.	Read STATUS FIFO.
5	TX status	<ol style="list-style-type: none"> <li>UART_THR empty before EOF sent. Last bit of transmission of the IrDA frame occurred, but with an underrun error. OR</li> <li>Transmission of the last bit of the IrDA frame completed successfully.</li> </ol>	<ol style="list-style-type: none"> <li>Read the UART_RESUME register. OR</li> <li>Read the UART_IIR register.</li> </ol>
6	Receiver line status interrupt	CRC, ABORT, or frame-length error is written into the STATUS FIFO.	Read the STATUS FIFO (read until empty - maximum of eight reads required).
7	Received EOF	Received end-of-frame	Read the UART_IIR register.

### 23.3.4.5.2.2 Wake-Up Interrupts

The wake-up interrupt for IrDA mode has the same function as that for UART mode (see [Section 23.3.4.5.1.2, Wake-Up Interrupt](#)).

#### CAUTION

Wake-Up interface implementation in this mode is based on the UARTi\_SIDLEACK low-to-high transition instead of the UARTi\_SIDLEACK state.

This does not ensure wake-up event generation as expected when configured in smart-idle mode, and the system wakes up for a short period.

### 23.3.4.5.3 CIR Mode Interrupt Management

#### 23.3.4.5.3.1 CIR Interrupts

The CIR function generates interrupts that can be enabled and disabled by writing to the appropriate bit in the interrupt enable register (UART3.UART\_IER). The interrupt status of the device can be checked by reading the interrupt identification register (UART3.UART\_IIR).

UART, IrDA, and CIR modes have different interrupts in the UART/IrDA/CIR module and, therefore, different UART3.UART\_IER and UART3.UART\_IIR mappings, depending on the selected mode.

[Table 23-148](#) lists the interrupt modes to be maintained. In CIR mode, the sole purpose of the UART3.UART\_IIR[5] bit is to indicate that the last bit of infrared data was passed to the uart3\_cts\_rctx pin.

**Table 23-148. CIR Mode Interrupts**

UART_IIR Bit Number	Interrupt Type	Interrupt Source	Interrupt Reset Method
0	N/A for CIR mode	N/A for CIR mode	N/A for CIR mode
1	THR interrupt	TFE (UART_THR empty) (FIFO disable) TX FIFO below trigger level (FIFO enable)	Write to the UART_THR register until the interrupt condition disappears.
2	N/A for CIR mode	N/A for CIR mode	N/A for CIR mode
3	N/A for CIR mode	N/A for CIR mode	N/A for CIR mode
4	N/A for CIR mode	N/A for CIR mode	N/A for CIR mode

**Table 23-148. CIR Mode Interrupts (continued)**

UART_IIR Bit Number	Interrupt Type	Interrupt Source	Interrupt Reset Method
5	TX status	Transmission of the last bit of the frame is complete successfully.	Read the <a href="#">UART_IIR</a> register.
6	N/A for CIR mode	N/A for CIR mode	N/A for CIR mode
7	N/A for CIR mode	N/A for CIR mode	N/A for CIR mode

### 23.3.4.5.3.2 Wake-Up Interrupts

The wake-up interrupt for CIR mode has the same function as that for UART mode (see [Section 23.3.4.5.1.2, Wake-Up Interrupt](#)).

### 23.3.4.6 FIFO Management

The FIFO is accessed by reading and writing the UARTi.[UART\\_RHR](#) and UARTi.[UART\\_THR](#) registers. Parameters are controlled using the FIFO control register (UARTi.[UART\\_FCR](#)) and supplementary control register (UARTi.[UART\\_SCR](#)). Reading the UARTi.[UART\\_SSR](#)[0] TX\_FIFO\_FULL bit at 1 means the FIFO is full.

The UARTi.[UART\\_TLR](#) register controls the FIFO trigger level, which enables DMA and interrupt generation. After reset, transmit (TX) and receive (RX) FIFOs are disabled; thus, the trigger level is the default value of 1 byte. [Figure 23-73](#) shows the FIFO management registers.

---

**NOTE:** Data in the UARTi.[UART\\_RHR](#) register is not overwritten when an overflow occurs.

---

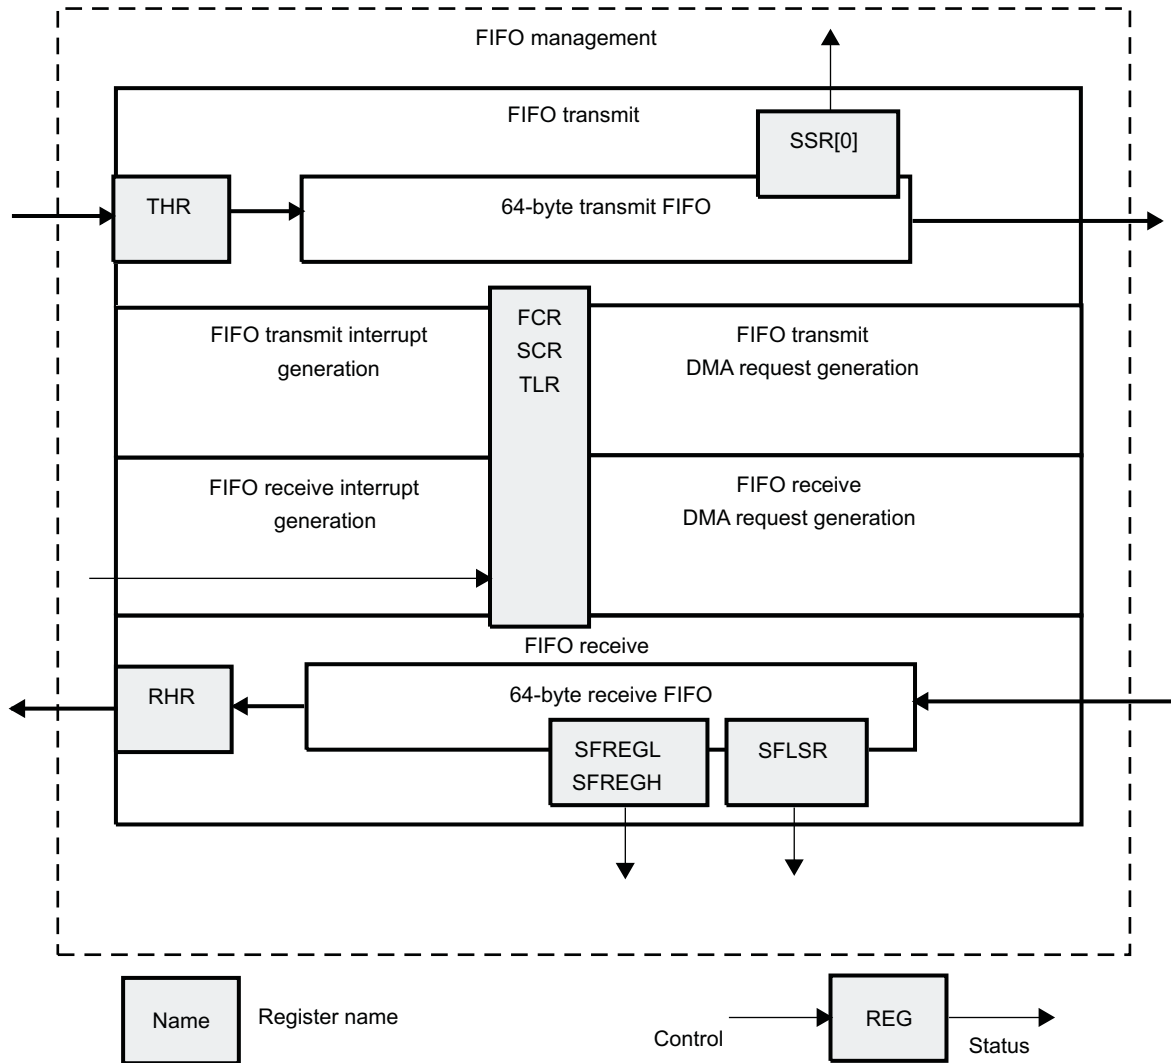

---

**NOTE:** The UARTi.[UART\\_SFLSR](#), UARTi.[UART\\_SFREGL](#), and UARTi.[UART\\_SFREGH](#) status registers are used in IrDA mode only. For use, see [Section 23.3.4.8.2.3, IrDA Data Formatting](#).

---

**Figure 23-73. FIFO Management Registers**

uart-023

### 23.3.4.6.1 FIFO Trigger

#### 23.3.4.6.1.1 Transmit FIFO Trigger

Table 23-149 lists the TX FIFO trigger level settings.

**Table 23-149. TX FIFO Trigger Level Setting Summary**

UART_SCR[6]	UART_TLR[3:0]	TX FIFO Trigger Level
0	= 0x0	Defined by the UARTi.UART_FCR[5:4] TX_FIFO_TRIG bit field (8,16, 32, or 56 spaces)
0	!= 0x0	Defined by the UARTi.UART_TLR[3:0] TX_FIFO_TRIG_DMA bit field (from 4 to 60 spaces with a granularity of 4 spaces)
1	Value	Defined by the concatenated value of TX_FIFO_TRIG_DMA and TX_FIFO_TRIG (from 1 to 63 spaces with a granularity of 1 space) <b>Note:</b> The combination of TX_FIFO_TRIG_DMA = 0x0 and TX_FIFO_TRIG = 0x0 (all zeros) is not supported (minimum of one space required). All zeros result in unpredictable behavior.

#### 23.3.4.6.1.2 Receive FIFO Trigger

Table 23-150 lists the RX FIFO trigger level settings.

**Table 23-150. RX FIFO Trigger Level Setting Summary**

UART_SCR[7]	UART_TLR[7:4]	RX FIFO Trigger Level
0	= 0x0	Defined by the UARTi.UART_FCR[7:6] RX_FIFO_TRIG bit field (8,16, 56, or 60 characters)
0	!= 0x0	Defined by the UARTi.UART_TLR[7:4] RX_FIFO_TRIG_DMA bit field (from 4 to 60 characters with a granularity of 4 characters)
1	Value	Defined by the concatenated value of RX_FIFO_TRIG_DMA and RX_FIFO_TRIG (from 1 to 63 characters with a granularity of 1 character) <b>Note:</b> The combination of RX_FIFO_TRIG_DMA = 0x0 and RX_FIFO_TRIG = 0x0 (all zeros) is not supported (minimum of one character required). All zeros result in unpredictable behavior.

The receive threshold is programmed using the UARTi.UART\_TCR[7:4] RX\_FIFO\_TRIG\_START and UARTi.UART\_TCR[3:0] RX\_FIFO\_TRIG\_HALT bit fields:

- Trigger levels from 0 to 60 bytes are available with a granularity of 4 (trigger level = 4 x [4-bit register value]).
- To ensure correct device operation, ensure that RX\_FIFO\_TRIG\_HALT > RX\_FIFO\_TRIG when auto-RTS is enabled.

$$\text{Delay} = [4 + 16 \times (1 + \text{CHAR\_LENGTH} + \text{Parity} + \text{Stop} - 0.5)] \times \text{Baud\_rate} + 4 \times \text{FCLK}$$

**NOTE:** The RTS signal is deasserted after the UART module receives the data over RX\_FIFO\_TRIG\_HALT. Delay means how long the UART module takes to deassert the RTS signal after reaching RX\_FIFO\_TRIG\_HALT.

- In FIFO interrupt mode with flow control, ensure that the trigger level to HALT transmission is greater than or equal to the RX FIFO trigger level (the UARTi.UART\_TCR[7:4] RX\_FIFO\_TRIG\_START bit field or the UARTi.UART\_FCR[7:6] RX\_FIFO\_TRIG bit field); otherwise, FIFO operation stalls. In FIFO DMA mode with flow control, this concept does not exist, because a DMA request is sent when a byte is received.

### 23.3.4.6.2 FIFO Interrupt Mode

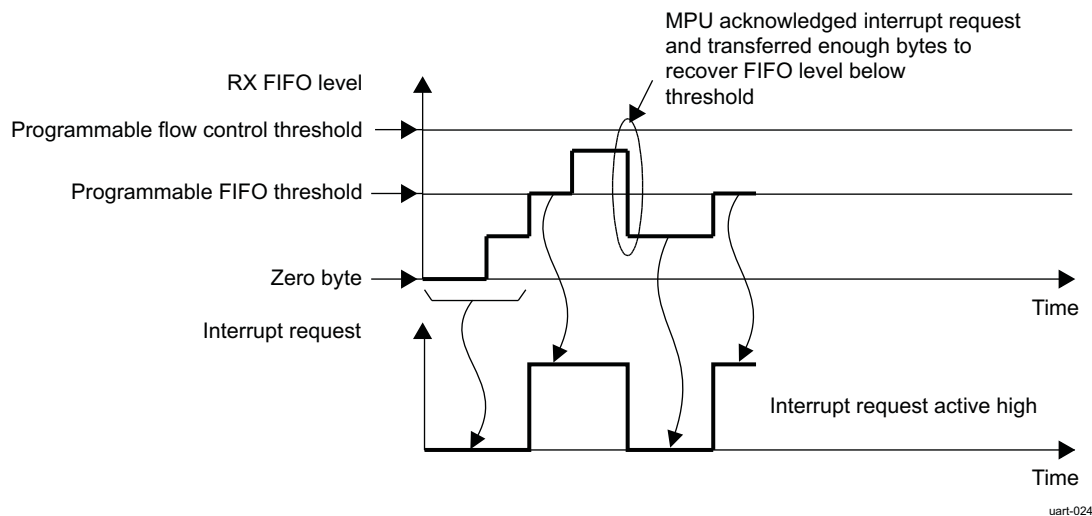

In FIFO interrupt mode (the FIFO control register UARTi.UART\_FCR[0] FIFO\_EN bit is set to 1 and relevant interrupts are enabled by the UARTi.UART\_IER register), an interrupt signal informs the processor of the status of the receiver and transmitter. These interrupts are raised when the RX/TX FIFO threshold (the UARTi.UART\_TLR[7:4] RX\_FIFO\_TRIG\_DMA and UARTi.UART\_TLR[3:0] TX\_FIFO\_TRIG\_DMA bit fields or the UARTi.UART\_FCR[7:6] RX\_FIFO\_TRIG and UARTi.UART\_FCR[5:4] TX\_FIFO\_TRIG bit fields, respectively) is reached.

The interrupt signals instruct the MPU to transfer data to the destination (from the UART in receive mode and/or from any source to the UART FIFO in transmit mode).

When UART flow control is enabled with interrupt capabilities, the UART flow control FIFO threshold (the UARTi.UART\_TCR[3:0] RX\_FIFO\_TRIG\_HALT bit field) must be greater than or equal to the RX FIFO threshold.

Figure 23-74 shows the generation of the RX FIFO interrupt request.

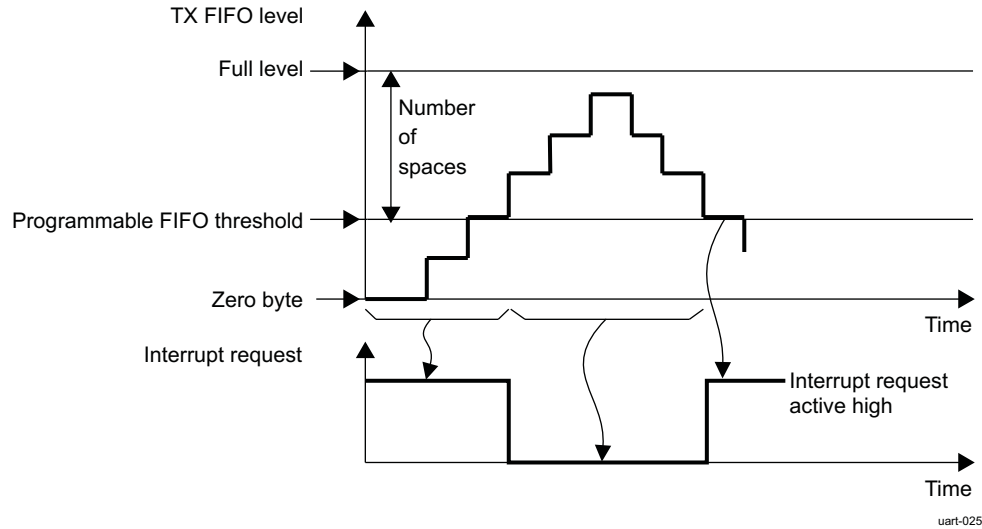

**Figure 23-74. RX FIFO Interrupt Request Generation**

In receive mode, no interrupt is generated until the RX FIFO reaches its threshold. Once low, the interrupt can be deasserted only when the MPU has handled enough bytes to put the FIFO level below threshold. The flow control threshold is set at a higher value than the FIFO threshold.

Figure 23-75 shows the generation of the TX FIFO interrupt request.

**Figure 23-75. TX FIFO Interrupt Request Generation**

In transmit mode, an interrupt request is automatically asserted when the TX FIFO is empty. This request is deasserted when the TX FIFO crosses the threshold level. The interrupt line is deasserted until a sufficient number of elements is transmitted to go below the TX FIFO threshold.

#### 23.3.4.6.3 FIFO Polled Mode Operation

In FIFO polled mode (the UARTi.UART\_FCR[0] FIFO\_EN bit is set to 0 and the relevant interrupts are disabled by the UARTi.UART\_IER register), the status of the receiver and transmitter can be checked by polling the line status register (UARTi.UART\_LSR).

This mode is an alternative to the FIFO interrupt mode of operation in which the status of the receiver and transmitter is automatically determined by sending interrupts to the MPU.

#### 23.3.4.6.4 FIFO DMA Mode Operation

Although DMA operation includes four modes (DMA modes 0 through 3), the information in Table 23-144 assumes that mode 1 is used. (Mode 2 and mode 3 are legacy modes that use only one DMA request for each module.)

In mode 2, the remaining DMA request is used for RX. In mode 3, the remaining DMA request is used for TX.

DMA requests in mode 2 and mode 3 use the following signals:

- S\_DMA\_48
- S\_DMA\_50
- S\_DMA\_52/D\_DMA\_10
- S\_DMA\_54

The following signals are not used by the module in mode 2 and mode 3:

- S\_DMA\_49
- S\_DMA\_51
- S\_DMA\_53/D\_DMA\_11
- S\_DMA\_55

These signals can be selected as follows:

- When the UARTi.UART\_SCR[0] DMA\_MODE\_CTL bit is set to 0, setting the UARTi.UART\_FCR[3] DMA\_MODE\_CTL bit to 0 enables DMA mode 0. Setting the DMA\_MODE\_CTL bit to 1 enables DMA mode 1.

- When the DMA\_MODE\_CTL bit is set to 1, the UARTi.UART\_FCR[2:1] DMA\_MODE\_2 bit field determines DMA mode 0 to mode 3 based on the supplementary control register (UART\_SCR) description.

For example:

- If no DMA operation is desired, set the DMA\_MODE\_CTL bit to 1 and the DMA\_MODE\_2 bit field to 0x0. (The DMA\_MODE bit is discarded.)
- If DMA mode 1 is desired, set the DMA\_MODE\_CTL bit to 0 and the DMA\_MODE bit to 1, or set the DMA\_MODE\_CTL bit to 1 and the DMA\_MODE\_2 bit field to 01. (The DMA\_MODE bit is discarded.)

If the FIFOs are disabled (the UARTi.UART\_FCR[0] FIFO\_EN bit is set to 0), the DMA occurs in single-character transfers.

When DMA mode 0 is programmed, the signals associated with DMA operation are not active.

Depending on UART\_MDR3[2] SET\_DMA\_TX\_THRESHOLD, the threshold can be programmed different ways:

- SET\_TX\_DMA\_THRESHOLD = 1:  
The threshold value will be the value of the UART\_TX\_DMA\_THRESHOLD register. If SET\_TX\_DMA\_THRESHOLD + TX trigger spaces 64, then the default method of threshold is used: threshold value = TX FIFO size.
- SET\_TX\_DMA\_THRESHOLD = 0:  
The threshold value = TX FIFO size TX trigger space. The TX DMA line is asserted if the TX FIFO level is lower than the threshold. It remains asserted until TX trigger spaces number of bytes are written into the FIFO. The DMA line is then deasserted and the FIFO level is compared with the threshold value.

#### 23.3.4.6.4.1 DMA Transfers (DMA Mode 1, 2, or 3)

Figure 23-76 through Figure 23-79 show the supported DMA operations.

**Figure 23-76. Receive FIFO DMA Request Generation (32 Characters)**

uart-026

In receive mode, a DMA request is generated when the RX FIFO reaches its threshold level defined in the trigger level register (UARTi.UART\_TLR). This request is deasserted when the number of bytes defined by the threshold level is read by the sDMA.

In transmit mode, a DMA request is automatically asserted when the TX FIFO is empty. This request is deasserted when the number of bytes defined by the number of spaces in the UARTi.UART\_TLR register is written by the sDMA. If an insufficient number of characters is written, the DMA request stays active.

Figure 23-77. Transmit FIFO DMA Request Generation (56 Spaces)

The DMA request is again asserted if the FIFO can receive the number of bytes defined by the UARTi.UART\_TLR register.

The threshold can be programmed in a number of ways. Figure 23-77 shows a DMA transfer operating with a space setting of 56 that can arise from using the auto settings in the UARTi.UART\_FCR[5:4] TX\_FIFO\_TRIG bit field or the UARTi.UART\_TLR[3:0] TX\_FIFO\_TRIG\_DMA bit field concatenated with the TX\_FIFO\_TRIG bit field.

The setting of 56 spaces in the UART/IrDA/CIR module must correlate with the settings of the sDMA so that the buffer does not overflow (program the DMA request size of the LH controller to equal the number of spaces in the UART/IrDA/CIR module).

Figure 23-78 shows an example with eight spaces to show the buffer level crossing the space threshold. The LH DMA controller settings must correspond to those of the UART/IrDA/CIR module.

**Figure 23-78. Transmit FIFO DMA Request Generation (8 Spaces)**

uart-028

The next example shows the setting of one space that uses the DMA for each transfer of one character to the transmit buffer (see [Figure 23-79](#)). The buffer is filled faster than the baud rate at which data is transmitted to the TX pin. Eventually, the buffer is completely full and the DMA operations stop transferring data to the transmit buffer.

On two occasions, the buffer holds the maximum amount of data words; shortly after this, the DMA is disabled to show the slower transmission of the data words to the TX pin. Eventually, the buffer is emptied at the rate specified by the baud rate settings of the UARTi.UART\_DLL and UARTi.UART\_DLH registers.

The DMA settings must correspond to the system LH DMA controller settings to ensure correct operation of this logic.

**Figure 23-79. Transmit FIFO DMA Request Generation (1 Space)**

uart-029

The final example shows the setting of eight spaces, but setting the TX DMA threshold directly by setting the `UART_MDR3[1]` `NONDEFAULT_FREQ` bit and the `UART_TX_DMA_THRESHOLD` register (see [Figure 23-80](#)). In the example, `UART_TX_DMA_THRESHOLD[5:0]` `TX_DMA_THRESHOLD` = 3 and the trigger level is 8. The buffer is filled at a faster rate than the baud rate transmits data to the TX pin. The buffer is filled with 8 bytes and the DMA operations stop transferring data to the transmit buffer. When the buffer is emptied to the threshold level by transmission, the DMA operation activates again to fill the buffer with 8 bytes.

Eventually, the buffer is emptied at the rate specified by the baud rate settings of the `UART_DLL` and `UART_DLH` registers.

If the selected threshold level plus the trigger level exceed the maximum buffer size, the original TX DMA threshold method is used to prevent TX overrun, regardless of the value of the `UART_MDR3[1]` `NONDEFAULT_FREQ` bit.

The DMA settings must correspond to the settings of the system local host DMA controller to ensure the correct operation of this logic.

**Figure 23-80. Transmit FIFO DMA Request Generation Using Direct TX DMA Threshold Programming. (Threshold = 3; Spaces = 8)**

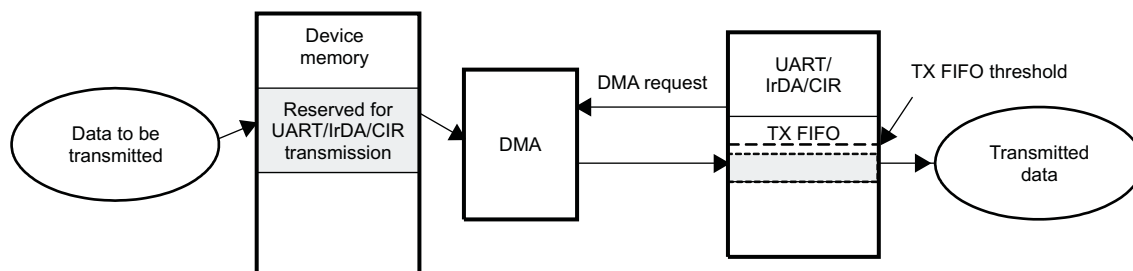

uart-035

#### 23.3.4.6.4.2 DMA Transmission

[Figure 23-81](#) shows DMA transmission.

**Figure 23-81. DMA Transmission**

uart-030

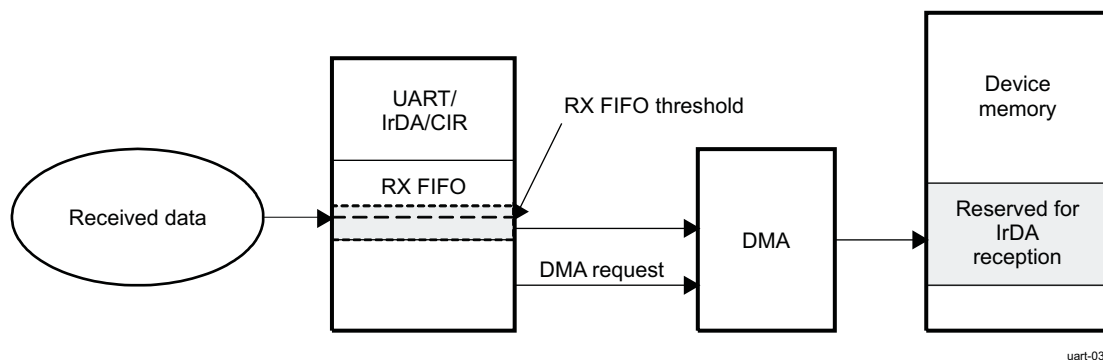

1. Data to be transmitted are put in the device memory reserved for UART/IrDA/CIR transmission by the DMA:
  - (a) Until the TX FIFO trigger level is not reached, a DMA request is generated
  - (b) An element (1 byte) is transferred from the SDRAM to the TX FIFO at each DMA request (DMA element synchronization).
2. Data in the TX FIFO are automatically transmitted.
3. The end of the transmission is signaled by the UARTi.UART\_THR empty (TX FIFO empty).

**NOTE:** In IrDA mode, the transmission does not end immediately after the TX FIFO empties, at which point the last data byte, the CRC field, and the stop flag still must be transmitted; thus, the end of transmission occurs a few milliseconds after the UARTi.UART\_THR register empties.

### 23.3.4.6.4.3 DMA Reception

Figure 23-82 shows DMA reception.

**Figure 23-82. DMA Reception**

1. Enable the reception.
2. Received data are put in the RX FIFO.
3. Data are transferred from the RX FIFO to the device memory by the DMA:
  - (a) At each received byte, the RX FIFO trigger level (one character) is reached and a DMA request is generated.
  - (b) An element (1 byte) is transferred from the RX FIFO to the SDRAM at each DMA request (DMA element synchronization).
4. The end of the reception is signaled by the EOF interrupt.

### 23.3.4.7 Mode Selection

#### 23.3.4.7.1 Register Access Modes

##### 23.3.4.7.1.1 Operational Mode and Configuration Modes

Register access depends on the register access mode, although register access modes are not correlated to functional mode selection. Three different modes are available:

- Operational mode
- Configuration mode A
- Configuration mode B

Operational mode is the selected mode when the function is active; serial data transfer can be performed in this mode.

Configuration mode A and configuration mode B are used during module initialization steps. These modes enable access to configuration registers, which are hidden in the operational mode. The modes are used when the module is inactive (no serial data transfer processed) and only for initialization or reconfiguration of the module.

The value of the UARTi.UART\_LCR register determines the register access mode (see [Table 23-151](#)).

**Table 23-151. UART/IrDA/CIR Register Access Mode Programming (Using UART\_LCR)**

Mode	Condition
Configuration mode A	UART_LCR[7] = 0x1 and UART_LCR[7:0] != 0xBF
Configuration mode B	UART_LCR[7] = 0x1 and UART_LCR[7:0] = 0xBF
Operational mode	UART_LCR[7] = 0x0

### 23.3.4.7.1.2 Register Access Submode

In each access register mode (operational mode or configuration mode A/B), some register accesses are conditional on the programming of a submode (MSR\_SPR, TCR\_TLR, and XOFF). These registers are identified in [Section 23.3.6, UART/IrDA/CIR Register Manual](#).

[Table 23-152](#) through [Table 23-154](#) summarize the register access submodes.

**Table 23-152. Subconfiguration Mode A Summary**

Mode	Condition
MSR_SPR	(UART_EFR[4] = 0x0 or UART_MCR[6] = 0x0)
TCR_TLR	UART_EFR[4] = 0x1 and UART_MCR[6] = 0x1

**Table 23-153. Subconfiguration Mode B Summary**

Mode	Condition
TCR_TLR	UART_EFR[4] = 0x1 and UART_MCR[6] = 0x1
XOFF	(UART_EFR[4] = 0x0 or UART_MCR[6] = 0x0)

**Table 23-154. Suboperational Mode Summary**

Mode	Condition
MSR_SPR	UART_EFR[4] = 0x0 or UART_MCR[6] = 0x0
TCR_TLR	UART_EFR[4] = 0x1 and UART_MCR[6] = 0x1

### 23.3.4.7.1.3 Registers Available for the Register Access Modes

[Table 23-155](#) lists the names of the register bits in each access register mode. Gray shading indicates that the register does not depend on the register access mode (available in all modes).

**Table 23-155. UART/IrDA/CIR Register Access Mode Overview**

Address Offset	Registers					
	Configuration Mode A		Configuration Mode B		Operational Mode	
	Read	Write	Read	Write	Read	Write
0x000	UART_DLL	UART_DLL	UART_DLL	UART_DLL	UART_RHR	UART_THR
0x004	UART_DLH	UART_DLH	UART_DLH	UART_DLH	UART_IER	UART_IER
0x008	UART_IIR	UART_FCR	UART_EFR	UART_EFR	UART_IIR	UART_FCR
0x00C	UART_LCR	UART_LCR	UART_LCR	UART_LCR	UART_LCR	UART_LCR
0x010	UART_MCR	UART_MCR	UART_XON1_ADD R1	UART_XON1_AD DR1	UART_MCR	UART_MCR

(<sup>1</sup>) MSR\_SPR mode is active (see [Section 23.3.4.7.1.2, Register Access Submode](#))

(<sup>2</sup>) TCR\_TLR mode is active (see [Section 23.3.4.7.1.2, Register Access Submode](#))

(<sup>3</sup>) XOFF mode is active (see [Section 23.3.4.7.1.2, Register Access Submode](#))

### 23.3.4.7.2 UART/IrDA (SIR, MIR, FIR)/CIR Mode Selection

To select a mode, set the UARTi.UART\_MDR1[2:0] MODE\_SELECT bit field (see [Table 23-156](#)).

**Table 23-156. UART Mode Selection**

Value	Mode
0x0:	UART 16x mode
0x1:	SIR mode (UART3 only)
0x2:	UART 16x auto-baud
0x3:	UART 13x mode
0x4:	MIR mode (UART3 only)
0x5:	FIR mode (UART3 only)
0x6:	CIR mode (UART3 only)

MODE\_SELECT is effective when the module is in operational mode (see [Section 23.3.4.7.1, Register Access Modes](#)).

### 23.3.4.7.2.1 Registers Available for the UART Function

Only the registers listed in [Table 23-157](#) are used for the UART function.

**Table 23-157. UART Mode Register Overview<sup>(1) (2)</sup>**

### 23.3.4.8 Protocol Formatting

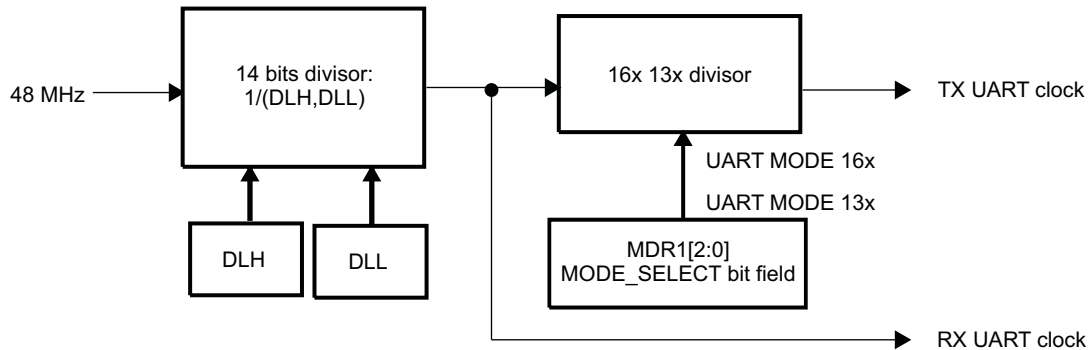

#### 23.3.4.8.1 UART Mode

##### 23.3.4.8.1.1 UART Clock Generation: Baud Rate Generation

The UART function contains a programmable baud generator and a set of fixed dividers that divide the 48-MHz clock input down to the expected baud rate.

Figure 23-83 shows the baud rate generator and associated controls.

Figure 23-83. Baud Rate Generation

uart-032

**CAUTION**

Before initializing or modifying clock parameter controls (UARTi.UART\_DLH, UARTi.UART\_DLL), MODE\_SELECT = DISABLE (UARTi.UART\_MDR1[2:0]) must be set to 0x7. Failure to observe this rule can result in unpredictable module behavior.

**23.3.4.8.1.2 Choosing the Appropriate Divisor Value**

Two divisor values are:

- UART 16x mode: Divisor value = Operating frequency/(16x baud rate)
- UART 13x mode: Divisor value = Operating frequency/(13x baud rate)

Table 23-160 describes the UART baud rate settings.

**Table 23-160. UART Baud Rate Settings (48-MHz Clock)**

### 23.3.4.8.1.3 UART Data Formatting

The UART can use hardware flow control to manage transmission and reception. Hardware flow control significantly reduces software overhead and increases system efficiency by automatically controlling serial data flow using the RTS output and CTS input signals.

The UART is enhanced with the autobauding function. In control mode, autobauding lets the speed, the number of bits per character, and the parity selected be set automatically.

#### 23.3.4.8.1.3.1 Frame Formatting

When autobauding is not used, frame format attributes must be defined in the UARTi.UART\_LCR register.

Character length is specified using the UARTi.UART\_LCR[1:0] CHAR\_LENGTH bit field.

The number of stop-bits is specified using the UARTi.UART\_LCR[2] NB\_STOP bit.

The parity bit is programmed using the UARTi.UART\_LCR[5:3] PARITY\_EN, PARITY\_TYPE\_1, and PARITY\_TYPE\_2 bit fields (see [Table 23-161](#)).

**Table 23-161. UART Parity Bit Encoding**

PARITY_EN	PARITY_TYPE_1	PARITY_TYPE_2	Parity
0	N/A	N/A	No parity
1	0	0	Odd parity
1	1	0	Even parity
1	0	1	Forced 1
1	1	1	Forced 0

#### 23.3.4.8.1.3.2 Hardware Flow Control

Hardware flow control is composed of auto-CTS and auto-RTS. Auto-CTS and auto-RTS can be enabled and disabled independently by programming the UARTi.UART\_EFR[7:6] AUTO\_CTS\_EN and AUTO\_RTS\_EN bit fields, respectively.

With auto-CTS, uarti\_cts must be active before the module can transmit data.

Auto-RTS activates the uarti\_rts output only when there is enough room in the RX FIFO to receive data. It deactivates the uarti\_rts output when the RX FIFO is sufficiently full. The HALT and RESTORE trigger levels in the UARTi.UART\_TCR register determine the levels at which uarti\_rts is activated and deactivated.

If auto-CTS and auto-RTS are enabled, data transmission does not occur unless the RX FIFO has empty space. Thus, overrun errors are eliminated during hardware flow control. If auto-CTS and auto-RTS are not enabled, overrun errors occur if the transmit data rate exceeds the RX FIFO latency.

- Auto-RTS:

Auto-RTS data flow control originates in the receiver block. The RX FIFO trigger levels used in auto-RTS are stored in the UARTi.UART\_TCR register. uarti\_rts is active if the RX FIFO level is below the HALT trigger level in the UARTi.UART\_TCR[3:0] RX\_FIFO\_TRIG\_HALT bit field. When the RX FIFO HALT trigger level is reached, uarti\_rts is deasserted. The sending device (for example, another UART) can send an additional byte after the trigger level is reached because it may not recognize the deassertion of RTS until it begins sending the additional byte.

uarti\_rts is automatically reasserted when the RX FIFO reaches the RESUME trigger level programmed by the UARTi.UART\_TCR[7:4] RX\_FIFO\_TRIG\_START bit field. This reassertion requests the sending device to resume transmission.

In this case, uarti\_rts is an active-low signal.

- Auto-CTS:

The transmitter circuitry checks uarti\_cts before sending the next data byte. When uarti\_cts is active, the transmitter sends the next byte. To stop the transmitter from sending the next byte, uarti\_cts must be deasserted before the middle of the last stop-bit currently sent.

The auto-CTS function reduces interrupts to the host system. When auto-CTS flow control is enabled, the `uarti_cts` state changes do not have to trigger host interrupts because the device automatically controls its own transmitter. Without auto-CTS, the transmitter sends any data present in the transmit FIFO, and a receiver overrun error can result.

In this case, `uarti_cts` is an active-low signal.

### 23.3.4.8.1.3.3 Software Flow Control

Software flow control is enabled through the enhanced feature register (UARTi.UART\_EFR) and the modem control register (UARTi.UART\_MCR). Different combinations of software flow control can be enabled by setting different combinations of the UARTi.UART\_EFR[3:0] bit field (see Table 23-162).

Two other enhanced features relate to software flow control:

- XON any function (UARTi.UART\_MCR[5]): Operation resumes after receiving any character after the XOFF character is recognized. If special character detect is enabled and special character is received after XOFF1, it does not resume transmission. The special character is stored in the RX FIFO.

---

**NOTE:** The XON-any character is written into the RX FIFO even if it is a software flow character.

---

- Special character (UARTi.UART\_EFR[5]): Incoming data is compared to XOFF2. When the special character is detected, the XOFF interrupt (UARTi.UART\_IIR[4]) is set, but it does not halt transmission. The XOFF interrupt is cleared by a read of UARTi.UART\_IIR. The special character is transferred to the RX FIFO. Special character does not work with XON2, XOFF2, or sequential XOFFs.

**Table 23-162. UART\_EFR[3:0] Software Flow Control Options**

Bit 3	Bit 2	Bit 1	Bit 0	TX, RX Software Flow Controls
0	0	X	X	No transmit flow control
1	0	X	X	Transmit XON1, XOFF1
0	1	X	X	Transmit XON2, XOFF2
1	1	X	X	Transmit XON1, XON2: XOFF1, XOFF2 <sup>(1)</sup>
X	X	0	0	No receive flow control
X	X	1	0	Receiver compares XON1, XOFF1
X	X	0	1	Receiver compares XON2, XOFF2
X	X	1	1	Receiver compares XON1, XON2: XOFF1, XOFF2 <sup>(1)</sup>

<sup>(1)</sup> In these cases, the XON1 and XON2 characters or the XOFF1 and XOFF2 characters must be transmitted/received sequentially with XON1/XOFF1 followed by XON2/XOFF2.  
XON1 is defined in the UARTi.UART\_XON1\_ADDR1[7:0] XON\_WORD1 bit field. XON2 is defined in the UARTi.UART\_XON2\_ADDR2[7:0] XON\_WORD2 bit field.  
XOFF1 is defined in the UARTi.UART\_XOFF1[7:0] XOFF\_WORD1 bit field. XOFF2 is defined in the UARTi.UART\_XOFF2[7:0] XOFF\_WORD2 bit field.

#### 23.3.4.8.1.3.3.1 Receive (RX)

When software flow control operation is enabled, the UART compares incoming data with XOFF1/2 programmed characters (in certain cases, XOFF1 and XOFF2 must be received sequentially). When the correct XOFF characters are received, transmission stops after transmission of the current character completes. Detection of XOFF also sets the UARTi.UART\_IIR[4] bit (if enabled by UARTi.UART\_IER[5]) and causes the interrupt line to go low.

To resume transmission, an XON1/2 character must be received (in certain cases, XON1 and XON2 must be received sequentially). When the correct XON characters are received, the UARTi.UART\_IIR[4] bit is cleared and the XOFF interrupt disappears.

---

**NOTE:** When a parity, framing, or break error occurs while receiving a software flow control character, this character is treated as normal data and is written to the RX FIFO.

---

When XON-any and special character detect are disabled and software flow control is enabled, no valid XON or XOFF characters are written to the RX FIFO. For example, when UARTi.UART\_EFR[1:0] = 0x2, if XON1 and XOFF1 characters are received, they are not written to the RX FIFO.

When pairs of software flow characters are programmed to be received sequentially (UARTi.UART\_EFR[1:0] = 0x3), the software flow characters are not written to the RX FIFO if they are received sequentially. However, received XON1/XOFF1 characters must be written to the RX FIFO if the subsequent character is not XON2/XOFF2.

#### 23.3.4.8.1.3.3.2 Transmit (TX)

Two XOFF1 characters are transmitted when the RX FIFO passes the trigger level programmed by UARTi.UART\_TCR[3:0]. As soon as the RX FIFO reaches the trigger level programmed by UARTi.UART\_TCR[7:4], two XON1 characters are sent, so the data transfer recovers.

---

**NOTE:** If software flow control is disabled after an XOFF character is sent, the module transmits XON characters automatically to enable normal transmission.

---

The transmission of XOFF(s)/XON(s) follows the same protocol as transmission of an ordinary byte from the TX FIFO. This means that even if the word length is 5, 6, or 7 characters, the 5, 6, or 7 LSBs of XOFF1/2 and XON1/2 are transmitted. The 5, 6, or 7 bits of a character are seldom transmitted, but this function is included to maintain compatibility with earlier designs.

It is assumed that software flow control and hardware flow control are never enabled simultaneously.

#### 23.3.4.8.1.3.4 Autobauding Modes

In autobauding mode, the UART can extract transfer characteristics (speed, length, and parity) from an "at" (AT) command (ASCII code). These characteristics are used to receive data after an AT and to send data.

The following AT commands are valid:

AT	DATA	<CR>
at	DATA	<CR>
A/		
a/		

A line break during the acquisition of the sequence AT is not recognized, and an echo function is not implemented in hardware.

A/ and a/ are not used to extract characteristics, but they must be recognized because of their special meaning. A/ or a/ is used to instruct the software to repeat the last received AT command; therefore, an a/ always follows an AT, and transfer characteristics are not expected to change between an AT and an a/.

When a valid AT is received, AT and all subsequent data, including the final <CR> (0x0D), are saved to the RX FIFO. The autobaud state-machine waits for the next valid AT command. If an a/ (A/) is received, the a/ (A/) is saved in the RX FIFO and the state-machine waits for the next valid AT command.

On the first successful detection of the baud rate, the UART activates an interrupt to signify that the AT (upper or lower case) sequence is detected. The UARTi.UART\_UASR register reflects the correct settings for the baud rate detected. Interrupt activity can continue in this fashion when a subsequent character is received. Therefore, it is recommended that the software enable the RHR interrupt when using the autobaud mode.

The following settings are detected in autobaud mode with a module clock of 48 MHz:

- Speed:
  - 115.2K baud
  - 57.6K baud
  - 38.4K baud

- 28.8K baud
- 19.2K baud
- 14.4K baud
- 9.6K baud
- 4.8K baud
- 2.4K baud
- 1.2K baud
- Length: 7 or 8 bits
- Parity: Odd, even, or space

---

**NOTE:** The combination of 7-bit character plus space parity is not supported.

---

Autobauding mode is selected when the UARTi.UART\_MDR1[2:0] MODE\_SELECT bit field is set to 0x2. In UART autobauding mode, UARTi.UART\_DLL, UARTi.UART\_DLH, and UARTi.UART\_LCR[5:0] bit field settings are not used; instead, UART\_UASR is updated with the configuration detected by the autobauding logic.

#### **UART\_UASR Autobauding Status Register Use**

This register is used to set up transmission according to the characteristics of the previous reception instead of the UARTi.UART\_LCR, UARTi.UART\_DLL, and UARTi.UART\_DLH registers when the UART is in autobauding mode.

To reset the autobauding hardware (to start a new AT detection) or to set the UART in standard mode (no autobaud), the UARTi.UART\_MDR1[2:0] MODE\_SELECT bit field must be set to reset state (0x7) and then to the UART in autobauding mode (0x2) or to the UART in standard mode (0x0).

Use limitation:

- Only 7- and 8-bit characters (5- and 6-bit not supported)
- 7-bit character with space parity not supported
- Baud rate between 1200 and 115,200 bps (10 possibilities)

#### **23.3.4.8.1.3.5 Error Detection**

When the UARTi.UART\_LSR register is read, the UARTi.UART\_LSR[4:2] bit field reflects the error bits (BI: break condition, FE: framing error, PE: parity error) of the character at the top of the RX FIFO (the next character to be read). Therefore, reading the UARTi.UART\_LSR register and then reading the UARTi.UART\_RHR register identifies errors in a character.

Reading the UARTi.UART\_RHR register updates the BI, FE, and PE bits (see [Table 23-146](#) for the UART mode interrupts).

The UARTi.UART\_LSR[7] RX\_FIFO\_STS bit is set when there is an error in the RX FIFO and is cleared only when no errors remain in the RX FIFO.

---

**NOTE:** Reading the UARTi.UART\_LSR register does not cause an increment of the RX FIFO read pointer. The RX FIFO read pointer is incremented by reading the UARTi.UART\_RHR register.

---

Reading the UARTi.UART\_LSR register clears the OE bit if it is set (see [Table 23-146](#) for the UART mode interrupts).

#### **23.3.4.8.1.3.6 Overrun During Receive**

Overrun during receive occurs if the RX state-machine tries to write data into the RX FIFO when it is already full. When overrun occurs, the device interrupts the MPU with the UARTi.UART\_IIR[5:1] IT\_TYPE bit field set to 0x3 (receiver line status error) and discards the remaining portion of the frame.

Overrun also causes an internal flag to be set, which disables further reception. Before the next frame can be received, the MPU must:

- Reset the RX FIFO.
- Read the UARTi.UART\_RESUME register, which clears the internal flag.

### 23.3.4.8.1.3.7 Time-Out and Break Conditions

#### 23.3.4.8.1.3.7.1 Time-Out Counter

An RX idle condition is detected when the receiver line (uarti\_rx) is high for a time that equals 4x the programmed word length + 12 bits. uarti\_rx is sampled midway through each bit.

For sleep mode, the counter is reset when there is activity on uarti\_rx.

For the time-out interrupt, the counter counts only when there is data in the RX FIFO, and the count is reset when there is activity on uarti\_rx or when the UARTi.UART\_RHR register is read.

#### 23.3.4.8.1.3.7.2 Break Condition

When a break condition occurs, uarti\_tx is pulled low. A break condition is activated by setting the UARTi.UART\_LCR[6] BREAK\_EN bit. The break condition is not aligned on word stream (a break condition can occur in the middle of a character). The only way to send a break condition on a full character is:

1. Reset the TX FIFO (if enabled).
2. Wait for the transmit shift register to empty (the UARTi.UART\_LSR[6] TX\_SR\_E bit is set to 1).
3. Take a guard time according to stop-bit definition.
4. Set the BREAK\_EN bit to 1.

The break condition is asserted while the BREAK\_EN bit is set to 1.

The time-out counter and break condition apply only to UART modem operation and not to IrDA/CIR mode operation.

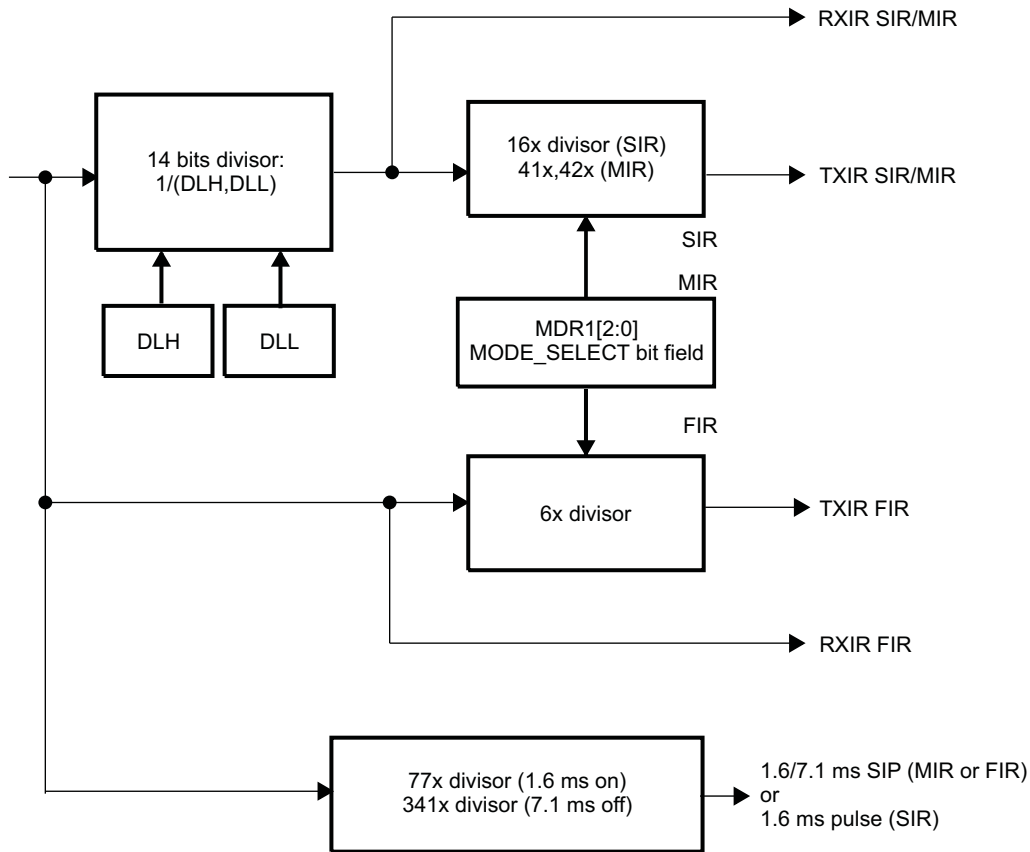

### 23.3.4.8.2 IrDA Mode (UART3 Only)

#### 23.3.4.8.2.1 IrDA Clock Generation: Baud Generator

The IrDA function contains a programmable baud generator and a set of fixed dividers that divide the 48-MHz clock input down to the expected baud rate.

Figure 23-84 shows the baud rate generator and associated controls.

Figure 23-84. Baud Rate Generator

uart-033

**CAUTION**

Before initializing or modifying clock parameter controls (UARTi.UART\_DLH, UARTi.UART\_DLL), MODE\_SELECT=DISABLE (UARTi.UART\_MDR1[2:0]) must be set to 0x7. Failure to observe this rule can result in unpredictable module behavior.

**23.3.4.8.2.2 Choosing the Appropriate Divisor Value**

Three divisor values are:

- SIR mode: Divisor value = Operating frequency/(16x baud rate)
- MIR mode: Divisor value = Operating frequency/(41x/42x baud rate)
- FIR mode: Divisor value = None

Table 23-163 lists the IrDA baud rate settings.

**Table 23-163. IrDA Baud Rate Settings**

Baud Rate	IR Mode	Baud Multiple	Encoding	DLH, DLL (Decimal)	Actual Baud Rate	Error (%)	Source Jitter (%)	Pulse Duration
2.4 kbps	SIR	16x	3/16	1250	2.4 kbps	0	0	78.1 μs
9.6 kbps	SIR	16x	3/16	312	9.6153 kbps	+0.16	0	19.5 μs
19.2 kbps	SIR	16x	3/16	156	19.231 kbps	+0.16	0	9.75 μs
38.4 kbps	SIR	16x	3/16	78	38.462 kbps	+0.16	0	4.87 μs
57.6 kbps	SIR	16x	3/16	52	57.692 kbps	+0.16	0	3.25 μs

**Table 23-163. IrDA Baud Rate Settings (continued)**

Baud Rate	IR Mode	Baud Multiple	Encoding	DLH, DLL (Decimal)	Actual Baud Rate	Error (%)	Source Jitter (%)	Pulse Duration
115.2 kbps	SIR	16x	3/16	26	115.38 kbps	+0.16	0	1.62 $\mu$ s
0.576 Mbps	MIR	41x/42x	1/4	2	0.5756 Mbps <sup>(1)</sup>	0	+1.63/–0.80	416 ns
1.152 Mbps	MIR	41x/42x	1/4	1	1.1511 Mbps <sup>(1)</sup>	0	+1.63/–0.80	208 ns
4 Mbps	FIR	6x	4 PPM	–	4 Mbps	0	0	125 ns

<sup>(1)</sup> Average value

**NOTE:** Baud rate error and source jitter table values do not include 48-MHz reference clock error and jitter.

### 23.3.4.8.2.3 IrDA Data Formatting

The methods described in this section apply to all IrDA modes (SIR, MIR, and FIR).

#### 23.3.4.8.2.3.1 IR RX Polarity Control

The UART3.UART\_MDR2[6] IRRXINVERT bit provides the flexibility to invert the uart3\_rx\_irrx pin in the UART to ensure that the protocol at the output of the transceiver has the same polarity at module level. By default, the uart3\_rx\_irrx pin is inverted because most transceivers invert the IR receive pin.

#### 23.3.4.8.2.3.2 IrDA Reception Control

The module can transmit and receive data, but when the device is transmitting, the IR RX circuitry is automatically disabled by hardware.

Operation of the uart3\_rx\_irrx input can be disabled by the UART3.UART\_ACREG[5] DIS\_IR\_RX bit.

#### 23.3.4.8.2.3.3 IR Address Checking

In all IR modes, when address checking is enabled, only frames intended for the device are written to the RX FIFO. This restriction avoids receiving frames not meant for this device in a multipoint infrared environment. It is possible to program two frame addresses that the UART IrDA receives, with the UART3.UART\_XON1\_ADDR1[7:0] XON\_WORD1 and UART3.UART\_XON2\_ADDR2[7:0] XON\_WORD2 bit fields.

Setting the UART\_EFR[0] bit to 1 selects address1 checking. Setting the UART\_EFR[1] bit to 1 selects address2 checking. Setting the UART\_EFR[1:0] bit field to 0 disables all address checking operations. If both bits are set, the incoming frame is checked for private and public addresses.

If address checking is disabled, all received frames write to the RX FIFO.

#### 23.3.4.8.2.3.4 Frame Closing

A transmission frame can be terminated in two ways:

- Frame-length method: Set the UART3.UART\_MDR1[7] FRAME\_END\_MODE bit to 0. The MPU writes the value of the frame length to the UART3.UART\_TXFLH and UART3.UART\_TXFLL registers. The device automatically attaches end flags to the frame when the number of bytes transmitted equals the value of the frame length.
- Set-EOT bit method: Set the FRAME\_END\_MODE bit to 1. The MPU writes 1 to the UART3.UART\_ACREG[0] EOT bit just before it writes the last byte to the TX FIFO. When the MPU writes the last byte to the TX FIFO, the device internally sets the tag bit for that character in the TX FIFO. As the TX state-machine reads data from the TX FIFO, it uses this tag-bit information to attach end flags and correctly terminate the frame.

### **23.3.4.8.2.3.5 Store and Controlled Transmission**

In store and controlled transmission (SCT) mode, the MPU starts writing data to the TX FIFO. Then, after writing a part of a frame (for a bigger frame) or an entire frame (a small frame; that is, a supervisory frame), the MPU writes 1 to the UART3.UART\_ACREG[2] SCTX\_EN bit (deferred TX start) to start transmission.

SCT mode is enabled by setting the UART3.UART\_MDR1[5] SCT bit to 1. This transmission method differs from normal mode, in which data transmission starts immediately after data is written to the TX FIFO. SCT mode is useful for sending short frames without TX underrun.

### **23.3.4.8.2.3.6 Error Detection**

When the UART3.UART\_LSR register is read, the UART3.UART\_LSR[4:2] bit field reflects the error bits [FL, CRC, ABORT] of the frame at the top of the STATUS FIFO (the next frame status to be read).

The error is triggered by an interrupt (for IrDA mode interrupts, see [Table 23-147](#)). The STATUS FIFO must be read until empty (a maximum of eight reads is required).

### **23.3.4.8.2.3.7 Underrun During Transmission**

Underrun during transmission occurs when the TX FIFO is empty before the end of the frame is transmitted. When underrun occurs, the device closes the frame with end flags but attaches an incorrect CRC value. The receiving device detects a CRC error and discards the frame; it can then ask for a retransmission.

Underrun also causes an internal flag to be set, which disables additional transmissions. Before the next frame can be transmitted, the MPU must:

- Reset the TX FIFO.
- Read the UART3.UART\_RESUME register, which clears the internal flag.

This function can be disabled by the UART3.UART\_ACREG[4] DIS\_TX\_UNDERRUN bit, compensated by the extension of the stop-bit in transmission if the TX FIFO is empty.

### **23.3.4.8.2.3.8 Overrun During Receive**

Overrun during receive for the IrDA mode has the same function as that for the UART mode (see [Section 23.3.4.8.1.3.6, Overrun During Receive](#)).

### **23.3.4.8.2.3.9 Status FIFO**

In IrDA modes, a status FIFO records the received frame status. When a complete frame is received, the length of the frame and the error bits associated with the frame are written to the status FIFO.

Reading the UART3.UART\_SFREGH[3:0] MSB and UART3.UART\_SFREGL[3:0] (LSB) bit fields obtains the frame length. The frame error status is read in the UART3.UART\_SFLSR register. Reading the UART3.UART\_SFLSR register increments the status FIFO read pointer. Because the status FIFO is eight entries deep, it can hold the status of eight frames.

The MPU uses the frame-length information to locate the frame boundary in the received frame data. The MPU can screen bad frames using the error status information and can later request the sender to resend only the bad frames.

This status FIFO can be used effectively in DMA mode because the MPU must be interrupted only when the programmed status FIFO trigger level is reached, not each time a frame is received.

### **23.3.4.8.2.4 SIR Mode Data Formatting**

This section provides specific instructions for SIR mode programming.

#### **23.3.4.8.2.4.1 Abort Sequence**

The transmitter can prematurely close a frame (abort) by sending the sequence 0x7DC1. The abort pattern closes the frame without a CRC field or an ending flag.

A transmission frame can be aborted by setting the UART3.UART\_ACREG[1] ABORT\_EN bit to 1. When this bit is set to 1, 0x7D and 0xC1 are transmitted and the frame is not terminated with CRC or stop flags.

When a 0x7D character followed immediately by a 0xC1 character is received without transparency, the receiver treats a frame as an aborted frame.

#### **CAUTION**

When the TX FIFO is not empty and the UART3.UART\_MDR1[5] SCT bit is set to 1, the UART IrDA starts a new transfer with data of a previous frame when the aborted frame is sent. Therefore, the TX FIFO must be reset before sending an aborted frame.

#### **23.3.4.8.2.4.2 Pulse Shaping**

SIR mode supports the 3/16 or the 1.6- $\mu$ s pulse duration methods in receive and transmit. The UART3.UART\_ACREG[7] PULSE\_TYPE bit selects the pulse width method in the transmit mode.

#### **23.3.4.8.2.4.3 SIR Free Format Programming**

The SIR FF mode is selected by setting the module in the UART mode (UART3.UART\_MDR1[2:0] MODE\_SELECT = 0x0) and the UART3.UART\_MDR2[3] UART\_PULSE bit to 1 to allow pulse shaping.

Because the bit format stays the same, some UART mode configuration registers must be set at specific values:

- UART3.UART\_LCR[1:0] CHAR\_LENGTH bit field = 0x3 (8 data bits)
- UART3.UART\_LCR[2] NB\_STOP bit = 0x0 (1 stop-bit)
- UART3.UART\_LCR[3] PARITY\_EN bit = 0x0 (no parity)

The UART mode interrupts are used for the SIR FF mode, but many are not relevant (XOFF, RTS, CTS, modem status register, etc.).

#### **23.3.4.8.2.5 MIR and FIR Mode Data Formatting**

This section describes common instructions for FIR and MIR mode programming.

At the end of a frame reception, the MPU reads the line status register (UART3.UART\_LSR) to detect errors in the received frame.

When the UART3.UART\_MDR1[6] SIP\_MODE bit is set to 1, the TX state-machine always sends one SIP at the end of a transmission frame. However, when the SIP\_MODE bit is set to 0, SIP transmission depends on the UART3.UART\_ACREG[3] SEND\_SIP bit.

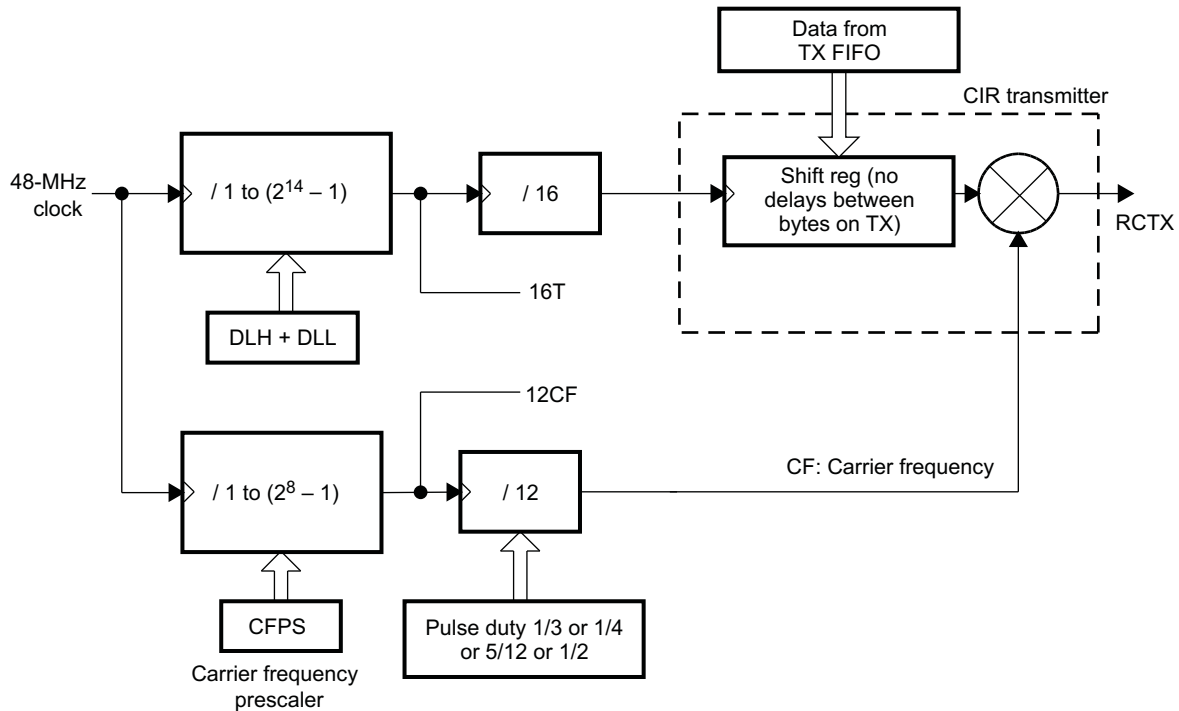

The MPU can set the SEND\_SIP bit at least once every 500 ms. The advantage of this approach over the default approach is that the TX state-machine does not have to send the SIP at the end of each frame, thus reducing the overhead required.

#### **23.3.4.8.3 CIR Mode (UART3 Only)**

##### **23.3.4.8.3.1 CIR Mode Clock Generation**

Depending on the encoding method (variable pulse distance/biphase), the MPU must develop a data structure that combines 1 and 0 with a  $t$  period to encode the complete frame to transmit. This can then be transmitted to the infrared output with a modulation method, as shown in [Figure 23-85](#).

Figure 23-85. CIR Mode Block Components

uart-034

Based on the requested modulation frequency, the UART3.UART\_CFPS register must be set with the correct dividing value to provide an accurate pulse frequency:

$$\text{Dividing value} = (\text{FCLK}/12)/\text{MODfreq}$$

Where:

FCLK = System clock frequency (48 MHz)

12 = Real value of baud multiple

MODfreq = Effective frequency of the modulation (MHz)

Example: For a targeted modulation frequency of 36 kHz, the value of UART\_CFPS must be set to 0x7 (decimal), which provides a modulation frequency of 36.04 kHz.

---

**NOTE:** The UART3.UART\_CFPS register starts with a reset value of 105 (decimal), which translates to a frequency of 38.1 kHz.

---

The duty cycle of these pulses is user-defined by the pulse duty register bits in the UART3.UART\_MDR2 register. Table 23-164 shows the duty cycle.

**Table 23-164. Duty Cycle**

UART_MDR2[5:4]	Duty Cycle (High-Level)
00	1/4
01	1/3
10	5/12
11	1/2

### 23.3.4.8.3.2 CIR Data Formatting

The methods described in this section apply to all CIR modes.

#### 23.3.4.8.3.2.1 IR RX Polarity Control

The IR RX polarity control for CIR mode has the same function as that for IrDA mode (see [Section 23.3.4.8.2.3.1, IR RX Polarity Control](#)).

#### 23.3.4.8.3.2.2 CIR Transmission

In transmission, the MPU software must exercise an element of real-time control to transmit data packets, each of which must be emitted at a constant delay from the start-bits of each individual packet. Thus, when sending a series of packets, the packet-to-packet delay must respect a specific delay. Two methods can be used to control this delay:

- Filling the TX FIFO with a number of zero bits that are transmitted with a  $t$  period
- Using an external system timer to control the delay between each start-of-frame or between the end of a frame and the start of the next one. This can be performed by:
  - Controlling the start of the frame using the UART3.UART\_MDR1[5] SCT bit and the UART3.UART\_ACREG[2] SCTX\_EN bit, depending on the timer status
  - Using the UART3.UART\_IIR[5] TX\_STATUS\_IT interrupt bit to preload the next frame in the TX FIFO and to control the start of the timer (in case of control delay between the end of a frame and the start of the next frame)

## 23.3.5 UART/IrDA/CIR Basic Programming Model

### 23.3.5.1 UART Programming Model

#### 23.3.5.1.1 Quick Start

This section describes the procedure for operating the UART with FIFO and DMA or interrupts. This three-part procedure ensures the quick start of the UART. It does not cover every UART feature.

The first programming model covers software reset of the UART. The second programming model describes FIFO and DMA configuration. The last programming model describes protocol, baud rate, and interrupt configuration.

---

**NOTE:** Each programming model can be used independently of the other two; for instance, reconfiguring the FIFOs and DMA settings only.

Each programming model can be executed starting from any UART register access mode (register modes, submodes, and other register dependencies). However, if the UART register access mode is known before executing the programming model, some steps that enable or restore register access are optional. For more information, see [Section 23.3.4.7.1, Register Access Modes](#).

---

#### 23.3.5.1.1.1 Software Reset

To clear the UART registers, perform the following steps:

1. Initiate a software reset:  
Set the UARTi.UART\_SYSC[1] SOFTRESET bit to 1.
2. Wait for the end of the reset operation:  
Poll the UARTi.UART\_SYSS[0] RESETDONE bit until it equals 1.

### 23.3.5.1.1.2 FIFOs and DMA Settings

To enable and configure the receive and transmit FIFOs and program the DMA mode, perform the following steps:

1. Switch to register configuration mode B to access the UARTi.UART\_EFR register:
  - (a) Save the current UARTi.UART\_LCR register value.
  - (b) Set the UARTi.UART\_LCR register value to 0x00BF.
2. Enable register submode TCR\_TLR to access the UARTi.UART\_TLR register (part 1 of 2):
  - (a) Save the UARTi.UART\_EFR[4] ENHANCED\_EN value.
  - (b) Set the UARTi.UART\_EFR[4] ENHANCED\_EN bit to 1.
3. Switch to register configuration mode A to access the UARTi.UART\_MCR register:  
Set the UARTi.UART\_LCR register value to 0x0080.
4. Enable register submode TCR\_TLR to access the UARTi.UART\_TLR register (part 2 of 2):
  - (a) Save the UARTi.UART\_MCR[6] TCR\_TLR value.
  - (b) Set the UARTi.UART\_MCR[6] TCR\_TLR bit to 1.
5. Enable the FIFO; load the new FIFO triggers (part 1 of 3) and the new DMA mode (part 1 of 2):  
Set the following bits to the desired values:
  - UARTi.UART\_FCR[7:6] RX\_FIFO\_TRIG
  - UARTi.UART\_FCR[5:4] TX\_FIFO\_TRIG
  - UARTi.UART\_FCR[3] DMA\_MODE
  - UARTi.UART\_FCR[0] FIFO\_ENABLE (0: Disable the FIFO; 1: Enable the FIFO)

---

**NOTE:** The UARTi.UART\_FCR register is not readable.

---

6. Switch to register configuration mode B to access the UARTi.UART\_EFR register:  
Set the UARTi.UART\_LCR register value to 0x00BF.
7. Load the new FIFO triggers (part 2 of 3):  
Set the following bits to the desired values:
  - UARTi.UART\_TLR[7:4] RX\_FIFO\_TRIG\_DMA
  - UARTi.UART\_TLR[3:0] TX\_FIFO\_TRIG\_DMA
8. Load the new FIFO triggers (part 3 of 3) and the new DMA mode (part 2 of 2):  
Set the following bits to the desired values:
  - UARTi.UART\_SCR[7] RX\_TRIG\_GRANU1
  - UARTi.UART\_SCR[6] TX\_TRIG\_GRANU1
  - UARTi.UART\_SCR[2:1] DMA\_MODE\_2
  - UARTi.UART\_SCR[0] DMA\_MODE\_CTL
9. Restore the UARTi.UART\_EFR[4] ENHANCED\_EN value saved in Step 2a.
10. Switch to register configuration mode A to access the UARTi.UART\_MCR register:  
Set the UARTi.UART\_LCR register value to 0x0080.
11. Restore the UARTi.UART\_MCR[6] TCR\_TLR value saved in Step 4a.
12. Restore the UARTi.UART\_LCR value saved in Step 1a.

Triggers are used to generate interrupt and DMA requests. See [Section 23.3.4.6.1.1](#), *Transmit FIFO Trigger*, to choose the following values:

- UARTi.UART\_FCR[5:4] TX\_FIFO\_TRIG
- UARTi.UART\_TLR[3:0] TX\_FIFO\_TRIG\_DMA
- UARTi.UART\_SCR[6] TX\_TRIG\_GRANU1

Triggers are used to generate interrupt and DMA requests. See [Section 23.3.4.6.1.2](#), *Receive FIFO Trigger*, to choose the following values:

- UARTi.UART\_FCR[7:6] RX\_FIFO\_TRIG
- UARTi.UART\_TLR[7:4] RX\_FIFO\_TRIG\_DMA
- UARTi.UART\_SCR[7] RX\_TRIG\_GRANU1

DMA mode enables DMA requests. See [Section 23.3.4.6.4](#), *FIFO DMA Mode Operation*, to choose the following values:

- UARTi.UART\_FCR[3] DMA\_MODE
- UARTi.UART\_SCR[2:1] DMA\_MODE\_2
- UARTi.UART\_SCR[0] DMA\_MODE\_CTL

### 23.3.5.1.1.3 Protocol, Baud Rate, and Interrupt Settings

To program the protocol, baud rate, and interrupt settings, perform the following steps:

1. Disable UART to access the UARTi.UART\_DLL and UARTi.UART\_DLH registers:  
Set the UARTi.UART\_MDR1[2:0] MODE\_SELECT bit field to 0x7.
2. Switch to register configuration mode B to access the UARTi.UART\_EFR register:  
Set the UARTi.UART\_LCR register value to 0x00BF.
3. Enable access to the UARTi.UART\_IER[7:4] bit field:
  - (a) Save the UARTi.UART\_EFR[4] ENHANCED\_EN value.
  - (b) Set the UARTi.UART\_EFR[4] ENHANCED\_EN bit to 1.
4. Switch to register operational mode to access the UARTi.UART\_IER register:  
Set the UARTi.UART\_LCR register value to 0x0000.
5. Clear the UARTi.UART\_IER register (set the UARTi.UART\_IER[4] SLEEP\_MODE bit to 0 to change the UARTi.UART\_DLL and UARTi.UART\_DLH registers). Set the UARTi.UART\_IER register value to 0x0000.
6. Switch to register configuration mode B to access the UARTi.UART\_DLL and UARTi.UART\_DLH registers:  
Set the UARTi.UART\_LCR register value to 0x00BF.
7. Load the new divisor value:  
Set the UARTi.UART\_DLL[7:0] CLOCK\_LSB and UARTi.UART\_DLH[5:0] CLOCK\_MSB bit fields to the desired values.
8. Switch to register operational mode to access the UARTi.UART\_IER register:  
Set the UARTi.UART\_LCR register value to 0x0000.
9. Load the new interrupt configuration (0: Disable the interrupt; 1: Enable the interrupt):  
Set the following bits to the desired values:
  - UARTi.UART\_IER[7] CTS\_IT
  - UARTi.UART\_IER[6] RTS\_IT
  - UARTi.UART\_IER[5] XOFF\_IT
  - UARTi.UART\_IER[4] SLEEP\_MODE
  - UARTi.UART\_IER[3] MODEM\_STS\_IT
  - UARTi.UART\_IER[2] LINE\_STS\_IT
  - UARTi.UART\_IER[1] THR\_IT

- UARTi.UART\_IER[0] RHR\_IT
10. Switch to register configuration mode B to access the UARTi.UART\_EFR register:  
Set the UARTi.UART\_LCR register value to 0x00BF.
  11. Restore the UARTi.UART\_EFR[4] ENHANCED\_EN value saved in Step 3a.
  12. Load the new protocol formatting (parity, stop-bit, character length) and switch to register operational mode:  
Set the UARTi.UART\_LCR[7] DIV\_EN bit to 0.  
Set the UARTi.UART\_LCR[6] BREAK\_EN bit to 0.  
Set the following bits to the desired values:
    - UARTi.UART\_LCR[5] PARITY\_TYPE\_2
    - UARTi.UART\_LCR[4] PARITY\_TYPE\_1
    - UARTi.UART\_LCR[3] PARITY\_EN
    - UARTi.UART\_LCR[2] NB\_STOP
    - UARTi.UART\_LCR[1:0] CHAR\_LENGTH
  13. Load the new UART mode:  
Set the UARTi.UART\_MDR1[2:0] MODE\_SELECT bit field to the desired value.
- See [Section 23.3.4.8.1.2, Choosing the Appropriate Divisor Value](#), to choose the following values:
- UARTi.UART\_DLL[7:0] CLOCK\_LSB
  - UARTi.UART\_DLH[5:0] CLOCK\_MSB
  - UARTi.UART\_MDR1[2:0] MODE\_SELECT
- See [Section 23.3.4.8.1.3.1, Frame Formatting](#), to choose the following values:
- UARTi.UART\_LCR[5] PARITY\_TYPE\_2
  - UARTi.UART\_LCR[4] PARITY\_TYPE\_1
  - UARTi.UART\_LCR[3] PARITY\_EN
  - UARTi.UART\_LCR[2] NB\_STOP
  - UARTi.UART\_LCR[1:0] CHAR\_LENGTH

### 23.3.5.1.2 Hardware and Software Flow Control Configuration

This section describes the programming steps to enable and configure hardware and software flow control. Hardware and software flow control cannot be used at the same time.

---

**NOTE:** Each programming model can be executed starting from any UART register access mode (register modes, submodes, and other register dependencies). However, if the UART register access mode is known before executing the programming model, some steps that enable or restore register access are optional. For more information, see [Section 23.3.4.7.1, Register Access Modes](#).

---

#### 23.3.5.1.2.1 Hardware Flow Control Configuration

To enable and configure hardware flow control, perform the following steps:

1. Switch to register configuration mode A to access the UARTi.UART\_MCR register:
  - (a) Save the current UARTi.UART\_LCR register value.
  - (b) Set the UARTi.UART\_LCR register value to 0x0080.
2. Enable register submode TCR\_TLR to access the UARTi.UART\_TCR register (part 1 of 2):
  - (a) Save the UARTi.UART\_MCR[6] TCR\_TLR value.
  - (b) Set the UARTi.UART\_MCR[6] TCR\_TLR bit to 1.
3. Switch to register configuration mode B to access the UARTi.UART\_EFR register:

- Set the UARTi.UART\_LCR register value to 0x00BF.
4. Enable register submode TCR\_TLR to access the UARTi.UART\_TCR register (part 2 of 2):
    - (a) Save the UARTi.UART\_EFR[4] ENHANCED\_EN value.
    - (b) Set the UARTi.UART\_EFR[4] ENHANCED\_EN bit to 1.
  5. Load the new start and halt trigger values for hardware flow control:
 

Set the following bits to the desired values:

    - UARTi.UART\_TCR[7:4] AUTO\_RTS\_START
    - UARTi.UART\_TCR[3:0] AUTO\_RTS\_HALT
  6. Enable or disable receive and transmit hardware flow control mode and restore the UARTi.UART\_EFR[4] ENHANCED\_EN value saved in Step 4a.
 

Set the following bits to the desired values:

    - UARTi.UART\_EFR[7] AUTO\_CTS\_EN (0: Disable; 1: Enable)
    - UARTi.UART\_EFR[6] AUTO\_RTS\_EN (0: Disable; 1: Enable)

Restore the UARTi.UART\_EFR[4] ENHANCED\_EN bit to the saved value.
  7. Switch to register configuration mode A to access the UARTi.UART\_MCR register:
 

Set the UARTi.UART\_LCR register value to 0x0080.
  8. Restore the UARTi.UART\_MCR[6] TCR\_TLR value saved in Step 2a.
  9. Restore the UARTi.UART\_LCR value saved in Step 1a.
- See [Section 23.3.4.8.1.3.2, Hardware Flow Control](#), to choose the following values:
- UARTi.UART\_EFR[7] AUTO\_CTS\_EN
  - UARTi.UART\_EFR[6] AUTO\_RTS\_EN
  - UARTi.UART\_TCR[7:4] AUTO\_RTS\_START
  - UARTi.UART\_TCR[3:0] AUTO\_RTS\_HALT

### 23.3.5.1.2.2 Software Flow Control Configuration

To enable and configure software flow control, perform the following steps:

1. Switch to register configuration mode B to access the UARTi.UART\_EFR register.
  - (a) Save the current UARTi.UART\_LCR register value.
  - (b) Set the UARTi.UART\_LCR register value to 0x00BF.
2. Enable register submode XOFF to access the UARTi.UART\_XOFF1 and UARTi.UART\_XOFF2 registers:
  - (a) Save the UARTi.UART\_EFR[4] ENHANCED\_EN value.
  - (b) Set the UARTi.UART\_EFR[4] ENHANCED\_EN bit to 0.
3. Load the new software flow control characters:
 

Set the following bits to the desired values:

  - UARTi.UART\_XON1\_ADDR1[7:0] XON\_WORD1
  - UARTi.UART\_XON2\_ADDR2[7:0] XON\_WORD2
  - UARTi.UART\_XOFF1[7:0] XOFF\_WORD1
  - UARTi.UART\_XOFF2[7:0] XOFF\_WORD2
4. Enable access to the UARTi.UART\_MCR[7:5] bit field and enable register submode TCR\_TLR to access the UARTi.UART\_TCR register (part 1 of 2):
 

Set the UARTi.UART\_EFR[4] ENHANCED\_EN bit to 1.
5. Switch to register configuration mode A to access the UARTi.UART\_MCR register:
 

Set the UARTi.UART\_LCR register value to 0x0080.
6. Enable register submode TCR\_TLR to access the UARTi.UART\_TCR register (part 2 of 2) and enable or disable XON any function:

- (a) Save the UARTi.UART\_MCR[6] TCR\_TLR value.
  - (b) Set the UARTi.UART\_MCR[6] TCR\_TLR bit to 1.
  - (c) Set the UARTi.UART\_MCR[5] XON\_EN bit to the desired value (0: Disable; 1: Enable).
  7. Switch to register configuration mode B to access the UARTi.UART\_EFR register:  
Set the UARTi.UART\_LCR register value to 0x00BF.
  8. Load the new start and halt trigger values for software flow control:  
Set the following bits to the desired values:
    - UARTi.UART\_TCR[7:4] AUTO\_RTS\_START
    - UARTi.UART\_TCR[3:0] AUTO\_RTS\_HALT
  9. Enable or disable special character function and load the new software flow control mode and restore the UARTi.UART\_EFR[4] ENHANCED\_EN value saved in Step 2a:  
Set the following bits to the desired values:
    - UARTi.UART\_EFR[5] SPEC\_CHAR (0: Disable; 1: Enable)
    - UARTi.UART\_EFR[3:0] SW\_FLOW\_CONTROL
Restore the UARTi.UART\_EFR[4] ENHANCED\_EN bit to the saved value.
  10. Switch to register configuration mode A to access the UARTi.UART\_MCR register:  
Set the UARTi.UART\_LCR register value to 0x0080.
  11. Restore the UARTi.UART\_MCR[6] TCR\_TLR bit value saved in Step 6a.
  12. Restore the UARTi.UART\_LCR value saved in Step 1a.
- See [Section 23.3.4.8.1.3.3, Software Flow Control](#), to choose the following values:
- UARTi.UART\_EFR[5] SPEC\_CHAR
  - UARTi.UART\_EFR[3:0] SW\_FLOW\_CONTROL
  - UARTi.UART\_TCR[7:4] AUTO\_RTS\_START
  - UARTi.UART\_TCR[3:0] AUTO\_RTS\_HALT
  - UARTi.UART\_XON1\_ADDR1[7:0] XON\_WORD1
  - UARTi.UART\_XON2\_ADDR2[7:0] XON\_WORD2
  - UARTi.UART\_XOFF1[7:0] XOFF\_WORD1
  - UARTi.UART\_XOFF2[7:0] XOFF\_WORD2

### 23.3.5.2 IrDA Programming Model (UART3 Only)

#### 23.3.5.2.1 SIR Mode

##### 23.3.5.2.1.1 Receive

The following programming model explains how to program the module to receive an IrDA frame with parity forced to 1, baud rate = 112.5KB, FIFOs disabled, 2 stop-bits, and 8-bit word length:

1. Disable the UART before accessing the UARTi.UART\_DLL and UARTi.UART\_DLH registers:  
Set the UARTi.UART\_MDR1[2:0] MODE\_SELECT bit field to 0x7.
2. Grant access to the UART\_DLL and UART\_DLH registers (the UART\_LCR[7] DIV\_EN bit = 1):  
UART3.UART\_LCR = 0x80 (Data format is unaffected by the use and settings of the UART3.UART\_LCR register in IrDA mode.)
3. Load the new baud rate (115.2 kbps):  
UART3.UART\_DLL = 0x1A  
UART3.UART\_DLH = 0x00
4. Set SIR mode:  
UART3.UART\_MDR1[2:0] MODE\_SELECT = 0x1
5. Disable access to the UART\_DLL and UART\_DLH registers and switch to register operational mode:  
UART3.UART\_LCR = 0x00.
6. Optional: Enable the RHR interrupt:  
UART3.UART\_IER[0] RHR\_IT = 0x1

##### 23.3.5.2.1.2 Transmit

The following programming model explains how to program the module to transmit an IrDA 6-byte frame with no parity, baud rate = 112.5 kbps, FIFOs disabled, 3/16 encoding, 2 stop-bits, and 7-bit word length:

1. Disable the UART before accessing the UARTi.UART\_DLL and UARTi.UART\_DLH registers:  
Set the UART\_MDR1[2:0] MODE\_SELECT bit field to 0x7.
2. Grant access to the UART\_EFR register:  
UART3.UART\_LCR = 0xBF
3. Enable the enhanced features (the UART\_EFR[4] ENHANCED\_EN bit = 1):  
Set the UART3.UART\_EFR register value to 0x10.
4. Grant access to the UART\_DLL and UART\_DLH registers (the UART\_LCR[7] DIV\_EN bit = 1):  
UART3.UART\_LCR = 0x80 (Data format is unaffected by the use and settings of the UART3.UART\_LCR register in IrDA mode.)
5. Load the new baud rate (115.2 kbps):  
UART3.UART\_DLL = 0x1A  
UART3.UART\_DLH = 0x00
6. Set SIR mode (the UART\_MDR1[2:0] MODE\_SELECT bit field = 0x1):  
UART3.UART\_MDR1 = 0x01
7. Disable access to the UART\_DLL and UART\_DLH registers and switch to register operational mode:  
UART3.UART\_LCR = 0x00.
8. Force DTR output to active:  
UART3.UART\_MCR[0] DTR = 1
9. Optional: Enable the THR interrupt:  
UART3.UART\_IER[1] THR\_IT = 1
10. Set transmit frame length to 6 bytes:  
UART3.UART\_TXFL = 0x06
11. Set 7 starts of frame transmission:  
UART3.UART\_EBLR = 0x08
12. Optional: Set SIR pulse width to be 1.6 us:  
UART3.UART\_ACREG[7] PULSE\_TYPE = 1
13. Load the UART\_THR register with the data to be transmitted.

### 23.3.5.2.2 *MIR Mode*

#### 23.3.5.2.2.1 *Receive*

The following programming model explains how to program the module to receive an IrDA frame with no parity, baud rate = 1.152 Mbps, and FIFOs disabled.

1. Disable the UART before accessing the UARTi.[UART\\_DLL](#) and UARTi.[UART\\_DLH](#) registers:  
Set the UARTi.[UART\\_MDR1](#)[2:0] `MODE_SELECT` bit field to 0x7.
2. Grant access to the [UART\\_DLL](#) and [UART\\_DLH](#) registers ([UART\\_LCR](#)[7] `DIV_EN` bit = 1):  
[UART3.UART\\_LCR](#) = 0x80 (Data format is unaffected by the use and settings of the [UART3.UART\\_LCR](#) register in IrDA mode.)
3. Load the new baud rate (1.152 Mbps):  
[UART3.UART\\_DLL](#) = 0x01  
[UART3.UART\\_DLH](#) = 0x00
4. Set MIR mode:  
[UART3.UART\\_MDR1](#)[2:0] `MODE_SELECT` = 0x4
5. Disable access to the [UART\\_DLL](#) and [UART\\_DLH](#) registers and switch to register operational mode:  
[UART3.UART\\_LCR](#) = 0x00
6. Force DTR output to active ([UART\\_MCR](#)[0] `DTR` = 1):  
Force RTS output to active ([UART\\_MCR](#)[1] `RTS` = 1).  
[UART3.UART\\_MCR](#) = 0x3
7. Optional: Enable the RHR interrupt:  
[UART3.UART\\_IER](#)[0] `RHR_IT` = 1

#### 23.3.5.2.2.2 *Transmit*

The following programming model explains how to program the module to transmit an IrDA 60-byte frame with no parity, baud rate = 1.152 Mbps, and FIFOs disabled:

1. Disable the UART before accessing the UARTi.[UART\\_DLL](#) and UARTi.[UART\\_DLH](#) registers:  
Set the UARTi.[UART\\_MDR1](#)[2:0] `MODE_SELECT` bit field to 0x7.
2. Grant access to the [UART\\_DLL](#) and [UART\\_DLH](#) registers ([UART\\_LCR](#)[7] `DIV_EN` bit = 1):  
[UART3.UART\\_LCR](#) = 0x80 (Data format is unaffected by the use and settings of the [UART3.UART\\_LCR](#) register in IrDA mode.)
3. Load the new baud rate (1.152 Mbps):  
[UART3.UART\\_DLL](#) = 0x01  
[UART3.UART\\_DLH](#) = 0x00
4. Set MIR mode:  
[UART3.UART\\_MDR1](#)[2:0] `MODE_SELECT` = 0x4
5. Disable access to the [UART\\_DLL](#) and [UART\\_DLH](#) registers and switch to register operational mode:  
[UART3.UART\\_LCR](#) = 0x00
6. Force DTR output to active:  
[UART3.UART\\_MCR](#)[0] `DTR` = 1
7. Optional: Enable the THR interrupt:  
[UART3.UART\\_IER](#)[1] `THR_IT` = 1
8. Set the frame length to 60 bytes:  
[UART3.UART\\_TXFLR](#) = 0x3C
9. Optional: Transmit eight additional starts of frame (MIR mode requires two starts):  
[UART3.UART\\_EBLR](#) = 0x08
10. SIP is sent at the end of transmission:  
[UART3.UART\\_ACREG](#)[3] = 1
11. Load the [UART\\_THR](#) register with the data to be transmitted.

### 23.3.5.2.3 FIR Mode

#### 23.3.5.2.3.1 Receive

The following programming model explains how to program the module to receive the IrDA frame with no parity, baud rate = 4 Mbps, FIFOs enabled, 8-bit word length.

1. Disable the UART before accessing the UART3.UART\_DLL and UART3.UART\_DLH registers:  
Set the UART3.UART\_MDR1[2:0] MODE\_SELECT bit field to 0x7.
2. Grant access to the UART\_DLL and UART\_DLH registers (UART\_LCR[7] DIV\_EN bit = 1):  
UART3.UART\_LCR = 0x80 (Data format is unaffected by the use and settings of the UART3.UART\_LCR register in IrDA mode.)
3. FIFO clear and enable:  
UART3.UART\_FCR = 0x7 (TX/RX FIFO trigger: UART\_FCR[7:6] and UART\_FCR[5:4])  
UART3.UART\_LCR[7] = 0
4. Set FIR mode:  
UART3.UART\_MDR1[2:0] MODE\_SELECT = 0x5
5. Set frame length:  
UART3.UART\_RXFLL = 0xA (Data + CRC + STOP)
6. Disable access to the UART3.UART\_DLL registers and UART3.UART\_DLH and switch to register operational mode:  
UART3.UART\_LCR[7] DIV\_EN = 0x0
7. Optional: Enable the RHR interrupt:  
UART3.UART\_IER[0] RHR\_IT = 1

#### 23.3.5.2.3.2 Transmit

The following programming model explains how to program the module to transmit an IrDA 4-byte frame with no parity, baud rate = 4 Mbps, FIFOs enabled, and 8-bit word length.

1. Disable the UART before accessing the UART3.UART\_DLL and UART3.UART\_DLH registers:  
Set the UART3.UART\_MDR1[2:0] MODE\_SELECT bit field to 0x7.
2. Grant access to EFR\_REG:  
UART3.UART\_LCR = 0xBF
3. Enable the enhanced features (EFR\_REG[4] ENAHNCED\_EN = 0x1):  
UART3.UART\_EFR = 0x10
4. FIFO clear and enable:  
UART3.UART\_FCR = 0x7 (TX/RX FIFO trigger: UART\_FCR[7:6] and UART\_FCR[5:4]).  
UART3.UART\_LCR[7] = 0
5. Set FIR mode and enable auto-SIP mode:  
UART3.UART\_MDR1 = 0x45
6. Set frame length:  
UART3.UART\_TXFLL = 0x4  
UART3.UART\_TXFLH = 0x0  
UART3.UART\_RXFLL = 0xA (Data + CRC + STOP)  
UART3.UART\_RXFLH = 0x0
7. Force DTR output to active:  
UART3.UART\_MCR[0] DTR = 0x1
8. Optional: Enable the THR interrupt:  
UART3.UART\_IER[1] THR\_IT = 0x1
9. Optional: Transmit eight additional starts of frame (MIR mode requires two starts):  
UART3.UART\_EBLR = 0x08
10. SIP is sent at the end of transmission:  
UART3.UART\_ACREG[3] = 1
11. Load the UART\_THR register with the data to be transmitted.

### 23.3.6 UART/IrDA/CIR Register Manual

#### 23.3.6.1 UART/IrDA/CIR Instance Summary

Table 23-165 shows the base address and address space for the UART/IrDA/CIR module instances.

**Table 23-165. UART/IrDA/CIR Instance Summary**

Module Name	Base Address	Size
UART1 <sup>(1)</sup>	0x4806 A000	1KB
UART2 <sup>(1)</sup>	0x4806 C000	1KB
UART3 <sup>(2)</sup>	0x4802 0000	1KB
UART4 <sup>(1)</sup>	0x4806 E000	1KB

<sup>(1)</sup> UART mode only

<sup>(2)</sup> UART, IrDA, or CIR mode

#### 23.3.6.2 UART/IrDA/CIR Registers

##### 23.3.6.2.1 UART/IrDA/CIR Register Summary

### 23.3.6.2.2 UART/IrDA/CIR Register Description

**Table 23-168. UART\_THR**

<b>Address Offset</b>	0x0000 0000	
<b>Physical Address</b>	0x4806 A000 0x4806 C000 0x4802 0000 0x4806 E000	<b>Instance</b> UART1 UART2 UART3 UART4
<b>Description</b>	The transmitter section consists of the transmit holding register (THR) and the transmit shift register. The THR is a 64-byte FIFO. The local host (LH) writes data to the THR. The data is placed in the transmit shift register where it is shifted out serially on the TX output. If the FIFO is disabled, location 0 of the FIFO stores the data.	
<b>Type</b>	W	

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																THR

**Table 23-170. UART\_RHR**

<b>Address Offset</b>	0x0000 0000	
<b>Physical Address</b>	0x4806 A000 0x4806 C000 0x4802 0000 0x4806 E000	<b>Instance</b> UART1 UART2 UART3 UART4
<b>Description</b>	The receiver section consists of the receiver holding register (RHR) and the receiver shift register. The RHR is a 64-byte FIFO. The receiver shift register receives serial data from RX input. The data is converted to parallel data and moved to the RHR. If the FIFO is disabled, location 0 of the FIFO stores the single data character. <b>Note:</b> If an overflow occurs, the data in the RHR is not overwritten.	
<b>Type</b>	R	

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Table 23-178. UART\_IER\_CIR**

<b>Address Offset</b>	0x0000 0004	<b>Instance</b>	UART1 UART2 UART3 UART4
<b>Physical Address</b>	0x4806 A004 0x4806 C004 0x4802 0004 0x4806 E004		
<b>Description</b>	There are 6 types of interrupt in these modes: TX status, status FIFO interrupt, RX overrun, last byte in RX FIFO, THR interrupt, and RHR interrupt. These interrupts can be enabled and disabled individually. Note: The RX_STOP_IT interrupt is generated based on the value set in the BOF Length register (EBLR). In IR-CIR mode, contrary to the IR-IRDA mode, the TX_STATUS_IT has only one meaning that corresponds to the case MDR2[0] = 0.		
<b>Type</b>	RW

Bits	Field Name	Description	Type	Reset
31:8	RESERVED	Read returns 0.	R	0x000000
7	THR_EMPTY	Read 0x0: Transmit holding register (TX FIFO) is not empty. Read 0x1: Transmit hold register (TX FIFO) is empty. The transmission is not necessarily complete.	R	1
6	STS_FIFO_FULL	Read 0x0: Status FIFO not full Read 0x1: Status FIFO full	R	0
5	RX_LAST_BYTE	Read 0x0: The RX FIFO (RHR) does not contain the last byte of the frame to be read.	R	0

Bits	Field Name	Description	Type	Reset
		Read 0x1: The RX FIFO (RHR) contains the last byte of the frame to be read. This bit is set only when the last byte of a frame is available to be read. It determines the frame boundary. It is cleared on a single read of the LSR register. See the note below.		
4	FRAME_TOO_LONG	Read 0x0: No frame-too-long error in frame  Read 0x1: Frame-too-long error in the frame at the top of the STATUS FIFO, (next character to be read). This bit is set to 1 when a frame exceeding the maximum length (set by RXFLH and RXFLL registers) is received. When this error is detected, current frame reception is terminated. Reception is stopped until the next START flag is detected.	R	0
3	ABORT	Read 0x0: No abort pattern error in frame  Read 0x1: Abort pattern is received. SIR and MIR: Abort pattern FIR: Illegal symbol	R	0
2	CRC	Read 0x0: No CRC error in frame  Read 0x1: CRC error in the frame at the top of the STATUS FIFO (next character to be read)	R	0
1	STS_FIFO_E	Read 0x0: Status FIFO not empty  Read 0x1: Status FIFO empty	R	1
0	RX_FIFO_E	Read 0x0: No data in the RX FIFO  Read 0x1: At least one data character in the RX FIFO	R	1

<b>Description</b>	Transmission control register  This register stores the RX FIFO threshold levels to start/stop transmission during hardware/software flow control. Notes: Trigger levels from 0 to 60 bytes are available with a granularity of 4. (Trigger level = 4 x [4-bit register value]) The programmer must ensure that <b>UART_TCR</b> [3:0] > <b>UART_TCR</b> [7:4] when auto-RTS or software flow control is enabled to avoid a mis-operation of the device. In FIFO interrupt mode with flow control, the programmer must ensure that the trigger level to halt transmission is greater than or equal to the RX FIFO trigger level ( <b>UART_TLR</b> [7:4] or <b>UART_FCR</b> [7:6]); otherwise, FIFO operation stalls. In FIFO DMA mode with flow control, this concept does not exist because a DMA request is sent each time a byte is received.		
<b>Type</b>	RW

**Table 23-220. UART\_MDR2**

<b>Address Offset</b>	0x0000 0024		
<b>Physical Address</b>	0x4806 A024 0x4806 C024 0x4802 0024 0x4806 E024	<b>Instance</b>	UART1 UART2 UART3 UART4
<b>Description</b>	Mode definition register 2 IR-IrDA and IR-CIR modes only. <b>UART_MDR2</b> [0] describes the status of the interrupt in <b>UART_IIR</b> [5]. The IRTX_UNDERRUN bit should be read after an <b>UART_IIR</b> [5] TX_STATUS_IT interrupt. The bits [2:1] of this register set the trigger level for the frame status FIFO (8 entries) and must be programmed before the mode is programmed in <b>UART_MDR1</b> [2:0]. <b>Note:</b> The <b>UART_MDR2</b> [6] gives the flexibility to invert the RX pin in the UART to ensure that the protocol at the input of the transceiver module has the same polarity at module level. By default, the RX pin is inverted because most transceivers invert the IR receive pin.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																SET_TXIR_ALT	IRRXINVERT	CIR_PULSE_MODE	UART_PULSE	STS_FIFO_TRIG	IRTX_UNDERRUN										

Bits	Field Name	Description	Type	Reset
31:8	RESERVED	Read returns 0. Write has no effect.	RW	0x000000
7	SET_TXIR_ALT	Provide alternate function for MDR1[4] (SET_TXIR). 0x0: Normal mode 0x1: Alternate mode for SET_TXIR	R	0
6	IRRXINVERT	IR mode only (IrDA and CIR). Invert RX pin in the module before the voting or sampling system logic of the infrared block. This does not affect the RX path in UART modem modes. 0x0: Inversion is performed. 0x1: No inversion is performed.	RW	0
5:4	CIR_PULSE_MODE	CIR pulse modulation definition. Defines high level of the pulse width associated with a digit: 0x0: Pulse width of 3 from 12 cycles 0x1: Pulse width of 4 from 12 cycles 0x2: Pulse width of 5 from 12 cycles 0x3: Pulse width of 6 from 12 cycles	RW	0x0
3	UART_PULSE	UART mode only. Allows pulse shaping in UART mode. 0x0: Normal UART mode 0x1: UART mode with a pulse shaping	RW	0
2:1	STS_FIFO_TRIG	IR-IrDA mode only. Frame status FIFO threshold select: 0x0: 1 entry 0x1: 4 entries 0x2: 7 entries 0x3: 8 entries	RW	0x0

Bits	Field Name	Description	Type	Reset
0	IRTX_UNDERRUN	IrDA transmission status interrupt. When the <a href="#">UART_IIR[5]</a> interrupt occurs, the meaning of the interrupt is:  Read 0x0: The last bit of the frame transmitted successfully without error.  Read 0x1: An underrun occurred. The last bit of the frame was transmitted but with an underrun error. The bit is reset to 0 when the <a href="#">UART_RESUME</a> register is read.	R	0

<b>Description</b>	<p>UART autobauding status register</p> <p>UART autobauding mode only. This status register returns the speed, the number of bits by characters, and the type of the parity in UART autobauding mode. In autobauding mode, the input frequency of the UART modem must be fixed to 48 MHz. Any other module clock frequency results in incorrect baud rate recognition.</p> <p><b>Note:</b> When the UART is in autobauding mode, this register, instead of the LCR, DLL, and DLH registers, is used to set up transmission according to the characteristics of the previous reception. To reset the autobauding hardware (to start a new AT detection), set MDR1[2:0] to 111 (reset value), then set MDR1[2:1] to 010 (UART in autobaud mode). To set the UART to standard mode (no autobaud), set MDR1[2:1] to 000.</p>

<b>Description</b>	Auxiliary control register. IR-IrDA and IR-CIR modes only.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																PULSE_TYPE	SD_MOD	DIS_IR_RX	DIS_TX_UNDERRUN	SEND_SIP	SCTX_EN	ABORT_EN	EOT_EN								

Bits	Field Name	Description	Type	Reset
31:8	RESERVED	Read returns 0. Write has no effect.	RW	0x000000
7	PULSE_TYPE	SIR pulse width select 0x0: 3/16 of baud-rate pulse width 0x1: 1.6 $\mu$ s	RW	0
6	SD_MOD	Primary output used to configure transceivers. Connected to the SD/MODE input pin of IrDA transceivers. 0x0: SD pin is set to high. 0x1: SD pin is set to low.	RW	0
5	DIS_IR_RX	0x0: Normal operation (RX input automatically disabled during transmit but enabled outside of transmit operation) 0x1: Disables RX input (permanent state - independent of transmit)	RW	0
4	DIS_TX_UNDERRUN	It is recommended to disable TX FIFO underrun capability by masking corresponding underrun interrupt. When disabling underrun by setting ACREG[4] = 1, garbage data is sent over TX line. 0x0: Long stop-bits cannot be transmitted; TX underrun is enabled. 0x1: Long stop-bits can be transmitted; TX underrun is disabled.	RW	0
3	SEND_SIP	MIR/FIR modes only. Send serial infrared interaction pulse (SIP). If this bit is set during an MIR/FIR transmission, the SIP is sent at the end of it. This bit is cleared automatically at the end of the SIP transmission. 0x0: No action 0x1: Send SIP pulse.	RW	0
2	SCTX_EN	Store and controlled TX start. When MDR1[5] = 1 and the LH writes 1 to this bit, the TX state-machine starts frame transmission. This bit is self-clearing.	RW	0
1	ABORT_EN	Frame abort. The LH can intentionally abort transmission of a frame by writing 1 to this bit. Neither the end flag nor the CRC bits are appended to the frame. If TX FIFO is not empty and MDR1[5] = 1, UART IrDA starts a new transfer with data of the previous frame when the abort frame is sent. Therefore, TX FIFO must be reset before sending an abort frame.	RW	0

Bits	Field Name	Description	Type	Reset
0	EOT_EN	EOT (end of transmission) bit. The LH writes 1 to this bit just before it writes the last byte to the TX FIFO in set-EOT bit frame closing method. This bit is cleared automatically when the LH writes to the THR (TX FIFO).	RW	0

<b>Description</b>	BOF length register  IR-IrDA and IR-CIR modes only. In IR-IrDA SIR operation, this register specifies the number of BOF + xBOFs to transmit. Value set into this register must account for the BOF character; therefore, to send only one BOF with no XBOF, this register must be set to 1. To send one BOF with N XBOF, this register must be set to N + 1. The value 0 sends 1 BOF plus 255 XBOF. In IR-IrDA MIR mode, this register specifies the number of additional start flags (MIR protocol mandates a minimum of 2 start flags). In IR-CIR mode, this register specifies the number of consecutive 0s to be received before generating the RX_STOP interrupt ( <a href="#">UART_IIR[2]</a> ). All received 0s are stored in the RX FIFO. When the register is set to 0, this feature is deactivated and always in reception state, which can be disabled by setting the ACREG[5] to 1. <b>Note:</b> If the RX_STOP interrupt occurs before a byte boundary, the remaining bits of the last byte are filled with 0s and passed into the RX FIFO.		
<b>Type</b>	RW

<b>Description</b>	Wake-up enable register  The UART wake-up enable register is used to mask and unmask a UART event that would subsequently notify the system. An event is any activity in the logic that could cause an interrupt and/or an activity that would require the system to wake up. Even if the wakeup is disabled for certain events, if these events are also an interrupt to the UART, the UART registers the interrupt.

<b>Description</b>	Carrier frequency prescaler  Because the consumer IR works at modulation rates of 30 to 56.8 kHz, the 48-MHz clock must be prescaled before the clock can drive the IR logic. This register sets the divisor rate to give a range to accommodate the remote-control requirements in baud multiples of 12x. The value of the CFPS at reset is 0105 decimal, which equals 38.1 kHz output from starting conditions. The 48-MHz carrier is prescaled by the CFPS, which is then divided by the 12x baud multiple.

## 23.4 Multichannel Serial Port Interface

This section describes the four multichannel serial port interface (MCSPi) modules for the device.

### 23.4.1 MCSPi Overview

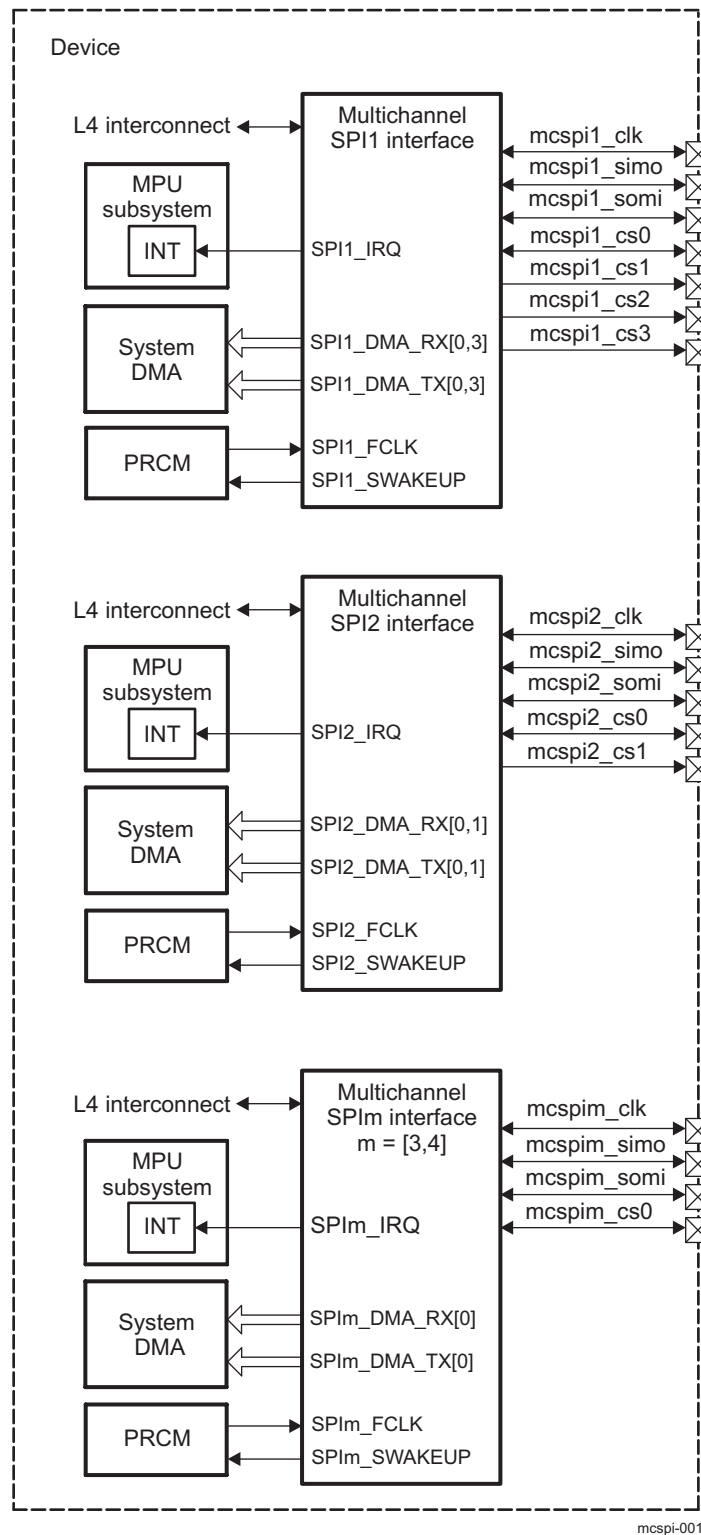

The MCSPi is a master/slave synchronous serial bus. The MCSPi has four separate modules (SPI1, SPI2, SPI3, and SPI4) in the device (see [Figure 23-86](#)). The MCSPi modules differ as follows: SPI1 supports up to four peripherals, SPI2 supports up to two peripherals, SPI3 and SPI4 support only one peripheral.

---

**NOTE:** In this chapter,  $m = [1,4]$  represents the module instance and  $x$  represents the channel in signal and register naming. The MCSPi has four instances, with each module instance having different channel numbers:

- SPI1: 4 channels (if  $m = 1$ ,  $x = 4$ )
  - SPI2: 2 channels (if  $m = 2$ ,  $x = 2$ )
  - SPI3: 1 channel (if  $m = 3$ ,  $x = 1$ )
  - SPI4: 1 channel (if  $m = 4$ ,  $x = 1$ )
-

Figure 23-86. Multichannel Modules SPI1, SPI2, SPI3, and SPI4

The MCSPI instances include the following main features:

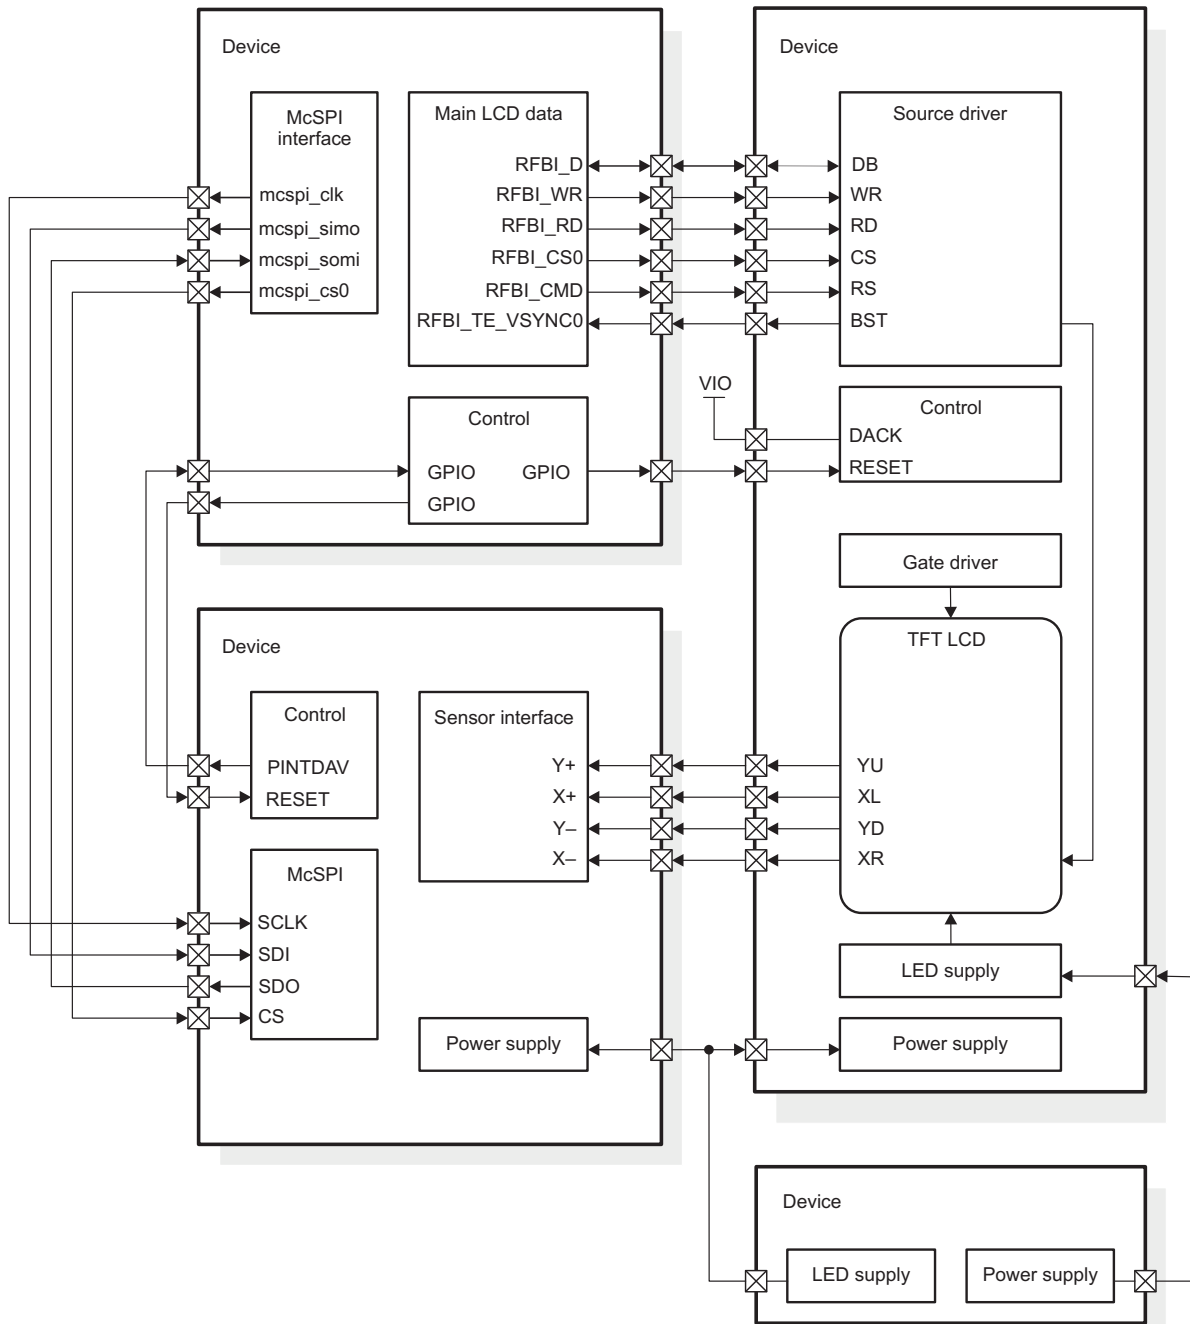

- Serial clock with programmable frequency, polarity, and phase for each channel
- Wide selection of SPI word lengths, ranging from 4 to 32 bits
- Up to four master channels, or single channel in slave mode

- Master multichannel mode:
  - Full duplex/half duplex
  - Transmit-only/receive-only/transmit-and-receive modes
  - Flexible I/O port controls per channel
  - Two DMA requests (read/write) per channel
- Single interrupt line for multiple interrupt source events
- Power management through wake-up capabilities
- Enable the addition of a programmable start-bit for SPI transfer per channel (start-bit mode)
- Supports start-bit write command
- Supports start-bit pause and break sequence
- 64-byte built-in FIFO available for a single channel
- Force CS mode for continuous transfers

### 23.4.2 MCSPI Environment

Figure 23-87 shows a simplified overview of a typical application system using the MCSPI. This example is based on a TFS chip set, including a 2.2-inch color-active matrix thin-film transistor (TFT) liquid crystal display (LCD) with a light-emitting diode (LED) front light, a 4-wire resistive touch-screen panel, and LCD controllers. This chip set is associated with a touch-screen controller, powered by a power-management unit, and driven by the device. The MCSPI device interface is set to master mode; the touch-screen MCSPI controller interface operates in slave mode.

Figure 23-87. Typical Application Using the MCSPI

mcspi-034

### 23.4.2.1 MCSPI Interface

#### 23.4.2.1.1 Basic MCSPI Pins for Master Mode

Figure 23-88 shows all of the MCSPI interface signals in master mode.

**Figure 23-88. MCSPI Interface Signals in Master Mode**

Table 23-274 describes the MCSPI I/O in master mode.

**Table 23-274. MCSPI I/O Description (Master Mode)**

Signal Name	I/O	Description	Reset <sup>(1)</sup>
mcs pim_clk	O	SPI m module serial clock	Unknown
mcs pim_simo	O	SPI m module serial data master out (slave input, master output)	Unknown
mcs pim_somi	I	SPI m module serial data master input (slave output, master input)	–
mcs pim_csx	O	SPI m module chip-select x output	Low

<sup>(1)</sup> After reset, the SPI modules are in slave mode by default. This paragraph implies that the MCSPI module is configured in slave mode. (See the MCSPI\_MODULCTRL[2] MS bit in the module control register [MCSPI\_MODULCTRL]).

#### 23.4.2.1.2 Basic MCSPI Pins for Slave Mode

Figure 23-89 shows all of the MCSPI interface signals in slave mode.

**Figure 23-89. MCSPI Interface Signals in Slave Mode**

Table 23-275 describes the MCSPI I/O in slave mode.

**Table 23-275. MCSPI I/O Description (Slave Mode)**

Signal Name	I/O	Description	Reset <sup>(1)</sup>
mcs pim_clk	I	SPI m module serial clock	Unknown

<sup>(1)</sup> After reset, the SPI modules are in slave mode by default. This paragraph implies that the MCSPI module is configured in slave mode. (See the MCSPI\_MODULCTRL[2] MS bit in the module control register (MCSPI\_MODULCTRL).)

**Table 23-275. MCSPI I/O Description (Slave Mode) (continued)**

Signal Name	I/O	Description	Reset <sup>(1)</sup>
mcspim_simo	I	SPI <sub>m</sub> module serial data master out (slave input, master output)	Unknown
mcspim_somi	O	SPI <sub>m</sub> module serial data master input (slave output, master input)	–
mcspim_csx	I	SPI <sub>m</sub> module chip-select x output	Low

### 23.4.2.1.3 Multichannel SPI Protocol and Data Format

The synchronous SPI protocol allows a master device to initiate serial data transfers to a slave device. A slave select line (mcspim\_csx) allows selection of an individual slave SPI device. Slave devices that are not selected do not interfere with SPI bus activities.

MCSPI offers the flexibility to modify the following parameters to adapt to the device features:

- Word length  
MCSPI supports any SPI word ranging from 4 bits to 32 bits long (the SPI<sub>m</sub>.MCSPI\_CHxCONF[11:7] WL bit field).  
SPI word length can be changed between transmissions to allow the master device to communicate with peripheral slaves that have different requirements.
- SPI enable (mcspim\_csx, for channel x of instance m)  
The polarity of the SPI enable signals is programmable (the SPI<sub>m</sub>.MCSPI\_CHxCONF[6] EPOL bit). mcspim\_csx signals can be active high or low.  
Assertion of the mcspim\_csx signals is programmable and can be done manually or automatically. The manual assertion mode is available in single master mode only. mcspim\_csx can be kept active between words with the SPI<sub>m</sub>.MCSPI\_CHxCONF[20] FORCE bit.  
Two consecutive words for two different slave devices can go along with active mcspim\_csx signals with different polarity.
- Programmable start-bit  
In start-bit mode a start-bit is added before the SPI word length to indicate how the next SPI word must be handled. The start-bit is enabled by setting the SPI<sub>m</sub>.MCSPI\_CHxCONF[23] SBE bit to 1. The SPI<sub>m</sub>.MCSPI\_CHxCONF[24] SBPOL bit defines the polarity of the start-bit.
- Programmable SPI clock
  - Bit rate  
In master mode, the baud rate of the SPI serial clock is programmable using the 48-MHz reference clock (from the PRCM module). [Table 23-276](#) lists the spim\_clk bit rates obtained for data transfer when programming the clock divider (the SPI<sub>m</sub>.MCSPI\_CHxCONF[5:2] CLKD bit field).

**Table 23-276. SPI Master Clock Rates**

Divider	Clock Rate
1	48 MHz
2	24 MHz
4	12 MHz
8	6 MHz
16	3 MHz
32	1.5 MHz
64	750 kHz
128	375 kHz
256	~187 kHz
512	~93.7 kHz
1024	~46.8 kHz

**Table 23-276. SPI Master Clock Rates (continued)**

Divider	Clock Rate
2048	~23.4 kHz
4096	~11.7 kHz

– Polarity and phase

The polarity (the SPI<sub>m</sub>.MCSPI\_CHxCONF[1] POL bit) and the phase (the SPI<sub>m</sub>.MCSPI\_CHxCONF[0] PHA bit) of the SPI serial clock (mcs<sub>pim</sub>\_clk) are configurable to offer four combinations. Software selects the right combination, depending on the device. See [Table 23-277](#) and [Figure 23-90](#).

**Table 23-277. Phase and Polarity Combinations**

Polarity (POL)	Phase (PHA)	SPI Mode	Comments
0	0	Mode 0	mcs <sub>pim</sub> _clk is active high and sampling occurs on the rising edge.
0	1	Mode 1	mcs <sub>pim</sub> _clk is active high and sampling occurs on the falling edge.
1	0	Mode 2	mcs <sub>pim</sub> _clk is active low and sampling occurs on the falling edge.
1	1	Mode 3	mcs <sub>pim</sub> _clk is active low and sampling occurs on the rising edge.

**Figure 23-90. Phase and Polarity Combinations****23.4.2.1.3.1 Transfer Format**

In master and slave modes, the MCSPI drives the data lines when spim<sub>csx</sub> is asserted.

Each word is transmitted starting with the MSB.

This section explains the two cases of data transmission determined by the clock phase (PHA) and the type of data transmission using a start-bit (SBE) called the start-bit mode:

- Transmission in mode 0 and mode 2 (PHA = 0)

When PHA = 0, the first bit of the SPI word to transmit (on the master or the slave data output pin) is valid one-half cycle of spim<sub>clk</sub> after the assertion of spim<sub>csx</sub>.

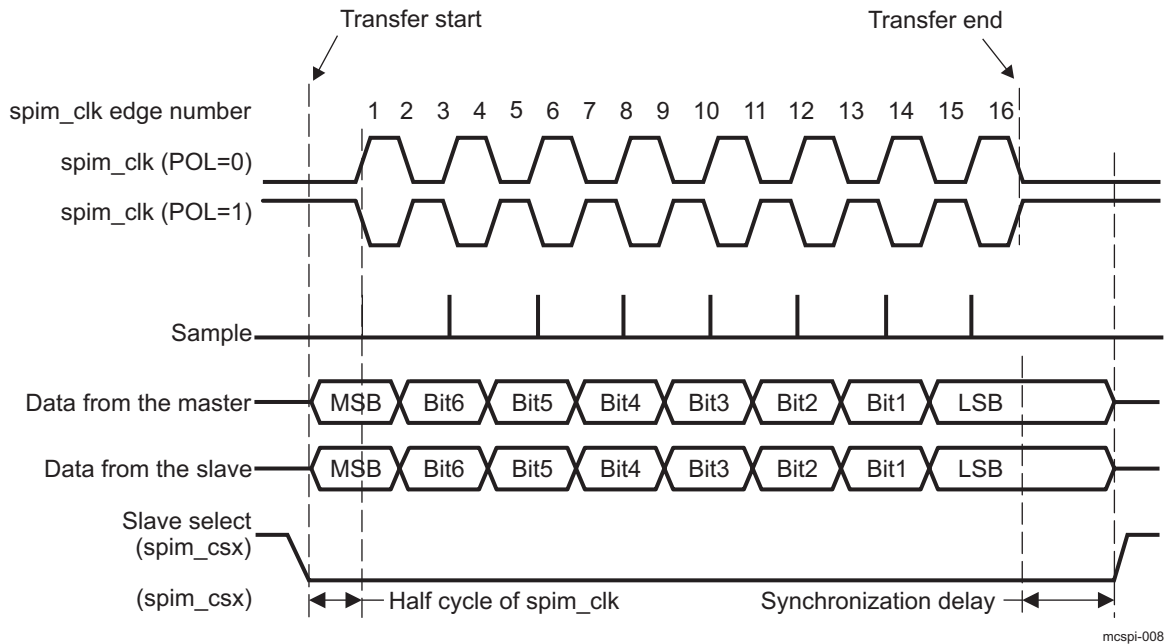

Therefore, the first edge of the mcs<sub>pim</sub>\_clk line is used by the master to sample the first data bit sent by the slave. On the same edge, the first data bit sent by the master is sampled by the slave.

On the next mcs<sub>pim</sub>\_clk edge, the received data bit is shifted into the receive shift register and a new data bit is transmitted on the serial data line.

This process continues for a number of pulses on the spim<sub>clk</sub> line defined by the SPI word length

programmed in the master device, with data being latched on odd-numbered edges and shifted on even-numbered edges. See [Figure 23-91](#).

**Figure 23-91. Full-Duplex Transfer Format With PHA = 0**

- Transmission in mode 1 and mode 3 (PHA = 1)

When PHA = 1, the first bit of the SPI word to transmit (on the master or the slave data output pin) is valid on the following mcspim\_clk edge (one-half cycle later). This is the sampling edge for the master and slave. A synchronization delay is added between the activation of mcspim\_csx and the first mcspim\_clk edge.

The received data bit is shifted into the shift register on the third mcspim\_clk edge.

This process continues for a number of pulses on the mcspim\_clk line defined by the SPI word length programmed in the master device, with data being latched on even-numbered edges and shifted on odd-numbered edges.

---

**NOTE:** The minimum synchronization delay is one cycle of mcspim\_clk, if the frequency of mcspim\_clk equals the frequency of SPIm\_FCLK (MCSPIm functional clock) in master mode. The minimum synchronization delay is one-half cycle of mcspim\_clk, if the frequency of mcspim\_clk is lower than the frequency of SPIm\_FCLK in the master and slave modes.

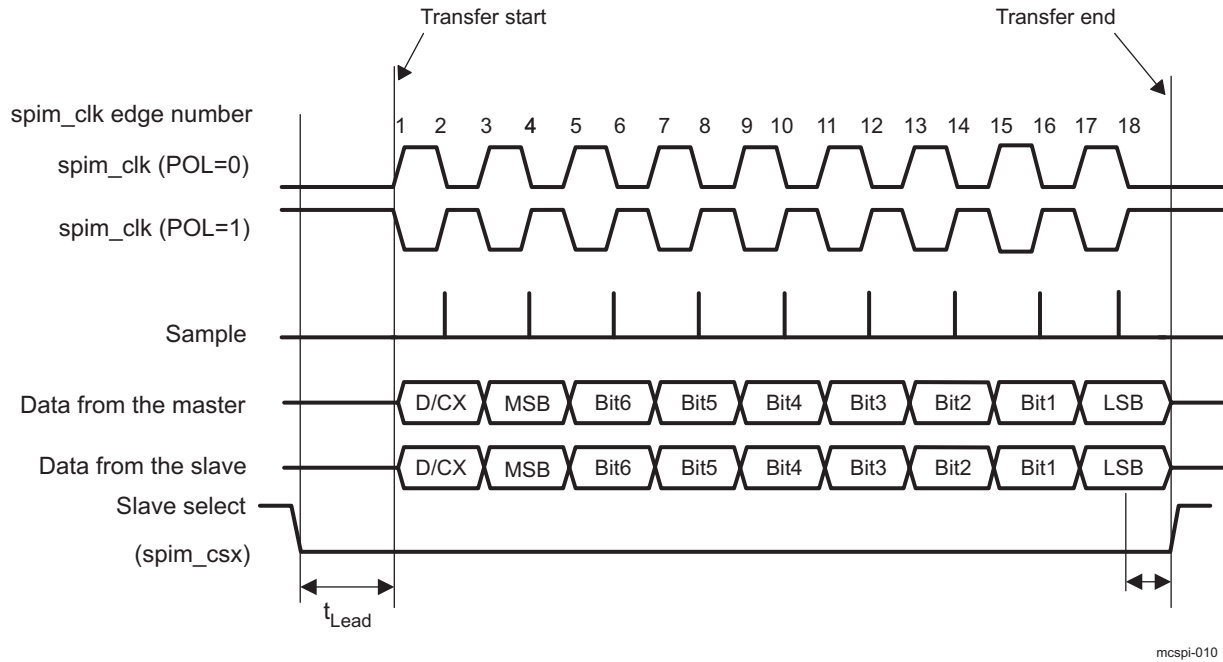

---

- Transmission with a start-bit (SBE = 1)

When the SPIm.MCSPI\_CHxCONF[23] SBE bit is set to 1, a start-bit is added before the MSB to indicate whether the next SPI word must be handled as a command or as data.

[Figure 23-92](#) shows an example of a data transfer with an extra start-bit.

**Figure 23-92. Extended SPI Transfer With a Start-Bit (SBE = 1)**

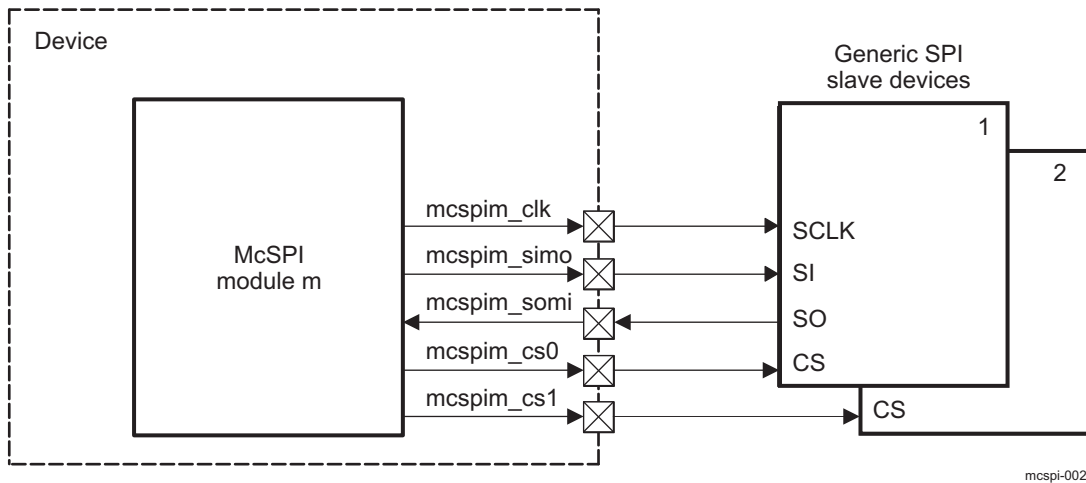

mcspi-010

**23.4.2.2 SPI in Master Mode**

Figure 23-93 shows a case in master mode (full-duplex) where the MCSPI module is connected with two slave devices.

**Figure 23-93. MCSPI Master Mode (Full Duplex)**

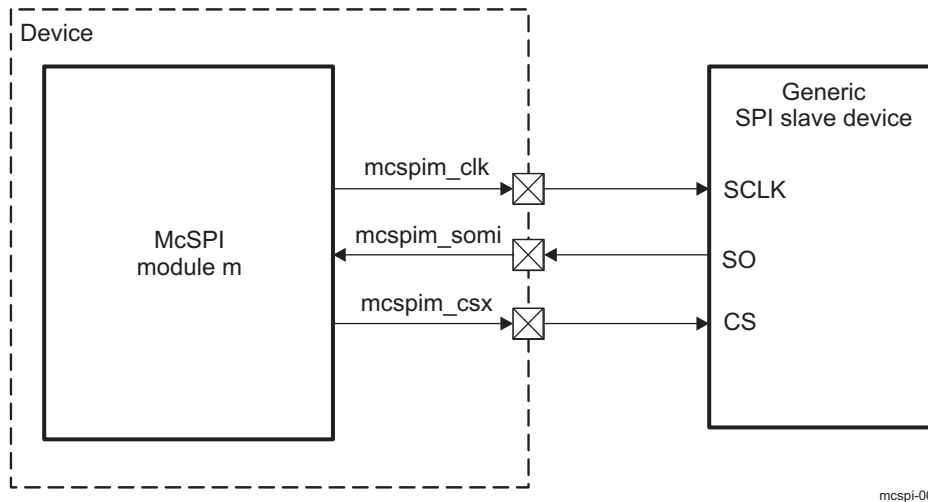

mcspi-002

**NOTE:** In this case  $m = [1,3]$ .

Figure 23-94 shows the master single mode, which can also be configured in receive-only mode.

Figure 23-94. MCSPi Master Single Mode (Receive Only)

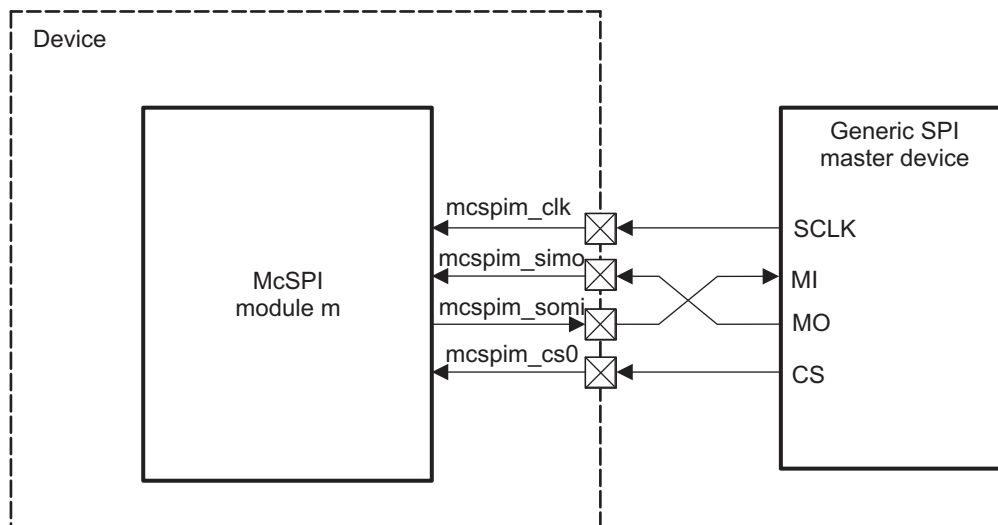

mcspi-003

### 23.4.2.3 SPI in Slave Mode

Figure 23-95 shows a case in slave mode (full-duplex).

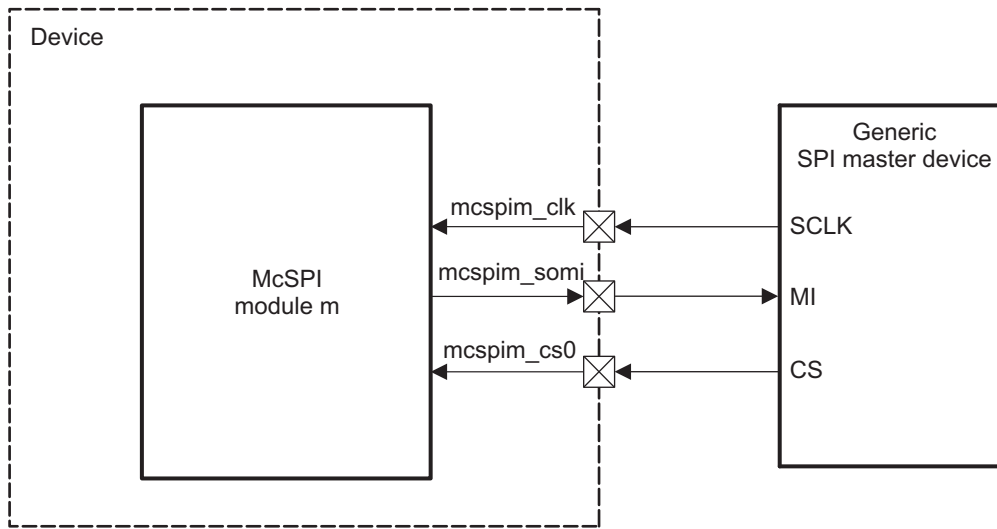

**NOTE:** Only channel 0 can be configured as slave, but the chip-enable signal can be connected to any mcspim\_csx pin and then rerouted internally to channel 0 (the SPI<sub>m</sub>.MCSPI\_CHxCONF[22:21] SPIENSLV bit field [where x = 0]). For more information, see Section 23.4.4.3, *Slave Mode*.

Figure 23-95. MCSPi Slave Mode (Full Duplex)

mcspi-004

Figure 23-96 shows the slave single mode, which can also be configured in transmit-only mode.

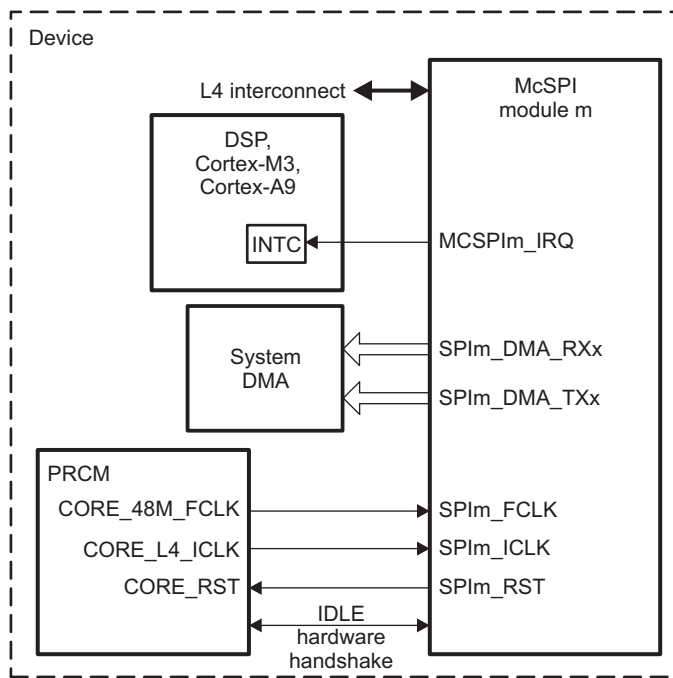

**Figure 23-96. MCSPI Slave Single Mode (Transmit Only)**

mcspi-005

### 23.4.3 MCSPI Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

Figure 23-97 shows MCSPI integration.

**Figure 23-97. MCSPI Integration**

mcspi-011

**NOTE:** For more information about the IDLE hardware handshake and the wake-up request, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

**NOTE:** For the names of the signals going from the MCSPI and to the DSP, Cortex-M3, and Cortex-A9 INTC, see [Table 23-280](#).

[Table 23-278](#) through [Table 23-280](#) summarize the integration of the module in the device.

**Table 23-278. Integration Attributes**

Module Instance	Attributes

SPI4	1	spi4_cs0	SPI4_SWAKEUP	Destination is the PRCM module.

### 23.4.4 MCSPI Functional Description

#### 23.4.4.1 MCSPI Block Diagram

Figure 23-98 shows the MCSPI module.

Figure 23-98. MCSPI Block Diagram

## 23.4.4.2 Master Mode

### 23.4.4.2.1 Master Mode Features

The MCSPI master mode supports multichannel communication with up to four independent SPI communication channel contexts. The MCSPI initiates a data transfer on the data lines (mcsnim\_simo and mcsnim\_somi) and generates clock (mcsnim\_clk) and control (mcsnim\_csx) signals.

Connected to multiple external devices, the MCSPI exchanges data with one SPI device at a time through two main modes (available in slave mode):

- Two-data-pins interface mode (transmit-and-receive mode for full-duplex transmission)
- Single-data-pin interface mode (recommended for half-duplex transmission)

Two DMA request events (read and write) allow synchronized accesses of the DMA controller with the activity of MCSPI.

Three interrupt events can be used for data transmission and reception in master mode (for more information about interrupts, see [Section 23.4.4.5.1, Interrupt Events in Master Mode](#)).

### 23.4.4.2.2 Master Transmit-and-Receive Mode (Full Duplex)

In full-duplex transmission, data is transmitted (shifted out serially on mcsnim\_simo) and received (shifted in serially on mcsnim\_somi) simultaneously on separate data lines.

The master transmit-and-receive mode is programmable per channel (the SPIm.MCSPI\_CHxCONF[13:12] TRM bit field).

Channel access to the shift registers for transmission/reception is based on the MCSPI\_TXx transmitter register state, the MCSPI\_RXx receiver register state, and round-robin arbitration.

Channels that meet the following rules are included in the round-robin list of active channels scheduled for transmission and/or reception. The arbiter skips channels that do not meet the rules and searches in the rotation for the next enabled channel.

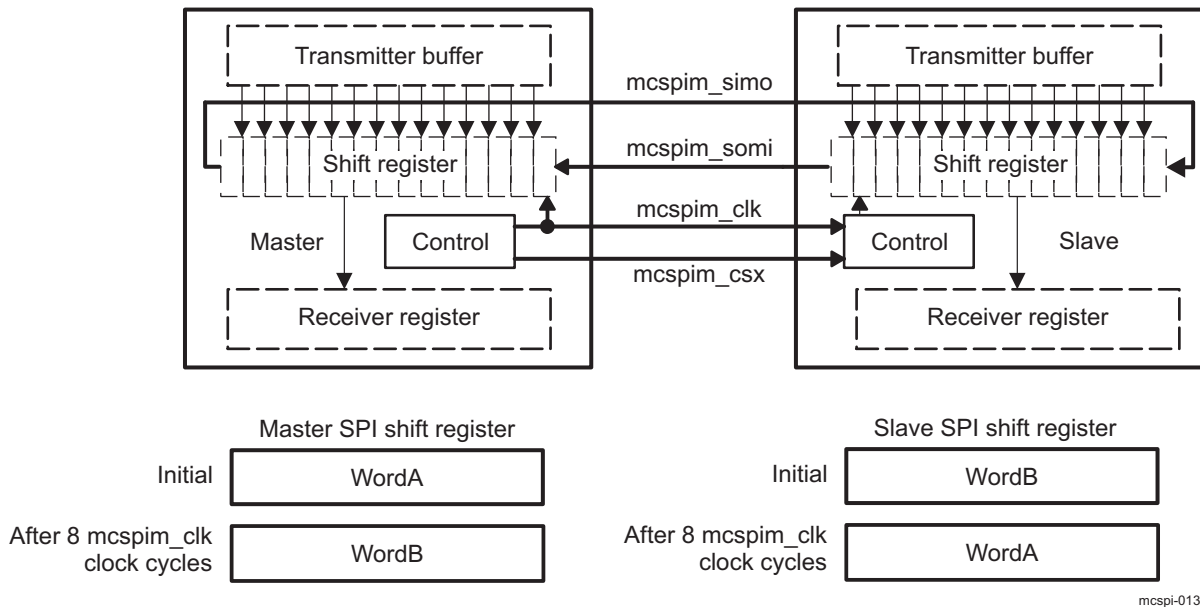

- Rule 1: Only enabled channels (the SPIm.MCSPI\_CHxCTRL[0] EN bit) can be scheduled for transmission and/or reception.
- Rule 2: If its MCSPI\_TXx transmitter register is not empty (the SPIm.MCSPI\_CHxSTAT[1] TXS bit), an enabled channel can be scheduled when the shift register is assigned. If the MCSPI\_TXx register is empty when the shift register is assigned, the TXx\_UNDERFLOW event is activated, and the next enabled channel with new data to transmit is scheduled (see also transmit-only mode).
- Rule 3: An enabled channel can be scheduled if its receive register is not full (the SPIm.MCSPI\_CHxSTAT[0] RXS bit) when the shift register is assigned (see also receive-only mode). Therefore, the MCSPI\_RXx register cannot be overwritten. The SPI1.MCSPI\_IRQSTATUS[3] RX0\_OVERFLOW bit is never set to this mode.

When SPI word transfer completes (the SPIm.MCSPI\_CHxSTAT[2] EOT bit is set), the updated MCSPI\_TXx register of the next scheduled channel is loaded into the shift register. The serialization (transmit-and-receive) starts depending on the channel communication configuration. When serialization completes, the received data transfers to the channel receive register.

The serial clock (mcsnim\_clk) synchronizes shifting and sampling of the information on the two serial data lines (mcsnim\_simo and mcsnim\_somi). Each time a bit transfers out from the master, 1 bit transfers in from the slave.

[Figure 23-99](#) shows an example of a full-duplex system with a master device (MCSPI module *m*) on the left and a slave device on the right. After eight cycles of the serial clock mcsnim\_clk, WordA transfers from the master to the slave. At the same time, WordB transfers from the slave to the master.

Figure 23-99. SPI Full-Duplex Transmission (Example)

### 23.4.4.2.3 Master Transmit-Only Mode (Half Duplex)

The master transmit-only mode prevents the MPU from reading the `MCSPI_RXx` register (minimizing data movement) when only transmission is meaningful.

The master transmit-only mode is programmable per channel (the `SPIm.MCSPI_CHxCONF[13:12]` TRM field). Transmission starts only after data is loaded into the `MCSPI_TXx` register.

Rule 1 and Rule 2, defined in Section 23.4.4.2.2, apply in this mode.

Rule 3, defined in Section 23.4.4.2.2, does not apply.

In master transmit-only mode, the `MCSPI_RXx` register state FULL does not prevent transmission and the `MCSPI_RXx` register is always overwritten with the new SPI word. This event is not significant when only transmission is meaningful. Thus, the `RX0_OVERFLOW` bit in the `SPIm.MCSPI_IRQSTATUS` register is never set in this mode.

The hardware automatically disables the `RX_FULL` interrupt and the DMA read requests.

The transfer status is given by the `SPIm.MCSPI_CHxSTAT[2]` EOT bit.

### 23.4.4.2.4 Master Receive-Only Mode (Half Duplex)

The master receive mode prevents the MPU from refilling the `MCSPI_TXx` register (minimizing data movement) when only reception is meaningful.

The master receive mode is programmable per channel (the `SPIm.MCSPI_CHxCONF[13:12]` TRM bit field).

The master receive-only mode enables channel scheduling only on the empty state of the `MCSPI_RXx` register.

Rule 1 and Rule 3, defined in Section 23.4.4.2.2, apply in this mode.

Rule 2, defined in Section 23.4.4.2.2, does not apply.

In the master receive-only mode, software must write dummy data to the [MCSPI\\_Tx](#) register. Only one dummy write is enough to receive any number of words from the slave. Software should ensure that the [MCSPI\\_Tx](#) register is always full (the [Tx\\_EMPTY](#) bits of [SPI.MCSPI\\_IRQSTATUS](#)) when receiving. The content of the [MCSPI\\_Tx](#) register is always loaded into the shift register when the shift register is assigned. After writing the dummy data to the [MCSPI\\_Tx](#) register, the [Tx\\_EMPTY](#) and [Tx\\_UNDERFLOW](#) bits in the [SPI.MCSPI\\_IRQSTATUS](#) register are never set in receive-only mode.

The [SPI.MCSPI\\_CHxSTAT\[2\]](#) EOT bit gives the status of serialization. The [Rx\\_FULL](#) bits of the [SPI.MCSPI\\_IRQSTATUS](#) register are set when received data is loaded from the shift register to the corresponding [MCSPI\\_Rx](#) register. The [SPI.MCSPI\\_IRQSTATUS\[3\]](#) [Rx0\\_OVERFLOW](#) bit is never set in this mode.

#### 23.4.4.2.5 Single-Channel Master Mode

When the MCSPI is configured as a master device with a single enabled channel, the assertion of the [mcs pim\\_csx](#) signal can be controlled in two different ways:

- If the [MCSPI\\_MODULCTRL\[0\]](#) [SINGLE](#) bit is set to 0, [mcs pim\\_csx](#) assertion and deassertion after each SPI word is automatically controlled by the MCSPI (see subsections of [Section 23.4.4.2.1](#), *Master Mode Features*).
- If the [MCSPI\\_MODULCTRL\[0\]](#) [SINGLE](#) and [MCSPI\\_CHxCONF\[20\]](#) [FORCE](#) bits are set to 1, [mcs pim\\_csx](#) assertion and deassertion is controlled by software (see [Section 23.4.4.2.5.1](#), *Programming Tips When Switching to Another Channel*).

##### 23.4.4.2.5.1 Programming Tips When Switching to Another Channel

When a single channel is enabled and data transfer is ongoing:

- Wait for completion of the SPI word transfer (wait until the [SPI.MCSPI\\_CHxSTAT\[2\]](#) EOT bit is set to 1) before disabling the current channel and enabling a different channel.
- Disable the current channel, and then enable the other channel.

##### 23.4.4.2.5.2 Force [mcs pim\\_csx](#) Mode

Continuous transfers are allowed manually by keeping the [mcs pim\\_csx](#) signal active for successive SPI words transfer. Several sequences (configuration/enable/disable of the channel) can be run without deactivating the [mcs pim\\_csx](#) line. This mode is supported by all channels and any master sequence can be used (transmit-receive, transmit-only, receive-only).

Keeping the [mcs pim\\_csx](#) active mode is supported when:

- A single channel is used (with the [SPI.MCSPI\\_MODULCTRL\[0\]](#) [SINGLE](#) bit set to 1).
- Transfer parameters are loaded in the configuration register of the appropriate channel ([SPI.MCSPI\\_CHxCONF](#)).

The state of the [mcs pim\\_csx](#) signal is programmable.

- Writing 1 to the [SPI.MCSPI\\_CHxCONF\[20\]](#) [FORCE](#) bit drives the [mcs pim\\_csx](#) line high when the [SPI.MCSPI\\_CHxCONF\[6\]](#) [EPOL](#) bit is set to 0. [mcs pim\\_csx](#) is driven low when the [SPI.MCSPI\\_CHxCONF\[6\]](#) [EPOL](#) bit is set to 1.
- Writing 0 to the [SPI.MCSPI\\_CHxCONF\[20\]](#) [FORCE](#) bit drives the [mcs pim\\_csx](#) line low when the [SPI.MCSPI\\_CHxCONF\[6\]](#) [EPOL](#) bit is set to 0. [mcs pim\\_csx](#) is driven high when the [SPI.MCSPI\\_CHxCONF\[6\]](#) [EPOL](#) bit is set to 1.
- A single channel is enabled (the [SPI.MCSPI\\_CHxCTRL\[0\]](#) [EN](#) bit is set to 1). The first enabled channel activates the [mcs pim\\_csx](#) line.

When the channel is enabled, the [mcs pim\\_csx](#) signal activates with the programmed polarity. As in the multichannel master mode, the transfer start depends on the status of the [MCSPI\\_Tx](#) register (the [SPI.MCSPI\\_CHxSTAT\[1\]](#) [TXS](#) bit), the status of the [MCSPI\\_Rx](#) register (the [SPI.MCSPI\\_CHxSTAT\[1\]](#) [RXS](#) bit), and the defined mode (the [SPI.MCSPI\\_CHxCONF\[13:12\]](#) [TRM](#) bit field) of the channel enabled.

The SPIm.MCSPI\_CHxSTAT[2] EOT bit gives the transfer status of each SPI word. The RXx\_FULL bit in the SPIm.MCSPI\_IRQSTATUS register is set when received data is loaded from the shift register to the MCSPI\_RXx register.

A change in the configuration parameters is propagated directly on the SPI interface. If the mcspim\_csx signal is activated, ensure that the configuration is changed only between SPI words to avoid corrupting the current transfer.

**NOTE:** To avoid data corruption, mcspim\_csx polarity and mcspim\_clk phase and mcspim\_clk polarity must not be modified when the mcspim\_csx signal is activated.

A delay between SPI words that requires the connected SPI slave device to switch from one configuration to another (for instance, from transmit-only to receive-only) must be handled by software.

At the end of the last SPI word, the channel must be deactivated (the SPIm.MCSPI\_CHxCTRL[0] EN bit set to 0) and mcspim\_csx can be forced to its INACTIVE state using the SPIm.MCSPI\_CHxCONF[20] FORCE bit.

Figure 23-100 and Figure 23-101 show successive transfers with mcspim\_csx maintained active low with a different configuration for each SPI word in single-data-pin and dual-data-pin interface modes, respectively.

**Figure 23-100. Continuous Transfers With mcspim\_csx Maintained Active (Single-Data-Pin Interface Mode)**

**Figure 23-101. Continuous Transfers With mcspim\_csx Maintained Active (Dual-Data-Pin Interface Mode)**

**NOTE:** Turbo mode described in Section 23.4.4.2.5.3, Turbo Mode, maintains mcspim\_csx in active mode when the following conditions are met:

- A single channel is explicitly used (the SPIm.MCSPI\_MODULCTRL[0] SINGLE bit is set to 1).
- Turbo mode is enabled in the configuration of the channel (the SPIm.MCSPI\_CHxCONF[19] TURBO bit is set to 1).

### 23.4.4.2.5.3 Turbo Mode

Turbo mode improves the throughput of the SPI interface when a single channel is enabled by allowing transfers until the shift register and the `MCSPi_RXx` register are full. Turbo mode is time saving when a transfer exceeds two words. This mode is programmable per channel (through the `SPI1.MCSPi_CHxCONF[9]` TURBO bit).

When several channels are enabled, the TURBO bit has no effect and the channel access to the shift registers remains as previously described.

In turbo mode, Rule 1 and Rule 2 apply, but Rule 3 does not (see [Section 23.4.4.2.2](#)). An enabled channel can be scheduled if its receive register is full (the `SPI.MCSPi_CHxSTAT[0]` RXS bit) at the time of the shift-register assignment until the shift register is full.

The `MCSPi_RXx` register cannot be overwritten in turbo mode. Consequently, the `SPI.MCSPi_IRQSTATUS[3]` RX0\_OVERFLOW bit is never set in this mode.

### 23.4.4.2.6 Start-Bit Mode

In start-bit mode, an extended bit is added before the SPI word to indicate whether the next SPI word must be handled as a command or as data. This feature is available only in master mode. Start-bit mode cannot be used at the same time as turbo mode and/or force `mcspim_csx` mode. In this case, only one channel can be used; round-robin arbitration is not possible.

This mode is programmable per channel by setting the `SPI.MCSPi_CHxCONF[23]` SBE bit to 1. The polarity of the extended bit is programmable per channel. When the `SPI.MCSPi_CHxCONF[24]` SBPOL bit is set to 0, the SPI word must be handled as a command. When the `SPI.MCSPi_CHxCONF[24]` SBPOL bit is set to 1, the SPI word must be handled as data. Moreover, start-bit polarity can be changed dynamically during start-bit transfer without disabling the channel for reconfiguration; in this case, users must configure the `SPI.MCSPi_CHxCONF[24]` SBPOL bit before writing the SPI word to be transmitted to the TX register.

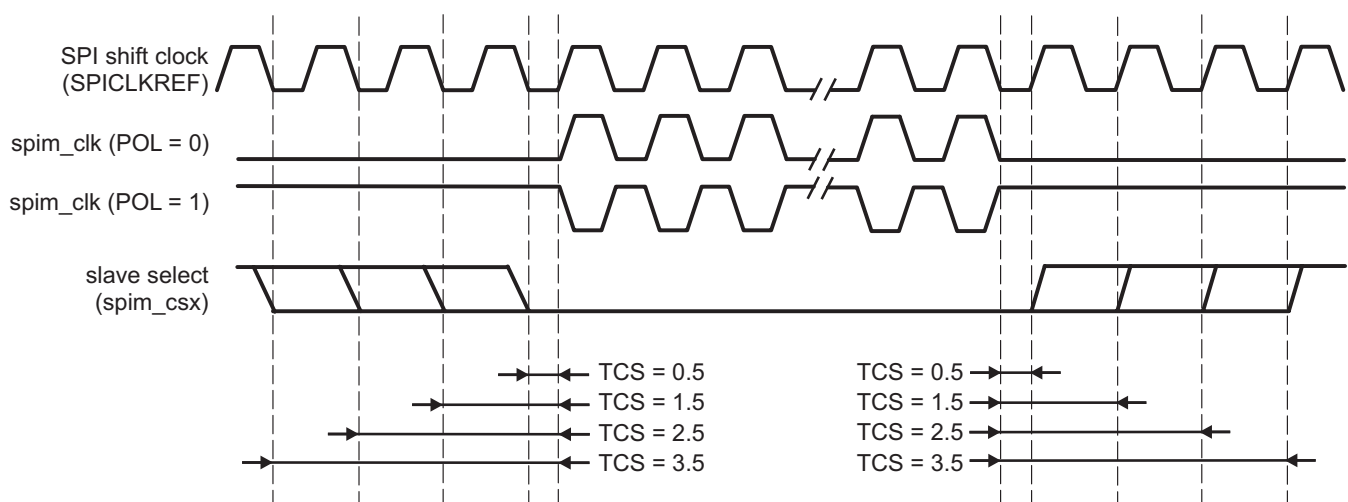

### 23.4.4.2.7 Chip-Select Timing Control

The chip-select (CS) timing control is available only in master mode with automatic CS generation (the `MCSPi_MODULCTRL[0]` SINGLE bit field set to 0) to add a programmable delay between CS assertion and first clock edge, or CS removal and last clock edge.

This mode is programmable per channel (the `SPI.MCSPi_CHxCONF` TCS bit).

[Figure 23-102](#) shows the CS SPIEN timing control.

**Figure 23-102. CS SPIEN Timing Controls**

mcspl-016

**NOTE:** Because of the design implementation for transfers using a clock divider ratio set to 1 (clock bypassed), a half cycle must be added to the value between CS assertion and the first clock edge with PHA = 1 or between CS removal and the last clock edge with PHA = 0.

### 23.4.4.2.8 Programmable SPI Clock (*mcspim\_clk*)

In master mode, the baud rate of the SPI serial clock is programmable.

An internal reference clock, SPI<sub>m</sub>\_FCLK, is used as input of a programmable divider (the SPI<sub>m</sub>.MCSPI\_CHxCONF[5:2] CLKD bit field) to generate the bit rate of the serial output clock *mcspim\_clk*. Table 23-282 summarizes the supported divisor values.

**Table 23-282. SPI Master Clock Rates**

Divider	Clock Rate
1	48 MHz
2	24 MHz
4	12 MHz
8	6 MHz
16	3 MHz
32	1.5 MHz
64	750 kHz
128	375 kHz
256	~187 kHz
512	~93.7 kHz
1024	~46.8 kHz
2048	~23.4 kHz
4096	~11.7 kHz
8192 and higher: Division not supported	–

#### 23.4.4.2.8.1 Clock Ratio Granularity

By default, the clock division ratio is defined by the SPI<sub>m</sub>.MCSPI\_CHxCONF[5:2] CLKD bit field with power-of-2 granularity leading to a clock division in the range 1 to 4096; in this case, the duty cycle is always 50 percent. With the SPI<sub>m</sub>.MCSPI\_CHxCONF[29] CLKG bit, clock division granularity can be changed to one clock cycle; in that case the SPI<sub>m</sub>.MCSPI\_CHxCTRL[15:8] EXTCLK bit field is concatenated with the SPI<sub>m</sub>.MCSPI\_CHxCONF[5:2] CLKD bit field to give a 12-bit-wide division ratio in the range 1 to 4096.

When granularity is one clock cycle (the CLKG bit set to 1), for the odd value of the clock ratio, the clock high level lasts one clock cycle more than the low level, depending on the SPI<sub>m</sub>.MCSPI\_CHxCONF[1] POL and SPI<sub>m</sub>.MCSPI\_CHxCONF[0] PHA bits (see Table 23-283).

**Table 23-283. CLKSPIO High/Low Time Computation**

Clock Ratio Fratio	CLKSPIO High Time	CLKSPIO Low Time
1	T <sub>high_ref</sub>	T <sub>low_ref</sub>
Even >= 2	T <sub>ref</sub> * (Fratio/2)	T <sub>ref</sub> * (Fratio/2)
Odd >= (POL = PHA)	T <sub>ref</sub> * (Fratio – 1)/2	T <sub>ref</sub> * (Fratio + 1)/2
Odd >= (POL != PHA)	T <sub>ref</sub> * (Fratio + 1)/2	T <sub>ref</sub> * (Fratio – 1)/2

---

**NOTE:** Fratio = spi1\_clk frequency (Fout) division ratio  
Thigh = spi1\_clk high time period  
Tlow = spi1\_clk low time period  
T\_ref = SPI1\_FCLK period  
Thigh\_ref = SPI1\_FCLK high time period  
Tlow\_ref = SPI1\_FCLK low time period

---

If the CLKG bit is set to 1; Fratio = EXTCLK concatenated with CLKD + 1.

For odd ratio values, the duty cycle is calculated as follows:

$$\text{Duty\_cycle} = (1 - 1/\text{Fratio})/2$$

Table 23-284 shows examples of clock granularity with a clock source frequency of 48 MHz.

**Table 23-284. Clock Granularity Examples**

EXTCLK	CLKD	CLKG	Fratio	PHA	POL	Thigh (ns)	Tlow (ns)	Tperiod (ns)	Duty Cycle	Fout (MHz)
X	0	0	1	X	X	10.4	10.4	20.8	50–50	48
X	1	0	2	X	X	20.8	20.8	41.6	50–50	24
X	2	0	4	X	X	41.6	41.6	83.2	50–50	12
X	3	0	8	X	X	83.2	83.2	166.4	50–50	6
0	0	1	1	X	X	10.4	10.4	20.8	50–50	48
0	1	1	2	X	X	20.8	20.8	41.6	50–50	24
0	2	1	3	1	0	41.6	20.8	62.4	66–33	16
0	2	1	3	1	1	20.8	41.6	62.4	33–66	16
0	3	1	4	X	X	41.6	41.6	83.2	50–50	12
5	0	1	81	1	0	852.8	832	1684.8	50.6–49.4	0.592
5	7	1	88	X	X	915.2	915.2	1830.4	50–50	0.545

### 23.4.4.3 Slave Mode

To select the MCSPI slave mode, set the SPI1.MCSPI\_MODULCTRL[2] MS bit.

A MCSPI slave device can be connected to up to four external SPI master devices but handles transactions with one SPI master device at a time.

In slave mode, the MCSPI initiates data transfer on the data lines (mcspim\_simo and mcspim\_somi) when it is selected by an active control signal (mcspim\_csx) and receives an SPI clock (mcspim\_clk) from the external SPI master device. Only channel 0 can be configured as a slave. In slave mode, the MCSPI uses the edge of mcspim\_csx to detect word length. For this reason, mcspim\_csx must become inactive between each word.

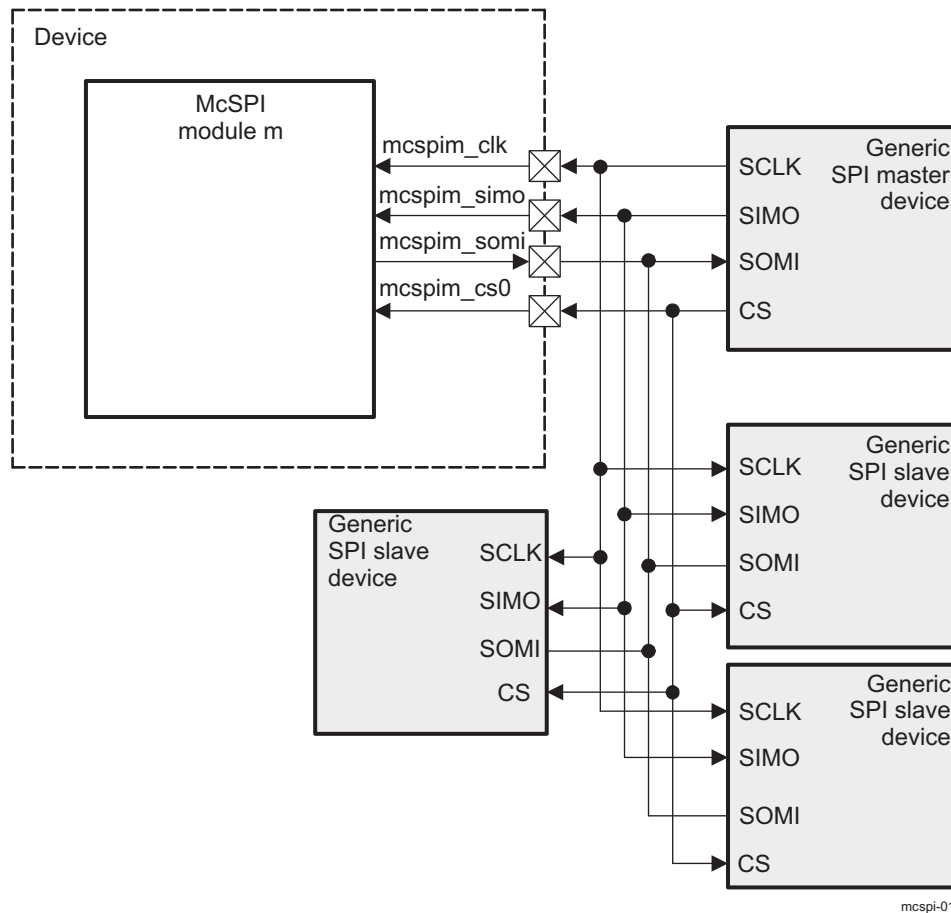

The MCSPI does not support mcspim\_csx active between SPI words. It uses the edge to detect word length.

#### 23.4.4.3.1 Dedicated Resources

Only channel 0 can be enabled in slave mode. In this section register names such as SPI1.MCSPI\_CHxCTRL stand for SPI1.MCSPI\_CH0CTRL, where x = 0 (channel 0 control register).

Figure 23-103 shows an example of four slaves wired on a single master device.

**Figure 23-103. Example of MCSPI Slave With One Master and Multiple Slave Devices on Channel 0**

The channel 0 in slave mode has the following resources:

- Its own channel enable, programmable with the `SPIm.MCSPI_CHxCTRL[0]` EN bit (where  $x = 0$ ). This channel must be enabled before transmission and reception.
- For this mode, the slave-select signal can be detected on any one of the `mcsnim_csx` ports. This is programmable with the `SPIm.MCSPI_CHxCONF[22:21]` SPIENSLV bit field (where  $x = 0$ ).
- Its own transmitter register, `SPIm.MCSPI_TXx` (where  $x = 0$ ), on top of the common transmit shift register. If the `MCSPI_TXx` register is empty, the `SPIm.MCSPI_CHxSTAT[1]` TXS bit (where  $x = 0$ ) is set. If MCSPI is selected by an external master (the active signal on the `mcsnim_csx` port assigned to channel 0), the `MCSPI_TXx` register content of channel 0 is always loaded into the shift register, whether its content is updated or not. The `MCSPI_TXx` register must be loaded before MCSPI is selected by a master.
- Its own receiver register, `SPIm.MCSPI_RXx` (where  $x = 0$ ), on top of the common receive shift register. If the `MCSPI_RXx` register is full, the `SPIm.MCSPI_CHxSTAT[0]` RXS bit (where  $x = 0$ ) is set.

**NOTE:** The `MCSPI_TXx` register and `MCSPI_RXx` registers of the other channels are not used. Reading from or writing to a channel register other than channel 0 has no effect.

- Its own communication configuration with the following parameters through the `SPIm.MCSPI_CHxCONF` register (where  $x = 0$ ):
  - Transmit and receive modes, programmable with the TRM field
  - Interface mode (two data pins or single data pin) and data pins assignment, both programmable with the IS and DPE bits. (The `SPIm` modules are in slave mode after reset and must be properly configured for the modules to act in master mode.)

- SPI word length, programmable with the WL bit
- mcsxim\_csx polarity, programmable with the EPOL bit
- mcsxim\_clk polarity, programmable with the POL bit
- mcsxim\_clk phase, programmable with the PHA bit

The mcsxim\_clk frequency of a transfer is controlled by the external SPI master connected to the MCSPI slave device. The SPIm.MCSPI\_CHxCONF[5:2] CLKD bit field (where x = 0) is not used in slave mode.

---

**NOTE:** The configuration of the channel can be loaded in the SPIm.MCSPI\_CHxCONF register (where x = 0) only when the channel is disabled.

---

- Two DMA request events, read and write, synchronize read/write accesses of the DMA controller with the activity of MCSPI. DMA requests are asserted using the SPIm.MCSPI\_CHxCONF[15] DMAR bit (where x = 0) for reading and the SPIm.MCSPI\_CHxCONF[14] DMAW bit (where x = 0) for writing.
- Four interrupt events (see [Section 23.4.4.5.2, Interrupt Events in Slave Mode](#))

#### **23.4.4.3.2 Slave Transmit-and-Receive Mode**

The slave receive mode is programmable (set the SPIm.MCSPI\_CHxCONF[13:12] TRM bit field [where x = 0] to 0x0).

In slave transmit-and-receive mode, the MCSPI\_TXx register must be loaded before MCSPI is selected by an external SPI master device.

After a channel is enabled, transmission and reception proceed with interrupt and DMA request events.

The MCSPI\_TXx register content is always loaded in the shift register whether it is updated or not. The event TXx\_UNDERFLOW is activated accordingly and does not prevent transmission.

When an SPI word transfer completes (the SPIm.MCSPI\_CHxSTAT0[2] EOT bit [where x = 0] set to 1), the received data is transferred to the channel receive register.

To use MCSPI as a slave transmit-only device, the RXx\_FULL and RX0\_OVERFLOW interrupts and DMA read requests must be disabled due to the MCSPI\_RXx register state (see [Section 23.4.4.5.2, Interrupt Events in Slave Mode](#)).

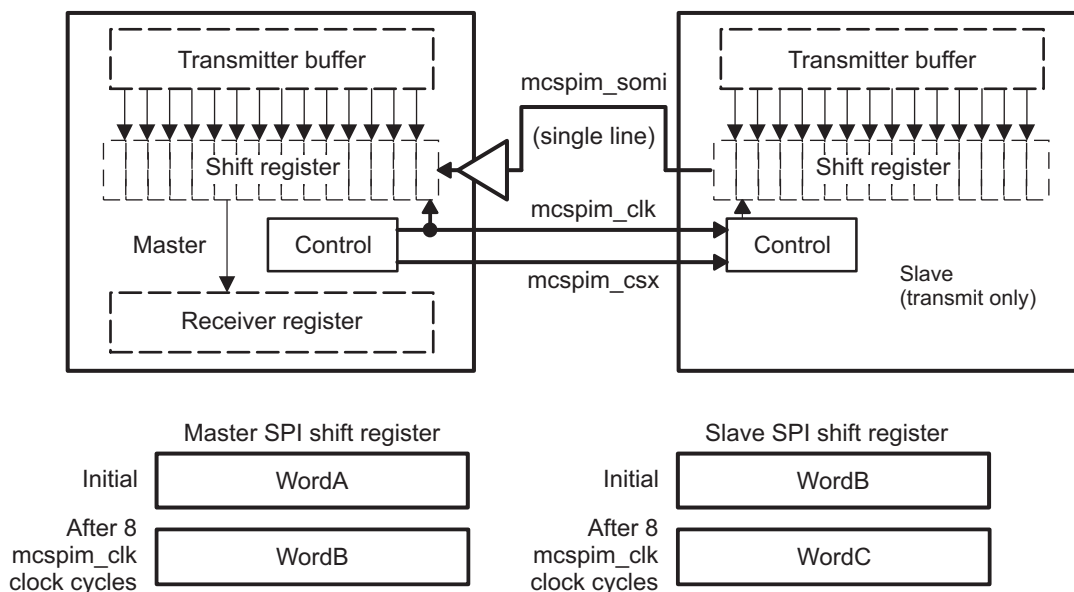

#### **23.4.4.3.3 Slave Transmit-Only Mode**

The slave transmit-only mode is programmable (set the SPIm.MCSPI\_CHxCONF[13:12] TRM bit field [where x = 0] to 0x2) and avoids the requirement for the MPU to read the MCSPI\_RXx register (minimizing data movement) only when transmission is meaningful.

To use the MCSPI as a slave transmit-only device, the RXx\_FULL and RX0\_OVERFLOW interrupts and DMA read requests must be disabled due to the MCSPI\_RXx register state.

When the SPI word transfer completes, the SPIm.MCSPI\_CHxSTAT[2] EOT bit is set (where x = 0).

[Figure 23-104](#) shows a half-duplex system with a master device on the left and a transmit-only slave device on the right. Each time a bit transfers out from the slave device, 1 bit transfers in the master. After eight cycles of the serial clock mcsxim\_clk, WordB transfers from the slave to the master.

**Figure 23-104. SPI Half-Duplex Transmission (Transmit-Only Slave)**

#### 23.4.4.3.4 Slave Receive-Only Mode

The slave receive mode is programmable (set the SPIm.MCSPI\_CHxCONF[13:12] TRM bit field [where x = 0] to 0x1).

In receive-only mode, the MCSPI\_TXx register must be loaded before the MCSPI is selected by an external SPI master device. The MCSPI\_TXx register content is always loaded into the shift register whether it is updated or not. The TXx\_UNDERFLOW event is activated accordingly and does not prevent transmission.

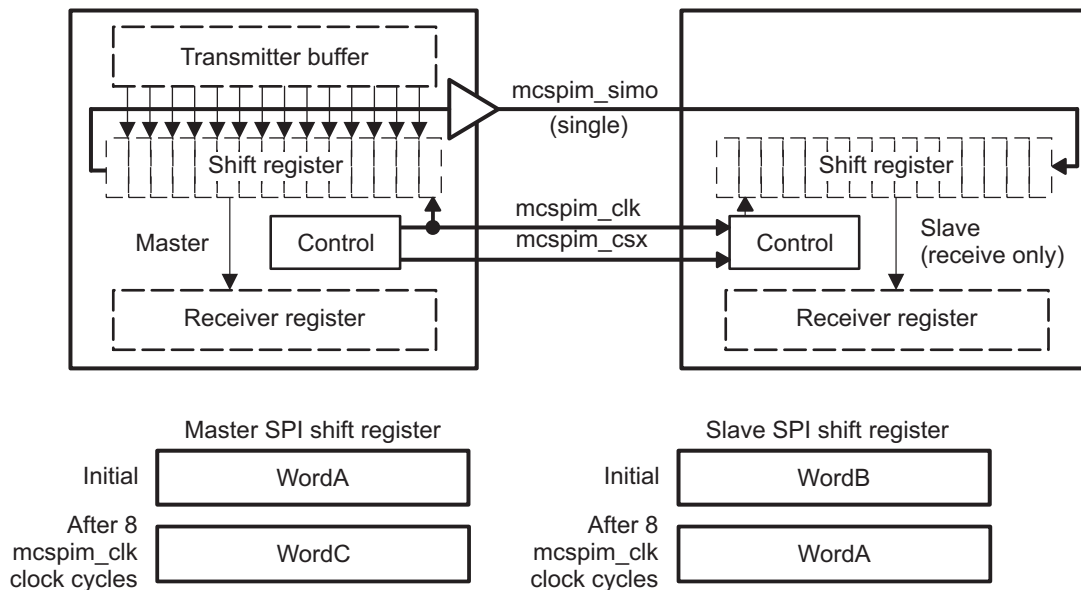

When an SPI word transfer completes (the SPIm.MCSPI\_CHxSTAT0[2] EOT bit [where x = 0] is set to 1), the received data is transferred to the channel receive register.

To use the MCSPI as a slave receive-only device, the TXx\_EMPTY and TXx\_UNDERFLOW interrupts and the DMA write requests must be disabled due to the MCSPI\_TXx register state.

For a full-duplex transmission, the serial clock (mcs pim\_clk) synchronizes shifting and sampling of the information on the single serial data line. For full duplex, two data lines are required. If mcs pim\_clk synchronizes on a single serial data line, the data line should be half-duplex.

Figure 23-105 shows an example of a half-duplex system with a master device on the left and a receive-only slave device on the right. Each time a bit transfers out from the master, 1 bit transfers in from the slave. After eight cycles of the serial clock mcs pim\_clk, Word A transfers from the master to the slave.

Figure 23-105. SPI Half-Duplex Transmission (Receive-Only Slave)

mcsnim-032

#### 23.4.4.4 FIFO Buffer Management

The MCSPI controller has a built-in 64-byte buffer to unload the DMA or interrupt handler and improve data throughput.

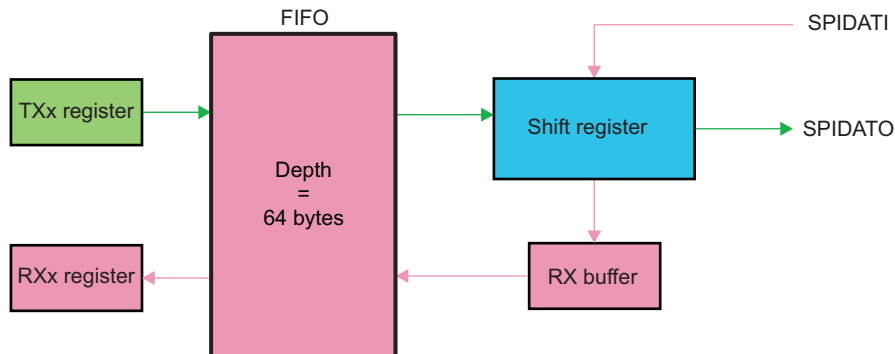

This buffer can be used by only one channel at a time and is selected by setting the `SPI.MCSPI_CHxCONF[28] FFER` or `SPI.MCSPI_CHxCONF[27] FFEW` bits to 1. If several channels are selected and several FIFO enable bit fields are set to 1, the controller forces the buffer not to be used; the driver must set only one FIFO enable bit field.

The buffer can be used in the following modes:

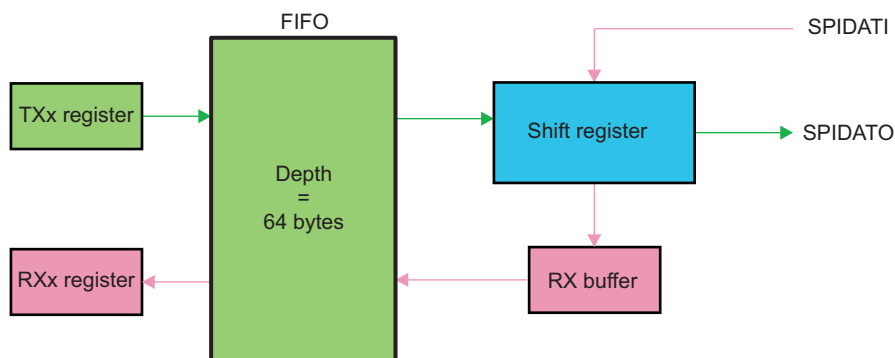

- Master or slave mode
- Transmit-only, receive-only, or transmit-and-receive mode
- Single channel or turbo mode, or normal round-robin mode. In round-robin mode the buffer is used by only one channel.

Every word length (`SPI.MCSPI_CHxCONF[11:7] WL`) is supported.

In transmit-and-receive mode, the buffer can be used in transmit (see [Figure 23-106](#)) or receive (see [Figure 23-107](#)) directions, or in both directions. If only one direction is chosen in transmit-and-receive mode, the full buffer is used for this direction. In both directions, the buffer is split into two 32-byte buffers, one for each direction (see [Figure 23-108](#)).

**Figure 23-106. Buffer Used in Transmit Direction Only**

mcspi-102

**Figure 23-107. Buffer Used in Receive Direction Only**

mcspi-103

**Figure 23-108. Buffer Used for Transmit and Receive Directions**

mcspi-101

Two levels (SPIm.MCSPI\_XFERLEVEL[5:0] AEL and SPIm.MCSPI\_XFERLEVEL[13:8] AFL) rule the buffer management. The granularity of these levels is 1 byte; it is not aligned with the SPI word length. The driver must set these values as a multiple of the SPI word length defined in WL. [Table 23-285](#) shows the number of bytes written in the FIFO, depending on the word length.

**Table 23-285. FIFO Writes, Word Length Relationship**

SPI Word Length WL	3 ≤ WL ≤ 7	8 ≤ WL ≤ 15	16 ≤ WL ≤ 31
Number of bytes written in the FIFO	1 byte	2 bytes	4 bytes

The FIFO buffer pointers are reset when the corresponding channel is enabled or the FIFO configuration changes.

#### 23.4.4.4.1 Buffer Almost Full

The `MCSPi_XFERLEVEL[15:8]` AFL bit field is needed when the buffer is used to receive an SPI word from a slave (the `MCSPi_CHxCONF[28]` FFER bit must be set to 1). It defines the almost-full buffer status. See Figure 23-109.

When the FIFO pointer reaches this level, an interrupt or a DMA request is sent to the MPU to enable the system to read AFL + 1 bytes from the receive register.

**NOTE:** AFL + 1 must correspond to a multiple value of the `MCSPi_CHxCONF[11:7]` WL bit field.

When DMA is used, the request is deasserted after the first receive register read.

No new request will be asserted again as long as the system has not performed the right number of read accesses.

Figure 23-109. Buffer Almost Full Level (AFL)

**NOTE:** The `MCSPi_IRQSTATUS` register bits are not available in DMA mode. In DMA mode, the `SPIm_DMA_RXx` request is asserted on the same conditions as the `MCSPi_IRQSTATUS` `Rxx_FULL` flag.

#### 23.4.4.4.2 Buffer Almost Empty

The `MCSPi_XFERLEVEL[7:0]` AEL bit field is needed when the buffer is used to transmit an SPI word to a slave (the `MCSPi_CHxCONF[27]` FFEW bit must be set to 1). It defines the almost-empty buffer status. See Figure 23-110.

When the FIFO pointer has not reached this level, an interrupt or a DMA request is sent to the MPU to enable the system to write AEL + 1 bytes to the transmit register.

**NOTE:** AEL + 1 must correspond to a multiple value of the `MCSPi_CHxCONF[11:7]` WL bit field.

When DMA is used, the request is deasserted after the first transmit register write.

No new request will be asserted again as long as the system has not performed the right number of write accesses.

**Figure 23-110. Buffer Almost Empty Level (AEL)**

**NOTE:** The [MCSPi\\_IRQSTATUS](#) register bits are not available in DMA mode. In DMA mode, the [SPIm\\_DMA\\_TXx](#) request is asserted on the same conditions as the [MCSPi\\_IRQSTATUS TXx\\_EMPTY](#) flag.

#### 23.4.4.4.3 End of Transfer Management

When the FIFO buffer is enabled for a channel, the user must previously configure in the [MCSPi\\_XFERLEVEL](#) register the AEL and AFL levels and especially the [MCSPi\\_XFERLEVEL\[31:16\]](#) WCNT bit field to define the number of SPI words to be transferred using the FIFO before enabling the channel.

This counter allows the controller to stop the transfer correctly after a defined number of SPI word transfers. If WCNT is set to 0x0000, the counter is not used and the user must stop the transfer manually by disabling the channel; in this case, the user does not know how many SPI transfers have been done. For received words, software must poll the [CHxSTAT\[5\]](#) RXFFE bit and read the [MCSPi\\_RXx](#) receive register to empty the FIFO buffer.

When the end-of-word count interrupt is generated (the [MCSPi\\_IRQSTATUS\[17\]](#) EOW bit is set), the user can disable the channel and poll the [MCSPi\\_CHxSTAT\[5\]](#) RXFFE bit to know it lasts SPI words in the FIFO buffer and read them.

No new request is asserted as long as the system has not performed the correct number of write accesses.

#### 23.4.4.5 Interrupts

Each channel can issue interrupt events.

Each interrupt event has status bits in the [SPIm.MCSPi\\_IRQSTATUS](#) register ([RXx\\_FULL](#), [TXx\\_UNDERFLOW](#), [TXx\\_EMPTY](#), ...) (where x = 0, 3) that indicate whether service is required. Each status bit has an interrupt enable bit (a mask) in the [SPIm.MCSPi\\_IRQENABLE](#) register ([RXx\\_FULL\\_ENABLE](#), [TXx\\_UNDERFLOW\\_ENABLE](#), [TXx\\_EMPTY\\_ENABLE](#), ...).

When an interrupt occurs and a mask is later applied on it, the interrupt line is not asserted again, even if the interrupt source is not serviced.

The MCSPi supports interrupt-driven and polling operations.

##### 23.4.4.5.1 Interrupt Events in Master Mode

In master mode, the interrupt events related to the [MCSPi\\_TXx](#) register state are [TXx\\_EMPTY](#) and [TXx\\_UNDERFLOW](#). The interrupt event related to the [MCSPi\\_RXx](#) register state is [RXx\\_FULL](#).

#### **23.4.4.5.1.1 TXx\_EMPTY**

The TXx\_EMPTY event is activated when a channel is enabled and its [MCSPI\\_TXx](#) register is empty (transient event). Enabling a channel automatically triggers this event, except in master receive-only mode (see [Section 23.4.4.2.4, Master Receive-Only Mode](#)). When the FIFO buffer is enabled (the [MCSPI\\_CHxCONF\[27\]](#) FFEW bit is set to 1), the [MCSPI\\_IRQSTATUS](#) TXx\_EMPTY bit is set as soon as there is enough space in the buffer to write a number of bytes defined by the [MCSPI\\_XFERLEVEL\[5:0\]](#) AEL bit field.

The [MCSPI\\_TXx](#) register must be loaded with data to remove the source of the interrupt; the [SPIm.MCSPI\\_IRQSTATUS](#) TXx\_EMPTY interrupt status bit must be cleared for interrupt line deassertion (if the event is enabled as the interrupt source).

When FIFO is enabled, no new TXx\_EMPTY event will be asserted as soon as the MPU has not performed the number of writes into the [MCSPI\\_TXx](#) register defined by the [MCSPI\\_XFERLEVEL\[5:0\]](#) AEL bit field. The MPU must perform the right number of writes.

#### **23.4.4.5.1.2 TXx\_UNDERFLOW**

The event TXx\_UNDERFLOW is activated when the channel is enabled and if the [MCSPI\\_TXx](#) register or the FIFO is empty (not updated with new data) when an external master device starts a data transfer with the MCSPI (transmit and receive).

The TXx\_UNDERFLOW is a harmless warning in master mode.

To avoid having a TXx\_UNDERFLOW event at the beginning of a transmission, the event TXx\_UNDERFLOW is not activated when no data has been loaded into the [MCSPI\\_TXx](#) register, because the channel has been enabled. To avoid having a TXx\_UNDERFLOW event, the [MCSPI\\_TXx](#) register must seldom be loaded.

The [SPIm.MCSPI\\_IRQSTATUS](#) TXx\_UNDERFLOW interrupt status bit must be cleared for interrupt line deassertion (if event enabled as the interrupt source).

#### **23.4.4.5.1.3 RXx\_FULL**

The RXx\_FULL event is activated when channel is enabled and [MCSPI\\_RXx](#) register becomes filled (transient event). When the FIFO buffer is enabled (the [MCSPI\\_CHxCONF\[28\]](#) FFER bit is set to 1), RXx\_FULL is asserted as soon as the number of bytes holds in the FIFO to be read reaches the [MCSPI\\_XFERLEVEL\[13:8\]](#) AFL threshold.

The [MCSPI\\_RXx](#) register must be read to remove the source of the interrupt; the [MCSPI\\_IRQSTATUS](#) RXx\_FULL interrupt status bit must be cleared for interrupt line deassertion (if the event is enabled as the interrupt source).

When FIFO is enabled, no new RXx\_FULL event will be asserted as soon as the MPU has not performed AFL + 1 reads into [MCSPI\\_RXx](#). The MPU must perform the right number of reads.

#### **23.4.4.5.1.4 End Of Word Count**

The [MCSPI\\_IRQSTATUS\[17\]](#) EOW event (end of word count) is activated when the channel is enabled and configured to use the built-in FIFO. This interrupt is raised when the controller performs the number of transfers defined in the [MCSPI\\_XFERLEVEL\[31:16\]](#) WCNT bit field. If WCNT is set to 0x0000, the counter is not enabled and this interrupt is not generated.

The end of word count interrupt also indicates that the SPI transfer is halted on the channel using the FIFO buffer as soon as [MCSPI\\_XFERLEVEL\[31:16\]](#) WCNT is not reloaded and the channel is not re-enabled.

The [MCSPI\\_IRQSTATUS\[17\]](#) EOW interrupt status bit must be cleared for interrupt line deassertion (if the event enabled as interrupt source).

### 23.4.4.5.2 Interrupt Events in Slave Mode

In slave mode, the interrupt events related to the [MCSPI\\_TXx](#) register state are [TXx\\_EMPTY](#) and [TXx\\_UNDERFLOW](#). The interrupt events related to the [MCSPI\\_RXx](#) register state are [RXx\\_FULL](#) and [RX0\\_OVERFLOW](#) (channels 1, 2, and 3 do not have a receiver overflow status bit). See the [MCSPI\\_IRQSTATUS](#) register.

#### 23.4.4.5.2.1 TXx\_EMPTY

The [TXx\\_EMPTY](#) event is activated when a channel is enabled and its [MCSPI\\_TXx](#) register is empty. Enabling the channel automatically raises this event. If the FIFO buffer is enabled (the [MCSPI\\_CHxCONF\[27\]](#) FFEW bit is set to 1), the [TXx\\_EMPTY](#) event will be asserted as soon as there is enough space in buffer to write a number of bytes defined by the [MCSPI\\_XFERLEVEL\[5:0\]](#) AEL bit field.

The [MCSPI\\_TXx](#) register must be loaded with data to remove the source of the interrupt; the [SPIm.MCSPI\\_IRQSTATUS](#) [TXx\\_EMPTY](#) interrupt status bit must be cleared for interrupt line deassertion (if the event is enabled as the interrupt source).

When FIFO is enabled, no new [TXx\\_EMPTY](#) event will be asserted as soon as the MPU has not performed the number of write into the [MCSPI\\_TXx](#) register defined by [MCSPI\\_XFERLEVEL\[5:0\]](#) AEL bit field. The MPU must perform the right number of writes.

#### 23.4.4.5.2.2 TXx\_UNDERFLOW

The [TXx\\_UNDERFLOW](#) event is activated when a channel is enabled and if the [MCSPI\\_TXx](#) register is empty (not updated with new data) when an external master device starts a data transfer with the MCSPI (transmit and receive).

When FIFO is enabled, the data emitted while the underflow event is raised is not the last data written in the FIFO but the next data in the FIFO (an old transmitted value or a dummy data in the FIFO has been reset).

[TXx\\_UNDERFLOW](#) indicates an error (data loss) in slave mode.

To avoid having a [TXx\\_UNDERFLOW](#) event at the beginning of a transmission, the [TXx\\_UNDERFLOW](#) event is not activated when no data has been loaded into the [MCSPI\\_TXx](#) register because the channel is enabled.

The [SPIm.MCSPI\\_IRQSTATUS](#) [TXx\\_UNDERFLOW](#) interrupt status bit must be cleared for interrupt line deassertion (if the event is enabled as the interrupt source).

#### 23.4.4.5.2.3 RXx\_FULL

The [RXx\\_FULL](#) event is activated when a channel is enabled and the [MCSPI\\_RXx](#) register is being filled (transient event). When the FIFO buffer is enabled (the [MCSPI\\_CHxCONF\[28\]](#) FFER bit is set to 1), [RXx\\_FULL](#) is asserted as soon as the number of bytes holds in the buffer to read defined by the [MCSPI\\_XFERLEVEL\[13:8\]](#) AFL bit field.

The [MCSPI\\_RXx](#) register must be read to remove the source of the interrupt; the [SPIm.MCSPI\\_IRQSTATUS](#) [RXx\\_FULL](#) interrupt status bit must be cleared for interrupt line deassertion (if the event is enabled as the interrupt source).

When FIFO is enabled, no new [RXx\\_FULL](#) event will be asserted as soon as the MPU has not performed [AFL + 1](#) reads into [MCSPI\\_RXx](#). The MPU must perform the correct number of reads.

#### 23.4.4.5.2.4 RX0\_OVERFLOW

The [RX0\\_OVERFLOW](#) event is activated in slave mode in either transmit-and-receive or receive-only mode, when a channel is enabled and the [MCSPI\\_RXx](#) register or FIFO is full when a new SPI word is received. The [MCSPI\\_RXx](#) register is always overwritten with the new SPI word. If the FIFO is enabled data within the FIFO are overwritten, it must be considered as corrupted. The [RX0\\_OVERFLOW](#) event should not appear in slave mode using the FIFO.

The [RX0\\_OVERFLOW](#) event indicates an error (data loss) in slave mode.

The [MCSPI\\_IRQSTATUS](#)[3] `RX0_OVERFLOW` interrupt status bit must be cleared for interrupt line deassertion (if the event is enabled as the interrupt source).

#### 23.4.4.5.2.5 End Of Word Count

The [MCSPI\\_IRQSTATUS](#)[17] EOW event (end of word count) is activated when the channel is enabled and configured to use the built-in FIFO. This interrupt is raised when the controller performs the number of transfer defined in the [MCSPI\\_XFERLEVEL](#)[31:16] `WCNT` bit field. If `WCNT` is set to `0x0000`, the counter is not enabled and this interrupt is not generated.

The end of word count interrupt also indicates that the SPI transfer is halted on the channel using the FIFO buffer as soon as `WCNT` is not reloaded and the channel re-enabled.

The [MCSPI\\_IRQSTATUS](#)[17] EOW interrupt status bit must be cleared for interrupt line deassertion (if event enable as interrupt source).

#### 23.4.4.5.3 Interrupt-Driven Operation

An interrupt enable bit in the SPIm.[MCSPI\\_IRQENABLE](#) register can be set to enable each event to generate interrupt requests when the corresponding event occurs. Status bits are automatically set by hardware logic conditions.

When an event occurs (the single interrupt line is asserted), the MPU must:

1. Read the SPIm.[MCSPI\\_IRQSTATUS](#) register to identify which event occurred.
2. Read the [MCSPI\\_RXx](#) register that corresponds to the event to remove the source of an `RXx_FULL` event or write into the [MCSPI\\_TXx](#) register that corresponds to the event to remove the source of a `TXx_EMPTY` event. No action is required to remove the source of the `WKS` (wake-up), `TXx_UNDERFLOW`, and `RX0_OVERFLOW` events.
3. Set the corresponding bit of the SPIm.[MCSPI\\_IRQSTATUS](#) register to 1 to clear an interrupt status and then release the interrupt line.

The interrupt status bit must always be reset after channel enabling and before events are enabled as interrupt sources.

#### 23.4.4.5.4 Polling

When the interrupt capability of an event is disabled in the SPIm.[MCSPI\\_IRQENABLE](#) register, the interrupt line is not asserted, but the status bits in the SPIm.[MCSPI\\_IRQSTATUS](#) register can be polled by software to detect when the corresponding event occurs.

Once the expected event occurs:

- `RXx_FULL`: To remove the source of the event, the MPU must read the corresponding [MCSPI\\_RXx](#) register.
- `TXx_EMPTY`: To remove the source of the event, the MPU must write into the corresponding [MCSPI\\_TXx](#) register.
- `WKS` (wake-up), `TXx_UNDERFLOW`, and `RX0_OVERFLOW`: No action is required to remove the source of the event.

To clear an interrupt, set the corresponding status bit of the SPIm.[MCSPI\\_IRQSTATUS](#) register to 1. This does not affect the interrupt line state.

#### 23.4.4.6 DMA Requests

The sDMA controller module manages DMA accesses. The sDMA controller advantage is to reduce the MPU charge for data transfers.

Each MCSPI channel, if enabled, can issue DMA requests. There are two DMA request lines per MCSPI channel (one for read and one for write).

The DMA read request line is asserted when the MCSPI channel is enabled and new data is available in the receive register of the MCSPI channel. A DMA read request can be individually masked with the SPI1.MCSPI\_CHxCONF[15] DMAR bit. The DMA read request line is deasserted when reading of the MCSPI\_RXx register of the MCSPI channel is complete.

The DMA write request line is asserted when the MCSPI channel is enabled and the MCSPI\_TXx register of the MCSPI channel is empty. A DMA write request can be individually masked with the SPI1.MCSPI\_CHxCONF[14] DMAW bit. The DMA write request line is deasserted when loading of the MCSPI\_TXx register of the channel is complete.

#### 23.4.4.7 Power Saving Management

Power consumption can be optimized by switching off internal clocks (interface and functional clock) when there is no activity. The MCSPI is compliant with the idle and wake-up system handshake protocol.

##### 23.4.4.7.1 Normal Mode

In normal mode, internal SPI module clocks are automatically switched off (autogated) when there is no activity in slave or master mode.

Autogating of the module interface clock and functional clock occurs when the following conditions are met:

- The SPI.MCSPI\_SYSCONFIG[0] AUTOIDLE bit is set.
- In master mode, there is no data to transmit or receive in all channels.
- In slave mode, the MCSPI is not selected by the external master and there are no register accesses.

Autogating of the module interface clock and functional clock stops when the following conditions are met:

- In master mode, an internal access occurs.
- In slave mode, an internal access occurs or the MCSPI is selected by the external master.

##### 23.4.4.7.2 Idle Mode

At the PRCM module level, when all conditions are met to shut off the CORE\_48M\_FCLK or CORE\_L4\_ICLK output clocks (for details, see [Chapter 3, Power, Reset, and Clock Management](#)), the PRCM module automatically launches a hardware handshake protocol to ensure that the MCSPI is ready to have its clocks switched off. Namely, the PRCM module asserts an idle request to the MCSPI.

Although this handshake is completely hardware-oriented and out of software control, the method in which the MCSPI module acknowledges the PRCM idle request is configurable through the MCSPI.SYSCONFIG[4:3] SIDLEMODE bit field.

The settings of the SIDLEMODE bit field and the related acknowledgment modes are:

- Force-idle mode (the SPI.MCSPI\_SYSCONFIG[4:3] SIDLEMODE bit field is set to 0x0): The MCSPI module acknowledges unconditionally the idle request from the PRCM module, regardless of its internal operations. This mode must be used carefully in this case because it does not prevent the loss of data when the clock is switched off.
- No-idle mode (the SIDLEMODE bit is set to 0x1): The MCSPI never acknowledges an idle request from the PRCM module and is safe from a module point of view because it ensures that the clocks remain active. However, it is not efficient to save power because it does not allow the PRCM output clock to be shut off and thus the power domain to be set to a lower power state.
- Smart-idle mode (the SIDLEMODE bit is set to 0x2): The MCSPI acknowledges the idle request, basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, IRQs, or DMA requests are treated. This is the best approach for efficient system power management.

When configured in smart-idle mode, the MCSPI also offers an additional granularity on the CORE\_48M\_FCLK and CORE\_L4\_ICLK gating. The SPI.MCSPI\_SYSCONFIG[9:8] CLOCKACTIVITY bit field determines which clock shuts down (the CORE\_48M\_FCLK, CORE\_L4\_ICLK, neither clock, or both clocks).

The CLOCKACTIVITY setting is used internally to the MCSPI to determine on which part of the module the conditions to acknowledge the PRCM idle request are tested. For example, if CORE\_48M\_FCLK is not shut down on a PRCM idle request, the MCSPI considers only CORE\_L4\_ICLK and the associated pending activities before acknowledging the request.

Some MCSPI features are associated with CORE\_L4\_ICLK and others with CORE\_48M\_FCLK. Using the CLOCKACTIVITY bit field with the smart-idle mode ensures that the features associated with the clock that remains active are always enabled, even if the MCSPI acknowledges an idle request.

The CLOCKACTIVITY settings and the associated features are:

- CLOCKACTIVITY set to 00: ICLK off and FCLK off, ICLK and FCLK are considered for generating the acknowledge. This setting also means that FCLK and ICLK are likely to be shut down on a PRCM idle request.
- CLOCKACTIVITY set to 01: ICLK on and FCLK off, ICLK is not shut down on a PRCM idle request; only FCLK is concerned.
- CLOCKACTIVITY set to 10: ICLK off and FCLK on, FCLK is not shut down on a PRCM idle request; only ICLK is concerned.
- CLOCKACTIVITY set to 11: ICLK on and FCLK on, none of the clocks are shut down. This means the MCSPI can potentially acknowledge the idle request without checking the internal functions linked to its clocks.

#### **CAUTION**

The PRCM module does not have a hardware means of reading the CLOCKACTIVITY settings. Therefore, software must ensure consistent programming between CLOCKACTIVITY and the CORE\_48M\_FCLK and CORE\_L4\_ICLK control bits in the PRCM module. If the MCSPI is disabled in the CM\_FCLKEN and CM\_ICLKEN PRCM registers while CLOCKACTIVITY is set to 11, nothing prevents the PRCM module from asserting its idle request, which is acknowledged regardless of the features associated with the MCSPI clocks. This can lead to unpredictable behavior.

#### **23.4.4.7.2.1 Wake-Up Event in Smart-Idle Mode**

The module wake-up feature is enabled when the SPIm.MCSPI\_SYSCONFIG[2] ENAWAKEUP and SPIm.MCSPI\_WAKEUPENABLE[0] WKEN bits are set. Wake-up capability is relevant only when the module is configured in slave mode.

The module generates an asynchronous wakeup request to the system power manager to switch back the interface clock and the functional clock. A wake-up is requested when channel 0 is enabled and an asynchronous selection occurs on the mcs pim.csx port associated with channel 0 (see the definition for the SPIm.MCSPI\_CHxCONF[22:21] SPIENSLV bit field [where x = 0] in the register description table).

After the McSPI wake-up request, the system power manager must reactivate the interface clock:

- Before the beginning of the second SPI word serialization when the McSPI is in slave transmit-only mode or in slave transmit-and-receive mode
- Before the end of the second received SPI word in slave receive-only mode. To avoid data loss, the first received SPI word must be read from the SPIm.MCSPI\_RXx register (where x = 0) before the completion of the second SPI word serialization.

Table 23-286 lists the supported cases in wake-up mode.

**Table 23-286. Smart-Idle Mode and Wake-Up Capabilities**

Mode	Interface Clock	SPI Clock Ref	Functionality	Wake-Up Event
Master	Must be maintained	Must be maintained	Full functionality, but the module does not generate a new interrupt or DMA request until the system exits wake-up mode	No wake-up event

**Table 23-286. Smart-Idle Mode and Wake-Up Capabilities (continued)**

Mode	Interface Clock	SPI Clock Ref	Functionality	Wake-Up Event
Slave	Can be switched off	Can be switched off	An SPI word can be transmitted and/or received, but the module does not generate any new interrupts or DMA requests until the system exits wake-up mode.	The module asynchronously sends a wake-up request if an event on the mcsxim_csx port associated with channel 0 is detected.

In wake-up mode, the interrupt and DMA request lines are no longer asserted.

Any access to the module in wake-up mode generates an error as long as the interface clock is alive.

#### 23.4.4.7.2.2 Transitions From Smart-Idle Mode to Normal Mode

The MCSPI detects the end of the wake period through the idle and wake-up hardware handshake protocol.

The interrupt status register (the SPIm.MCSPI\_IRQSTATUS[16] WKS bit) is updated with the event causing the wakeup; the wake-up event at the origin of the transition to the normal mode is converted to its corresponding interrupt when enabled by the SPIm.MCSPI\_IRQENABLE[16] WKE bit or the DMA request.

Interrupts and wake-up events have independent enable and disable controls, accessible through the SPIm.MCSPI\_IRQENABLE and SPIm.MCSPI\_WAKEUPENABLE registers. Software must ensure the overall consistency.

The interrupt status register SPIm.MCSPI\_IRQSTATUS is updated with the event causing the wake-up; the wake-up event at the origin of the transition to normal mode is converted to its corresponding interrupt request or DMA request. The module is fully operational.

#### 23.4.4.7.2.3 Force-Idle Mode

Force-idle mode is enabled and exited as follows:

- Force-idle mode is enabled when the SPIm.MCSPI\_SYSCONFIG[4:3] SIDLEMODE bit field is set to 0x0.
  - In force-idle mode, the MCSPI responds unconditionally to the idle request by deasserting unconditionally the interrupt and DMA request lines, if asserted. In addition, the wake-up capability is totally inhibited even if the SPIm.MCSPI\_SYSCONFIG[2] ENAWAKEUP and SPIm.MCSPI\_WAKEUPENABLE[0] WKEN bits are set.
  - The transition from normal mode to idle mode does not affect the interrupt event bits of the SPIm.MCSPI\_IRQSTATUS register.
  - In force-idle mode, because the module must be disabled, the interrupt and DMA request lines are likely deasserted. The interface clock and SPI clock provided to the MCSPI can be switched off.
  - An idle request during an SPI data transfer can lead to an unexpected and unpredictable result. Software must avoid such a request.
- The module exits force-idle mode through the idle and wake-up hardware handshake protocol. The module is fully operational. The interrupt and DMA request lines are optionally asserted one clock cycle later.

## 23.4.5 MCSPI Programming Guide

### 23.4.5.1 MCSPI Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the MCSPI module.

#### 23.4.5.1.1 Global Initialization

##### 23.4.5.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the I<sup>2</sup>C module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the I<sup>2</sup>C. For further information, see the *I<sup>2</sup>C Module Integration and Environment* sections.

For more information, see [Section 23.4.3](#).

[Table 23-287](#) lists the information on the global initialization of the surrounding modules.

**Table 23-287. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	MCSPI_FCLK functional clock must be enabled. See <a href="#">Section 3.1.1.1.2</a> , <i>Module Level Clock Management</i> , in <a href="#">Chapter 3</a> , <i>Power, Reset, and Clock Management</i> .
L4 Interconnect	For information about L4-PER interconnect configuration, see <a href="#">Section 13.3</a> , <i>L4 Interconnects</i> , in <a href="#">Chapter 13</a> , <i>Interconnect</i> .
sDMA	DMA configuration must be done to enable the module DMA channel requests. See <a href="#">Chapter 16</a> , <i>SDMA</i> .
MPU INTC	Cortex-A9 MPU, Cortex-M3 MPU, or DSP INTC must be configured to enable the interrupt request generation to the Cortex-A9 MPU or Cortex-M3 MPU, or in <a href="#">Section 5.3.2.6</a> , <i>INTC</i> , in <a href="#">Chapter 5</a> , <i>DSP Subsystem</i> .

#### 23.4.5.1.1.2 MCSPI Global Initialization

##### 23.4.5.1.1.2.1 Main Sequence – MCSPI Global Initialization

This procedure initializes the MCSPI module after a POR or software reset.

**Table 23-288. MCSPI Global Initialization**

Step	Register/Bit Field/Programming Model	Value
Perform a software reset.	SPIm.MCSPI_SYSCONFIG[1] SOFTRESET	0x1
Wait until reset is finished?	SPIm.MCSPI_SYSSTATUS[0] RESETDONE	=0x1

#### 23.4.5.1.2 Operational Mode Configuration

##### 23.4.5.1.2.1 MCSPI Operational Modes

The selection of the working mode is done with the SPIm.MCSPI\_CHxCONF register. [Table 23-289](#) through [Table 23-291](#) list the possible operating modes and their configurations.

**Table 23-289. MCSPI Receive Mode Initialization**

Step	Register/Bit Field/Programming Model	Value
Set receive mode.	SPIm.MCSPI_CHxCONF[13:12] TRM	0x1
Set the word length.	SPIm.MCSPI_CHxCONF[11:7] WL	0x8
Clock initialization and channel enabling	SPIm.MCSPI_MODULCTRL[2] MS SPIm.MCSPI_CHxCTRL[0] EN	0x0 0x1

**Table 23-289. MCSPI Receive Mode Initialization (continued)**

Step	Register/Bit Field/Programming Model	Value
Channels activated low during active state	SPIm.MCSPI_CHxCONF[6] EPOL	0x1
Clock held low during inactive state	SPIm.MCSPI_CHxCONF[1] POL	0x0
Data latched on odd-numbered edges of the SPI clock	SPIm.MCSPI_CHxCONF[0] PHA	0x0
Reset the status bits.	SPIm.MCSPI_IRQSTATUS	0x0

**Table 23-290. MCSPI Transmit Mode Initialization**

Step	Register/Bit Field/Programming Model	Value
Set transmit mode.	SPIm.MCSPI_CHxCONF[13:12] TRM	0x2
Set the word length.	SPIm.MCSPI_CHxCONF[11:7] WL	0x8
Clock initialization and channel enabling	SPIm.MCSPI_MODULCTRL[2] MS SPIm.MCSPI_CHxCTRL[0] EN	0x0 0x1
Channels activated low during active state	SPIm.MCSPI_CHxCONF[6] EPOL	0x1
Clock held low during inactive state	SPIm.MCSPI_CHxCONF[1] POL	0x0
Data latched on odd-numbered edges of the SPI clock	SPIm.MCSPI_CHxCONF[0] PHA	0x0
Reset the status bits.	SPIm.MCSPI_IRQSTATUS	0x0

**Table 23-291. MCSPI Transmit-and-Receive Mode Initialization**

Step	Register/Bit Field/Programming Model	Value
Set transmit and receive mode.	SPIm.MCSPI_CHxCONF[13:12] TRM	0x0
Set the word length.	SPIm.MCSPI_CHxCONF[11:7] WL	0x8
Clock initialization and channel enabling	SPIm.MCSPI_MODULCTRL[2] MS SPIm.MCSPI_CHxCTRL[0] EN	0x0 0x1
Channels activated low during active state	SPIm.MCSPI_CHxCONF[6] EPOL	0x1
Clock held low during inactive state	SPIm.MCSPI_CHxCONF[1] POL	0x0
Data latched on odd-numbered edges of the SPI clock	SPIm.MCSPI_CHxCONF[0] PHA	0x0
Reset the status bits.	SPIm.MCSPI_IRQSTATUS	0x0

### 23.4.5.1.2.1.1 Common Transfer Procedures Without FIFO – Polling Method

#### 23.4.5.1.2.1.1.1 Receive-Only Procedure – Polling Method

Table 23-292 lists the receive-only procedure using the polling method. The MCSPI is acting as slave.

**Table 23-292. Receive-Only Procedure – Polling Method**

Step	Register/Bit Field/Programming Model	Value
Configure the channel according to the mode	See Table 23-289.	
Start the channel.	SPIm.MCSPI_CHxCTRL[0] EN	0x1
Wait until receive register is full?	SPIm.MCSPI_RXx	=0x1
Stop the channel.	SPIm.MCSPI_CHxCTRL[0] EN	0x0

#### 23.4.5.1.2.1.1.2 Receive-Only Procedure – Interrupt Method

Table 23-293 lists the receive-only procedure using the interrupt method. The MCSPI is acting as slave.

**Table 23-293. Receive-Only Procedure – Interrupt Method**

Step	Register/Bit Field/Programming Model	Value
Configure the channel according to the mode.	See <a href="#">Table 23-289</a> .	
Start the channel.	SPIm.MCSPI_CHxCTRL[0] EN	0x1
Enable the interrupt for the receiver register.	SPIm.MCSPI_IRQENABLE[2] RX_FULL_ENABLE	0x1
Read the status register.	SPIm.MCSPI_IRQSTATUS[2] RX_FULL	0x0
Disable the interrupt.	SPIm.MCSPI_IRQENABLE[2] RX_FULL_ENABLE	0x0
Stop the channel.	SPIm.MCSPI_CHxCTRL[0] EN	0x0
Read the receiver register.	SPIm.MCSPI_RXx	xxxx

#### 23.4.5.1.2.1.1.3 Transmit-Only Procedure – Polling Method

[Table 23-294](#) lists the transmit-only procedure using the polling method. The MCSPI is acting as master.

**Table 23-294. Transmit-Only Procedure – Polling Method**

Step	Register/Bit Field/Programming Model	Value
Configure the channel according to the mode.	See <a href="#">Table 23-290</a>	
Start the channel.	SPIm.MCSPI_CHxCTRL[0] EN	0x1
Wait until end of transfer?	SPIm.MCSPI_CHxSTAT[2:1]	=0x2
Stop the channel.	SPIm.MCSPI_CHxCTRL[0] EN	0x0

#### 23.4.5.1.2.1.1.4 Transmit-and-Receive Procedure – Polling Method

[Table 23-294](#) lists the transmit-and-receive procedure using the polling method. The MCSPI is acting as master and slave.

**Table 23-295. Transmit-and-Receive Procedure – Polling Method**

Step	Register/Bit Field/Programming Model	Value
Configure the channel according to the mode.	See <a href="#">Table 23-291</a> .	
Start the channel.	SPIm.MCSPI_CHxCTRL[0] EN	0x1
Wait until transmit/receive word?	SPIm.MCSPI_CHxSTAT[2:0]	=0x3
Stop the channel.	SPIm.MCSPI_CHxCTRL[0] EN	0x0

#### 23.4.5.1.3 Common Transfer Procedures With FIFO – Polling Method

When using FIFO the MCSPI module can start the transfer only after the first write request is released by writing the [MCSPI\\_TXx](#) register. The first write request can be managed by the IRQ routine or DMA handler. The end of transfer is more complex and depends on the transfer type. See [Table 23-294](#) through [Table 23-301](#).

##### 23.4.5.1.3.1 Receive-Only Procedure With Word Count – Polling Method

**Table 23-296. Receive-Only Procedure With Word Count – Polling Method**

Step	Register/Bit Field/Programming Model	Value
Configure the channel according to the mode.	See <a href="#">Table 23-289</a> .	
Start the channel.	SPIm.MCSPI_CHxCTRL[0] EN	0x1
Wait until end of word count?	SPIm.MCSPI_IRQSTATUS[17] EOW	=0x1
Stop the channel.	SPIm.MCSPI_CHxCTRL[0] EN	0x0
Read from the receiver register.	SPIm.MCSPI_RXx	xxxx

### 23.4.5.1.3.2 Transmit-Only Procedure With and Without Word Count – Polling Method

**Table 23-297. Transmit-Only Procedure Without Word Count – Polling Method**

Step	Register/Bit Field/Programming Model	Value
Configure the channel according to the mode.	See <a href="#">Table 23-290</a> .	
Start the channel.	SPIm.MCSPI_CHxCTRL[0] EN	0x1
Wait until end of word count?	SPIm.MCSPI_IRQSTATUS[17] EOW	=0x1
Wait until end of transfer?	SPIm.MCSPI_CHxSTAT[2] EOT SPIm.MCSPI_CHxSTAT[3] TXFFE	=0x1 =0x1
Stop the channel.	SPIm.MCSPI_CHxCTRL[0] EN	0x0

### 23.4.5.1.3.3 Transmit-Only Procedure With and Without Word Count – Interrupt Method

**Table 23-298. Transmit-Only Procedure With Word Count – Interrupt Method**

Step	Register/Bit Field/Programming Model	Value
Configure the channel according to the mode.	See <a href="#">Table 23-290</a> .	
Start the channel.	SPIm.MCSPI_CHxCTRL[0] EN	0x1
Enable the interrupt for the transmit register.	SPIm.MCSPI_IRQENABLE[4] TX_EMPTY_ENABLE	0x1
End of word count.	SPIm.MCSPI_IRQSTATUS[17] EOW	=0x1
End of transfer	SPIm.MCSPI_CHxSTAT[2] EOT SPIm.MCSPI_CHxSTAT[3] TXFFE	=0x1 =0x1
Clear the interrupt.	SPIm.MCSPI_IRQENABLE[17] EOW_ENABLE	=0x0
Disable the interrupt for the transmit register.	SPIm.MCSPI_IRQENABLE[4] TX_EMPTY_ENABLE	0x0
Stop the channel.	SPIm.MCSPI_CHxCTRL[0] EN	0x0

### 23.4.5.1.3.4 Transmit-and-Receive Procedure With Word Count – Polling Method

**Table 23-299. Transmit-and-Receive Procedure With Word Count – Polling Method**

Step	Register/Bit Field/Programming Model	Value
Configure the channel according to the mode.	See <a href="#">Table 23-291</a> .	
Start the channel.	SPIm.MCSPI_CHxCTRL[0] EN	0x1
Wait until end of word count?	SPIm.MCSPI_IRQSTATUS[17] EOW	=0x1
Stop the channel.	SPIm.MCSPI_CHxCTRL[0] EN	0x0
Read from the receiver register.	SPIm.MCSPI_RXx	xxxx

### 23.4.5.1.3.5 Transmit-and-Receive Procedure with Word Count – Interrupt Method

**Table 23-300. Transmit-and-Receive Procedure With Word Count – Interrupt Method**

Step	Register/Bit Field/Programming Model	Value
Configure the channel according to the mode.	See <a href="#">Table 23-291</a> .	
Start the channel.	SPIm.MCSPI_CHxCTRL[0] EN	0x1
Enable the interrupt for the receiver register.	SPIm.MCSPI_IRQENABLE[2] RX_FULL_ENABLE	0x1
Enable the interrupt for the transmit register.	SPIm.MCSPI_IRQENABLE[4] TX_EMPTY_ENABLE	0x1
End of word count?	SPIm.MCSPI_IRQSTATUS[17] EOW	=0x1
Clear the interrupt.	SPIm.MCSPI_IRQENABLE[17] EOW_ENABLE	=0x0

**Table 23-300. Transmit-and-Receive Procedure With Word Count – Interrupt Method (continued)**

Step	Register/Bit Field/Programming Model	Value
Disable the interrupt for the receiver register.	SPIm.MCSPI_IRQENABLE[4] TX_EMPTY_ENABLE	0x0
Disable the interrupt for the transmit register.	SPIm.MCSPI_IRQENABLE[2] RX_FULL_ENABLE	0x0
Stop the channel.	SPIm.MCSPI_CHXCTRL[0] EN	0x0
Read from the receiver register.	SPIm.MCSPI_RXx	xxxx

**23.4.5.1.3.6 Transmit-and-Receive Procedure Without Word Count – Polling Method**
**Table 23-301. Transmit-and-Receive Procedure Without Word Count – Polling Method**

Step	Register/Bit Field/Programming Model	Value
Configure the channel according to the mode.	See <a href="#">Table 23-291</a> .	
Start the channel.	SPIm.MCSPI_CHXCTRL[0] EN	0x1
Wait until end of transfer?	SPIm.MCSPI_CHXSTAT[2] EOT SPIm.MCSPI_CHXSTAT[3] TXFFE	=0x1 =0x1
Stop the channel.	SPIm.MCSPI_CHXCTRL[0] EN	0x0
Read from the receiver register.	SPIm.MCSPI_RXx	xxxx

## 23.4.6 MCSPI Register Manual

### 23.4.6.1 MCSPI Instance Summary

**Table 23-302. MCSPI Instance Summary**

Module Name	Base Address	Size
MCSPI1	0x4809 8000	4KB
MCSPI2	0x4809 A000	4KB
MCSPI3	0x480B 8000	4KB
MCSPI4	0x480B A000	4KB

### 23.4.6.2 MCSPI Registers

#### 23.4.6.2.1 MCSPI Register Summary

Table 23-303 lists the MCSPI registers. Each register is 32 bits wide.

**Table 23-303. MCSPI Register Summary**

Register	Type	Offset Address	MCSPI1 L3 Physical Address	MCSPI2 L3 Physical Address	MCSPI3 L3 Physical Address	MCSPI4 L3 Physical Address
<a href="#">MCSPI_HL_REV</a>	Rw	0x00	0x4809 8000	0x4809 A000	0x480B 8000	0x480B A000
<a href="#">MCSPI_HL_HWINFO</a>	Rw	0x04	0x4809 8004	0x4809 A004	0x480B 8004	0x480B A004
<a href="#">MCSPI_HL_SYSCONFIG</a>	Rw	0x10	0x4809 8010	0x4809 A010	0x480B 8010	0x480B A010

<sup>(1)</sup> x = 0 to 3 for MCSPI1  
x = 0 to 1 for MCSPI2  
x = 0 for MCSPI3  
x = 0 for MCSPI4

### 23.4.6.2.2 MCSPI Register Description

Table 23-304 through Table 23-336 describe the individual MCSPI register bits.

**Table 23-304. MCSPI\_HL\_REV**

<b>Address Offset</b>	0x00		
<b>Physical Address</b>	See Table 23-303.	<b>Instance</b>	MCSPI1 MCSPI2 MCSPI3 MCSPI4
<b>Description</b>	IP Revision Identifier (X.Y.R) Used by software to track features, bugs, and compatibility		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REVISION																															

Bits	Field Name	Description	Type	Reset
31:0	REVISION	IP Revision	R	TI internal data

**Table 23-305. Register Call Summary for Register MCSPI\_HL\_REV**

Multichannel Serial Port Interface (MCSPI)

- [MCSPI Register Summary: \[0\]](#)

**Table 23-306. MCSPI\_HL\_HWINFO**

<b>Address Offset</b>	0x04		
<b>Physical Address</b>	See Table 23-303.	<b>Instance</b>	MCSPI1 MCSPI2 MCSPI3 MCSPI4
<b>Description</b>	Information about the IP module's hardware configuration, that is, typically the module's HDL generics (if any). Actual field format and encoding is up to the module's designer to decide.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RSVD																								RETMODE	FFNBYTE				USEFIFO		

Bits	Field Name	Description	Type	Reset
31:7	RSVD	Reserved These bits are initialized to 0, and writes to them are ignored.	R	0x0000000
6	RETMODE	Retention Mode generic parameter. This bit field indicates whether the retention mode is supported using the pin PIRFFRET. 0x0: Retention mode disabled 0x1: Retention mode enabled	R	RETMODE

Bits	Field Name	Description	Type	Reset
5:1	FFNBYTE	FIFO number of byte generic parameter This register defines the value of FFNBYTE generic parameter, only MSB bits from 8 down to 4 are taken into account. Read 0x1: FIFO 16 bytes depth Read 0x2: FIFO 32 bytes depth Read 0x4: FIFO 64 bytes depth Read 0x8: FIFO 128 bytes depth Read 0x10: FIFO 256 bytes depth	R	0x04
0	USEFIFO	Use of a FIFO enable: This bit indicates if a FIFO is integrated within controller design with its management. Read 0x0: FIFO not implemented in design Read 0x1: FIFO and its management implemented in design with depth defined by FFNBYTE generic	R	0

**Table 23-307. Register Call Summary for Register MCSPI\_HL\_HWINFO**

Multichannel Serial Port Interface (MCSPI)

- [MCSPI Register Summary: \[0\]](#)

**Table 23-308. MCSPI\_HL\_SYSCONFIG**

<b>Address Offset</b>	0x10	<b>Instance</b>	MCSPI1 MCSPI2 MCSPI3 MCSPI4
<b>Physical Address</b>	See <a href="#">Table 23-303</a> .		
<b>Description</b>	Clock management configuration		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RSVD																IDLEMODE			FREEMU		SOFTRESET										

Bits	Field Name	Description	Type	Reset
31:4	RSVD		R	0x00000000
3:2	IDLEMODE	<p>Configuration of the local target state management mode.</p> <p>By definition, target can handle read/write transaction as long as it is out of IDLE state.</p> <p>0x0: Force-idle mode: local target's IDLE state follows (acknowledges) the system's idle requests unconditionally, that is, regardless of the IP module's internal requirements. Backup mode, for debug only.</p> <p>0x1: No-idle mode: local target never enters IDLE state. Backup mode, for debug only.</p> <p>0x2: Smart-idle mode: local target's IDLE state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA-request-related) wake-up events.</p> <p>0x3: Smart-idle wake-up-capable mode: local target's IDLE state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module may generate (IRQ- or DMA-request-related) wake-up events when in IDLE state. Mode is relevant only if the appropriate IP module "swake-up" output(s) is (are) implemented.</p>	RW	0x2
1	FREEEMU	<p>Sensitivity to emulation (debug) suspend input signal.</p> <p>0x0: IP module is sensitive to emulation suspend.</p> <p>0x1: IP module is not sensitive to emulation suspend.</p>	RW	0
0	SOFTRESET	<p>Software reset. (Optional)</p> <p>Write 0x0: No action</p> <p>Read 0x0: Reset done, no pending action</p> <p>Read 0x1: Reset (software or other) ongoing</p> <p>Write 0x1: Initiate software reset</p>	RW	0

- [MCSPI Register Summary: \[1\]](#)

**Table 23-316. MCSPI\_IRQSTATUS**

<b>Address Offset</b>	0x118	<b>Instance</b>	MCSPI1 MCSPI2 MCSPI3 MCSPI4
<b>Physical Address</b>	See <a href="#">Table 23-303</a> .		
<b>Description</b>	The interrupt status regroups all the status of the module internal events that can generate an interrupt.		
<b>Type</b>	RW		

## Multichannel Serial Port Interface

www.ti.com

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
RESERVED																EOW	WKS	RESERVED	RX3_FULL	TX3_UNDERFLOW	TX3_EMPTY	RESERVED	RX2_FULL	TX2_UNDERFLOW	TX2_EMPTY	RESERVED	RX1_FULL	TX1_UNDERFLOW	TX1_EMPTY	RX0_OVERFLOW	RX0_FULL	TX0_UNDERFLOW	TX0_EMPTY

Bits	Field Name	Description	Type	Reset
31:18	RESERVED	Reads returns 0	RW	0x0000
17	EOW	End of word count event when a channel is enabled using the FIFO buffer and the channel had sent the number of SPI word defined by <a href="#">MCSPI_XFERLEVEL[WCNT]</a> . Write 0x0: w:Event status bit unchanged Read 0x0: r: Event false Read 0x1: r: Event is pending Write 0x1: w:Event status bit is reset	RW W1toClr	0
16	WKS	Wake-up event in slave mode when an active control signal is detected on the SPIEN line programmed in the field MCSPI_CH0CONF[SPIENSLV] Read 0x0: r: Event false Write 0x0: w:Event status bit unchanged Write 0x1: w:Event status bit is reset Read 0x1: r: Event is pending	RW W1toClr	0
15	RESERVED	Reads returns 0	RW	0
14	RX3_FULL	Receiver register is full or almost full. Only when Channel 3 is enabled Read 0x0: r: Event false Write 0x0: w:Event status bit unchanged Write 0x1: w:Event status bit is reset Read 0x1: r: Event is pending	RW W1toClr	0
13	TX3_UNDERFLOW	Transmitter register underflow. Only when Channel 3 is enabled. The transmitter register is empty (not updated by host or DMA with new data) before its time slot assignment. Exception: No TX_underflow event when no data has been loaded into the transmitter register since channel has been enabled. Read 0x0: r: Event false Write 0x0: w:Event status bit unchanged Write 0x1: w:Event status bit is reset Read 0x1: r: Event is pending	RW W1toClr	0
12	TX3_EMPTY	Transmitter register is empty or almost empty. Note: Enabling the channel automatically rises this event. Read 0x0: r: Event false Write 0x0: w:Event status bit unchanged Write 0x1: w:Event status bit is reset Read 0x1: r: Event is pending	RW W1toClr	0
11	RESERVED	Reads returns 0.	RW	0

Bits	Field Name	Description	Type	Reset
10	RX2_FULL	Receiver register full or almost full. Channel 2 Read 0x0: r: Event false Write 0x0: w:Event status bit unchanged Write 0x1: w:Event status bit is reset Read 0x1: r: Event is pending	RW W1toClr	0
9	TX2_UNDERFLOW	Transmitter register underflow. Channel 2 Read 0x0: r: Event false Write 0x0: w:Event status bit unchanged Write 0x1: w:Event status bit is reset Read 0x1: r: Event is pending	RW W1toClr	0
8	TX2_EMPTY	Transmitter register empty or almost empty. Channel 2 Read 0x0: r: Event false Write 0x0: w:Event status bit unchanged Write 0x1: w:Event status bit is reset Read 0x1: r: Event is pending	RW W1toClr	0
7	RESERVED	Reads returns 0	RW	0
6	RX1_FULL	Receiver register full or almost full. Channel 1 Read 0x0: r: Event false Write 0x0: w:Event status bit unchanged Write 0x1: w:Event status bit is reset Read 0x1: r: Event is pending	RW W1toClr	0
5	TX1_UNDERFLOW	Transmitter register underflow. Channel 1 Read 0x0: r: Event false Write 0x0: w:Event status bit unchanged Write 0x1: w:Event status bit is reset Read 0x1: r: Event is pending	RW W1toClr	0
4	TX1_EMPTY	Transmitter register empty or almost empty. Channel 1 Read 0x0: r: Event false Write 0x0: w:Event status bit unchanged Write 0x1: w:Event status bit is reset Read 0x1: r: Event is pending	RW W1toClr	0
3	RX0_OVERFLOW	Receiver register overflow (slave mode only). Channel 0 Read 0x0: r: Event false Write 0x0: w:Event status bit unchanged Write 0x1: w:Event status bit is reset Read 0x1: r: Event is pending	RW W1toClr	0
2	RX0_FULL	Receiver register full or almost full. Channel 0 Read 0x0: r: Event false Write 0x0: w:Event status bit unchanged Write 0x1: w:Event status bit is reset Read 0x1: r: Event is pending	RW W1toClr	0
1	TX0_UNDERFLOW	Transmitter register underflow. Channel 0 Read 0x0: r: Event false Write 0x0: w:Event status bit unchanged Write 0x1: w:Event status bit is reset Read 0x1: r: Event is pending	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
0	TX0_EMPTY	Transmitter register empty or almost empty. Channel 0 Read 0x0: r: Event false Write 0x0: w:Event status bit unchanged Write 0x1: w:Event status bit is reset Read 0x1: r: Event is pending	RW W1toClr	0

<b>Address Offset</b>	0x124	<b>Instance</b>	MCSPI1 MCSPI2 MCSPI3 MCSPI4
<b>Physical Address</b>	See <a href="#">Table 23-303</a> .		
<b>Description</b>	This register is used to check the correctness of the system interconnect either internally to peripheral bus, or externally to device I/O pads, when the module is configured in system test (SYSTEST) mode.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																SSB	SPIENDIR	SPIDATDIR1	SPIDATDIR0	WAKD	SPICLK	SPIDAT_1	SPIDAT_0	SPIEN_3	SPIEN_2	SPIEN_1	SPIEN_0				

Bits	Field Name	Description	Type	Reset
31:12	RESERVED	Reads returns 0.	RW	0x00000
11	SSB	Set status bit  0x0: No action. Writing 0 does not clear already set status bits. This bit must be cleared before trying to clear a status bit of the <MCSPI_IRQSTATUS> register.  0x1: Force to 1 all status bits of <a href="#">MCSPI_IRQSTATUS</a> register. Writing 1 into this bit sets to 1 all status bits in the <MCSPI_IRQSTATUS> register.	RW	0
10	SPIENDIR	Set the direction of the SPIEN[3:0] lines and SPICLK line.  0x0: Output (as in master mode) 0x1: Input (as in slave mode)	RW	0
9	SPIDATDIR1	Set the direction of the SPIDAT[1].  0x0: Output 0x1: Input	RW	0
8	SPIDATDIR0	Set the direction of the SPIDAT[0].  0x0: Output 0x1: Input	RW	0

Bits	Field Name	Description	Type	Reset
7	WAKD	SWAKEUP output (signal data value of internal signal to system). The signal is driven high or low according to the value written into this register bit. 0x0: The pin is driven low. 0x1: The pin is driven high.	RW	0
6	SPICLK	SPICLK line (signal data value) If <a href="#">MCSPI_SYST[SPIENDIR]</a> = 1 (input mode direction), this bit returns the value on the CLKSPI line (high or low), and a write into this bit has no effect. If <a href="#">MCSPI_SYST[SPIENDIR]</a> = 0 (output mode direction), the CLKSPI line is driven high or low according to the value written into this register.	RW	0
5	SPIDAT_1	SPIDAT[1] line (signal data value) If <a href="#">MCSPI_SYST[SPIDATDIR1]</a> = 0 (output mode direction), the SPIDAT[1] line is driven high or low according to the value written into this register. If <a href="#">MCSPI_SYST[SPIDATDIR1]</a> = 1 (input mode direction), this bit returns the value on the SPIDAT[1] line (high or low), and a write into this bit has no effect.	RW	0
4	SPIDAT_0	SPIDAT[0] line (signal data value) If <a href="#">MCSPI_SYST[SPIDATDIR0]</a> = 0 (output mode direction), the SPIDAT[0] line is driven high or low according to the value written into this register. If <a href="#">MCSPI_SYST[SPIDATDIR0]</a> = 1 (input mode direction), this bit returns the value on the SPIDAT[0] line (high or low), and a write into this bit has no effect.	RW	0
3	SPIEN_3	SPIEN[3] line (signal data value) If <a href="#">MCSPI_SYST[SPIENDIR]</a> = 0 (output mode direction), the SPIEN[3] line is driven high or low according to the value written into this register. If <a href="#">MCSPI_SYST[SPIENDIR]</a> = 1 (input mode direction), this bit returns the value on the SPIEN[3] line (high or low), and a write into this bit has no effect.	RW	0
2	SPIEN_2	SPIEN[2] line (signal data value) If <a href="#">MCSPI_SYST[SPIENDIR]</a> = 0 (output mode direction), the SPIEN[2] line is driven high or low according to the value written into this register. If <a href="#">MCSPI_SYST[SPIENDIR]</a> = 1 (input mode direction), this bit returns the value on the SPIEN[2] line (high or low), and a write into this bit has no effect.	RW	0
1	SPIEN_1	SPIEN[1] line (signal data value) If <a href="#">MCSPI_SYST[SPIENDIR]</a> = 0 (output mode direction), the SPIEN[1] line is driven high or low according to the value written into this register. If <a href="#">MCSPI_SYST[SPIENDIR]</a> = 1 (input mode direction), this bit returns the value on the SPIEN[1] line (high or low), and a write into this bit has no effect.	RW	0
0	SPIEN_0	SPIEN[0] line (signal data value) If <a href="#">MCSPI_SYST[SPIENDIR]</a> = 0 (output mode direction), the SPIEN[0] line is driven high or low according to the value written into this register. If <a href="#">MCSPI_SYST[SPIENDIR]</a> = 1 (input mode direction), this bit returns the value on the SPIEN[0] line (high or low), and a write into this bit has no effect.	RW	0

<b>Address Offset</b>	0x128		
<b>Physical Address</b>	See <a href="#">Table 23-303</a> .	<b>Instance</b>	MCSPI1 MCSPI2 MCSPI3 MCSPI4
<b>Description</b>	This register is dedicated to the configuration of the serial port interface.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																FDAA	MOA	INITDLY				SYSTEM_TEST	MS	PIN34	SINGLE						

Bits	Field Name	Description	Type	Reset
31:9	RESERVED	Reads returns 0.	RW	0x000000
8	FDAA	FIFO DMA address 256-bit aligned This register is used when a FIFO is managed by the module and DMA connected to the controller provides only 256-bit aligned address. If this bit is set the enabled channel which uses the FIFO has its data managed through MCSPI_DAFTX and MCSPI_DAFRX registers instead of MCSPI_TX(i) and MCSPI_RX(i) registers.  0x0: FIFO data managed by MCSPI_TX(i) and MCSPI_RX(i) registers. 0x1: FIFO data managed by MCSPI_DAFTX and MCSPI_DAFRX registers.	RW	0
7	MOA	Multiple word OCP access: This register can only be used when a channel is enabled using a FIFO. It allows the system to perform multiple SPI word access for a single 32-bit OCP word access. This is possible for WL < 16.  0x0: Multiple word access disabled 0x1: Multiple word access enabled with FIFO	RW	0
6:4	INITDLY	Initial SPI delay for first transfer: This register is an option only available in SINGLE master mode. The controller waits for a delay to transmit the first SPI word after channel enabled and corresponding TX register filled. This delay is based on SPI output frequency clock. No clock output provided to the boundary and chip select is not active in 4-pin mode within this period.  0x0: No delay for first spi transfer. 0x1: The controller wait 4 SPI bus clock 0x2: The controller wait 8 SPI bus clock 0x3: The controller wait 16 SPI bus clock 0x4: The controller wait 32 SPI bus clock	RW	0x0
3	SYSTEM_TEST	Enables the system test mode  0x0: Functional mode 0x1: System test mode (SYSTEST)	RW	0
2	MS	Master/slave  0x0: Master - The module generates the SPICLK and SPIEN[3:0]. 0x1: Slave - The module receives the SPICLK and SPIEN[3:0].	RW	1

Bits	Field Name	Description	Type	Reset
1	PIN34	Pin mode selection: This register is used to configure the SPI pin mode, in master or slave mode. If asserted the controller only use SIMO, SOMI, and SPICLK clock pin for SPI transfers. 0x0: SPIEN is used as a chip-select. 0x1: SPIEN is not used. In this mode all related options to chip-select have no meaning.	RW	0
0	SINGLE	Single channel/Multi Channel (master mode only) 0x0: More than one channel will be used in master mode. 0x1: Only one channel will be used in master mode. This bit must be set in Force SPIEN mode.	RW	0

RESERVED	RESERVED	CLKG	FFER	FFEW	TCS0	SBPOL	SBE	SPIENSLV	FORCE	TURBO	IS	DPE1	DPE0	DMAR	DMAW	TRM	WL	EPOL	CLKD	POL	PHA										

Bits	Field Name	Description	Type	Reset
31:30	RESERVED	Read returns 0.	R	0x0
29	CLKG	Clock divider granularity This register defines the granularity of channel clock divider: power of 2 or one clock cycle granularity. When this bit is set the register MCSPI_CHCTRL[EXTCLK] must be configured to reach a maximum of 4096 clock divider ratio. Then the clock divider ratio is a concatenation of MCSPI_CHCONF[CLKD] and MCSPI_CHCTRL[EXTCLK] values 0x0: Clock granularity of power of 2 0x1: One clock cycle granularity	RW	0

Bits	Field Name	Description	Type	Reset
28	FFER	FIFO enabled for receive: Only one channel can have this bit field set. 0x0: The buffer is not used to receive data. 0x1: The buffer is used to receive data.	RW	0
27	FFEW	FIFO enabled for transmit: Only one channel can have this bit field set. 0x0: The buffer is not used to transmit data. 0x1: The buffer is used to transmit data.	RW	0
26:25	TCS0	Chip-select time control This 2-bit field defines the number of interface clock cycles between CS toggling and first or last edge of SPI clock. 0x0: 0.5 clock cycle 0x1: 1.5 clock cycles 0x2: 2.5 clock cycles 0x3: 3.5 clock cycles	RW	0x0
24	SBPOL	Start-bit polarity 0x0: Start-bit polarity is held to 0 during SPI transfer. 0x1: Start-bit polarity is held to 1 during SPI transfer.	RW	0
23	SBE	Start-bit enable for SPI transfer 0x0: Default SPI transfer length as specified by WL bit field 0x1: Start bit D/CX added before SPI transfer polarity is defined by MCSPI_CH0CONF[SBPOL]	RW	0
22:21	SPIENSLV	Channel 0 only and slave mode only: SPI slave select signal detection. Reserved bits for other cases. 0x0: Detection enabled only on SPIEN[0] 0x1: Detection enabled only on SPIEN[1] 0x2: Detection enabled only on SPIEN[2] 0x3: Detection enabled only on SPIEN[3]	RW	0x0
20	FORCE	Manual SPIEN assertion to keep SPIEN active between SPI words (single channel master mode only). 0x0: Writing 0 into this bit drives low the SPIEN line when MCSPI_CHCONF(i)[EPOL]=0, and drives it high when MCSPI_CHCONF(i)[EPOL]=1. 0x1: Writing 1 into this bit drives high the SPIEN line when MCSPI_CHCONF(i)[EPOL]=0, and drives it low when MCSPI_CHCONF(i)[EPOL]=1.	RW	0
19	TURBO	Turbo mode 0x0: Turbo is deactivated (recommended for single SPI word transfer). 0x1: Turbo is activated to maximize the throughput for multiple SPI words transfer.	RW	0

## 23.5 Multichannel Buffered Serial Port (McBSP)

This section introduces the multichannel buffered serial port (McBSP)

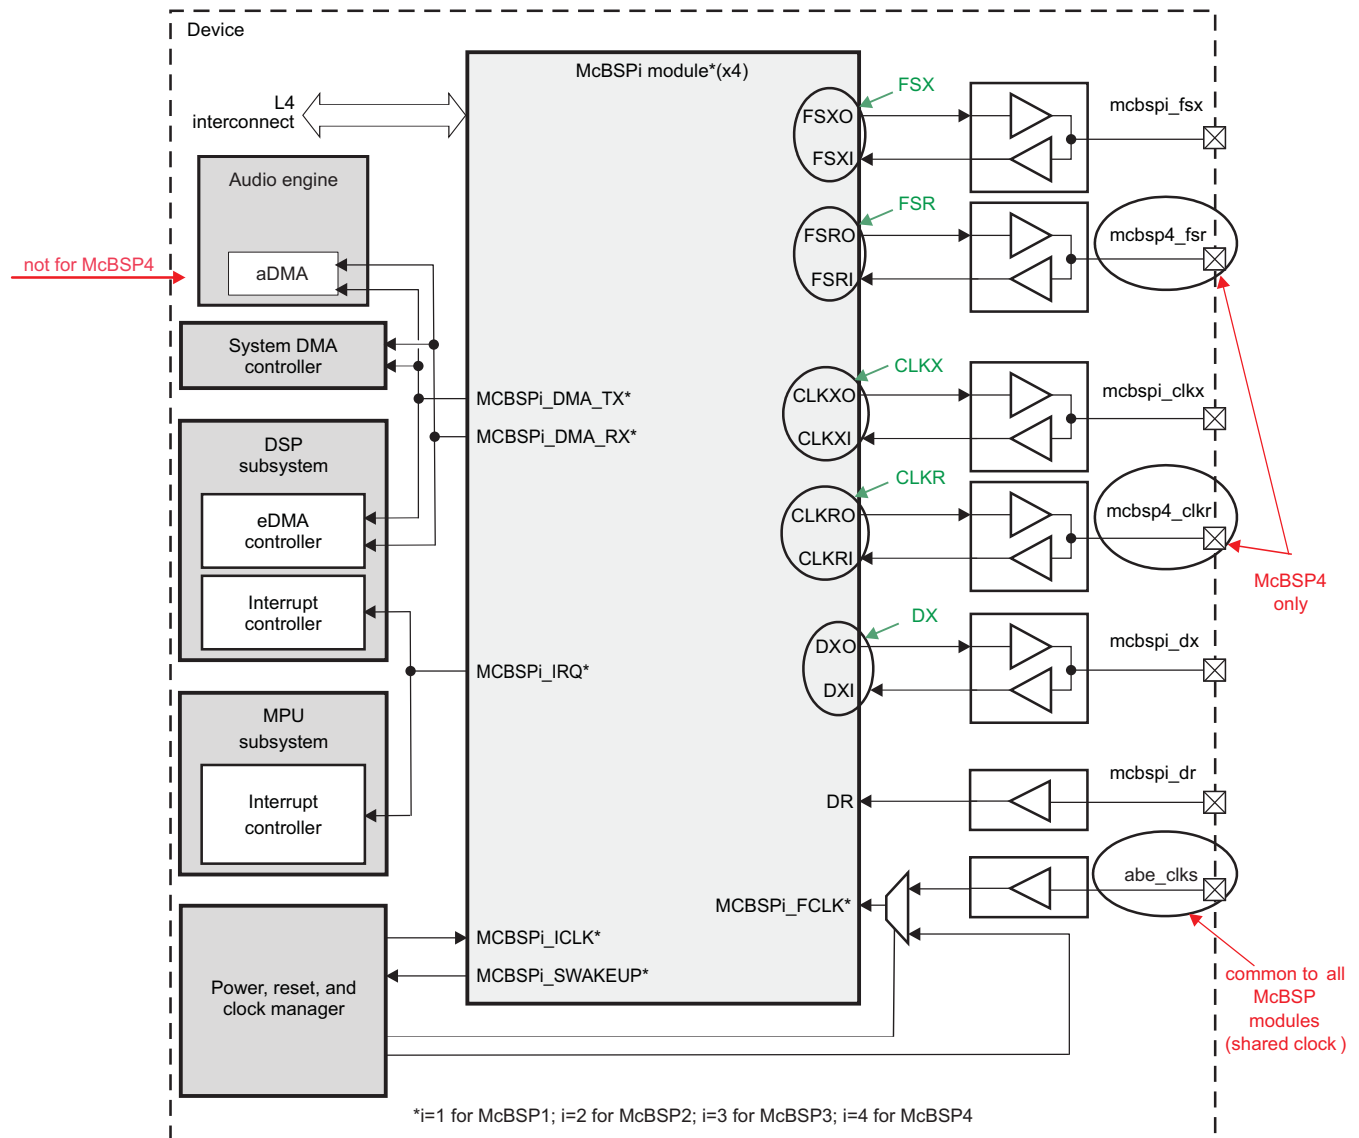

### 23.5.1 McBSP Overview

The McBSP provides a full-duplex direct serial interface between the device and other devices in a system such as other application devices (digital base band), audio and voice codec, etc. Because of its high level of versatility, it can accommodate a wide range of peripherals and clocked frame oriented protocols (for more information, see [Section 23.5.1.1, McBSP Features](#)).

The device provides four instances of the McBSP module.

Figure 23-111 is an overview of the McBSP in the device.

Figure 23-111. McBSP Highlight

mcbbsp-001

#### 23.5.1.1 McBSP Features

The main features of the McBSP modules are:

- L4 interconnect slave interface supports:

- 32-bit data bus width
- 32-bit access supported
- 16-/8-bit access not supported
- 10-bit address bus width
- Burst mode not supported
- Write nonposted transaction mode supported
- 128 × 32-bit words (512 bytes) for each buffer for transmit/receive operations
- Transmit and receive direct memory access (DMA) requests triggered with programmable FIFO thresholds
- Serial interface description
  - 6-pin configuration (McBSP 4 only)
  - 4-pin configuration (McBSP1, 2, 3)
  - Full-duplex communication
  - Multichannel selection modes
    - Support to enable or block transfers in each channel
    - 128 channels for transmission and reception
  - Direct interface to industry-standard codecs, analog interface chips (AICs), and other serially connected A/D and D/A devices:
    - Inter-IC sound (I2S™) compliant devices
    - Pulse code modulation (PCM) devices
    - Time division multiplexed (TDM) bus devices

**CAUTION**

McBSP modules do not offer support for  $\mu$ -law and A-law companding, two partitions mode dynamic reassignment, AC'97, and SPI protocol.

- A wide selection of data sizes: 8, 12, 16, 20, 24, and 32 bits
- Bit reordering (send/receive least-significant bit [LSB])
- Clock and frame-synchronization generation support:
  - Independent clocking and framing for reception and for transmission up to 48 MHz
  - Support for external generation of clock signals and frame-synchronization (frame-sync) signals
  - A programmable sample rate generator (SRG) for internal generation and control of clock signals and frame-sync signals
  - Programmable polarity for frame-sync pulses and clock signals

---

**NOTE:**

- McBSP modules do not support features such as retransmit or re-receive of an erroneous frame or word.
  - McBSP modules support dual-phase frames to provide I2S fully compliant capabilities. This dual-phase mode, however, is limited to one channel (or word) for each phase instead of 128 channels maximum for single-phase mode.
-

## 23.5.2 McBSP Environment

This section describes the intended functions for the McBSP module from an environment point of view (that is, external connections). It presents the McBSP connectivity options, lists the possible interfaces, and details the protocol and data format used in each case.

### 23.5.2.1 McBSP Functions

The device provides four instances of the McBSP module called McBSP1, McBSP2, McBSP3, and McBSP4.

The recommended use (nonexhaustive) for each McBSP module in the device is:

- McBSP1: Digital baseband (DBB) data
- McBSP2: Audio data
- McBSP3: Bluetooth® voice data
- McBSP4: Midi data

[Table 23-338](#) describes the functions and the corresponding application fields.

**Table 23-338. Functions Description**

Function	Application Field	Recommended McBSP Module	Description
Control and data	DBB data	McBSP1	Serial interface to transfer data
Audio data	Audio data without audio buffer and sidetone feature	McBSP2	Audio interface to transfer audio data with I2S
	Midi data	McBSP4	
Voice data	Bluetooth voice data without sidetone feature	McBSP3	Voice interface to transfer voice data with PCM

### 23.5.2.2 McBSP Signals Descriptions

The four McBSP modules consist of a data-flow path and a control path connected to external devices by a serial interface with 6-pin configuration (McBSP 4 only) or 4-pin configuration (McBSP1, 2, 3).

For a McBSP module with 6-pin configuration, an internal loopback capability between transmitter and receiver clock signals, and both frame-sync signals, enables using the McBSP module with 4-pin configuration. The related internal multiplexers are controlled through the system control module on the device (see [Section 23.5.3, McBSP Integration](#)). [Table 23-339](#) describes the inputs/outputs (I/Os).

**Table 23-339. I/O Description**

mcbbsp4_clkr	I/O <sup>(2)</sup>	Receive clock <sup>(5)</sup>	CLKR	Z	✓		
mcbbsp4_fsr	I/O <sup>(2)</sup>	Receive frame synchronization <sup>(6)</sup>	FSR	Z	✓		

<sup>(1)</sup> i = 1 to 3; I = Input; O = Output; I/O = Bidirectional

<sup>(2)</sup> For details of the I/O selection, see [Section 23.5.2.3.1, McBSP Modes](#).

<sup>(3)</sup> This signal is also used as CLKR when it is configured as output.

<sup>(4)</sup> This signal is also used as FSR when it is configured as output.

<sup>(5)</sup> This signal is also used as CLKX when it is configured as input.

<sup>(6)</sup> This signal is also used as FSX when it is configured as input.

- The abe\_clks pin can be used to inject an external clock. This clock is used to generate control signals depending on the module internal configuration (see [Section 23.5.4.9, McBSP SRG](#)). The CLKS signal of the McBSP modules is linked to an external signal through the abe\_clks pin, but the CLKS signal can also be linked to an internal clock provided by the power, reset, and clock management (PRCM) module of the device. For more information, see [Section 23.5.3, McBSP Integration](#).
- Data are transmitted to external devices interfacing with McBSP modules through the mcbspi\_dx pin. Data from those devices are received on the mcbspi\_dr pin.

---

**NOTE:** The mcbspi\_dx pin is an I/O signal to use the McBSP module in half-duplex mode.

---

- Control information is communicated by the following pins:
  - mcbspi\_clkx (transmit clock)
  - mcbbsp4\_clkr (receive clock)
  - mcbspi\_fsx (transmit frame-sync)
  - mcbbsp4\_fsr (receive frame-sync)

**CAUTION**

External pins `mcbasp4_clkr` and `mcbasp4_fsr` are connected to pads only for McBSP4; other McBSP modules do not have these connections. For these modules, `CLKR` and `FSR` signals sources are `mcbspi_clkx` and `mcbspi_fsx` pins, respectively. Consequently, there is a light restriction on other McBSP modules when used in full-duplex mode. Reception and transmission use the same clock signal and the same frame-sync signal.

**23.5.2.3 McBSP Functions Description**

**23.5.2.3.1 McBSP Modes**

For all McBSP functions, McBSP modules can operate in master or slave mode. The difference between these modes is the definition of the source of McBSP clocks and McBSP frames synchronization:

- Master mode: McBSP module provides them to the external device
- Slave mode: McBSP module receives them from the external device

The choice between the two modes depends on technical data of the external device and the type of interface (protocols and data formats). For one McBSP module, there are four possible functions:

- Transmit-and-receive master mode
- Transmit-and-receive slave mode
- Transmit master mode and receive slave mode
- Transmit slave mode and receive master mode

**NOTE:** If the McBSP has a serial interface with 4-pin configuration (McBSP1, 2, 3), only modes 1 and 2 are possible.

Figure 23-112 shows the connection between McBSP4 (6-pin configuration) and an external device in transmit master mode and receive slave mode.

**Figure 23-112. Mode Overview of McBSP4**

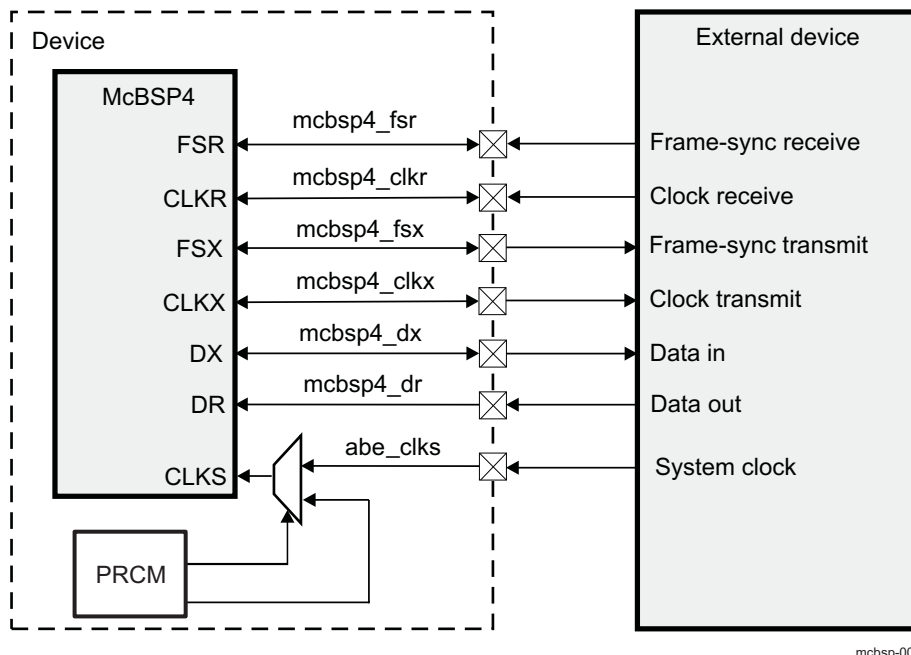

Figure 23-113 shows the connection between the McBSPi module, where  $i = 1, 2, \text{ or } 3$  (4-pin configuration) and an external device in transmit and receive master mode.

**Figure 23-113. Mode Overview of McBSPi**

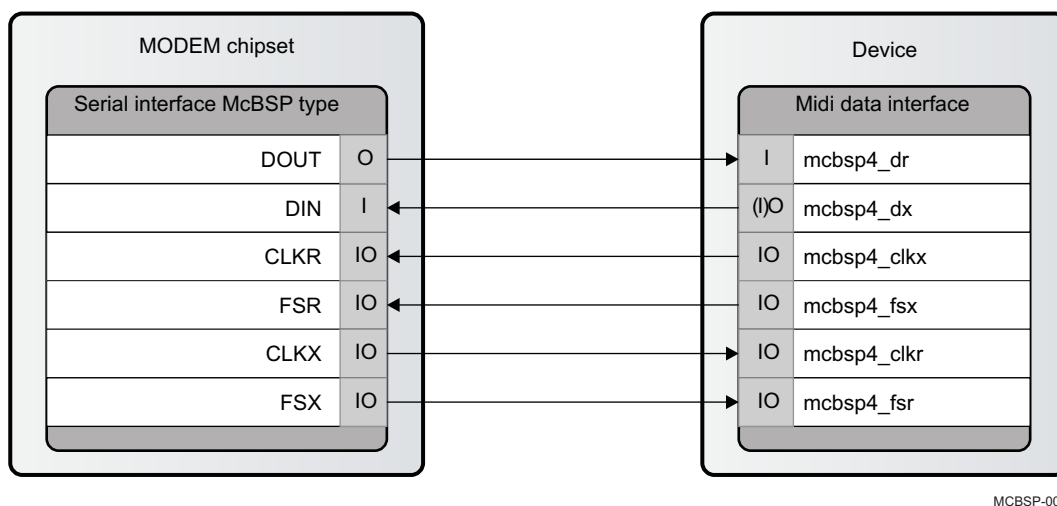

### 23.5.2.3.2 McBSP Functions

#### 23.5.2.3.2.1 McBSP Function 1: Control and Data

In full-duplex mode (reception and transmission use independent clock signals and frame-sync signals), the McBSP module can be used to exchange control and data with an external chipset, allowing the device to be interfaced with a modem device. Figure 23-114 shows typical connections between device and modem chipset to show the Midi data application.

**Figure 23-114. Midi Data Application**

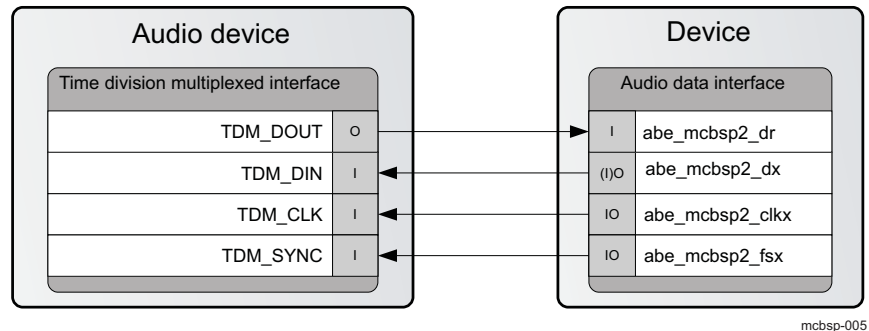

In Figure 23-114, McBSP4 is configured in transmit master mode and receive slave mode.

#### 23.5.2.3.2.2 McBSP Function 2: Audio Data

The McBSP module is connected to audio devices through the I2S interface. The I2S link serial interface is a TDM slot-based serial interface that is used to transfer audio data. Those audio devices can be either AICs or other serially connected A/D and D/A devices.

Figure 23-115 shows typical connections between a device and a typical device of analog audio interface to show the audio data application. The typical device contains several audio analog inputs and outputs and digital microphone inputs.

Figure 23-115. Audio Data Application

In Figure 23-115, McBSP2 is configured in transmit-and-receive master mode.

### 23.5.2.3.2.3 McBSP Function 3: Voice Data

The McBSP module is connected to a voice device through the PCM interface. The PCM link serial interface is a TDM slot-based serial interface that is used to transfer voice data. The voice devices can be modem chipsets, Bluetooth chipsets, or other devices with voice data interface.

Figure 23-116 shows typical connections between a device and a Bluetooth chipset (TI BRF6300 or TI BRF6350) to show voice data application.

Figure 23-116. Voice Data Application

In Figure 23-116, McBSP3 is configured in transmit-and-receive master mode.

### 23.5.2.4 McBSP Protocols and Data Formats

The McBSP module can use one of the three protocols with associated data formats:

- Serial protocol to exchange serial data
- Audio protocol to exchange the audio samples
- Voice protocol to exchange the voice samples

The McBSP modules offer the flexibility to modify the following parameters to adapt to the device features as described in the following subsections.

### 23.5.2.4.1 Words, Frames, and Phases Definitions

#### 23.5.2.4.1.1 Words or Channels

The data bits are transferred (transmission or reception) in a group called a serial word or channel. The number of bits in a word (length) is programmable through bit fields (McBSPi.MCBSPLP\_RCR1\_REG[7:5] RWDLEN1 and McBSPi.MCBSPLP\_RCR2\_REG[7:5] RWDLEN2, McBSPi.MCBSPLP\_XCR1\_REG[7:5] XWDLEN1 and McBSPi.MCBSPLP\_XCR2\_REG[7:5] XWDLEN2) and can be 8, 12, 16, 20, 24, or 32 bits (see [Section 23.5.4.8.3, Clocking and Framing Data](#)). The McBSP module uses clock signals to control the time for each bit transfer. Data are sampled/driven on the rising or falling edge of clock signals. This clock polarity is programmable through bit fields of the pin-control register (McBSPi.MCBSPLP\_PCR\_REG).

For more information, see [Section 23.5.4.8.4, Frame Phases \(Dual-Phase Frame I2S Support\)](#).

#### 23.5.2.4.1.2 Frames

One or more words (maximum 128) are transferred in a group called a frame. The McBSP module can transmit and receive a maximum of 128 words per frame, programmable through bit fields of transmit-and-receive control registers (McBSPi.MCBSPLP\_XCR1\_REG/McBSPi.MCBSPLP\_XCR2\_REG and McBSPi.MCBSPLP\_RCR1\_REG/McBSPi.MCBSPLP\_RCR2\_REG). For more details, see [Section 23.5.4.8.3, Clocking and Framing Data](#).

All the words in a frame are sent in a continuous stream. However, there can be pauses between frame transfers. The McBSP module uses frame-sync signals to determine when each frame is received or transmitted. When a pulse occurs on a frame-sync signal, the McBSP module begins receiving or transmitting a frame of data. When the next pulse occurs, the McBSP module receives or transmits the next frame, and so on. The frame-sync pulse is active high or low. This pulse polarity is programmable through bit fields of the pin control register (McBSPi.MCBSPLP\_PCR\_REG).

Each frame transfer can be delayed by 0, 1, or 2 clock cycles, depending on the value of bits for transmit and receive control registers (McBSPi.MCBSPLP\_XCR2\_REG and McBSPi.MCBSPLP\_RCR2\_REG). For more information, see [Section 23.5.4.10.6.3, Preventing Unexpected Transmit Frame-sync Pulses](#) and [Section 23.5.4.10.3.3, Preventing Unexpected Receive Frame-sync Pulses](#).

#### 23.5.2.4.1.3 Phases

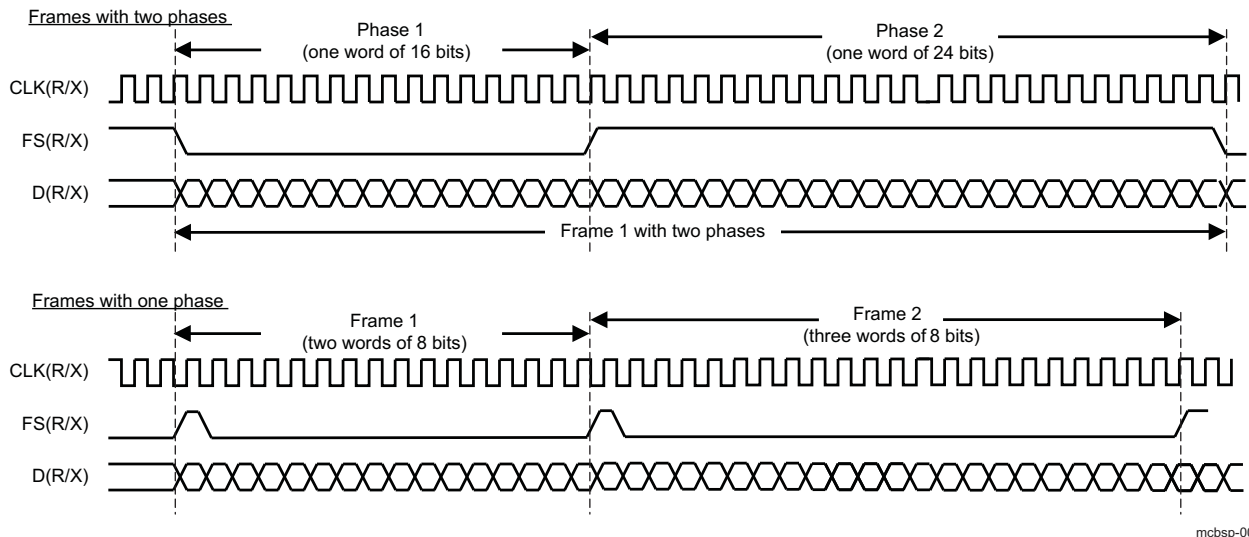

The McBSP module allows configuring of each frame to contain one or two phases. The McBSP module supports dual-phase frames to provide I2S fully compliant capabilities. These two phases represent left and right channels of audio stereo signals.

The limitation on dual-phase frame is that the number of words per phase must be set to 1 for both first and second phases. The number of bits per word, however, can be specified differently for each of the two phases of a frame, allowing greater flexibility in structuring data transfers.

For example, software may define a frame composed of a first phase with one 12-bit word and a second phase with one 16-bit word. This configuration allows the software to compose frames for custom applications. For more details, see [Section 23.5.4.8.4, Frame Phases \(Dual-Phase Frame I2S Support\)](#).

[Figure 23-117](#) shows signal activity for two possible reception/transmission scenarios.

Figure 23-117. McBSP Reception/Transmission Signal Activity

mcbasp-007

### 23.5.2.4.2 Serial Protocol and Data Formats

#### 23.5.2.4.2.1 Protocol

The serial protocol is used to send and receive control data without specific formats. This allows the McBSP module to accommodate all serial devices and their protocols.

#### 23.5.2.4.2.2 Data Format

Figure 23-118 shows typical operation of the McBSP clock and frame-sync signals. Serial clocks CLKR and CLKX define the boundaries between bits for receive and transmit, respectively. Similarly, frame-sync signals FSR and FSX define the beginning of an element and/or frame transfer. The McBSP module allows the configuration of the following parameters for data and frame synchronization:

- Polarity of FSR, FSX, CLKX, and CLKR
- The number of words per frame
- The number of bits per word
- Whether subsequent frame synchronization restarts the serial data stream or is ignored
- The data delay from frame synchronization to first data bit which can be 0-, 1-, or 2-bit delays

The configuration is independent for receive and transmit parts. For more details and configuration examples, see Section 23.5.4, *McBSP Functional Description*, and Section 23.5.5, *McBSP Basic Programming Model*.

Figure 23-118. Serial Data Formats

mcbasp-009

### 23.5.2.4.3 Audio Protocol and Data Formats

#### 23.5.2.4.3.1 Protocol

The I2S protocol is used to send and receive audio data from 8-kHz to 48-kHz sampling rate (frame-sync frequency), with 16 bits or 32 bits per words. Two standard sample rate groups used in audio applications are supported: 48KHz and 44.1KHz. The 48KHz sample rate group includes 8KHz, 16KHz, 24KHz, 32KHz, and 48KHz frequencies. The 44.1KHz sample rate group includes 11.025KHz, 22.05KHz, and 44.1KHz frequencies.

Based on required sample rate, it is recommended the I2S clock to be configured as multiple of 44.1KHz or 96KHz (48KHz × 2).

For example:

McBSP clock is provided by the system clock and is set to 12.288MHz (48KHz × 256) for the first group and 11.2896MHz (44.1 × 256) for the second group. In this example, 256 is the value for Sample Rate Generator Clock Divider, which should be set in the `MCBSPLP_SRGR1_REG[7:0]` CLKGDIV bit field.

The frame-sync signal defines the frame length in the I2S protocol. Each frame consists of a fixed number of words. In dual-phase frame, the frame-sync signal is low for the left phase time slot and is high for the right phase time slot. In addition, the frame-sync signal is synchronous to the falling edge of the clock signal.

#### 23.5.2.4.3.2 Data Formats

The I2S protocol supports TDM, I2S, left-justified, and right-justified data formats.

Bits of each word (sample) are clocked using the clock signal. For each word, the most-significant bit (MSB) is first. LSBs are padded to 0 when the data length (8, 12, 16, 20, or 24 bits) is less than the sample word width (16 or 32 bits).

##### 23.5.2.4.3.2.1 TDM Data Format

Figure 23-119 shows that each frame of TDM data format is composed of four words (or channels).

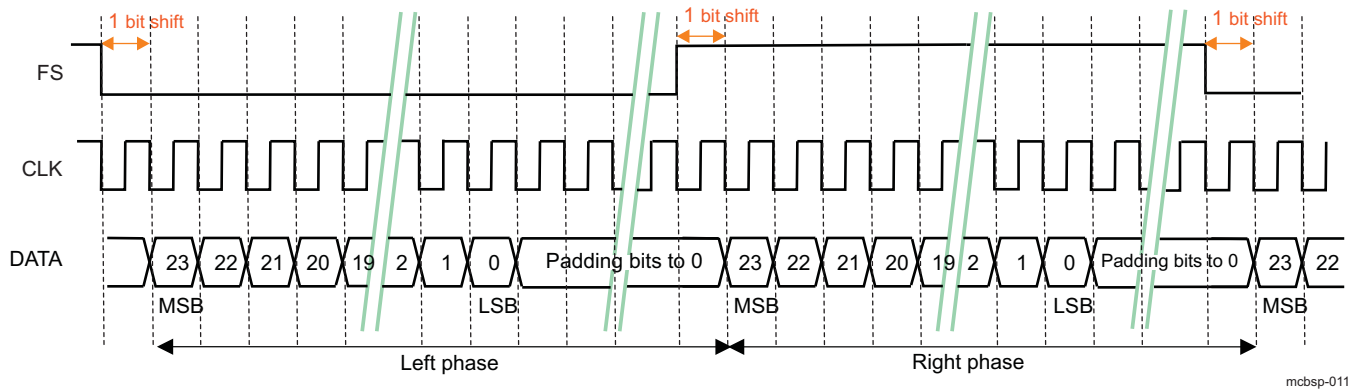

**Figure 23-119. TDM Data Format; Word Width: 32 Bits; Data Length: 24 Bits**

##### 23.5.2.4.3.2.2 I2S Data Format

Figure 23-120 shows an example with 24-bit data (MSB first) and 8 padding bits at 0.

Figure 23-120. I2S Data Format; Word Width: 32 Bits; Data Length: 24 Bits

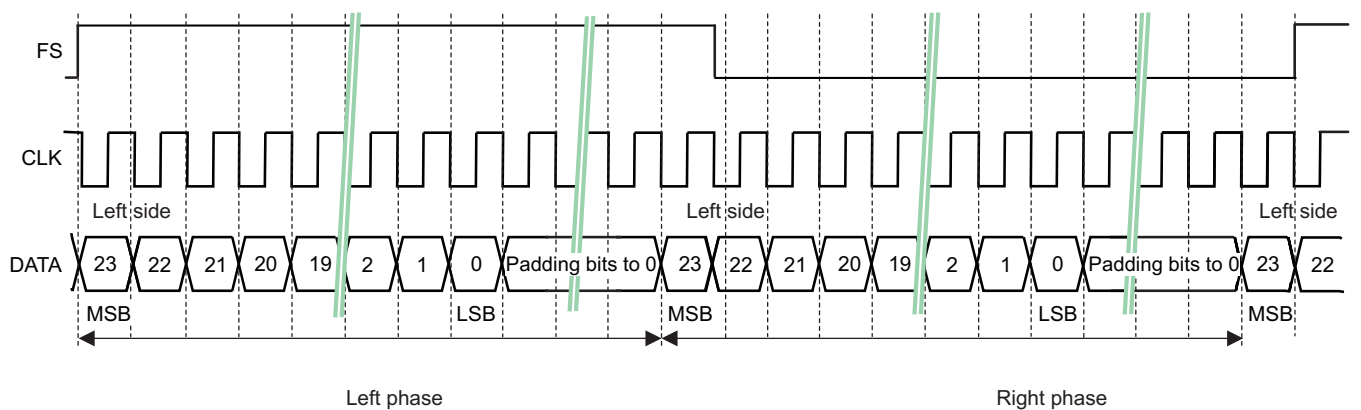

mcbasp-011

### 23.5.2.4.3.2.3 Left-Justified Data Format

Figure 23-121 shows an example with 24-bit data (MSB first) and 8 padding bits at 0.

Figure 23-121. Left-Justified Data Format; Word Width: 32 Bits; Data Length: 24 Bits

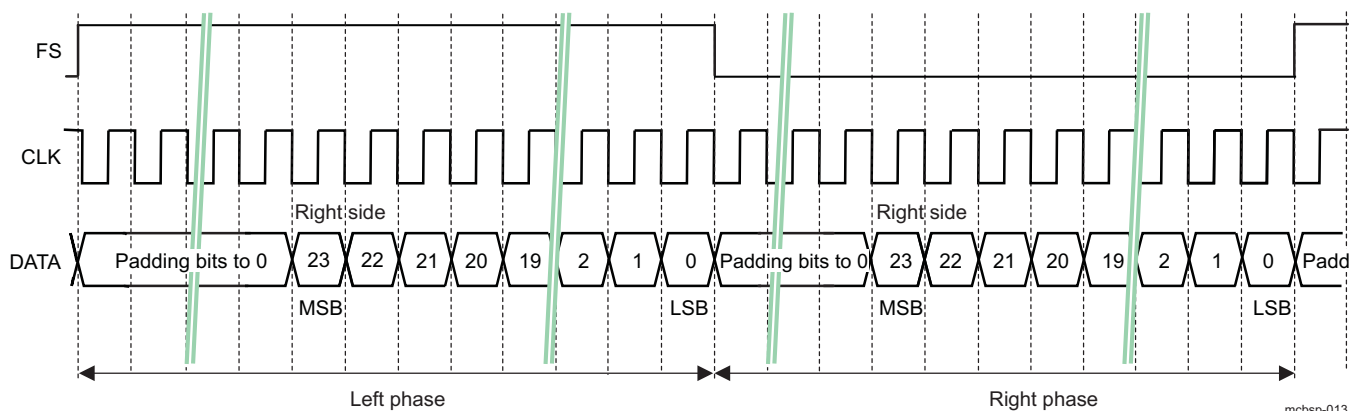

mcbasp-012

### 23.5.2.4.3.2.4 Right-Justified Data Format

Figure 23-122 shows an example with 24-bit data (MSB first) and 8 padding bits at 0.

Figure 23-122. Right-Justified Data Format; Word Width: 32 Bits; Data Length: 24 Bits

mcbasp-013

### 23.5.2.4.4 Voice Protocol and Data Formats

#### 23.5.2.4.4.1 Protocol

The PCM protocol is intended to transfer voice data at 8-kHz (default narrowband mode) or 16-kHz (wideband mode) sample rate (frame-sync frequency). PCM protocol can act as a slave or master, and is used by the Bluetooth interface and the modem generic interface. The frame synchronization defines the frame length in the PCM protocol. Bits are clocked using the PCM clock signal, with the MSB first.

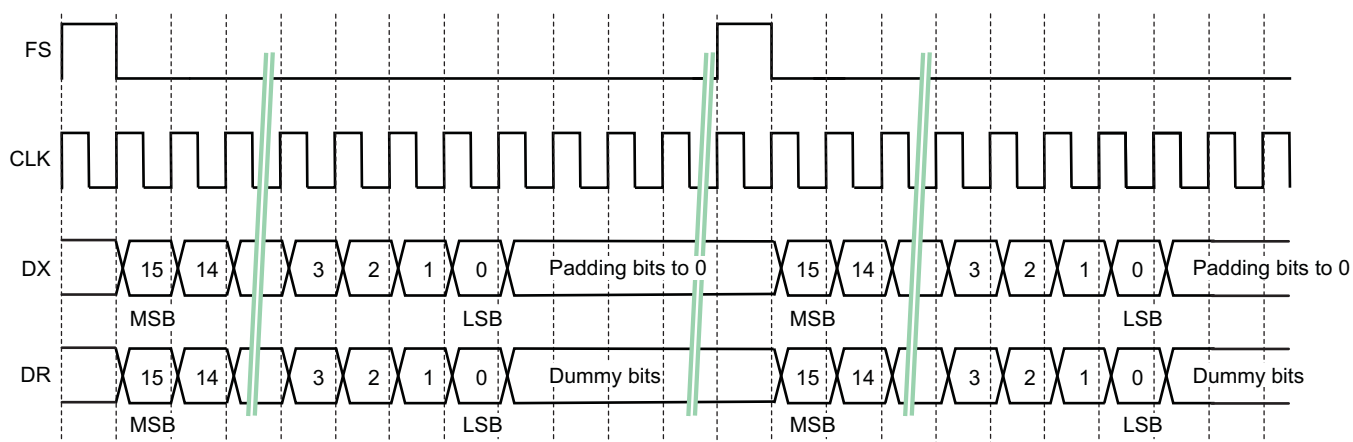

#### 23.5.2.4.4.2 Data Formats

Two modes are available for the PCM protocol: mode 1 and mode 2. Both modes have two types of operations: mono or stereo channels. The difference between PCM mode 1 and PCM mode 2 is in the way in which they use the rising or the falling edge of the clock signal, and the frame-sync polarity.

- PCM mode 1: Input data is latched on the falling edge of the clock, and the transmitted data starts on the rising edge of the clock. The frame-sync pulse is active high.
- PCM mode 2: Input data is latched on the rising edge of the clock, and the transmitted data starts on the falling edge of the clock. The frame-sync pulse is active low.

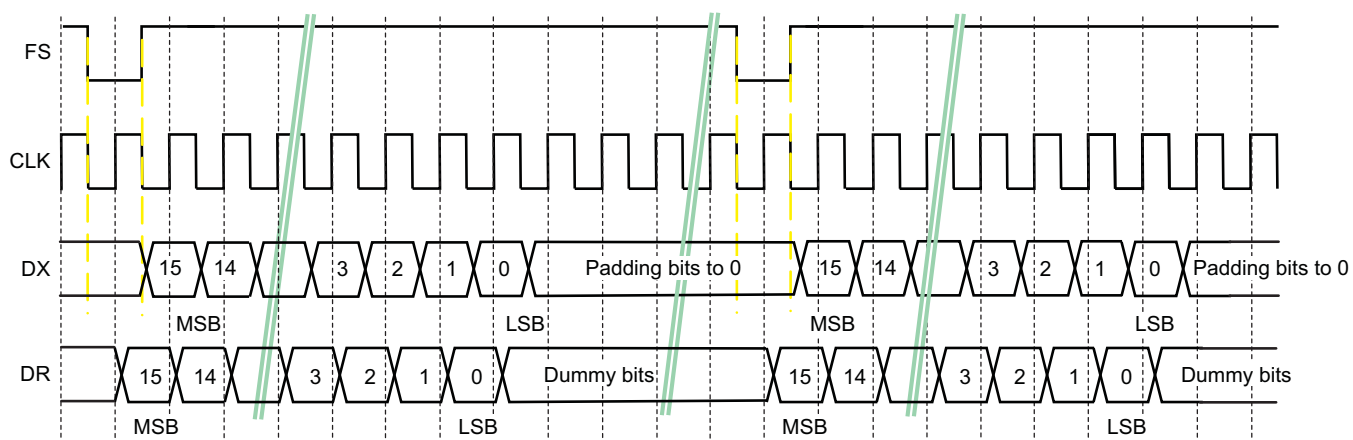

Figure 23-123 and Figure 23-124 show an example of PCM protocol, mode 1 and mode 2, respectively, for a frame composed of one word (32 bits wide) with 16 bits of data.

**Figure 23-123. PCM Protocol – Mode 1 Data Format**

mcbasp-014

**Figure 23-124. PCM Protocol – Mode 2 Data Format**

mcbasp-015

### 23.5.3 McBSP Integration

This section describes the integration of the McBSP module in the device, including information about clocks, resets, and hardware requests.

McBSP modules are divided into two families: McBSP modules that are gated in the AUDIO power domain (McBSP1, 2, and 3) and in the L4\_PER power domain (McBSP4).

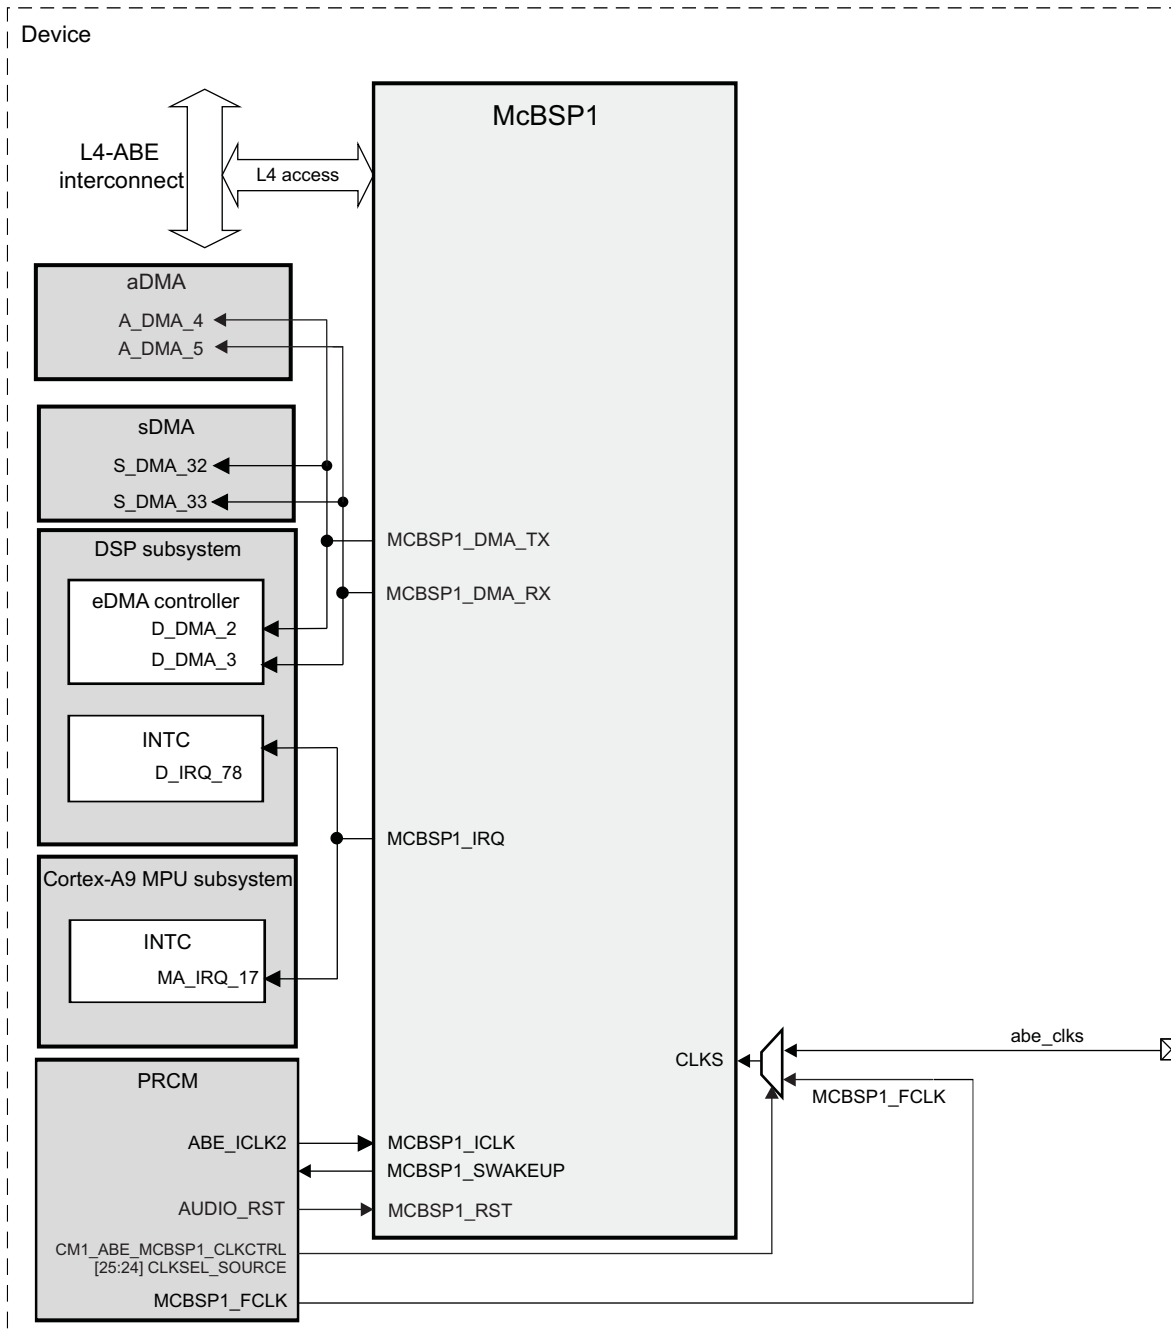

[Figure 23-125](#) through [Figure 23-128](#) show the integration of the McBSP modules in the device, including interrupt handlers, DMA requests, clock generators, and interconnections.

The features of the McBSP modules are:

- Wake-up request
- Two DMA requests
- One IRQ
- One functional clock
- One interface clock

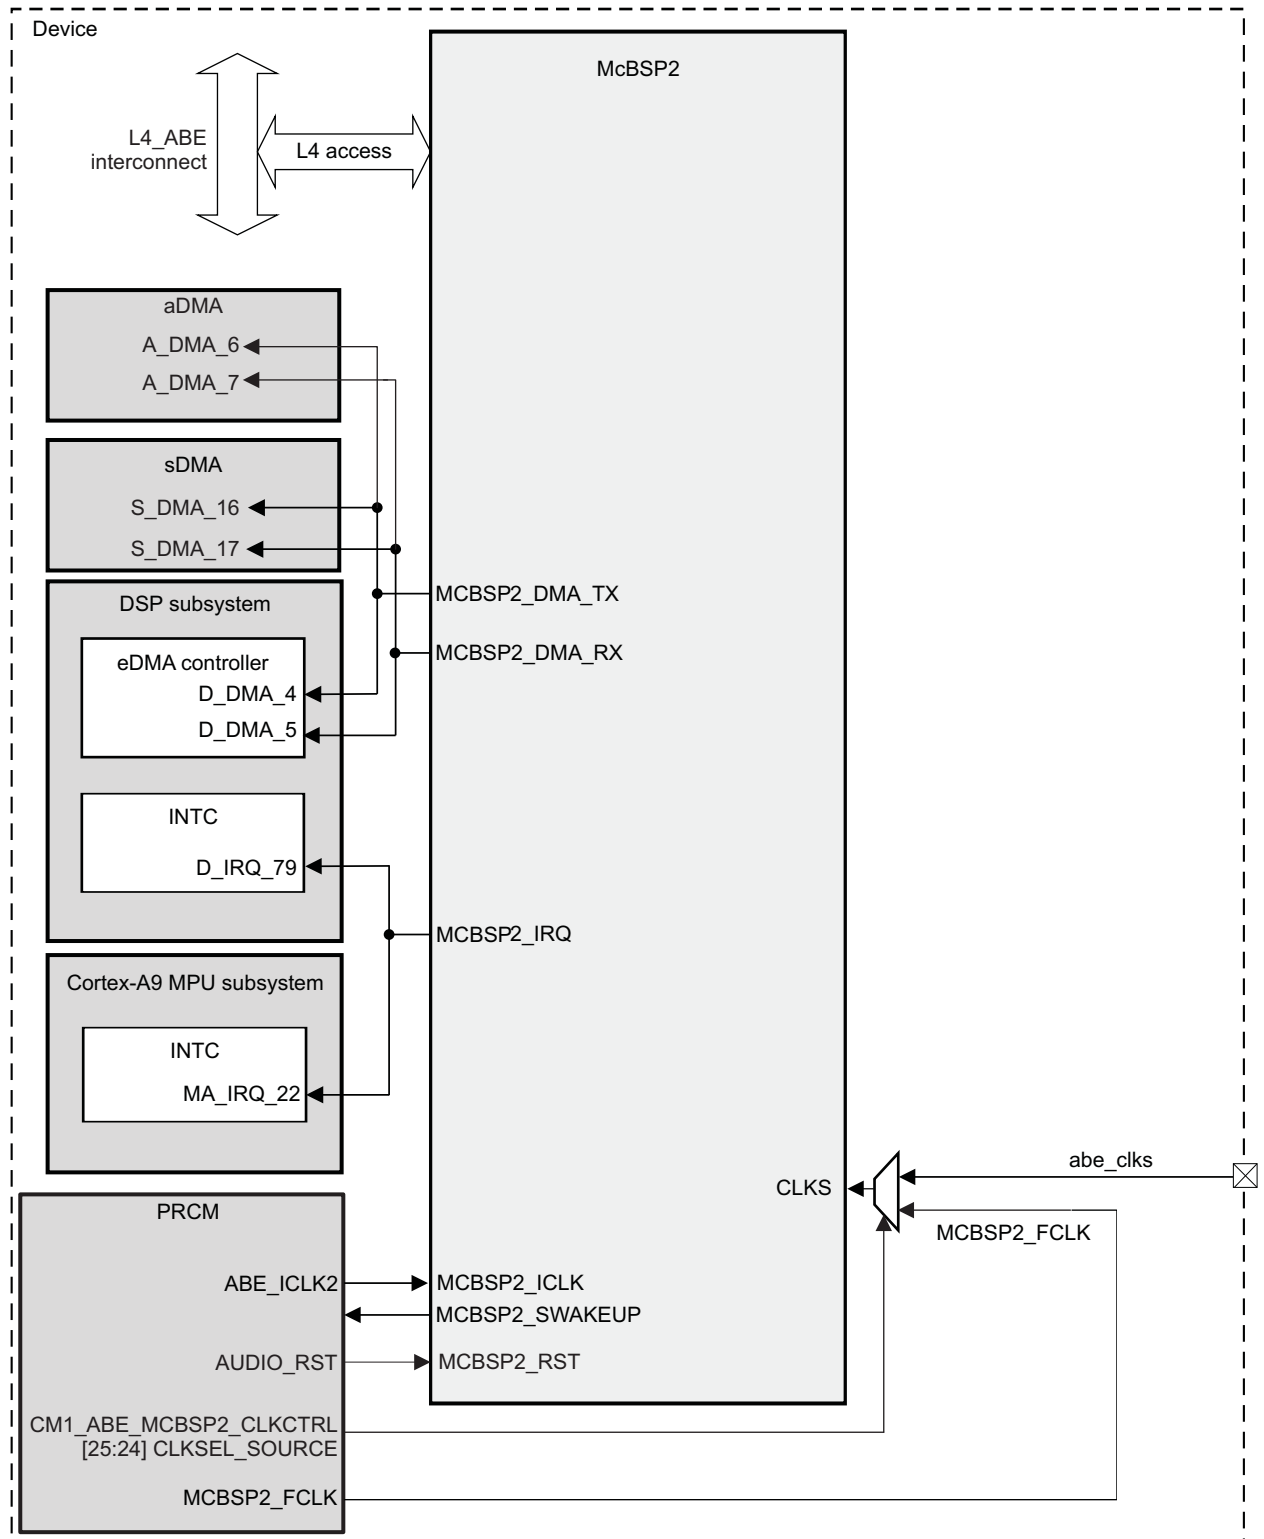

Figure 23-125. McBSP1 Integration

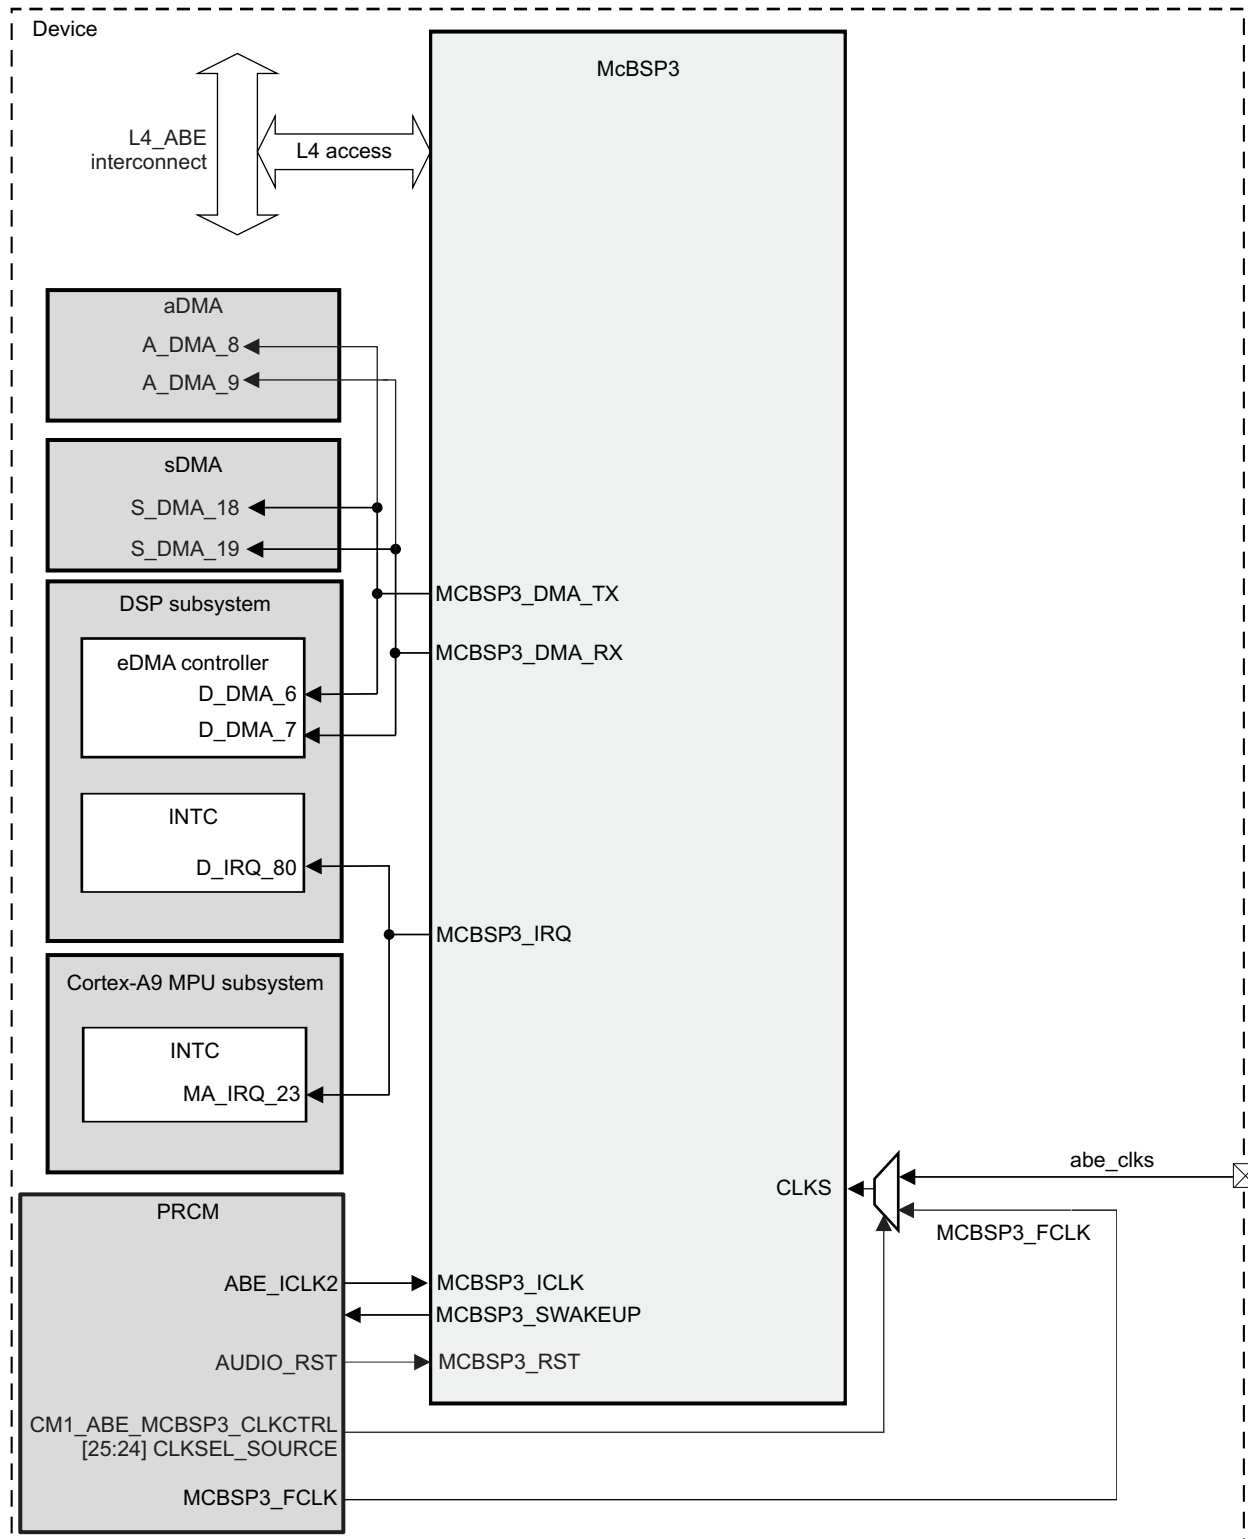

mcbasp-074

Figure 23-126. McBSP2 Integration

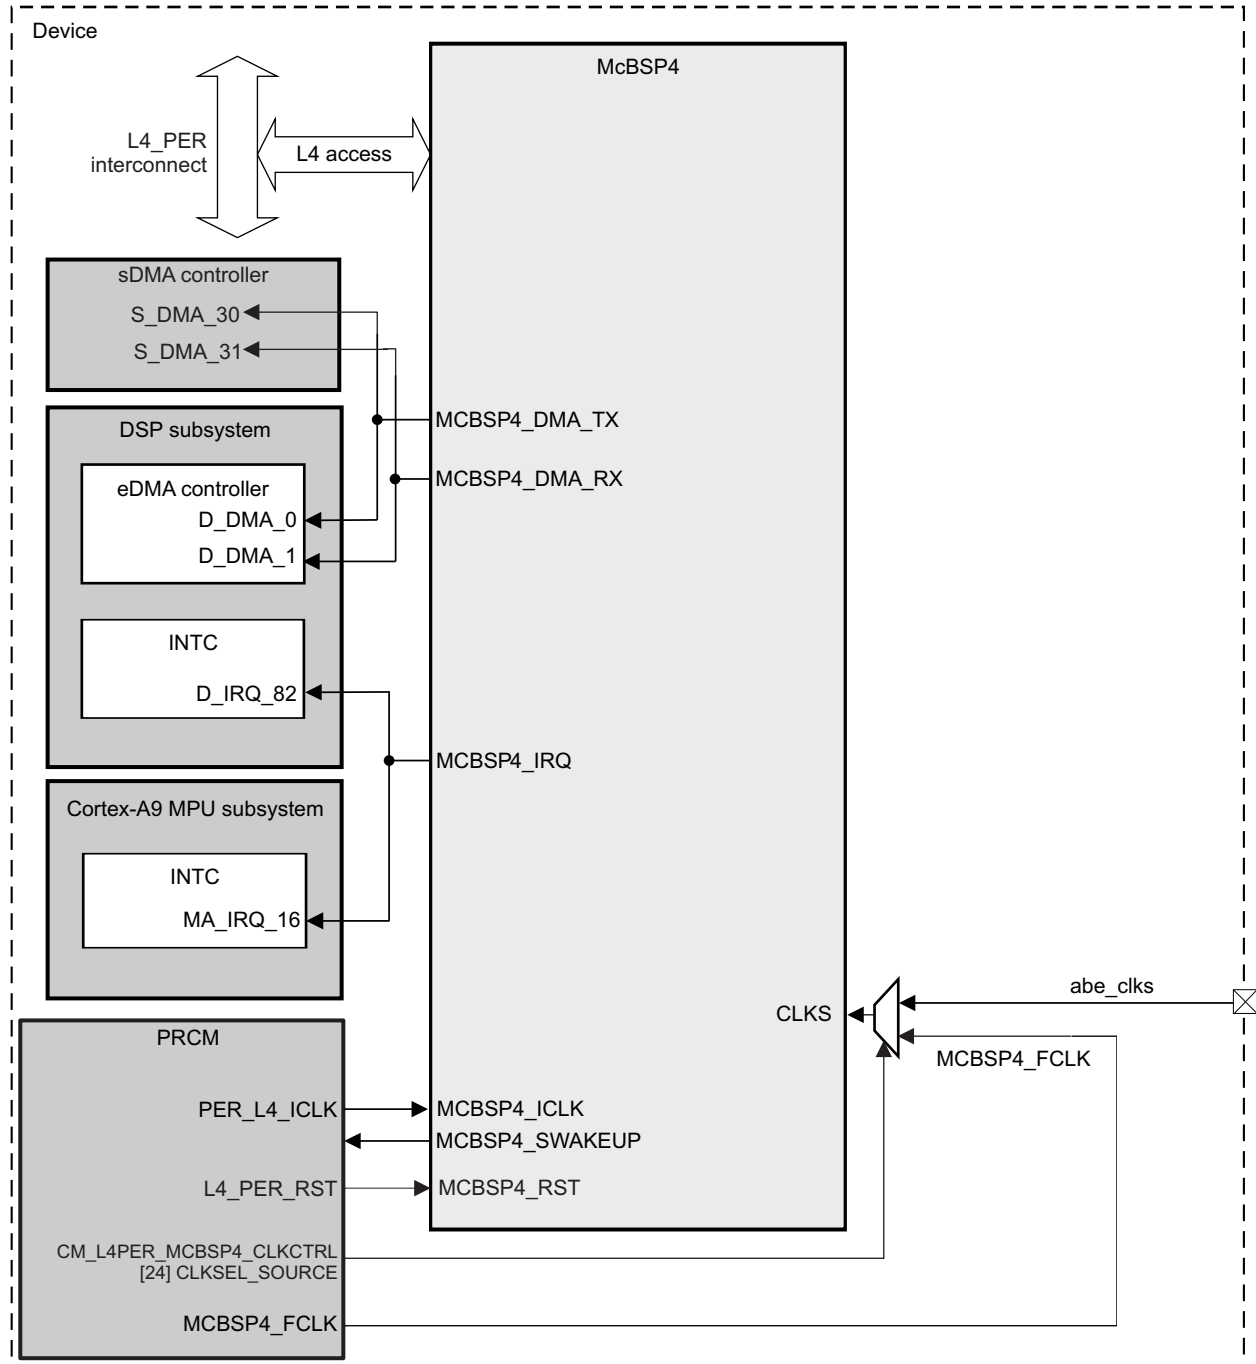

mcbasp-018

Figure 23-127. McBSP3 Integration

mcbasp-019

Figure 23-128. McBSP4 Integration

mcbasp-017

**NOTE:** The selection between the FSX and FSR signals is made in the CONTROL\_MCBSP4[31] ALBCTRLRX\_FSX bit in the control module register. The selection between the CLKR and CLKX signals is made in the CONTROL\_MCBSP4[30] ALBCTRLRX\_CLKX bit in the control module register.

Table 23-340 through Table 23-342 summarize the integration of the module in the device.

**Table 23-340. Integration Attributes**

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
MCBSP1	PD_AUDIO	Yes	L4_ABE
MCBSP2	PD_AUDIO	Yes	L4_ABE
MCBSP3	PD_AUDIO	Yes	L4_ABE
MCBSP4	PD_L4_PER	Yes	L4_PER

**Table 23-341. Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
MCBSP1	MCBSP1_ICLK	ABE_ICLK2	PRCM	MCBSP1 interface clock
	MCBSP1_FCLK	MCBSP1_FCLK	PRCM	MCBSP1 functional clock

MCBSP3	MCBSP3_DMA_TX	A_DMA_8	aDMA	MCBSP module 3: Transmit DMA request
	MCBSP3_DMA_RX	A_DMA_9	aDMA	MCBSP module 3: Receive DMA request
	MCBSP3_DMA_TX	S_DMA_18	sDMA	MCBSP module 3: Transmit DMA request
	MCBSP3_DMA_RX	S_DMA_19	sDMA	MCBSP module 3: Receive DMA request
	MCBSP3_DMA_TX	D_DMA_6	dDMA	MCBSP module 3: Transmit DMA request
	MCBSP3_DMA_RX	D_DMA_7	dDMA	MCBSP module 3: Receive DMA request
MCBSP4	MCBSP4_DMA_TX	S_DMA_30	sDMA	MCBSP module 4: Transmit DMA request
	MCBSP4_DMA_RX	S_DMA_31	sDMA	MCBSP module 4: Receive DMA request
	MCBSP4_DMA_TX	D_DMA_0	aDMA	MCBSP module 4: Transmit DMA request
	MCBSP4_DMA_RX	D_DMA_1	aDMA	MCBSP module 4: Receive DMA request

**NOTE:**

- For more information about the interrupt source, see [Section 23.5.4.6, Interrupt Requests](#).
- For more information about the DMA source, see [Section 23.5.4.7, DMA Requests](#).

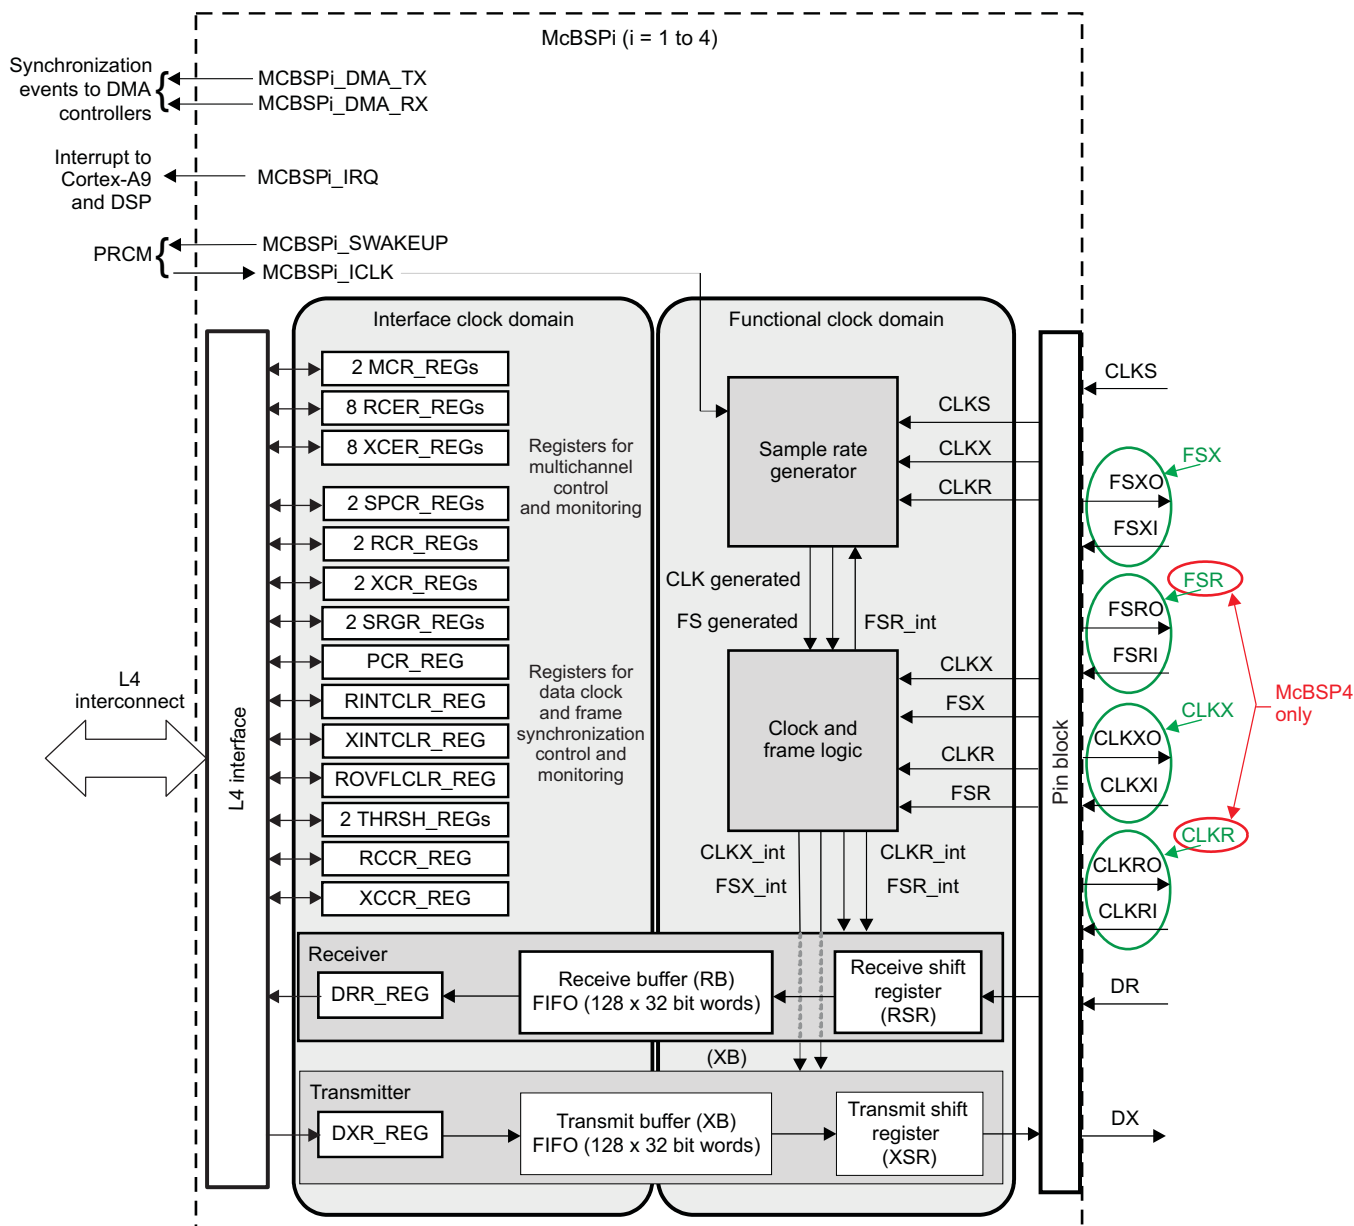

### 23.5.4 McBSP Functional Description

This section is a functional description of the McBSP module.

#### 23.5.4.1 Block Diagram

Figure 23-129 shows the functional block diagram of the four instances of the McBSP modules.

Figure 23-129. McBSPi Block Diagram

mcbasp-021

#### 23.5.4.2 Signal Source Control

The sources of the CLKX, DX, DR, FSX, FSR, and CLKR signals are defined by the system control module. The control registers of the system control module are used to select these signal sources. For more information, see [Chapter 18, Control Module](#).

### 23.5.4.3 McBSP Clock Configuration

#### 23.5.4.3.1 McBSP1 Clocks

McBSP1 is clocked by a functional clock (CLKS and CLKX) and an interface clock (MCBSP1\_ICLK).

- The functional clock is used to generate control signals depending on the internal configuration of the module (see [Section 23.5.4, McBSP Functional Description](#)). For McBSP1, the functional clock comes from the CLKS and CLKX signals. The choice between these two clocks is defined by the MCBSP1.MCBSPLP\_PCR\_REG[7] SCLKME bit and the MCBSP1.MCBSPLP\_SRGR2\_REG[13] CLKSM bit.

The CLKS signal of McBSP1 is linked to an internal clock (MCBSP1\_FCLK) provided by the PRCM module. The CLKS signal can also be linked to an external signal through the `abe_clks` pin of the device boundary.

---

**NOTE:** When McBSP1 no longer requires the functional clock, software can disable it at the PRCM level by configuring the MODULEMODE bit field to 0x0 (PRCM.CM1\_ABE\_MCBSP1\_CLKCTRL[1:0]) in the PRCM registers. The clock is effectively cut, provided the other modules that receive it do not require it.

At the PRCM level, when all the conditions to shut off the MCBSP1\_FCLK clock are met, the PRCM module automatically launches a hardware handshake protocol to ensure McBSP is ready to have this clock switched off. Namely, the PRCM module asserts an IDLE request to the McBSP module. For more information, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

---

Only the CLKX signal is connected by `mcbbsp4_clkx` pads. The CLKR signal is connected to the CLKX signal. These signals are used like functional clocks by the intermediary of SRG.

- The MCBSP1\_ICLK runs at the L4 core interconnect clock speed. It is used to trigger access to the McBSP1 L4 interface and McBSP1 configuration interface through the Cortex-A9 MPU/DSP shared bus. It can also be an input clock for the McBSP SRG (clock divider), depending on the module configuration (see [Section 23.5.4.9, McBSP SRG](#)). Its source is the ABE\_ICLK2 signal.

---

**NOTE:** When McBSP1 no longer requires the interface clock, software can disable it at the PRCM level by configuring the MODULEMODE bit field (PRCM.CM1\_ABE\_MCBSP1\_CLKCTRL[1:0]) in the PRCM registers. The clock is effectively cut, provided the other modules that receive it do not require it.

At the PRCM level, when all the conditions to shut off the ABE\_ICLK2 clock are met the PRCM module automatically launches a hardware handshake protocol to ensure McBSP is ready to have this clock switched off. Namely, the PRCM module asserts an IDLE request to the McBSP module. For more information, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

---

#### 23.5.4.3.2 McBSP2 Clocks

McBSP2 is clocked by a functional clock (CLKS or CLKX) and an interface clock (MCBSP2\_ICLK).

- The functional clock is used to generate control signals depending on the internal configuration of the module (see [Section 23.5.4, McBSP Functional Description](#)). For McBSP2, the functional clock comes from the CLKS and CLKX signals. The choice between these two clocks is defined by the MCBSP2.MCBSPLP\_PCR\_REG[7] SCLKME bit and the MCBSP2.MCBSPLP\_SRGR2\_REG[13] CLKSM bit.

---

**NOTE:** When McBSP2 no longer requires the functional clock, software can disable it at the PRCM level by configuring the MODULEMODE bit field to 0x0 (PRCM.CM1\_ABE\_MCBSP2\_CLKCTRL[1:0]) in the PRCM registers. The clock is effectively cut, provided the other modules that receive it do not require it.

At the PRCM level, when all the conditions to shut off the MCBSP2\_FCLK clock are met the PRCM automatically launches a hardware handshake protocol to ensure McBSP is ready to have this clock switched off. Namely, the PRCM module asserts an IDLE request to the McBSP module. For more information, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

---

Only the CLKX signal is connected by mcbasp2\_clkx pads. The CLKR signal is connected to the CLKX signal. These signals are used like functional clocks by the intermediary of the SRG.

- The MCBSP2\_ICLK runs at the L4 core interconnect clock speed. It is used to trigger access to the McBSP2 L4 interface and McBSP2 configuration interface through the Cortex-A9 MPU/DSP shared bus. It can also be an input clock for the McBSP SRG (clock divider), depending on the module configuration (see [Section 23.5.4.9, McBSP SRG](#)). Its source is the ABE\_ICLK2 signal.

---

**NOTE:** When McBSP2 no longer requires the interface clock, software can disable it at the PRCM level by configuring the MODULEMODE bit field (PRCM.CM1\_ABE\_MCBSP2\_CLKCTRL[1:0]) in the PRCM registers. The clock is effectively cut, provided the other modules that receive it do not require it.

At the PRCM level, when all the conditions to shut off the ABE\_ICLK2 clock are met the PRCM module automatically launches a hardware handshake protocol to ensure McBSP is ready to have this clock switched off. Namely, the PRCM module asserts an IDLE request to the McBSP module. For more information, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

---

### 23.5.4.3.3 McBSP3 Clocks

McBSP3 is clocked by a functional clock (CLKS or CLKX) and an interface clock (MCBSP3\_ICLK).

- The functional clock is used to generate control signals depending on the internal configuration of the module (see [Section 23.5.4, McBSP Functional Description](#)). For McBSP3, the functional clock comes from the CLKS and CLKX signals. The choice between these two clocks is defined by the MCBSP3.MCBSPLP\_PCR\_REG[7] SCLKME bit and the MCBSP3.MCBSPLP\_SRGR2\_REG[13] CLKSM bit.

---

**NOTE:** When McBSP3 no longer requires the functional clock, software can disable it at the PRCM level by configuring the MODULEMODE bit field to 0x0 (PRCM.CM1\_ABE\_MCBSP3\_CLKCTRL[1:0]) in the PRCM registers. The clock is effectively cut, provided the other modules that receive it do not require it.

At the PRCM level, when all the conditions to shut off the MCBSP3\_FCLK clock are met the PRCM module automatically launches a hardware handshake protocol to ensure McBSP is ready to have this clock switched off. Namely, the PRCM module asserts an IDLE request to the McBSP module. For more information, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

---

Only, the CLKX signal is connected by mcbasp3\_clkx pads. The CLKR signal is connected to the CLKX signal. These signals are used like functional clocks by the intermediary of SRG.

- The MCBSP3\_ICLK runs at the L4 core interconnect clock speed. It is used to trigger access to the McBSP3 L4 interface and McBSP3 configuration interface via the Cortex-A9 MPU/DSP shared bus. It can also be an input clock for the McBSP sample-rate generator (clock divider), depending on the module configuration (see [Section 23.5.4.9, McBSP SRG](#)). Its source is either the ABE\_ICLK2 signal.

**NOTE:** When the McBSP2 module does not require the interface clock anymore, the software can disable it at the PRCM level by configuring the MODULEMODE bit field (PRCM.CM1\_ABE\_MCBSP3\_CLKCTRL[1:0]) in the PRCM registers. The clock is effectively cut, provided the other modules that receive it do not require it.

At PRCM level, when all the conditions to shut-off ABE\_ICLK2 clock are met the PRCM automatically launches a hardware handshake protocol to ensure McBSP is ready to have this clock switched off. Namely, the PRCM asserts an IDLE request to McBSP module. For more information, see [Section 3.1.1.1.2, Module Level Clock Management](#) in [Chapter 3, Power, Reset, and Clock Management](#).

It is also possible to activate an autoidle mode for this clock (PRCM.CM\_AUTOIDLE\_PER[1] register AUTO\_MCBSP3 bit set to 1). In this case, McBSP3\_ICLK follows the AUDIO\_L4 clock domain behavior on the device. For more information, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

#### 23.5.4.3.4 McBSP4 Clocks

McBSP4 is clocked by a functional clock (CLKS, CLKX, or CLKR) and an interface clock (MCBSP4\_ICLK).

- The functional clock is used to generate control signals depending on the internal configuration of the module (see [Section 23.5.4, McBSP Functional Description](#)). For McBSP4, the functional clock comes from the CLKS, CLKX, or CLKR signal. The choice between these three clocks is defined by the MCBSP4.MCBSPLP\_PCR\_REG[7] SCLKME bit and the MCBSP4.MCBSPLP\_SRGR2\_REG[13] CLKSM bit.

**NOTE:** When McBSP4 no longer requires the PRCM functional clock, software can disable it at the PRCM level by setting the MODULEMODE bit (PRCM.CM\_L4PER\_MCBSP4\_CLKCTRL[1:0]) in the PRCM registers. The clock is effectively cut, provided the other modules that receive it do not require it.

At the PRCM level, when all the conditions to shut off the MCBSP4\_FCLK clock are met the PRCM module automatically launches a hardware handshake protocol to ensure McBSP is ready to have this clock switched off. Namely, the PRCM asserts an IDLE request to McBSP module. For more information, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

The CLKX and CLKR signals are connected either by mcbbsp4\_clkx or mcbbsp4\_clkr pads. These signals are used like functional clocks by the intermediary of the SRG.

- The McBSP4\_ICLK runs at the L4 core interconnect clock speed. It is used to trigger access to the McBSP4 L4 interface and McBSP4 configuration interface via the Cortex-A9 MPU/DSP shared bus. It can also be an input clock for the McBSP sample-rate generator (clock divider), depending on the module configuration (see [Section 23.5.4.9, McBSP SRG](#)). Its source is the PER\_L4\_ICLK signal.

**NOTE:** When the McBSP4 module does not require the interface clock anymore, the software can disable it at the PRCM level by setting the MODULEMODE bit (PRCM.CM\_L4PER\_MCBSP4\_CLKCTRL[1:0]) in the PRCM registers. The clock is effectively cut, provided the other modules that receive it do not require it.

At PRCM level, when all the conditions to shut-off PER\_L4\_ICLK clock are met the PRCM automatically launches a hardware handshake protocol to ensure McBSP is ready to have this clock switched off. Namely, the PRCM module asserts an IDLE request to the McBSP module. For more information, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

#### 23.5.4.4 McBSP Software Reset

McBSP4 belongs to the L4\_PER domain and its reset signal is L4\_PER\_RST from the PRCM module. The McBSP1, 2, and 3 modules belong to the AUDIO domain and their reset signal is AUDIO\_RST from the PRCM module. [Table 23-343](#) lists the software reset signals to all McBSP modules.

**Table 23-343. Software Reset Signals to All McBSP Modules**

Type	Bit Field	Register Source	Activation	Description
Software	SOFTRESET	MCBSPi.MCBSPLP_SYSCONFIG_REG[1]	Active high	McBSP global software reset
	RRST	MCBSPi.MCBSPLP_SPCR1_REG[0]	Active low	This resets and disables the receiver, including the RB.
	XRST	MCBSPi.MCBSPLP_SPCR2_REG[0]		This resets and disables the transmitter, including the XB.
	GRST	MCBSPi.MCBSPLP_SPCR2_REG[6]		SRG is reset.
	FRST	MCBSPi.MCBSPLP_SPCR2_REG[7]		Frame-sync logic is reset. Frame-sync generated signal is not generated by the SRG.

For a complete description of the McBSP initialization procedure, see [Section 23.5.5.1, McBSP Initialization Procedure](#).

#### 23.5.4.5 McBSP Power Management

##### 23.5.4.5.1 McBSP Operating States

Two operating states are defined for all the McBSP modules:

- **ACTIVE state:** The module is running synchronously on the interface and functional clocks. Interrupts and DMA requests can be generated according to the configuration (register, master or slave mode, etc) and the external signals.
- **IDLE state:** As part of the system power management, the PRCM module can request the McBSP modules to enter IDLE state. Depending on the configured acknowledgment mode (force-idle, no-idle and smart-idle modes), a McBSP module effectively enters IDLE state or not. As soon as a McBSP module enters IDLE state, its only activities are those unrelated to clock activity (for example, wake-up features) and its clocks are likely to be switched off at the PRCM level.

---

**NOTE:** IDLE request and IDLE acknowledge are only internal signals, with no means to observe or to control. The generation and control of the signals is purely hardware (managed automatically by the PRCM module and the McBSP depending on the SIDLEMODE settings).

---

##### 23.5.4.5.2 McBSP Acknowledgment Modes

During initialization or configuration of the McBSP module, software must configure how the McBSP module will answer an IDLE solicitation from the PRCM module (that is, the way IDLE acknowledge is asserted following assertion of an idle request).

Each McBSP module can be configured through the MCBSPi.MCBSPLP\_SYSCONFIG\_REG[4:3] SIDLEMODE bit field as one of the following acknowledgment modes:

- **Force-idle mode (SIDLEMODE bit = 0x0):** An IDLE request is acknowledged unconditionally, regardless of the internal state of the module. The McBSP module immediately enters IDLE state (no activity), interface and PRCM functional clocks can be stopped, and no interrupts and DMA requests can be generated. In this mode, the McBSP module freezes all the internal activity when the PRCM clocks are switched off by the PRCM module, leading to a potential loss of data.

**CAUTION**

In force-idle mode, the wake-up feature is inhibited.

**CAUTION**

If the McBSP functional part, transmitter or receiver, is running within this period of time (the functional clock source is not the PRCM functional clock), the internal state of the McBSP module will not be idle (FSM states, processes, etc.), and when the McBSP module exits from the Force Idle state unexpected behavior may happen in both receiver and transmitter. To avoid this, both receive and transmit parts, must be disabled by software prior to idle request assertion (all functional clock external sources must be disabled).

- No-idle mode (SIDLEMODE bit = 0x1): An IDLE request is never acknowledged, meaning it prevents the PRCM module from switching off its related clocks and from putting in a lower power state than the power domain to which it belongs. The McBSP module never enters IDLE state (is active).
- Smart-idle mode (SIDLEMODE bit = 0x2): Acknowledgement to an IDLE request is given based on the internal activity of the McBSP module. The McBSP module is in a waiting state, interface and functional clocks can be stopped, no interrupts can be generated, and a wake-up signal can be generated according to the configuration (see [Section 23.5.4.5.4, Analysis of the Receiver Smart-Idle Behavior](#)) and external signals.

---

**NOTE:** The value MCBSPi.MCBSPLP\_SYSCONFIG\_REG[4:3] SIDLEMODE field = 0x3 must not be used.

---

When configured in smart-idle mode, the McBSP module also offers an additional granularity on MCBSPi\_FCLK and MCBSPi\_ICLK gating. The MCBSPi.MCBSPLP\_SYSCONFIG\_REG[9:8] CLOCKACTIVITY bit field is used to determine which clock will be shut down (MCBSPi\_FCLK, MCBSPi\_ICLK, none of them, or both of them).

CLOCKACTIVITY setting is used in the McBSP module to determine on which part of the module the conditions to acknowledge the PRCM IDLE request will be tested. As an example, if MCBSPi\_FCLK is said not to be shut down upon a PRCM IDLE request, this means the McBSP module will consider only MCBSPi\_ICLK and the associated pending activities before acknowledging the request.

---

**NOTE:** Some McBSP features are associated with MCBSPi\_ICLK and others with MCBSPi\_FCLK. Using CLOCKACTIVITY along with the smart-idle mode ensures that the features associated with the clock that remain active are always enabled, even if the McBSP has acknowledged an IDLE request. For more information, see [Section 23.5.4.5.4, Analysis of the Receiver Smart-Idle Behavior](#).

---

[Table 23-344](#) lists the value of the bit field and indicates whether the interface (MCBSPi\_ICLK) and PRCM functional (MCBSPi\_FCLK) clocks can be switched off or not when an IDLE request is received by the McBSP module.

**Table 23-344. State of Clocks When the Module is in Idle State**

CLOCKACTIVITY Value	Interface Clock (MCBSPi_ICLK)	PRCM Functional Clock
0b00	Off	Off
0b01	Off	On
0b10	On	Off
0b11	On	On

**NOTE:** Off means this clock can be switched off.

On means this clock must be maintained during the wake-up period.

#### **CAUTION**

The PRCM module does not have any hardware means to read CLOCKACTIVITY settings. Software must ensure a consistent programming between the McBSPi.MCBSPLP\_SYSCONFIG\_REG[9:8] CLOCKACTIVITY bit field and the PRCM McBSPi\_FCLK and L4\_ICLK control bits (see notes in [Section 23.5.4.3, McBSP Clock Configuration](#)). If the McBSP module is disabled while CLOCKACTIVITY is set to 0x3, nothing prevents the PRCM module from asserting its IDLE request, which is acknowledged regardless of the features associated with the McBSP clocks. This may lead to unpredictable behaviors.

#### **23.5.4.5.3 Wake-Up Capability**

When configured in smart-idle mode, the sources for wake-up generation are a subset of the interrupt sources. The wake-up sources are enabled by setting the McBSPi.MCBSPLP\_SYSCONFIG\_REG[2] ENAWAKEUP bit (wake-up feature control):

- Set to 0, wake-up capability is disabled.
- Set to 1, wake-up capability is enabled.

The McBSPi\_SWAKEUP signal is the McBSP module asynchronous wake-up signal sent to the PRCM module when a wake-up generation is requested.

The wake-up configurations are defined by setting the corresponding bits in the McBSPi.MCBSPLP\_WAKEUPEN\_REG register.

##### **23.5.4.5.3.1 Receive Wakeup**

There are four receive possible wake-up configurations:

- McBSPi.MCBSPLP\_WAKEUPEN\_REG[3] RRDYEN bit: The McBSP module asserts the McBSPi\_SWAKEUP request when the receive buffer reaches the high threshold value (RTHRESHOLD value + 1) of the McBSPi.MCBSPLP\_THRSH1\_REG register. If the McBSPi.MCBSPLP\_IRQENABLE\_REG[3] RRDYEN bit is set to 1, the McBSP module sends an interrupt (McBSPi\_IRQ) request to the MPU or DSP subsystems when exiting from idle mode (interrupt will be asserted once the McBSPi.MCBSPLP\_IRQSTATUS\_REG[3] RRDY bit changes from 0 to 1, indicating that received data is ready to be read).
- McBSPi.MCBSPLP\_WAKEUPEN\_REG[2] REOFEN bit: The McBSP module asserts the McBSPi\_SWAKEUP request at the end of the frame. If the McBSPi.MCBSPLP\_IRQENABLE\_REG[2] REOFEN bit is set to 1, the McBSP module sends an interrupt (McBSPi\_IRQ) request to the MPU or DSP subsystems when exiting idle mode.
- McBSPi.MCBSPLP\_WAKEUPEN\_REG[1] RFSREN bit: The McBSP module sends a McBSPi\_SWAKEUP request to the PRCM module when a receive frame-sync pulse is detected while the McBSP module is in idle mode. If the McBSPi.MCBSPLP\_IRQENABLE\_REG[1] RFSREN bit is set to 1, the McBSP module sends an interrupt (McBSPi\_IRQ) request to the MPU or DSP subsystems when exiting idle mode.
- McBSPi.MCBSPLP\_WAKEUPEN\_REG[0] RSYNCERREN bit: The McBSP module asserts the McBSPi\_SWAKEUP request when an unexpected receive frame-sync pulse is detected. If the McBSPi.MCBSPLP\_IRQENABLE\_REG[0] RSYNCERREN bit is set to 1, the McBSP module sends an interrupt (McBSPi\_IRQ) request to the MPU or DSP subsystems when exiting from idle mode (interrupt is asserted once the McBSPi.MCBSPLP\_IRQSTATUS\_REG[0] RSYNCERR bit changes from 0 to 1, indicating that a receive error occurred).

### 23.5.4.5.3.2 Transmit Wakeup

For transmit, there are five possible wake-up configuration scenarios:

- McBSPi.MCBSPLP\_WAKEUPEN\_REG[14] XEMPTYEOFEN bit: The McBSP module asserts the McBSPi\_SWAKEUP request when a complete frame was transmitted and the transmit buffer is empty. If the McBSPi.MCBSPLP\_IRQENABLE\_REG[14] XEMPTYEOFEN bit is set to 1, the McBSP module sends an interrupt (McBSPi\_IRQ) request to the MPU or DSP subsystems when exiting idle mode.
- McBSPi.MCBSPLP\_WAKEUPEN\_REG[10] XRDYEN bit: The McBSP module asserts the McBSPi\_SWAKEUP request when the transmit buffer reaches the high threshold value (XTHRESHOLD value + 1) of the McBSPi.MCBSPLP\_THRSH2\_REG register. If the McBSPi.MCBSPLP\_IRQENABLE\_REG[10] XRDYEN bit is set to 1, the McBSP module sends an interrupt (McBSPi\_IRQ) request to the MPU or DSP subsystems when exiting from idle mode (interrupt is asserted once the McBSPi.MCBSPLP\_IRQSTATUS\_REG[10] XRDY bit changes from 0 to 1, indicating that transmit buffer data is ready to accept new data).
- McBSPi.MCBSPLP\_WAKEUPEN\_REG[9] XEOFEN bit: The McBSP module asserts the McBSPi\_SWAKEUP request at the end of the frame. If the McBSPi.MCBSPLP\_IRQENABLE\_REG[9] XEOFEN bit is set to 1, the McBSP module sends an interrupt (McBSPi\_IRQ) request to the MPU or DSP subsystems when exiting idle mode.
- McBSPi.MCBSPLP\_WAKEUPEN\_REG[8] XFSXEN bit: The McBSP module sends a McBSPi\_SWAKEUP request when a transmit frame-sync pulse is detected while the module is in idle mode. If the McBSPi.MCBSPLP\_IRQENABLE\_REG[8] XFSXEN bit is set to 1, the McBSP module sends an interrupt (McBSPi\_IRQ) request to the MPU or DSP subsystems when exiting idle mode.
- McBSPi.MCBSPLP\_WAKEUPEN\_REG[7] XSYNCERREN bit: The McBSP module asserts the McBSPi\_SWAKEUP request when an unexpected transmits frame-sync pulse is detected. If the McBSPi.MCBSPLP\_IRQENABLE\_REG[7] XSYNCERREN bit is set to 1, the McBSP module sends an interrupt (McBSPi\_IRQ) request to the MPU or DSP subsystems when exiting idle mode (interrupt is asserted once the McBSPi.MCBSPLP\_IRQSTATUS\_REG[7] XSYNCERR bit changes from 0 to 1, indicating that a transmit error occurred).

### 23.5.4.5.3.3 Notes

When the mcbbsp4\_fsr/mcbspi\_fsx pin is configured as an output, FSR/FSX wake-up generation makes no sense (the module cannot be in smart-idle mode).

Detection of RSYNCERR/XSYNCERR during idle mode can be used only when the mcbbsp4\_fsr/mcbspi\_fsx pin is configured as an input and the remote system knows to assert such an error to trigger the wakeup of the McBSP module.

The module does not implement interrupt request (IRQ) assertion when configured as GPIO (pins that can be used to accept input signals and/or send output signals but are not linked to specific uses); also a wake-up capability in this mode is not available.

### 23.5.4.5.4 Analysis of the Receiver Smart-Idle Behavior

Table 23-345 provides an analysis of the power mode behavior.

In this table, the CLKRM bit is in the McBSPi.MCBSPLP\_PCR\_REG register on position 8, the CLKXM bit is in the McBSPi.MCBSPLP\_PCR\_REG[9] register, and the CLOCKACTIVITY bit is in the McBSPi.MCBSPLP\_SYSCONFIG\_REG[9:8] register.

The value X indicates that the bit value is not significant.

**Table 23-345. McBSP Smart-Idle Mode Configuration Behavior**

CLKRM Bit	CLKXM Bit	McBSP Mode	Source of Functional Clock	CLOCKACTIVITY Bit	Behavior
0	0	Slave	Outside	0bXX	The module acknowledges the IDLE request as soon as there is no pending DMA, interrupt request, or transmit buffer threshold synchronization (only when wake-up event is set on transmit threshold reached), regardless of the CLOCKACTIVITY settings or receive and transmit activity.
0	1	Transmit master	MCBSPi_ICLK	0b0X	The McBSP does not acknowledge the IDLE request unless: <ul style="list-style-type: none"> <li>The transmit part is disabled (XDISABLE) or under software reset (XRST).</li> <li>Transmit and receive parts are disabled (XDISABLE/RDISABLE) or under software reset (XRST/RRST).</li> </ul> The IDLE acknowledge is asserted as soon as there is no pending DMA, interrupt request, or transmit/receive buffer threshold synchronization (only when the wake-up event is set on transmit/receive threshold reached) and the pending transmit and/or receive frames were completed in case of transmit and/or receive disable.
			CLKS	0bX0	
			MCBSPi_ICLK	0b1X	The module acknowledges the IDLE request as soon as there is no pending DMA, interrupt request, or transmit/receive buffer threshold synchronization (only when the wake-up event is set on transmit/receive threshold reached).
			CLKS	0bX1	
			CLKR (outside)	0bXX	The module acknowledges the idle request as soon as there is no pending DMA, interrupt request, or transmit/receive buffer threshold synchronization (only when the wake-up event is set on transmit/receive threshold reached), regardless of the CLOCKACTIVITY settings.
			1	0	Receive master
CLKS	0bX0				
			MCBSPi_ICLK	0b1X	The module acknowledges the IDLE request as soon as there is no pending DMA, interrupt request, or transmit/receive buffer threshold synchronization (only when wake-up event is set on transmit/receive threshold reached).
			CLKS	0bX1	
			CLKX	0bXX	When CLKX is used as source (the functional clock is provided from outside), the module acknowledges the IDLE request as soon as there is no pending DMA, interrupt request, or transmit/receive buffer threshold synchronization (only when the wake-up event is set on transmit/receive threshold reached), regardless of the CLOCKACTIVITY settings.

**Table 23-345. McBSP Smart-Idle Mode Configuration Behavior (continued)**

CLKRM Bit	CLKXM Bit	McBSP Mode	Source of Functional Clock	CLOCKACTIVITY Bit	Behavior
1	1	Transmit and receive master	MCBSPi_ICLK	0b0X	The McBSP does not acknowledge the IDLE request unless transmit and receive parts are disabled (XDISABLE/RDISABLE) or under software reset (XRST/RRST). The IDLE acknowledge is asserted as soon as there is no pending DMA, interrupt request, or transmit/receive buffer threshold synchronization (only when the wake-up event is set on transmit/receive threshold reached) and the pending transmit and/or receive frames were completed in case of transmit and/or receive disable. No wake-up event is available in this mode, because the entire McBSP and remote device activity is frozen.
			CLKS	0bX0	
			MCBSPi_ICLK	0b1X	The module acknowledges the IDLE request as soon as there is no pending DMA, interrupt request, or transmit/receive buffer threshold synchronization (only when the wake-up event is set on transmit/receive threshold reached).
			CLKS	0bX1	

**NOTE:** The RFSREN/XFSXEN mode is suitable for wake-up generation when both clocks (PRCM functional and interface) are switched off and the mcbasp4\_fsr/mcbspi\_fsx pin is configured as input. The frame-sync pulse is asynchronously detected during idle.

The RSYNCERREN/XSYNCERREN mode can be used to wake up the McBSP module only by a remote module implementing such a feature to trigger a wakeup. In this mode, the functional clock must be active.

#### 23.5.4.6 McBSP Interrupt Requests

Each of the four McBSP modules can generate one common interrupt (MCBSPi\_IRQ), shared between the Cortex-A9 MPU subsystem and DSP subsystem interrupt controllers (INTCs).

An event can generate an interrupt request when the corresponding mask bit in the MCBSPi.MCBSPLP\_IRQENABLE\_REG register is set to 1.

Once an interrupt request is generated, software must read the MCBSPi.MCBSPLP\_IRQSTATUS\_REG register to check which event has caused the interrupt request generation, and acknowledge each processed event by setting the corresponding bit in the MCBSPi.MCBSPLP\_IRQSTATUS\_REG register to 1.

#### 23.5.4.7 McBSP DMA Requests

The DMA requests are shared between the DSP subsystem DMA (eDMA) controller, system DMA (sDMA) controller, and audio engine DMA (aDMA) controller. Each of the four McBSP modules can generate two DMA events:

- MCBSPi\_DMA\_TX: McBSPi module transmit DMA request
- MCBSPi\_DMA\_RX: McBSPi module receive DMA request

[Table 23-342](#) summarizes the DMA events with the mapping on both DMA controllers.

The receive and transmit DMA requests can be individually disabled by setting the MCBSPi.MCBSPLP\_RCCR\_REG[3] RDMAEN and MCBSPi.MCBSPLP\_XCCR\_REG[3] XDMAEN bits to 0. When disabling the DMA, the DMA request line is deasserted even if a DMA transfer is pending and the DMA state-machine is not reset.

For more information, see [Section 23.5.4.11, McBSP DMA Configuration](#).

### 23.5.4.8 McBSP Data Transfer Process

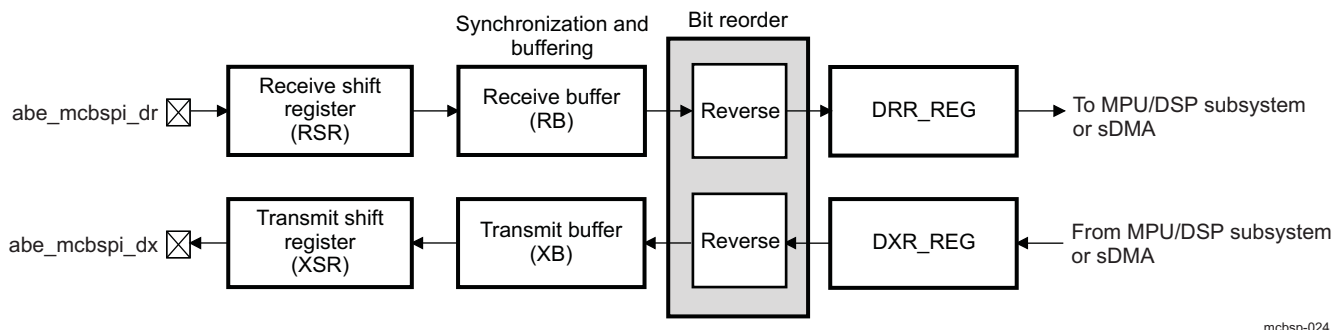

For McBSP modules, receive and transmit operations are triple-buffered (512 bytes buffers organized in 32-bit words are used).

All registers of McBSP data transfer paths are 32 bits wide. Figure 23-130 shows the McBSP data transfer paths.

**CAUTION**

The McBSP registers (DRR\_REG and DXR\_REG) are limited to 32-bit data accesses (L4 Interconnect); 16-and 8-bit accesses are not allowed and can corrupt register content.

**Figure 23-130. McBSP Data Transfer Paths**

mcbasp-024

#### 23.5.4.8.1 Data Transfer Process for 8-/12-/16-/20-/24-/32-Bit-Long Words

**NOTE:** For each data word length, one data occupies one 32-bit buffer word.

Receive data arrives on the mcbspi\_dr pin and is shifted into the receive shift register (RSR). When a full word (depending on the data length configuration) is received, the content of the shift register is copied into the receive buffer (RB) if it is not full. When the threshold of the RB is reached, the McBSP module asserts DMA or interrupt request and the content of the RB is then transferred (the sDMA or the eDMA controller reads the data receive register McBSPi.MCBSPLP\_DRR\_REG).

Transmit data is written by the MPU subsystem, DSP subsystem, or the DMA controller to the data transmit register (McBSPi.MCBSPLP\_DXR\_REG) using the McBSPi.MCBSPLP\_SPCR2\_REG[1] XRDY bit enable input (when a byte is not enabled, the byte value in the memory contains the previous written value). If there is no previous data in the transmit shift register (XSR), the value from the transmit buffer (XB) is copied to the XSR; otherwise, the content is copied to the XSR when the last bit of the previous data is shifted out on the mcbspi\_dx pin.

#### 23.5.4.8.2 Bit Reordering (Option to Transfer LSB First)

Generally, the McBSP module transmits or receives all data with the MSB first. However, some data protocols require the LSB to be transferred first.

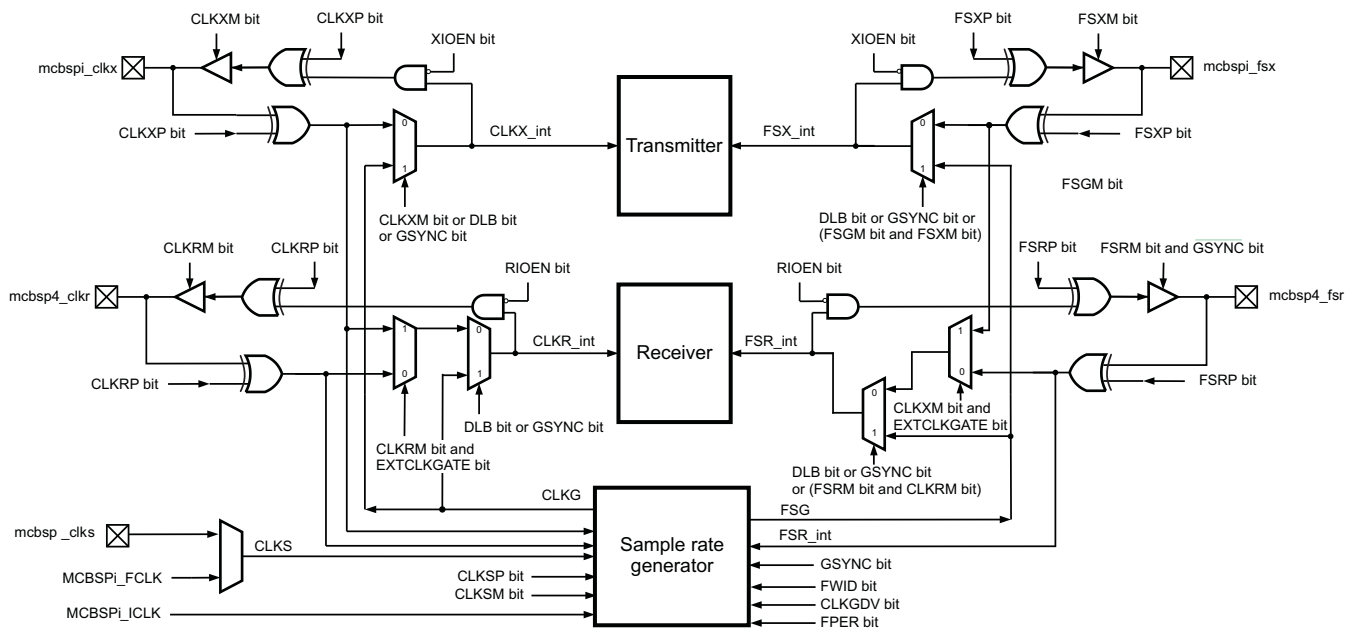

If the McBSPi.MCBSPLP\_XCR2\_REG[4:3] XREVERSE bit field is set to 0b01, the bit ordering of the data words is reversed (LSB first) before being sent to the serial port. If McBSPi.MCBSPLP\_RCR2\_REG[4:3] RREVERSE bit field is set to 0b01, the bit ordering of the data words is reversed during reception (LSB first).

This feature is available for all the data formats from 8- to 32-bit data length.

23.5.4.8.3 Clocking and Framing Data

This section explains basic concepts and terminology important for understanding how McBSP data transfers are timed and delimited.

Figure 23-131. Conceptual Block Diagram for Clock and Frame Generation When MCBSP1P\_SPCR1\_REG[15] ALB = 0

mcbasp-025

**NOTE:** For McBSP1, McBSP2, and McBSP3, the mcbspi\_clkr pin is connected to the mcbspi\_clkx pin, and the mcbspi\_fsr pin is connected to the mcbspi\_fsx pin.

The CLKR\_int clock signal can be derived from three sources:

- The sample rate generator (CLKG): When [MCBSPLP\\_XCCR\\_REG\[5\] DLB = 1](#) or [MCBSPLP\\_SRGR2\\_REG\[15\] GSYNC = 1](#)
- mcbbsp4\_clkr pin (CLKR): When [MCBSPLP\\_PCR\\_REG\[9\] CLKXM = 0](#) and [MCBSPLP\\_XCCR\\_REG\[15\] EXTCLKGATE = 0](#) and ([MCBSPLP\\_XCCR\\_REG\[5\] DLB = 0](#) or [MCBSPLP\\_SRGR2\\_REG\[15\] GSYNC = 0](#))
- mcbspi\_clkx pin (CLKX) driven by sample rate generator (CLKG): When [MCBSPLP\\_PCR\\_REG\[9\] CLKXM = 1](#) and [MCBSPLP\\_XCCR\\_REG\[15\] EXTCLKGATE = 1](#) and ([MCBSPLP\\_XCCR\\_REG\[5\] DLB = 0](#) or [MCBSPLP\\_SRGR2\\_REG\[15\] GSYNC = 0](#))

The CLKX\_int clock signal can be derived from two sources:

- The sample rate generator (CLKG): When [MCBSPLP\\_PCR\\_REG\[9\] CLKXM = 1](#) or [MCBSPLP\\_XCCR\\_REG\[5\] DLB = 1](#) or [MCBSPLP\\_SRGR2\\_REG\[15\] GSYNC = 1](#)
- mcbspi\_clkx pin (CLKX): When [MCBSPLP\\_PCR\\_REG\[9\] CLKXM = 0](#) or [MCBSPLP\\_XCCR\\_REG\[5\] DLB = 0](#) or [MCBSPLP\\_SRGR2\\_REG\[15\] GSYNC = 0](#)

The FSR\_int frame-sync signal can be derived from three sources:

- The sample rate generator (FSG): When [MCBSPLP\\_XCCR\\_REG\[5\] DLB = 1](#) or [MCBSPLP\\_SRGR2\\_REG\[15\] GSYNC = 1](#) or ([MCBSPLP\\_PCR\\_REG\[10\] FSRM = 1](#) and [MCBSPLP\\_PCR\\_REG\[8\] CLKRM = 1](#))
- mcbbsp4\_fsr pin (FSR): When [MCBSPLP\\_PCR\\_REG\[9\] CLKXM = 0](#) and [MCBSPLP\\_XCCR\\_REG\[15\] EXTCLKGATE = 0](#) and ([MCBSPLP\\_XCCR\\_REG\[5\] DLB = 0](#) or [MCBSPLP\\_SRGR2\\_REG\[15\] GSYNC = 0](#) or ([MCBSPLP\\_PCR\\_REG\[10\] FSRM = 0](#) and [MCBSPLP\\_PCR\\_REG\[8\] CLKRM = 0](#)))
- mcbspi\_fsx pin (FSX) driven by sample rate generator (FSG): When [MCBSPLP\\_PCR\\_REG\[9\] CLKXM = 1](#) and [MCBSPLP\\_XCCR\\_REG\[15\] EXTCLKGATE = 1](#) and ([MCBSPLP\\_XCCR\\_REG\[5\] DLB = 0](#) or

[MCBSPLP\\_SRGR2\\_REG\[15\]](#) GSYNC = 0 or ([MCBSPLP\\_PCR\\_REG\[10\]](#) FSRM = 0 and [MCBSPLP\\_PCR\\_REG\[8\]](#) CLKRM = 0)

The FSX\_int frame-sync signal can be derived from two sources:

- The sample rate generator (FSG): When [MCBSPLP\\_XCCR\\_REG\[5\]](#) DLB = 1 or [MCBSPLP\\_SRGR2\\_REG\[15\]](#) GSYNC = 1 or ([MCBSPLP\\_SRGR2\\_REG\[12\]](#) FSGM = 1 and [MCBSPLP\\_PCR\\_REG\[11\]](#) FSXM = 1)
- mcbspi\_fsx pin (FSX): When [MCBSPLP\\_XCCR\\_REG\[5\]](#) DLB = 0 or [MCBSPLP\\_SRGR2\\_REG\[15\]](#) GSYNC = 0 or ([MCBSPLP\\_SRGR2\\_REG\[12\]](#) FSGM = 0 and [MCBSPLP\\_PCR\\_REG\[11\]](#) FSXM = 0)

### 23.5.4.8.3.1 Clocking

Data is shifted 1 bit at a time from the mcbspi\_dr pin to the RSRs or from the XSRs to the mcbspi\_dx pin. The time for each bit transfer is controlled by the rising or falling edge of a clock signal.

The receive clock signal (CLKR\_int) controls bit transfers from the mcbspi\_dr pin to the RSRs. The transmit clock signal (CLKX\_int) controls bit transfers from the XSRs to the mcbspi\_dx pin. The CLKR\_int and CLKX\_int signals can be derived from a pin at the boundary of the McBSP module (mcbbsp4\_clkr and mcbspi\_clkx, respectively) or derived from inside the McBSP module (see [Figure 23-131](#)). The clock source is selected by programming the McBSPi.MCBSPLP\_PCR\_REG[9] CLKXM and McBSPi.MCBSPLP\_PCR\_REG[8] CLKRM bits, respectively.

When the McBSPi.MCBSPLP\_PCR\_REG[9] CLKXM bit (transmitter clock mode) is set to:

- 0: CLKX\_int is driven by an external clock and mcbspi\_clkx is an input pin.
- 1: CLKX\_int is driven by the internal SRG and mcbspi\_clkx is an output pin.

For the McBSPi.MCBSPLP\_PCR\_REG[8] CLKRM bit (receiver clock mode), see [Table 23-346](#).

**Table 23-346. Receiver Clock Mode**

Value	Digital Loopback Mode	mcbbsp4_clkr Pin	Description
0x0	McBSPi.MCBSPLP_XCCR_REG[5] DLB = 0	Input	CLKR_int is driven by an external clock.
	McBSPi.MCBSPLP_XCCR_REG[5] DLB = 1	High -impedance	CLKR_int is driven by CLKX_int. The CLKX_int is derived based on the value of CLKXM.
0x1	McBSPi.MCBSPLP_XCCR_REG[5] DLB = 0	Output	CLKR_int is driven by the internal SRG.
	McBSPi.MCBSPLP_XCCR_REG[5] DLB = 1	Output	CLKR_int is driven by CLKX_int. The CLKX_int is derived based on the value of CLKXM.

The polarities of CLKR and CLKX signals are configured in McBSPi.MCBSPLP\_PCR\_REG register.

The McBSPi.MCBSPLP\_PCR\_REG[1] CLKXP bit defines the transmit clock polarity:

- When set to 0, transmit data is driven on the rising edge of the CLKX signal.
- When set to 1, transmit data is driven on the falling edge of the CLKX signal.

The McBSPi.MCBSPLP\_PCR\_REG[0] CLKRP bit defines the receive clock polarity:

- When set to 0, receive data is sampled on the falling edge of the CLKX signal.
- When set to 1, transmit data sampled on the rising edge of the CLKX signal.

[Figure 23-132](#) shows an example in which the clock signal controls the timing of each bit transfer on the pin.

Figure 23-132. Clock Signal Control of Bit Transfer Timing

mcbasp-026

**NOTE:** The McBSP module is constrained to operate at an internal functional frequency of up to L4 interface frequency divided by 2. When driving CLKX or CLKR at the pin, choose an appropriate input clock frequency. When using the internal SRG for CLKX/CLKR/CLKS, choose an appropriate input clock frequency (up to L4 interface frequency) and divide down value by programming the McBSPi.MCBSPLP\_SRGR1\_REG[7:0] CLKGDV bit field.

### 23.5.4.8.3.2 Serial Words

Bits traveling between a shift register (RSR or XSR) and a data pin (mcbspi\_dr or mcbspi\_dx) are transferred in a group called a serial word. Software defines how many bits are in a word by programming:

- For the receiver: The McBSPi.MCBSPLP\_RCR1\_REG[7:5] RWDLEN1 and McBSPi.MCBSPLP\_RCR2\_REG[7:5] RWDLEN2 bit fields
- For the transmitter: The McBSPi.MCBSPLP\_XCR1\_REG[7:5] XWDLEN1 and McBSPi.MCBSPLP\_XCR2\_REG[7:5] XWDLEN2 bit fields

The difference of use is explained in [Section 23.5.4.8.4.1, Number of Phases, Words, and Bits per Frame](#).

The various possibilities of word length are 8, 12, 16, 20, 24, and 32 bits (for field values, see [Section 23.5.6, McBSP Register Manual](#))

Bits coming from the mcbspi\_dr pin are held in the RSR until it holds a full serial word, and then the word is passed to the RB and the McBSPi.MCBSPLP\_DRR\_REG register.

During transmission, the XSR accepts new data from the XB after a full serial word has been passed from the XSR to the mcbspi\_dx pin.

In the example in [Figure 23-135](#), an 8-bit word size was defined (see the transfer of the 8-bit word B).

### 23.5.4.8.3.3 Frames and Frame Synchronization

One or more words (up to 128) are transferred in a group called a frame. Software defines how many words are in a frame by programming:

- For the receiver: The McBSPi.MCBSPLP\_RCR1\_REG[14:8] RFRLLEN1 and McBSPi.MCBSPLP\_RCR2\_REG[14:8] RFRLLEN2 bit fields
- For the transmitter: The McBSPi.MCBSPLP\_XCR1\_REG[14:8] XFRLLEN1 and McBSPi.MCBSPLP\_XCR2\_REG[14:8] XFRLLEN2 bit fields

The difference between these registers is explained in [Section 23.5.4.8.4.1, Number of Phases, Words, and Bits per Frame](#). For the corresponding field values and number of words, see [Section 23.5.6, McBSP Register Manual](#).

All the words in a frame are sent in a continuous stream. However, there can be pauses between frame transfers. The McBSP module uses frame-sync signals (FSG) to determine when each frame is received/transmitted. When a pulse occurs on a frame-sync signal, the McBSP module begins receiving/transmitting a frame of data. When the next pulse occurs, the McBSP module receives/transmits the next frame, and so on.

Pulses on the receive frame-sync (FSR\_int) signal initiate frame transfers on mcbspi\_dr. Pulses on the transmit frame-sync (FSX\_int) signal initiate frame transfers on mcbspi\_dx. FSR\_int or FSX\_int signals can be derived from a pin at the boundary of the McBSP module (mcbbsp4\_fsr and mcbspi\_fsx, respectively) or derived from inside the McBSP module (see [Figure 23-130](#)). The frame-sync source is selected by programming the McBSPi.MCBSPLP\_PCR\_REG[11] FSXM and McBSPi.MCBSPLP\_PCR\_REG[10] FSRM bits, respectively.

When the McBSPi.MCBSPLP\_PCR\_REG[11] FSXM bit (transmitter frame-sync mode) is set to:

- 0: FSX\_int is derived from an external source and mcbspi\_fsx is an input pin.
- 1: FSX\_int is determined by the McBSPi.MCBSPLP\_SRGR2\_REG[12] FSGM bit and mcbspi\_fsx is an output pin.

For the McBSPi.MCBSPLP\_PCR\_REG[10] FSRM bit (receiver frame-sync mode), is set to:

- 0: FSR\_int is generated by an external source and mcbbsp4\_fsr is an input pin.
- 1: FSR\_int is generated internally by the SRG. The mcbbsp4\_fsr is an output pin except when McBSPi.MCBSPLP\_SRGR2\_REG[15] GSYNC bit is set to 0x1.

In the example in [Figure 23-131](#), a one-word frame is transferred when a frame-sync pulse occurs. The polarities of FSR and FSX signals are programmable by bits in the McBSPi.MCBSPLP\_PCR\_REG register.

The McBSPi.MCBSPLP\_PCR\_REG[3] FSXP bit defines the transmit frame-sync polarity:

- When set to 0, frame-sync pulse FSX is active high.
- When set to 1, frame-sync pulse FSX is active low.

The McBSPi.MCBSPLP\_PCR\_REG[2] FSRP bit defines the receive frame-sync polarity:

- When set to 0, frame-sync pulse FSR is active high.
- When set to 1, frame-sync pulse FSR is active low.

In McBSP operation, the inactive-to-active transition of the frame-sync signal indicates the start of the next frame. For this reason, the frame-sync signal may be high for an arbitrary number of clock cycles. Only after the signal is recognized to have gone inactive, and then active again, does the next frame synchronization occur.

#### 23.5.4.8.3.4 Detecting Frame-Sync Pulses, Even in Reset State

The McBSP module can generate receive and transmit interrupts to the Cortex-A9 MPU/DSP subsystems to indicate specific events in the McBSP module. To facilitate detection of frame synchronization, these interrupts can be sent in response to frame-sync pulses (see [Section 23.5.5, McBSP Basic Programming Model](#) for more information).

Unlike other serial port interrupt modes, this mode can operate while the associated portion of the serial port is in reset (such as activating receive interrupt when the receiver is in reset). In this case, the McBSPi.MCBSPLP\_PCR\_REG[0] FSRM/McBSPi.MCBSPLP\_PCR\_REG[1] FSXM bit and the McBSPi.MCBSPLP\_PCR\_REG[2] FSRP/McBSPi.MCBSPLP\_PCR\_REG[3] FSXP bit still selects the appropriate source and polarity of frame synchronization. Thus, even when the serial port is in reset state, these signals are synchronized to the interface clock (MCBSPi\_ICLK) and then sent to the Cortex-A9 MPU/DSP subsystem in the form of receive interrupt and transmit interrupt at the point where they feed the receiver and transmitter of the serial port. Consequently, a new frame-sync pulse can be detected, and then the Cortex-A9 MPU/DSP subsystem can take the serial port out of reset safely.

#### 23.5.4.8.3.5 Ignoring Frame-Sync Pulses

The McBSP module ignores transmit and/or receive frame-sync pulses if the frame transfer was started by a previous frame-sync pulse (unexpected frame-sync pulses). The McBSP module does not support features such as retransmit or re-receive of an erroneous frame or word. The receiver or transmitter ignores frame-sync pulses until the desired frame length or number of words is reached. For more information about unexpected frame-sync pulses, see [Section 23.5.4.10.3, Unexpected Receive Frame-Sync Pulse](#), or [Section 23.5.4.10.6, Unexpected Transmit Frame-Sync Pulse](#).

**23.5.4.8.3.6 Frame Frequency**

The frame frequency is determined by the period between frame-sync pulses and is defined as shown in the following equation:

$$\text{Frame frequency} = \text{Clock frequency} / (\text{number of clock cycles between two rising edges [or falling edges] of two consecutive frame-sync pulses})$$

The frame frequency can be increased by decreasing the time between frame-sync pulses (limited only by the number of bits per frame). As the frame transmit frequency increases, the inactivity period between the data packets for adjacent transfers decreases to zero.

**23.5.4.8.3.7 Maximum Frame Frequency**

The minimum number of clock cycles between frame-sync pulses is equal to the number of bits transferred per frame. The maximum frame frequency is defined as shown in the following equation:

$$\text{Maximum frame frequency} = \text{Clock frequency} / \text{number of bits per frame}$$

Figure 23-133 shows the McBSP operating at maximum packet frequency. At maximum packet frequency, the data bits in consecutive packets are transmitted contiguously with no inactivity between bits.

**Figure 23-133. McBSP Operating at Maximum Packet Frequency**

mcbasp-027

If there is a 1-bit data delay as shown in Figure 23-133, the frame-sync pulse overlaps the last bit transmitted in the previous frame. Effectively, this permits a continuous stream of data, back-to-back transfers.

**NOTE:** When the McBSPi.MCBSPLP\_XCR2\_REG[1:0] XDATDLY bit field is set to 0x0 (0-bit data delay), the first bit of data is transmitted asynchronously to the internal transmit clock signal (CLKX\_int). For more information, see Table 23-396.

**23.5.4.8.4 Frame Phases (Dual-Phase Frame I2S Support)**

The McBSP module allows configuration of each frame to contain one or two phases. The support for dual-phase frames is required to provide I2S fully compliant capabilities (audio left and right channels—stereo audio stream).

**CAUTION**

The limitation on dual-phase frame support is that the number of words per phase must be set to 1 for both first and second phases. It is the only possible value for word per frame when using the dual-phase frame.

The number of bits per word can be specified differently for each of the two phases of a frame, allowing greater flexibility in structuring data transfers. For example, a user may define a frame as consisting of one phase containing one 16-bit word, followed by a second phase consisting of one 32-bit word. This configuration allows the user to compose frames for custom applications such as I2S protocol.

### 23.5.4.8.4.1 Number of Phases, Words, and Bits per Frame

Table 23-347 shows which bit fields in the receive control registers (McBSPi.MCBSPLP\_RCR1\_REG and McBSPi.MCBSPLP\_RCR2\_REG) and in the transmit control registers (McBSPi.MCBSPLP\_XCR1\_REG and McBSPi.MCBSPLP\_XCR2\_REG) determine the number of phases per frame, the number of words per frame, and the number of bits per word for each phase, for both receiver and transmitter. The maximum number of words per frame is limited to 2 when using dual-phase frames (one word for each phase), and to 128 for a single-phase frame. The number of bits per word can be 8, 12, 16, 20, 24, or 32 bits.

The following legend applies to Table 23-347:

- RPHASE => McBSPi.MCBSPLP\_RCR2\_REG[15] RPHASE bit
- XPHASE => McBSPi.MCBSPLP\_XCR2\_REG[15] XPHASE bit
- RFRLN1 => McBSPi.MCBSPLP\_RCR1\_REG[14:8] RFRLN1 bit field
- RFRLN2 => McBSPi.MCBSPLP\_RCR2\_REG[14:8] RFRLN2 bit field
- XFRLEN1 => McBSPi.MCBSPLP\_XCR1\_REG[14:8] XFRLEN1 bit field
- XFRLEN2 => McBSPi.MCBSPLP\_XCR2\_REG[14:8] XFRLEN2 bit field
- RWDLEN1 => McBSPi.MCBSPLP\_RCR1\_REG[7:5] RWDLEN1 bit field
- RWDLEN2 => McBSPi.MCBSPLP\_RCR2\_REG[7:5] RWDLEN2 bit field
- XWDLEN1 => McBSPi.MCBSPLP\_XCR1\_REG[7:5] XWDLEN1 bit field
- XWDLEN2 => McBSPi.MCBSPLP\_XCR2\_REG[7:5] XWDLEN2 bit field

**Table 23-347. Phases, Words and Bits per Frame Control Bit**

Operation	Number of Phases	Words per Frame Set With	Bits per Word Set With
Reception	1 (RPHASE = 0)	RFRLN1	RWDLEN1
Reception	2 (RPHASE = 1)	RFRLN1 = 0x0 and RFRLN2 = 0x0	RWDLEN1 for phase 1 RWDLEN2 for phase 2
Transmission	1 (XPHASE = 0)	XFRLEN1	XWDLEN1
Transmission	2 (XPHASE = 1)	XFRLEN1 = 0x0 and XFRLEN2 = 0x0	XWDLEN1 for phase 1 XWDLEN2 for phase 2

### 23.5.4.8.4.2 Single-Phase Frame Example

Figure 23-134 shows an example of a single-phase data frame containing one 8-bit word. Because the transfer is configured for one data bit delay, the data on the mcbspi\_dx and mcbspi\_dr pins are available one clock cycle after FS(R/X) goes active. Table 23-348 lists the assumptions used in the example in Figure 23-134.

**Table 23-348. Assumptions for the Single-Phase Frame Example**

Assumption	Value	Bit or Field Name
Single-phase frame	0	McBSPi.MCBSPLP_RCR2_REG[15] RPHASE
		McBSPi.MCBSPLP_XCR2_REG[15] XPHASE
One word per frame	0x0	McBSPi.MCBSPLP_RCR1_REG[14:8] RFRLN1
		McBSPi.MCBSPLP_XCR1_REG[14:8] XFRLEN1
8-bit word length	0x0	McBSPi.MCBSPLP_RCR1_REG[7:5] RWDLEN1
		McBSPi.MCBSPLP_XCR1_REG[7:5] XWDLEN1
Word length in register2	Ignored	McBSPi.MCBSPLP_RCR2_REG[14:8] RFRLN2
		McBSPi.MCBSPLP_XCR2_REG[14:8] XWDLEN2
Receive data clocked on falling edge	0	McBSPi.MCBSPLP_PCR_REG[0] CLKRP
Transmit data clocked on rising edge		McBSPi.MCBSPLP_PCR_REG[1] CLKXP
Active-high frame-sync signals	0	McBSPi.MCBSPLP_PCR_REG[2] FSRP
		McBSPi.MCBSPLP_PCR_REG[3] FSXP
1-bit data delay	01b	McBSPi.MCBSPLP_RCR2_REG[1:0] RDATDLY
		McBSPi.MCBSPLP_XCR2_REG[1:0] XDARDLY

Figure 23-134. Single-Phase Frame for a McBSP Data Transfer

mcbasp-028

### 23.5.4.8.4.3 Dual-Phase Frame Example

Figure 23-135 shows an example of a frame. The first phase consists of one word of 16 bits, followed by a second phase of one word of 8 bits. The entire bitstream in the frame is contiguous. There are no gaps between words/phases. Table 23-349 lists the assumptions used in the example in Figure 23-135.

Table 23-349. Assumptions for the Dual-Phase Frame Example

Assumption	Value	Bit or Field Name
Single-phase frame	1	McBSPi.MCBSPLP_RCR2_REG[15] RPHASE
		McBSPi.MCBSPLP_XCR2_REG[15] XPHASE
One word per frame	0x0	McBSPi.MCBSPLP_RCR1_REG[14:8] RFRLLEN1
		McBSPi.MCBSPLP_XCR1_REG[14:8] XFRLLEN1
16-bit word length	0x0	McBSPi.MCBSPLP_RCR1_REG[7:5] RWDLEN1
		McBSPi.MCBSPLP_XCR1_REG[7:5] XWDLEN1
8-bit word length	0x2	McBSPi.MCBSPLP_RCR2_REG[14:8] RFRLLEN2
		McBSPi.MCBSPLP_XCR2_REG[14:8] XWDLEN2
Receive data clocked on falling edge	0	McBSPi.MCBSPLP_PCR_REG[0] CLKRP
Transmit data clocked on rising edge		McBSPi.MCBSPLP_PCR_REG[1] CLKXP
Active-high frame-sync signals	0	McBSPi.MCBSPLP_PCR_REG[2] FSRP
		McBSPi.MCBSPLP_PCR_REG[3] FSXP
0-bit data delay	00b	McBSPi.MCBSPLP_RCR2_REG[1:0] RDATDLY
		McBSPi.MCBSPLP_XCR2_REG[1:0] XDARDLY

### 23.5.4.8.5 McBSP Reception

This section explains the fundamental process of reception in the McBSP module. For information about how to program the McBSP receiver, see Section 23.5.5, *McBSP Basic Programming Model*, Section 23.5.5.4, *Interrupt Configuration*, and Section 23.5.5.5, *Receiver Configuration*.

Figure 23-136 and Figure 23-137 show how reception occurs in the McBSP module. A description of the process follows the figures. Figure 23-136 shows the physical path for the data.

**Figure 23-136. McBSP Reception Physical Data Path**

mcbasp-030

Figure 23-137 is a timing diagram showing signal activity for one possible reception scenario.

**Figure 23-137. McBSP Reception Signal Activity**

RRDY: Status of receiver ready bit (high is 1)

mcbasp-031

The following process describes how data travels from the mcbspi\_dr pin to the MPU/DSP subsystem or to the sDMA controller:

1. The McBSP module waits for a receive frame-sync pulse on FSR\_int.
2. When the pulse arrives, the McBSP module inserts the appropriate data delay that is selected with the McBSPi.MCBSPLP\_RCR2\_REG[1:0] RDATDLY bit field. In the preceding timing diagram a 1-bit data delay is selected.
3. The McBSP module accepts data bits on the mcbspi\_dr pin and shifts them into the RSR. For information about choosing a word length, see [Section 23.5.5.6, Transmitter Configuration](#).
4. When a full word is received, the McBSP module copies the contents of the RSR to the RB, provided that RB is not full.
5. When the programmed receive threshold is reached (McBSPi.MCBSPLP\_THRSH1\_REG[6:0] RTHRESHOLD bit field), the McBSP module asserts the receiver ready bit (McBSPi.MCBSPLP\_SPCR1\_REG[1] RRDY). This indicates that receive data is ready to be read by the Cortex-A9 MPU/DSP subsystem or the sDMA controller by accessing the McBSPi.MCBSPLP\_DRR\_REG register.

The data copied from RB to McBSPi.MCBSPLP\_DRR\_REG is justified and bit-filled according to the McBSPi.MCBSPLP\_SPCR1\_REG[14:13] RJUST bit field.

6. The Cortex-A9 MPU/DSP subsystem or the sDMA controller reads the data from the data receive register. When the RB is empty, the McBSPi.MCBSPLP\_SPCR1\_REG[1] RRDY bit is cleared.

#### 23.5.4.8.6 McBSP Transmission

This section explains the fundamental process of transmission in the McBSP module. For information about how to program the McBSP transmitter, see [Section 23.5.5, McBSP Basic Programming Model](#) and [Section 23.5.5.6, Transmitter Configuration](#).

Figure 23-138 and Figure 23-139 show how transmission occurs in the McBSP module. A description of the process follows the figures. Figure 23-138 shows the physical path for the data.

Figure 23-138. McBSP Transmission Physical Data Path

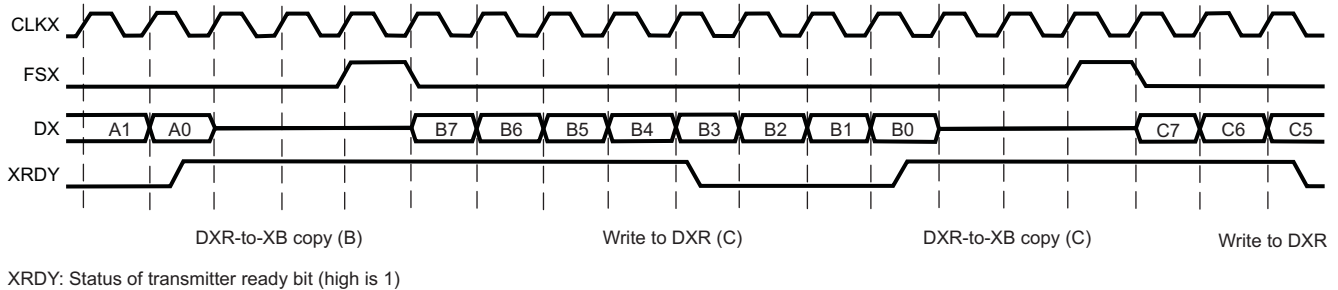

Figure 23-139 is a timing diagram showing signal activity for one possible transmission scenario.

Figure 23-139. McBSP Transmission Signal Activity

XRDY: Status of transmitter ready bit (high is 1)

1. The Cortex-A9 MPU/DSP subsystem or the sDMA controller writes data to the data transmit register (McBSPi.MCBSPLP\_DXR\_REG). When the XB is reached the transmitter ready bit (McBSPi.MCBSPLP\_SPCR2\_REG[1] XRDY) is cleared to indicate that the transmitter is not ready for new data. For information about choosing a word length, see Table 23-392.
2. When new data arrives in the McBSPi.MCBSPLP\_DXR\_REG register, the McBSP module copies the content of the data transmit register to the XB. In addition, the transmit ready bit (McBSPi.MCBSPLP\_SPCR2\_REG[1] XRDY) is set as long as the buffer contains at least the transmit threshold number of free locations (the McBSPi.MCBSPLP\_THRSH2\_REG[6:0] XTHRESHOLD bit field). This indicates that the transmitter is ready to accept new data from the MPU/DSP subsystem or the sDMA controller.
3. The McBSP module waits for a transmit frame-sync pulse on FSX\_int.
4. When the pulse arrives, the McBSP module inserts the appropriate data delay that is selected with the McBSPi.MCBSPLP\_XCR2\_REG[1:0] XDADTLY bit field.  
In the preceding timing diagram, a 1-bit data delay is selected.
5. The McBSP module shifts data bits from the XSR to the mcbspi\_dx pin.

#### 23.5.4.8.7 Enable/Disable the Transmit and Receive Processes

The McBSP module has the option to stop and resume the transmit/receive process while the module is in functional mode (out of transmit/receive reset).

When the transmit/receive disable bit (McBSPi.MCBSPLP\_XCCR\_REG[0] XDISABLE/McBSPi.MCBSPLP\_RCCR\_REG[0] RDISABLE) is set, the McBSP module stops the transmit/receive operation at the next frame boundary (frame corruption avoided).

During the receive disable state, the frames that are sent (when the FSR signal is asserted while receive disable) by the remote device are lost, and the receive buffer overflow status bit (McBSPi.MCBSPLP\_IRQSTATUS\_REG[5] ROVFLSTAT) is not set. Also, the frames received by the remote device while the McBSPi.MCBSPLP\_XCCR\_REG[0] XDISABLE bit is set (when the FSX signal is asserted while transmit disable) are meaningless undefined data frames, and transmit buffer underflow status bit (McBSPi.MCBSPLP\_IRQSTATUS\_REG[11] XUNDFLSTAT) is not set. The presence of the frame synchronization while transmit/receive process is disabled can be checked by reading the transmit/receive frame-sync interrupt status: McBSPi.MCBSPLP\_IRQSTATUS\_REG[8] XFSX/McBSPi.MCBSPLP\_IRQSTATUS\_REG[1] RFSR bits.

As soon as the `McBSPi.MCBSPLP_XCCR_REG[0]` `XDISABLE`/`McBSPi.MCBSPLP_RCCR_REG[0]` `RDISABLE` bit is cleared, the transmit/receive process resumes at the next frame boundary.

**NOTE:** It is not recommended to use this mechanism together with the possibility to interrogate the transmit/receive buffer status register (`McBSPi.MCBSPLP_XBUFFSTAT_REG[7:0]` `XBUFFSTAT`/`McBSPi.MCBSPLP_RBUFFSTAT_REG[7:0]` `RBUFFSTAT` bit field indicating the occupied/available buffer locations), because this register is an interface clock (`McBSPi_ICLK`) synchronous register and does not reflect the exact number of occupied/free locations available in the functional clock domain.

### 23.5.4.8.8 MCBSP Data Transfer Mode

**NOTE:** For all examples in this section, the configured `CLKX` edge is the rising edge (`McBSPi.MCBSPLP_PCR_REG[1]` `CLKXP` = 0x0) and the configured `CLKR` edge is the falling edge (`McBSPi.MCBSPLP_PCR_REG[0]` `CLKRP` = 0x0). These are the reset values.

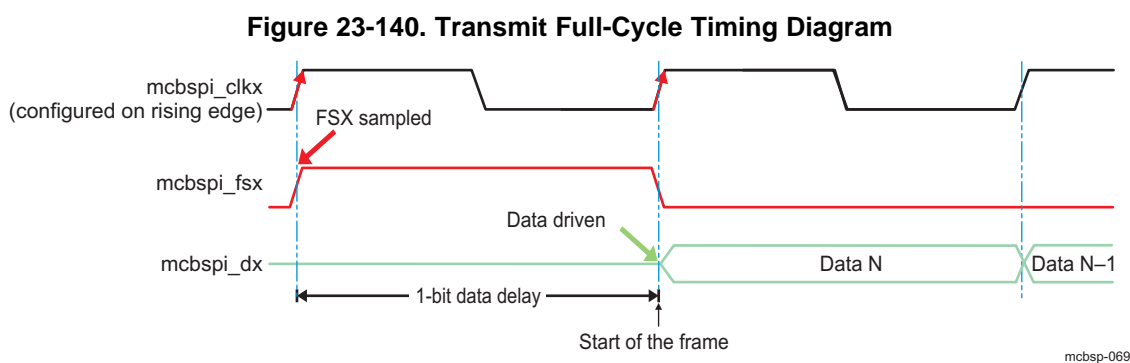

In the following timing diagrams, a 1-bit data delay is selected (`McBSPi.MCBSPLP_RCR2_REG[1:0]` `RDATDLY` = 0x01 and `McBSPi.MCBSPLP_XCR2_REG[1:0]` `XDATDLY` = 0x01), because data often follows a 1-cycle active frame-synchronization.

McBSP modules can support two edge selection modes for transmit and receive data transfer at the system level:

- The full-cycle mode, for which one clock period is used to transfer the data, generated on one edge and captured on the same edge (one clock period later)
- The half-cycle mode, for which one-half clock period is used to transfer the data, generated on one edge and captured on the opposite edge (one-half clock period later). New data are generated only every clock period, which ensures the required hold time.

#### 23.5.4.8.8.1 Transmit Full-Cycle Mode

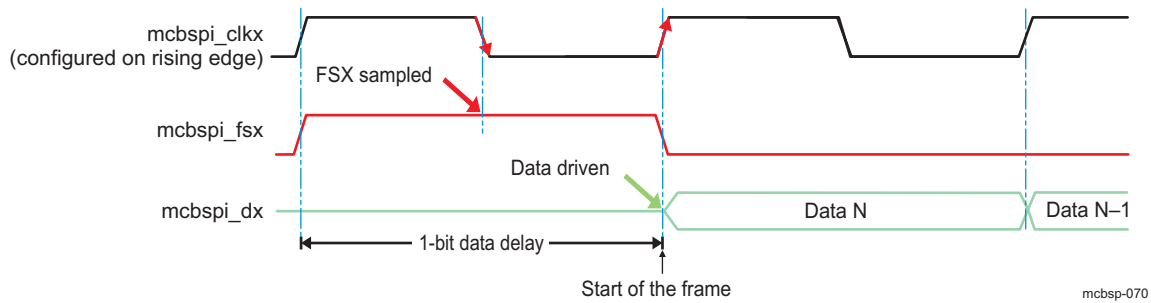

When configured in full-cycle mode (`McBSPi.MCBSPLP_XCCR_REG[11]` `XFULL_CYCLE` = 0x1), the `FSX` signal is sampled on the configured `CLKX` edge and the data is driven on the same configured edge. See [Figure 23-140](#).

#### 23.5.4.8.8.2 Transmit Half-Cycle Mode

When configured in half-cycle mode (`McBSPi.MCBSPLP_XCCR_REG[11]` `XFULL_CYCLE` = 0x0, reset value), the `FSX` signal is sampled on the opposite configured `CLKX` edge and the data is driven on the next configured edge. See [Figure 23-141](#).

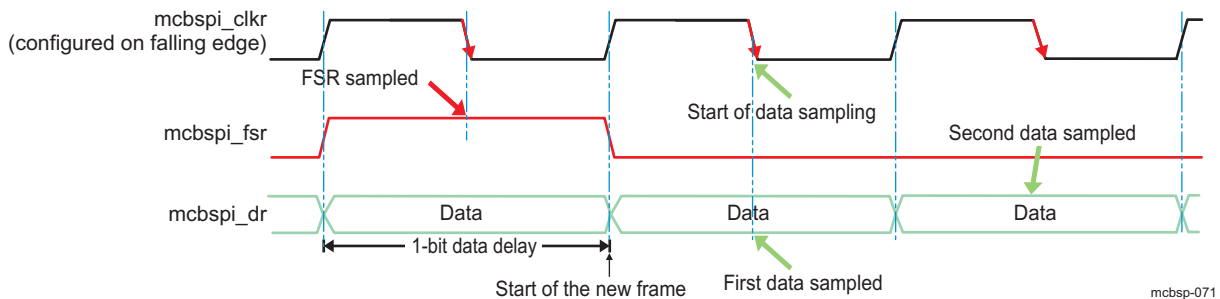

Figure 23-141. Transmit Half-Cycle Timing Diagram

23.5.4.8.8.3 Receive Full-Cycle Mode

When configured in full-cycle mode (McBSPi.MCBSPLP\_RCCR\_REG[11] RFULL\_CYCLE = 0x1, reset value), the FSR signal is sampled on the configured CLKR edge and the data is driven on the same configured edge. See Figure 23-142.

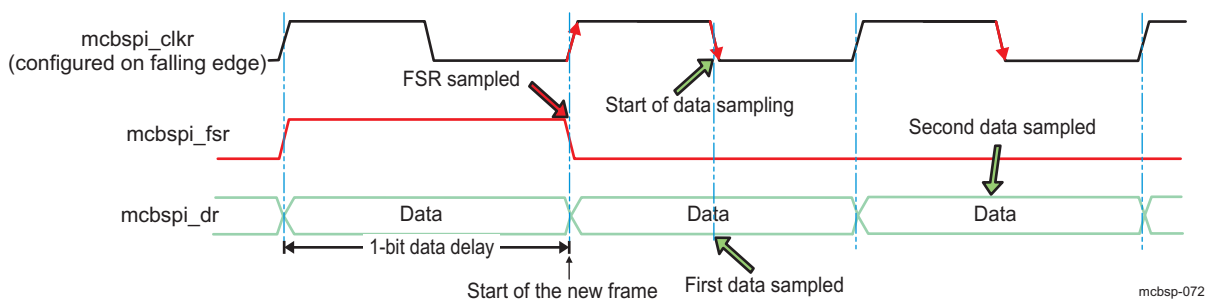

Figure 23-142. Receive Full-Cycle Timing Diagram

23.5.4.8.8.4 Receive Half-Cycle Mode

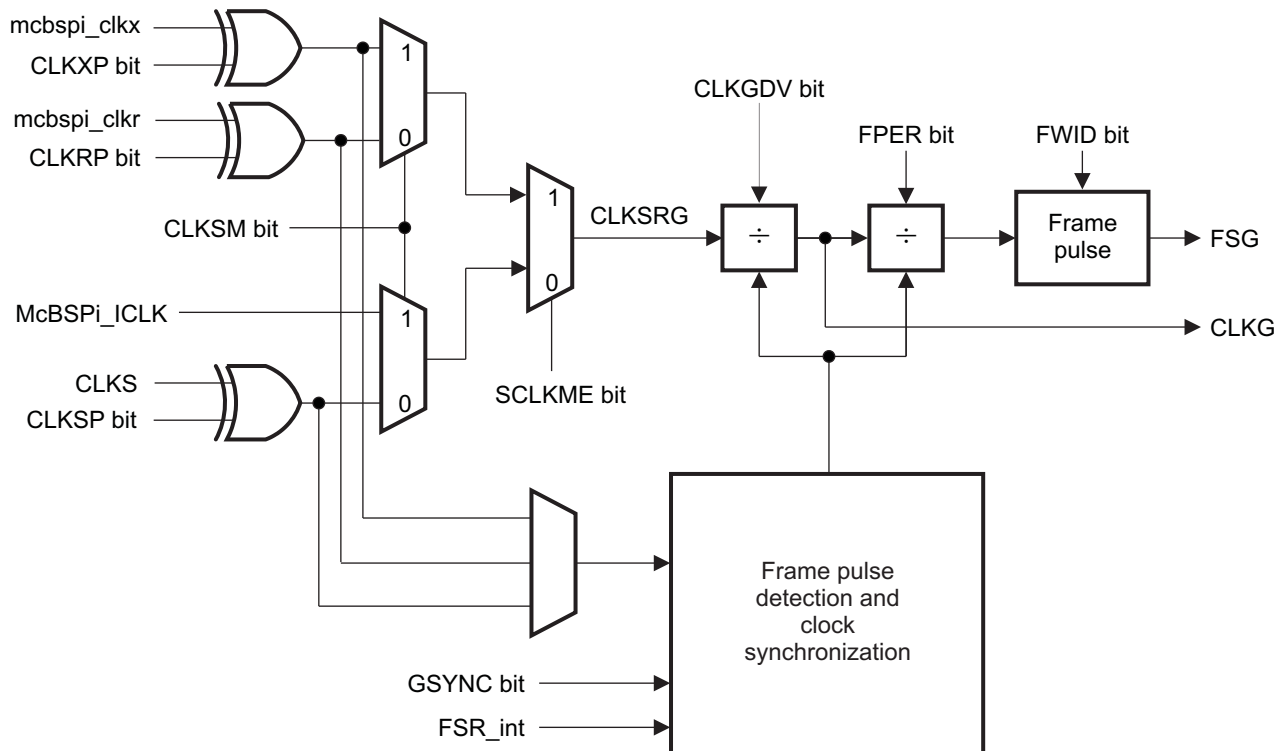

When configured in half-cycle mode (McBSPi.MCBSPLP\_RCCR\_REG[11] RFULL\_CYCLE = 0x0), the FSR signal is sampled on the opposite configured CLKR edge and the data is driven on the next configured edge. See Figure 23-143.

Figure 23-143. Receive Half-Cycle Timing Diagram

23.5.4.9 McBSP SRG

The McBSP module contains an internal SRG that can be used to generate an internal data clock (CLKG) and an internal frame-sync signal (FSG). CLKG can be used for bit shifting on the data receive pin (mcbspi\_dr) and/or the data transmit pin (mcbspi\_dx). FSG can be used to initiate frame transfers on the mcbspi\_dr pin and/or mcbspi\_dx pin. Figure 23-144 is a conceptual block diagram of the SRG.

**Figure 23-144. Conceptual Block Diagram of the SRG**

mcbasp-034

The source clock for the SRG (labeled CLKSRG in the diagram) can be supplied by the interface clock (McBSPi\_ICLK) or the functional clock (CLKS input), or by an external pin (mcbspi\_clkx or mcbasp4\_clkr). The source is selected with the McBSPi.MCBSPLP\_PCR\_REG[7] SCLKME bit and the McBSPi.MCBSPLP\_SRGR2\_REG[13] CLKSM bit.

If a pin or CLKS signal is used, the polarity of the incoming signal can be inverted with the appropriate polarity bit (McBSPi.MCBSPLP\_SRGR2\_REG[14] CLKSP, McBSPi.MCBSPLP\_PCR\_REG[1] CLKXP, or McBSPi.MCBSPLP\_PCR\_REG[0] CLKRP).

The SRG has a 3-stage clock divider that gives CLKG and FSG programmability.

The three stages provide:

- Clock divide-down: The source clock (CLKSRG) is divided according to the McBSPi.MCBSPLP\_SRGR1\_REG[7:0] CLKGDV bit field to produce the CLKG signal.
- Frame period divide-down: CLKG is divided according to the McBSPi.MCBSPLP\_SRGR2\_REG[11:0] FPER bit field to control the period from the start of a frame-pulse to the start of the next pulse.
- Frame-sync pulse-width countdown: CLKG cycles are counted according to the McBSPi.MCBSPLP\_SRGR1\_REG[15:8] FWID bit field to control the width of each frame-sync pulse.

**NOTE:** The McBSP module cannot operate at an internal functional frequency faster than L4 interface frequency divided by 2. Choose an input clock frequency and a McBSPi.MCBSPLP\_SRGR1\_REG[7:0] CLKGDV value such that CLKG is less than or equal to L4 interface frequency divided by 2.

In addition to the 3-stage clock divider, the SRG has a frame-sync pulse detection and clock synchronization module that allows synchronization of the clock divide-down with an incoming frame-sync pulse on the mcbasp4\_fsr pin. This feature is enabled or disabled with the McBSPi.MCBSPLP\_SRGR2\_REG[15] GSYNC bit.

CLKG is used as source to generate the output clocks CLKX and CLKR when the McBSPi.MCBSPLP\_PCR\_REG[9] CLKXM/McBSPi.MCBSPLP\_PCR\_REG[8] CLKRM bit indicates that the clock is an output. The output CLKX/CLKR is generated according to the clock polarity setting (see [Figure 23-131](#)).

For information about preparing the SRG for operation, see [Section 23.5.5, McBSP Basic Programming Model](#).

### 23.5.4.9.1 Clock Generation in the SRG

The SRG can produce a clock signal (CLKG) for use by the receiver, the transmitter, or both. Use of the SRG to drive clocking is controlled by the clock mode bits (McBSPi.MCBSPLP\_PCR\_REG[9] CLKXM and McBSPi.MCBSPLP\_PCR\_REG[8] CLKRM) and polarity mode bits (McBSPi.MCBSPLP\_PCR\_REG[1] CLKXP and McBSPi.MCBSPLP\_PCR\_REG[0] CLKRP).

When a clock mode bit is set to 1 (CLKRM = 1 for reception, CLKXM = 1 for transmission), the corresponding data clock (CLKR for reception, CLKX for transmission) is driven by the internal SRG output clock (CLKG) according to the polarity setting.

The effects of this setting on the McBSP module are partially affected by use of the digital loopback (DLB) mode, the analog loopback (ALB) mode, and by the synchronous receive/transmit setting, respectively, as described in [Table 23-350](#). ALB mode is selected with the McBSPi.MCBSPLP\_SPCR1\_REG[15] ALB bit. DLB mode is selected with the McBSPi.MCBSPLP\_XCCR\_REG[5] DLB bit. The synchronous setting is controlled by input signals. These signals are defined by the control registers of the control module (for more information, see [Chapter 18, Control Module](#)).

When using the SRG as a clock source, ensure that the SRG is enabled (the McBSPi.MCBSPLP\_SPCR2\_REG[6] GRST bit is set to 1).

**Table 23-350. Effects of DLB and ALB Bits on Clock Modes**

Mode Bit Settings		Effect
CLKRM=1	DLB = 0 and ALB = 0 (Digital and analog loopback mode disabled)	mcbbsp1_clk is an output pin driven by the SRG output clock (CLKG).
	DLB = 0 and ALB = 1 (Digital loopback mode disabled and analog loopback mode enabled)	mcbbsp1_clk is an output pin driven by the SRG output clock (CLKG). The receiver functional part internal clock is driven by the CLKX input signal provided by the mcbbsp1_clkx pin. The source of CLKX depends on the CLKXM bit. The receive frame synchronization is driven by the FSX input signal provided by the mcbbsp1_fsx pin. The receive data is driven by the DX input loopback pin (mcbbsp1_dx).
	DLB = 1 and ALB = 0 (Digital loopback mode enabled and analog loopback mode disabled)	The SRG and the frame-sync generator must be enabled. The internal transmit and receive clocks are driven by the SRG (CLKG having the appropriate CLKXP polarity). The transmit and receive frame-sync signals are driven by the FSG (having the appropriate FSXP polarity). The transmit data is connected to the DR input data. In digital loopback mode, no serial link activity is seen by the remote device.
	DLB = 1 and ALB = 1 (Reserved mode)	Undefined functionality.

**Table 23-350. Effects of DLB and ALB Bits on Clock Modes (continued)**

Mode Bit Settings		Effect
CLKXM=1	DLB = 0 and ALB = 0 (Digital and analog loopback mode disabled)	mcbspi_clkx is an output pin driven by the SRG output clock (CLKG).
	DLB = 0 and ALB = 1 (Digital loopback mode disabled and analog loopback mode enabled)	mcbspi_clkx is an output pin driven by the SRG output clock (CLKG).
	DLB = 1 and ALB = 0 (Digital loopback mode enabled and analog loopback mode disabled)	<p>The SRG and the frame-sync generator must be enabled.</p> <p>The internal transmit and receive clocks are driven by the SRG (CLKG having the appropriate CLKXP polarity).</p> <p>The transmit and receive frame-sync signals are driven by the FSG (having the appropriate FSXP polarity).</p> <p>The transmit data is connected to the DR input data.</p> <p>In digital loopback mode, no serial link activity is seen by the remote device.</p>
	DLB = 1 and ALB = 1 (Reserved mode)	Undefined functionality
	CONTROL_MCBSPLP[30] ALBCTRLRX_CLKX bit = 1 (synchronous setting and DLB = 0 and ALB = 0)	CLKX is an output pin driven by the SRG output clock (CLKG). CLKR is connected to the CLKX.

#### 23.5.4.9.2 Frame-Sync Generation in the SRG

The SRG can produce a frame-sync signal (FSG) for use by the receiver, the transmitter, or both.

For the receiver to use FSG for frame synchronization, make sure the McBSPi.MCBSPLP\_PCR\_REG[10] FSRM bit is set to 1. (When FSRM is set to 0, receive frame synchronization is supplied through the mcbsp4\_fsr pin.)

For the transmitter to use FSG for frame synchronization, the following bits must be set:

- McBSPi.MCBSPLP\_PCR\_REG[11] FSXM = 1: This indicates that transmit frame synchronization is supplied by the McBSP module rather than from the mcbspi\_fsx pin.
- McBSPi.MCBSPLP\_SRGR2\_REG[12] FSGM = 1: This indicates that when FSXM is set to 1, transmit frame synchronization is supplied by the SRG.

**NOTE:** When FSGM = 0 and FSXM = 1, the transmit frame-sync signal (FSX) is generated when XB is not empty. When FSGM = 0, the McBSPi.MCBSPLP\_SRGR2\_REG[11:0] FPER and McBSPi.MCBSPLP\_SRGR1\_REG[15:8] FWID bit fields are used to determine the frame-sync period and width (external FSX is gated by the buffer empty condition).

In either case, the SRG must be enabled (the McBSPi.MCBSPLP\_SPCR2\_REG[6] GRST bit is set to 1) and the frame-sync logic in the SRG must be enabled (the McBSPi.MCBSPLP\_SPCR2\_REG[7] FRST bit is set to 0).

##### 23.5.4.9.2.1 Choosing the Width of the Frame-Sync Pulse

Each pulse on FSG has a programmable width. Program the McBSPi.MCBSPLP\_SRGR1\_REG[15:8] FWID bit field, and the resulting pulse width is (FWID + 1) CLKG cycles, where CLKG is the output clock of the SRG. The range is from 1 to 256 clock periods.

##### 23.5.4.9.2.2 Controlling the Period Between the Starting Edges of Frame-Sync Pulses

The user can control the amount of time from the starting edge of one FSG pulse to the starting edge of the next FSG pulse. This period is controlled in one of two ways, depending on the configuration of the SRG:

- If the SRG is using an external input clock and the McBSPi.MCBSPLP\_SRGR2\_REG[15] GSYNC bit is set to 1, FSG pulses in response to an inactive-to-active transition on the mcbsp4\_fsr pin. Thus, an external device controls the frame-sync period.
- Otherwise, software programs the McBSPi.MCBSPLP\_SRGR2\_REG[11:0] FPER bit field, and the resulting frame-sync period is (FPER + 1) CLKG cycles, where CLKG is the output clock of the SRG.

The range is from 1 to 4096 clock periods.

### 23.5.4.9.2.3 Keeping FSG Synchronized to an External Clock

When an external signal is selected to drive the SRG, the McBSPi.MCBSPLP\_SRGR2\_REG[15] GSYNC bit and the mcbbsp4\_fsr pin can be used to configure the timing of FSG pulses.

Setting the McBSPi.MCBSPLP\_SRGR2\_REG[15] GSYNC bit to 1 ensures that the McBSP module and an external device are dividing down the input clock with the same phase relationship.

If the McBSPi.MCBSPLP\_SRGR2\_REG[15] GSYNC bit is set to 1, an inactive-to-active transition on the mcbbsp4\_fsr pin triggers a resynchronization of CLKG and generation of FSG.

### 23.5.4.9.3 Synchronizing SRG Outputs to an External Clock

The SRG can produce a clock signal (CLKG) and an FSG based on an input clock signal that is either:

- The interface clock signal (MCBSPi\_ICLK)
- The CLKS signal (PRCM functional clock or abe\_clks)
- A signal at the mcbbsp4\_clkr
- The mcbspi\_clkx pin

When an external clock (abe\_clks, mcbbsp4\_clkr, or mcbspi\_clkx) is selected to drive the SRG, the McBSPi.MCBSPLP\_SRGR2\_REG[15] GSYNC bit and the mcbbsp4\_fsr pin can be used to control the timing of CLKG and the pulsing of FSG relative to the chosen input clock. Set the GSYNC bit to 1 so that the McBSP module and an external device divide-down the input clock with the same phase relationship.

If the McBSPi.MCBSPLP\_SRGR2\_REG[15] GSYNC bit is set to 1:

- An inactive-to-active transition on the mcbbsp4\_fsr pin triggers a resynchronization of the CLKG signal and a pulsing of the FSG signal.
- The CLKG signal always begins with a high state after synchronization.
- The FSR signal is always detected at the same edge of the input clock signal that generates the CLKG signal, no matter how long the FSR pulse is.
- The McBSPi.MCBSPLP\_SRGR2\_REG[11:0] FPER bit field is ignored because the frame-sync period on FSG is determined by the arrival of the next frame-sync pulse on the mcbbsp4\_fsr pin.

If the McBSPi.MCBSPLP\_SRGR2\_REG[15] GSYNC bit is set to 0, the CLKG signal runs freely and is not resynchronized, and the frame-sync period on the FSG signal is determined by the McBSPi.MCBSPLP\_SRGR2\_REG[11:0] FPER bit field.

#### 23.5.4.9.3.1 Operating the Transmitter Synchronously With the Receiver

When the McBSPi.MCBSPLP\_SRGR2\_REG[15] GSYNC bit is set to 1, the transmitter can operate synchronously with the receiver, provided that the FSX signal is programmed to be driven by the FSG signal (McBSPi.MCBSPLP\_SRGR2\_REG[12] FSGM = 1 and McBSPi.MCBSPLP\_PCR\_REG[11] FSXM = 1). If the FSR input signal has appropriate timing so that it can be sampled by the falling edge of the CLKG signal, it can be used, instead, by setting the McBSPi.MCBSPLP\_PCR\_REG[11] FSXM bit to 0 and connecting the FSR signal to FSX externally.

The SRG clock drives the transmit and receive clocking (the McBSPi.MCBSPLP\_PCR\_REG[8] CLKRM and McBSPi.MCBSPLP\_PCR\_REG[9] CLKXM bits are set to 1). Therefore, the CLK(R/X) pin must not be driven by any other driving source.

#### 23.5.4.9.3.2 Synchronization Examples

Figure 23-145 and Figure 23-146 show the clock and frame-sync operation with various polarities of CLKS (the chosen input clock) and FSR signals. These figures assume McBSPi.MCBSPLP\_SRGR1\_REG[15:8] FWID = 0x0, for an FSG pulse that is one CLKG cycle wide. The McBSPi.MCBSPLP\_SRGR2\_REG[11:0] FPER bit field is not programmed; the period from the start of a frame-sync pulse to the start of the next pulse is determined by the arrival of the next inactive-to-active transition on the mcbbsp4\_fsr pin.

Both figures show what happens to the CLKG signal when the McBSPi.MCBSPLP\_SRGR2\_REG[15] GSYNC bit is set to 1 and if it is initially synchronized or not initially synchronized. Figure 23-146 has a slower CLKG frequency (it has a larger divide-down value in the McBSPi.MCBSPLP\_SRGR1\_REG[7:0] CLKGDV bit field).

**Figure 23-145. CLKG Synchronization and FSG Generation (GSYNC = 1 and CLKGDV = 0x1)**

mcbasp-035

**Figure 23-146. CLKG Synchronization and FSG Generation (GSYNC = 1 and CLKGDV = 0x3)**

mcbasp-036

### 23.5.4.10 McBSP Exception/Error Conditions

#### 23.5.4.10.1 Introduction

Several serial port events can constitute a system error. Any error condition can be a source of an interrupt:

- Receiver overrun (the McBSPi.MCBSPLP\_IRQSTATUS\_REG[5] ROVFLSTAT bit is set to 1, and the legacy mode McBSPi.MCBSPLP\_SPCR1\_REG[2] RFULL bit is set to 1)

This occurs when the RB is full and the RSR is full with another new word shifted in from mcbspi\_dr. Therefore, the McBSPi.MCBSPLP\_IRQSTATUS\_REG[5] ROVFLSTAT bit (McBSPi.MCBSPLP\_SPCR1\_REG[2] RFULL) indicates an error condition wherein any new data that can arrive at this time on mcbspi\_dr replaces the contents of the RSR, and the previous word is lost. The RSR continues to be overwritten as long as new data arrives on mcbspi\_dr and the McBSPi.MCBSPLP\_DRR\_REG register is not read. For more information about overrun in the receiver, see Section 23.5.4.10.2, *Overrun in the Receiver*.

- Unexpected receive frame-sync pulse (the McBSPi.MCBSPLP\_IRQSTATUS\_REG[0] RSYNCERR bit is set to 1, and the legacy mode McBSPi.MCBSPLP\_SPCR1\_REG[3] RSYNCERR bit is set to 1)  
This occurs during reception when an unexpected frame-sync pulse arrives. An unexpected frame-sync pulse is one that is supposed to begin the next frame transfer before all the bits of the current frame are received. Such a pulse is ignored by the receiver, but sets the McBSPi.MCBSPLP\_SPCR1\_REG[3] RSYNCERR bit. For more information about receive frame-sync errors, see [Section 23.5.4.10.3, Unexpected Receive Frame-Sync Pulse](#).
- Receiver underflow (the McBSPi.MCBSPLP\_IRQSTATUS\_REG[4] RUNDLSTAT bit is set to 1)  
This occurs when the sDMA controller or MPU/DSP subsystem reads data from an empty receive buffer. For more information about underflow in the receiver, see [Section 23.5.4.10.4, Underflow in the Receiver](#).
- Transmitter underflow (the McBSPi.MCBSPLP\_IRQSTATUS\_REG[11] XUNDLSTAT bit is set to 1, and the legacy mode McBSPi.MCBSPLP\_SPCR2\_REG[2] XEMPTY bit is set to 0)  
If a new frame-sync signal arrives when the XB is empty, the previous data in the XSR is re-sent. This procedure continues for every new frame-sync pulse that arrives until the McBSPi.MCBSPLP\_DXR\_REG register is loaded with new data (and the XB is no longer empty). For more information about underflow in the transmitter, see [Section 23.5.4.10.5, Underflow in the Transmitter](#).
- Unexpected transmit frame-sync pulse (the McBSPi.MCBSPLP\_IRQSTATUS\_REG[7] XSYNCERR bit is set to 1, and the legacy mode McBSPi.MCBSPLP\_SPCR2\_REG[3] XSYNCERRbit is set to 1)  
This occurs during transmission when an unexpected frame-sync pulse arrives. An unexpected frame-sync pulse is one that is supposed to begin the next frame transfer before all the bits of the current frame are transferred. Such a pulse is ignored by the transmitter, but sets the McBSPi.MCBSPLP\_SPCR2\_REG[3] XSYNCERR bit. For more information, see [Section 23.5.4.10.6, Unexpected Transmit Frame-Sync Pulse](#).
- Transmitter overflow (the McBSPi.MCBSPLP\_IRQSTATUS\_REG[12] XOVLSTAT bit is set to 1)  
This occurs when the sDMA controller or MPU/DSP subsystem writes data to a full XB. For more information about underflow in the receiver, see [Section 23.5.4.10.7, Overflow in the Transmitter](#).

### 23.5.4.10.2 Overrun in the Receiver

When the McBSPi.MCBSPLP\_IRQSTATUS\_REG[5] ROVLSTAT bit is set to 1, and the McBSPi.MCBSPLP\_SPCR1\_REG[2] RFULL bit is set to 1 (legacy mode) indicates that the receiver has experienced overrun and is in an error condition. Receive overrun is set when all of the following conditions are met:

1. McBSPi.MCBSPLP\_DRR\_REG is not read even if the McBSPi.MCBSPLP\_IRQSTATUS\_REG[3] RRDY bit is set (legacy mode) and DMA or interrupt request has been asserted.
2. RB is full.
3. RSR is full.

As previously described, data arriving on mcbspi\_dr is continuously shifted into the RSR. Once a complete word is shifted into the RSR, an RSR-to-RB copy can occur only if the RB is not full.

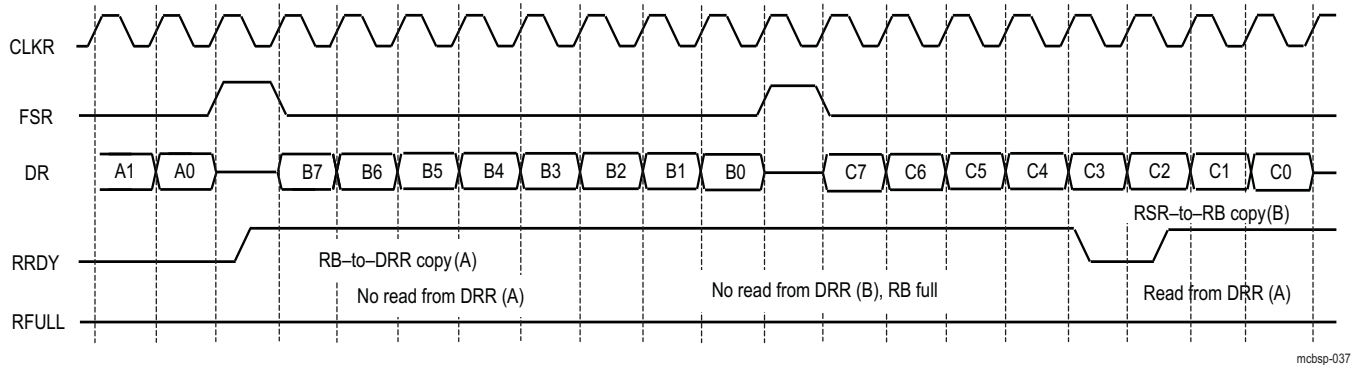

Either of the following events clears the legacy mode McBSPi.MCBSPLP\_SPCR1\_REG[2] RFULL bit and allows subsequent transfers to be read properly:

- The MPU/DSP subsystems or sDMA controller reads the McBSPi.MCBSPLP\_DRR\_REG register.
- The receiver is reset individually (the McBSPi.MCBSPLP\_SPCR1\_REG[0] RRST bit is set to 0) or as part of a global reset.

Another frame-sync pulse is required to restart the receiver.

According to the McBSPi.MCBSPLP\_IRQENABLE\_REG register setting, this condition can generate the McBSPi\_IRQ line to be asserted low. Writing 1 to the corresponding bit in the McBSPi.MCBSPLP\_IRQSTATUS\_REG register clears the interrupt.

[Figure 23-147](#) shows the receive overrun condition.

**Figure 23-147. Overrun in the McBSP Receiver**

mcbasp-037

### 23.5.4.10.3 Unexpected Receive Frame-Sync Pulse

#### 23.5.4.10.3.1 Possible Responses to Receive Frame-Sync Pulses

If a frame-sync pulse starts the transfer of a new frame before the current frame is fully received, this pulse is treated as an unexpected frame-sync pulse, and the receiver sets the receive frame-sync error bit `McBSPi.MCBSPLP_IRQSTATUS_REG[0] RSYNCERR` (and the legacy `McBSPi.MCBSPLP_SPCR1_REG[3] RSYNCERR` bit).

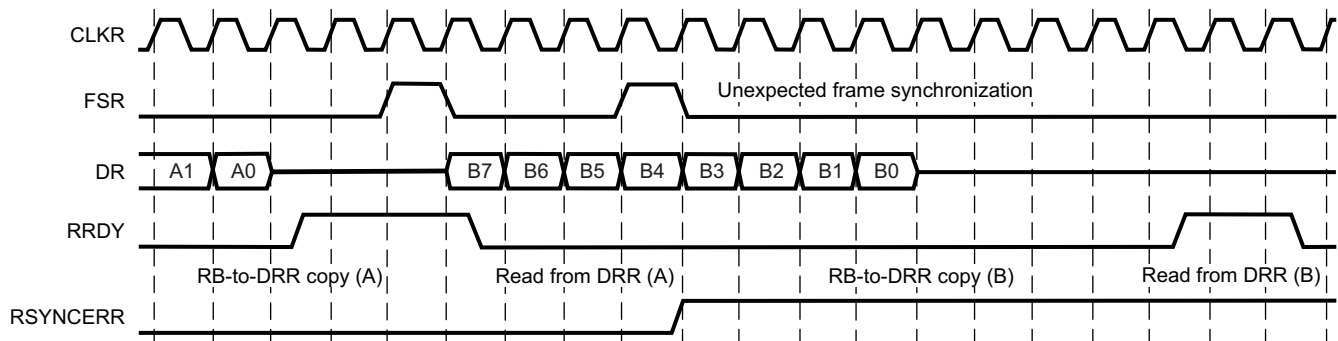

According to the settings of the `McBSPi.MCBSPLP_IRQENABLE_REG` register, this condition can generate the `MCBSPi_IRQ` line to be asserted low. Writing 1 to the corresponding bit in the `McBSPi.MCBSPLP_IRQSTATUS_REG` register clears the interrupt.

Using the legacy mode, the `McBSPi.MCBSPLP_SPCR1_REG[3] RSYNCERR` bit can be cleared only by a receiver reset or by setting this bit to 0. For the McBSP module to notify the MPU/DSP subsystem of receive frame-sync errors, set the legacy mode receive interrupt with the `McBSPi.MCBSPLP_SPCR1_REG[5:4] RINTM` bit field. When `RINTM` is set to `0b11`, the McBSP module sends a receive interrupt (legacy mode) request to the MPU/DSP subsystems each time that `RSYNCERR` is set.

#### 23.5.4.10.3.2 Example of an Unexpected Receive Frame-Sync Pulse

Figure 23-148 shows an unexpected receive frame-sync pulse during normal operation of the serial port with time intervals between data packets.

**NOTE:** The unexpected receive frame-sync pulse does not influence the data receive process, being ignored by the data receive state-machine.

**Figure 23-148. Unexpected Frame-Sync Pulse During a McBSP Reception**

mcbasp-038

### 23.5.4.10.3.3 Preventing Unexpected Receive Frame-Sync Pulses

Each frame transfer can be delayed by 0, 1, or 2 CLKR cycles, depending on the value of the McBSPi.MCBSPLP\_RCR2\_REG[1:0] RDATDLY bit field. For each possible data delay, Figure 23-149 shows when a new frame-sync pulse on FSR can safely occur relative to the last bit of the current frame.

Figure 23-149. Proper Positioning of Receive Frame-Sync Pulses

### 23.5.4.10.4 Underflow in the Receiver

The McBSP module indicates a receiver underflow condition by setting the McBSPi.MCBSPLP\_IRQSTATUS\_REG[4] RUNDFLSTAT bit. This error occurs when sDMA controller or MPU/DSP subsystem reads data from an empty RB this happens only if the MPU/DSP subsystem or sDMA controller does not respect the DMA length, does not wait for DMA request, or does not check the buffer status before reading data. According to the McBSPi.MCBSPLP\_IRQENABLE\_REG register settings this condition can generate the McBSPi\_IRQ line to be asserted low. Writing 1 to the corresponding bit in McBSPi.MCBSPLP\_IRQSTATUS\_REG register clears the interrupt.

### 23.5.4.10.5 Underflow in the Transmitter

The McBSP module indicates a transmitter empty (or underflow) condition by setting the McBSPi.MCBSPLP\_IRQSTATUS\_REG[11] XUNDFLSTAT bit. The legacy mode McBSPi.MCBSPLP\_SPCR2\_REG[2] XEMPTY bit is also cleared. Either of the following events activates the XEMPTY bit (XEMPTY = 0):

- The McBSPi.MCBSPLP\_DXR\_REG register has not been loaded and the XB is empty, and all bits of the data word in the XSR have been shifted out on the mcbspi\_dx pin.
- The transmitter is reset (by forcing McBSPi.MCBSPLP\_SPCR2\_REG[0] XRST to 0, or by a global reset) and is then restarted.

The XEMPTY bit is deactivated (XEMPTY = 1) when a new word in the McBSPi.MCBSPLP\_DXR\_REG register is transferred to the XB. If the McBSPi.MCBSPLP\_PCR\_REG[11] FSXM bit is set to 1 and the McBSPi.MCBSPLP\_SRGR2\_REG[12] FSGM bit is set to 0, the FSX signal is generated when the XB is not empty. When the McBSPi.MCBSPLP\_SRGR2\_REG[12] FSGM bit is set to 0, the McBSPi.MCBSPLP\_SRGR2\_REG[11:0] FPER and McBSPi.MCBSPLP\_SRGR1\_REG[15:8] FWID bit fields are used to determine the frame-sync period and width (external FSX is gated by the buffer empty condition). Otherwise, the transmitter waits for the next frame-sync pulse before sending the next frame on the mcbspi\_dx pin.

When the transmitter is taken out of reset (the `cBSPi.MCBSPLP_SPCR2_REG[0]` XRST bit is set to 1), it is in a transmitter ready state (the `McBSPi.MCBSPLP_SPCR2_REG[1]` XRDY bit is set to 1) and transmitter empty (the `McBSPi.MCBSPLP_SPCR2_REG[2]` XEMPTY bit is set to 0) state. If the `McBSPi.MCBSPLP_DXR_REG` register is loaded by the MPU/DSP subsystem or the sDMA controller before internal the FSX goes active high, a valid XB-to-XSR transfer occurs. This allows for the first word of the first frame to be valid even before the transmit frame-sync pulse is generated or detected. Alternatively, if a transmit frame-sync pulse is detected before `McBSPi.MCBSPLP_DXR_REG` is loaded, zeros are output on the `mcbspi_dx` pin.

The `McBSPi.MCBSPLP_IRQSTATUS_REG[11]` XUNDFLSTAT bit indicates a real underflow condition, in which the frame is corrupted due to lack of data availability during the transmit process. According to the settings of the `McBSPi.MCBSPLP_IRQENABLE_REG` register, this condition can generate the `MCBSPi_IRQ` line to be asserted low. Writing 1 to the corresponding bit in `McBSPi.MCBSPLP_IRQSTATUS_REG` register clears the interrupt.

### 23.5.4.10.6 Unexpected Transmit Frame-Sync Pulse

#### 23.5.4.10.6.1 Possible Responses to Transmit Frame-Sync Pulses

If a frame-sync pulse starts the transfer of a new frame before the current frame is fully transmitted, this pulse is treated as an unexpected frame-sync pulse, and the transmitter sets the transmit frame-sync error bit `McBSPi.MCBSPLP_IRQSTATUS_REG[7]` XSYNCERR (and the legacy `McBSPi.MCBSPLP_SPCR2_REG[3]` XSYNCERR bit).

According to the settings of the `McBSPi.MCBSPLP_IRQENABLE_REG` register, this condition can generate the `MCBSPi_IRQ` line to be asserted low. Writing 1 to the corresponding bit in the status register clears the interrupt.

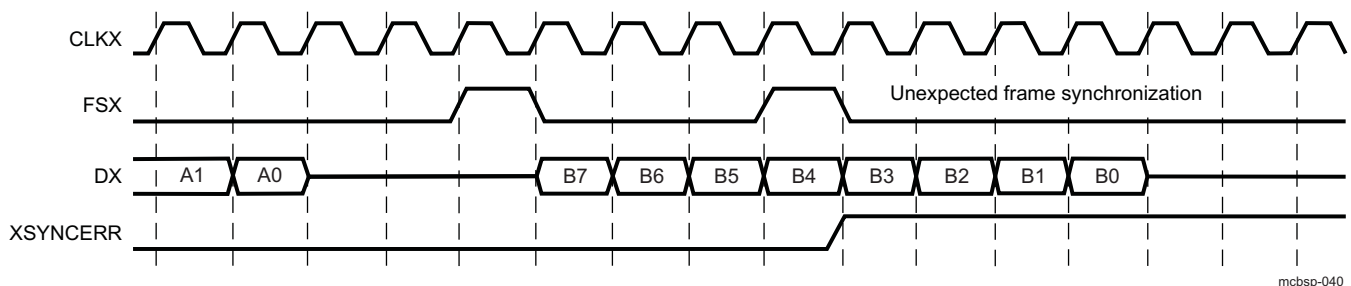

Using the legacy mode, the `McBSPi.MCBSPLP_SPCR2_REG[3]` XSYNCERR bit can be cleared only by a transmitter reset or by setting this bit to 0. For the McBSP module to notify the MPU/DSP subsystem of frame-sync errors, set a special transmit interrupt mode with the `McBSPi.MCBSPLP_SPCR2_REG[5:4]` XINTM bit field. When XINTM is set to 0b11, the McBSP module sends a transmit interrupt request to the MPU/DSP subsystem each time XSYNCERR is set.

#### 23.5.4.10.6.2 Example of Unexpected Transmit Frame-Sync Pulse

Figure 23-150 shows an unexpected transmit frame-sync pulse during normal operation of the serial port with intervals between the data packets.

**NOTE:** The unexpected transmit frame-sync pulse does not influence the data transmit process, being ignored by the data transmit state-machine.

**Figure 23-150. Unexpected Frame-Sync Pulse During a McBSP Transmission**

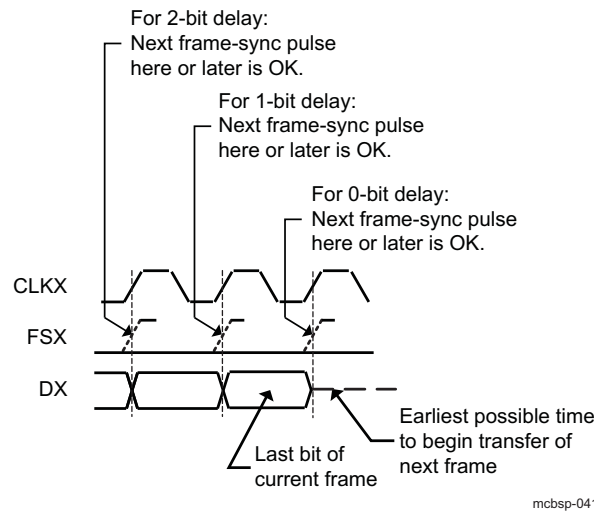

mcbbsp-040

#### 23.5.4.10.6.3 Preventing Unexpected Transmit Frame-Sync Pulses

Each frame transfer can be delayed by 0, 1, or 2 CLKX cycles, depending on the value in the `McBSPi.MCBSPLP_XCR2_REG[1:0]` XDATDLY bit field. For each possible data delay, Figure 23-151 shows when a new frame-sync pulse on FSX can safely occur relative to the last bit of the current frame.

**Figure 23-151. Proper Positioning of Transmit Frame-Sync Pulses**

mcbasp-041

#### 23.5.4.10.7 Overflow in the Transmitter

The McBSP module indicates a transmitter overflow condition by setting the `McBSPi.MCBSPLP_IRQSTATUS_REG[12]` `XOVFLSTAT` bit. This error occurs when the sDMA controller or MPU/DSP subsystem writes data to a full XB (this happens only if the MPU/DSP subsystem or sDMA controller does not respect the DMA length, does not wait for DMA request, or does not check the buffer status before writing data). According to the settings of the `McBSPi.MCBSPLP_IRQENABLE_REG` register, this condition can generate the `McBSPi_IRQ` line to be asserted low. Writing 1 to the corresponding bit in the status register clears the interrupt.

#### 23.5.4.11 McBSP DMA Configuration

The McBSP receive and transmit data DMA requests are active after the receive `McBSPi.MCBSPLP_SPCR1_REG[0]` `RRST` and transmit `McBSPi.MCBSPLP_SPCR2_REG[0]` `XRST` bits are released. After reset the default DMA threshold (and length) is one.

The receive and transmit DMA requests can be individually disabled by setting the `McBSPi.MCBSPLP_RCCR_REG[3]` `RDMAEN` and `McBSPi.MCBSPLP_XCCR_REG[3]` `XDMAEN` bits to 0. When disabling the DMA, the DMA request line is deasserted even if a DMA transfer is pending and the DMA state-machine is not reset.

The DMA threshold and length configuration is done through the `McBSPi.MCBSPLP_THRSH1_REG` and `McBSPi.MCBSPLP_THRSH2_REG` registers as follows:

- `(THRSH1_REG + 1)` value represents the required receive DMA request length (the length of the transfer is the same as the threshold value plus 1). As long as the RB occupied locations level is greater than or equal to the `THRSH1_REG` value + 1, the DMA request is asserted. After transferring the configured `(THRSH1_REG + 1)` number of words, the receive DMA request is de-asserted and reasserted as soon as the conditions are met again.
- `(THRSH2_REG + 1)` value represents the required transmit DMA request length (the length of the transfer is the same as the threshold value plus 1). As long as the XB free locations level is greater than or equal to the `THRSH2_REG` value + 1, the DMA request is asserted. After transferring the configured `(THRSH2_REG + 1)` number of words, the transmit DMA request is deasserted and reasserted as soon as the conditions are met.

**NOTE:** The MPU/DSP subsystem can decide not to use the DMA to transfer the data. In this case, the DMA must be disabled (or the DMA request can be ignored by MPU/DSP subsystem) and the common interrupt line (MCBSPi\_IRQ) can be used. The MCBSPi.MCBSPLP\_SPCR1\_REG[1] RRDY bit for receive and the MCBSPi.MCBSPLP\_SPCR2\_REG[1] XRDY bit for transmit indicate when the threshold values are reached. Also, by reading the receive buffer status MCBSPi.MCBSPLP\_RBUFFSTAT\_REG register and transmit buffer status MCBSPi.MCBSPLP\_XBUFFSTAT\_REG register, the MPU/DSP subsystem can decide to transfer data even if the threshold is not reached. This mechanism is useful on the last transfer on the receive side when the threshold value is bigger than the occupied locations inside the receive buffer and the MPU/DSP subsystem needs to read this data. Because no interrupt or DMA request is asserted, the only option in this case is to read the value of the RB status register and to transfer the remaining data without using the DMA or interrupt indication.

### 23.5.4.12 Multichannel Selection Modes

#### 23.5.4.12.1 Channels, Blocks and Partitions

A McBSP channel is a time slot for shifting in/out the bits of one serial word. The McBSP module supports up to 128 channels for reception and 128 channels for transmission. In the receiver and in the transmitter, the 128 available channels are divided into eight blocks that contain 16 contiguous channels each (see [Table 23-351](#)).

**Table 23-351. McBSP Channels**

<b>Block 0: Channels 0–15</b>	<b>Block 4: Channels 64–79</b>
<b>Block 1: Channels 16–31</b>	<b>Block 5: Channels 80–95</b>
<b>Block 2: Channels 32–47</b>	<b>Block 6: Channels 96–111</b>
<b>Block 3: Channels 48–63</b>	<b>Block 7: Channels 112–127</b>

The blocks are assigned to partitions according to the selected partition mode. In the 2-partition mode described in [Section 23.5.4.12.6, Using Two Partitions \(Legacy Only\)](#), assign one even-numbered block (0, 2, 4, or 6) to partition A and one odd-numbered block (1, 3, 5, or 7) block to partition B. In the 8-partition mode described in [Section 23.5.4.12.4, Using Eight Partitions](#), blocks 0 through 7 are automatically assigned to partitions A through H, respectively.

The number of partitions for reception and the number of partitions for transmission are independent of one another. For example, it is possible to use two receive partitions (A and B) and eight transmit partitions (A–H).

#### 23.5.4.12.2 Multichannel Selection

When a McBSP module uses a time-division multiplexed (TDM) data stream while communicating with other McBSP modules or serial devices, the McBSP module may need to receive and/or transmit on only a few channels. To save memory and bus bandwidth, use a multichannel selection mode to prevent data flow in some of the channels.

Each channel partition has a dedicated channel enable register. If the appropriate multichannel selection mode is on, each bit in the register controls whether data flow is allowed or prevented in one of the channels that is assigned to that partition.

The McBSP module has one receive multichannel selection mode (see [Section 23.5.4.12.5, Receive Multichannel Selection Mode](#)) and three transmit multichannel selection modes (see [Section 23.5.4.12.7, Transmit Multichannel Selection Modes](#)).

#### 23.5.4.12.3 Configuring a Frame for Multichannel Selection

Before enabling a multichannel selection mode, ensure that the data frame is properly configured:

- Select a single-phase frame (the McBSPi.MCBSPLP\_RCR2\_REG[15] RPHASE and McBSPi.MCBSPLP\_XCR2\_REG[15] XPHASE bits are set to 0). Each frame represents a TDM data stream.
- Set a frame length (in the McBSPi.MCBSPLP\_RCR1\_REG[14:8] RFLEN1 and McBSPi.MCBSPLP\_XCR1\_REG[14:8] XFLEN1 bit fields) that includes the highest numbered channel to be used. For example, to use channels 0, 15, and 39 for reception, the receive frame length must be at least 40 (RFLEN1 = 39). In this case, if XFLEN1 = 39, the receiver creates 40 time slots per frame but receives data only during time slots 0, 15, and 39 of each frame.

#### 23.5.4.12.4 Using Eight Partitions

For multichannel selection operation in the receiver and/or transmitter, eight partitions or two partitions (as previously described) can be used. If 8-partition mode (McBSPi.MCBSPLP\_MCR1\_REG[9] RMCME = 1 for reception, and McBSPi.MCBSPLP\_MCR2\_REG[9] XMCME = 1 for transmission) is selected, McBSP channels are activated in the following order: A, B, C, D, E, F, G, H.

In response to a frame-sync pulse, the receiver or transmitter begins with the channels in partition A and then continues with the other partitions, in order, until the complete frame is transferred. When the next frame-sync pulse occurs, the next frame is transferred, beginning with the channels in partition A.

In 8-partition mode, the McBSPi.MCBSPLP\_MCR1\_REG[6:5] RPABLK/McBSPi.MCBSPLP\_MCR2\_REG[6:5] XPABLK bit fields, and the McBSPi.MCBSPLP\_MCR1\_REG[8:7] RPBBLK/McBSPi.MCBSPLP\_MCR2\_REG[8:7] XPBBLK bit fields are ignored and the 16-channel blocks are assigned to the partitions as shown in [Table 23-352](#) and [Table 23-353](#). These assignments cannot be changed. The tables also show the registers used to control the channels in the partitions.

**Table 23-352. Eight Partitions – Receive Channel Assignment and Control**

Receive Partition	Assigned Block of Receive Channels	Register Used for Channel Control
A	Block 0: Channels 0–15	McBSPi.MCBSPLP_RCERA_REG
B	Block 1: Channels 16–31	McBSPi.MCBSPLP_RCERB_REG
C	Block 2: Channels 32–47	McBSPi.MCBSPLP_RCERC_REG
D	Block 3: Channels 48–63	McBSPi.MCBSPLP_RCERD_REG
E	Block 4: Channels 64–79	McBSPi.MCBSPLP_RCERE_REG
F	Block 5: Channels 80–95	McBSPi.MCBSPLP_RCERF_REG
G	Block 6: Channels 96–111	McBSPi.MCBSPLP_RCERG_REG
H	Block 7: Channels 112–127	McBSPi.MCBSPLP_RCERH_REG

**Table 23-353. Eight Partitions – Transmit Channel Assignment and Control**

Transmit Partition	Assigned Block of Receive Channels	Register Used for Channel Control
A	Block 0: Channels 0–15	McBSPi.MCBSPLP_XCERA_REG
B	Block 1: Channels 16–31	McBSPi.MCBSPLP_XCERB_REG
C	Block 2: Channels 32–47	McBSPi.MCBSPLP_XCERC_REG
D	Block 3: Channels 48–63	McBSPi.MCBSPLP_XCERD_REG
E	Block 4: Channels 64–79	McBSPi.MCBSPLP_XCERE_REG
F	Block 5: Channels 80–95	McBSPi.MCBSPLP_XCERF_REG
G	Block 6: Channels 96–111	McBSPi.MCBSPLP_XCERG_REG
H	Block 7: Channels 112–127	McBSPi.MCBSPLP_XCERH_REG

Figure 23-152 shows an example of the McBSP using 8-partition mode. In response to a frame-sync pulse, the McBSP module begins a frame transfer with partition A and then activates B, C, D, E, F, G, and H to complete a 128-word frame.

**Figure 23-152. McBSP Data Transfer in 8-Partition Mode**

### 23.5.4.12.5 Receive Multichannel Selection Mode

The `McBSPi.MCBSPLP_MCR1_REG[0]` RCMCM bit determines whether all channels or only selected channels are enabled for reception.

- When `RCMCM = 0`, all 128 receive channels are enabled and cannot be disabled.
- When `RCMCM = 1`, the receive multichannel selection mode is enabled. In this mode:
  - Channels can be individually enabled or disabled. The enabled channels are those selected in the appropriate receive channel enable registers (`McBSPi.MCBSPLP_RCERA_REG/McBSPi.MCBSPLP_RCERH_REG`). The channels assigned to the `McBSPi.MCBSPLP_RCERA_REG/McBSPi.MCBSPLP_RCERH_REG` registers depend on the number of receive channel partitions (2 or 8), as defined by the `McBSPi.MCBSPLP_MCR1_REG[9]` RMCME bit.
  - If a receive channel is disabled, any bits received in that channel are not transferred to the RB, and as a result, the receiver ready bit (RRDY) is not set. Therefore, no DMA synchronization event is generated and, if the receiver interrupt mode depends on RRDY (`McBSPi.MCBSPLP_SPCR1_REG[5:4]` `RINTM = 0b00`), no interrupt is generated.

As an example of how the McBSP module behaves in the receive multichannel selection mode, suppose only channels 0, 15, and 39 are enabled and that the frame length is 40. The McBSP module:

1. Accepts bits shifted in from the `mcbspi_dr` pin in channel 0
2. Ignores bits received in channels 1–14
3. Accepts bits shifted in from the `mcbspi_dr` pin in channel 15
4. Ignores bits received in channels 16–38
5. Accepts bits shifted in from the `mcbspi_dr` pin in channel 39

### 23.5.4.12.6 Using Two Partitions (Legacy Only)

For multichannel selection operation in the receiver and/or the transmitter, two partitions or eight partitions can be used. If 2-partition mode (the `McBSPi.MCBSPLP_MCR1_REG[9]` RMCME bit is set to 0 for reception, and the `McBSPi.MCBSPLP_MCR2_REG[9]` XMCME bit is set to 0 for transmission) is selected, the McBSP channels are activated using an alternating scheme. In response to a frame-sync pulse, the receiver or transmitter begins with the channels in partition A and then alternates between partitions B and A until the complete frame is transferred. When the next frame-sync pulse occurs, the next frame is transferred beginning with the channels in partition A.

For reception, any two of the eight receive-channel blocks can be assigned to receive partitions A and B, which means up to 32 receive channels can be enabled at any given point. Similarly, any two of the eight transmit-channel blocks (up to 32 enabled transmit channels) can be assigned to transmit partitions A and B.

For reception:

- Assign an even-numbered channel block (0, 2, 4, or 6) to receive partition A by writing to the `McBSPi.MCBSPLP_MCR1_REG[6:5]` RPABLK bit field. In the receive multichannel selection mode,

the channels in this partition are controlled by receive channel enable register A (McBSPi.MCBSPLP\_RCERA\_REG).

- Assign an odd-numbered block (1, 3, 5, or 7) to receive partition B with the McBSPi.MCBSPLP\_MCR1\_REG[8:7] RPBBLK bit field. In the receive multichannel selection mode, the channels in this partition are controlled by receive channel enable register B (McBSPi.MCBSPLP\_RCERB\_REG).

For transmission:

- Assign an even-numbered channel block (0, 2, 4, or 6) to transmit partition A by writing to the McBSPi.MCBSPLP\_MCR2\_REG[6:5] XPABLK bit field. In one of the transmit multichannel selection modes, the channels in this partition are controlled by transmit channel enable register A (McBSPi.MCBSPLP\_XCERA\_REG).
- Assign an odd-numbered block (1, 3, 5, or 7) to transmit partition B with the McBSPi.MCBSPLP\_MCR1\_REG[8:7] XPBBLK bit field. In one of the transmit multichannel selection modes, the channels in this partition are controlled by transmit channel enable register B (McBSPi.MCBSPLP\_XCERB\_REG).

Figure 23-153 shows an example of alternating between the channels of partition A and the channels of partition B. Channels 0–15 have been assigned to partition A, and channels 16–31 have been assigned to partition B. In response to a frame-sync pulse, the McBSP module begins a frame transfer with partition A and then alternates between partitions B and A until the complete frame is transferred.

Figure 23-153. Alternating Between Partitions A and B Channels

### 23.5.4.12.7 Transmit Multichannel Selection Modes

The McBSPi.MCBSPLP\_MCR2\_REG[1:0] XMCM bit field determines whether all channels or only selected channels are enabled and unmasked for transmission. The McBSP module has three transmit multichannel selection modes (XMCM = 0b01, XMCM = 0b10, and XMCM = 0b11), which are described in Table 23-354.

Table 23-354. Selecting a Transmit Multichannel Selection Mode With the XMCM Bit Field

XMCM	Transmit Multichannel Selection Mode
0b00	No transmit multichannel selection mode is on. All channels are enabled and unmasked. No channels can be disabled or masked.
0b01	All channels are disabled unless they are selected in the appropriate transmit channel enable registers (McBSPi.MCBSPLP_XCERA_REG/McBSPi.MCBSPLP_XCERH_REG). If enabled, a channel in this mode is also unmasked. The McBSPi.MCBSPLP_MCR2_REG[9] XMCM bit determines whether 32 or 128 channels are selectable in the McBSPi.MCBSPLP_XCERA_REG/McBSPi.MCBSPLP_XCERH_REG registers.
0b10	All channels are enabled, but they are masked unless they are selected in the appropriate transmit channel enable registers (McBSPi.MCBSPLP_XCERA_REG/McBSPi.MCBSPLP_XCERH_REG). The McBSPi.MCBSPLP_MCR2_REG[9] XMCM bit determines whether 32 or 128 channels are selectable in the McBSPi.MCBSPLP_XCERA_REG/McBSPi.MCBSPLP_XCERH_REG registers.
0b11	This mode is used for symmetric transmission and reception. All channels are disabled for transmission unless they are enabled for reception in the appropriate receive channel enable registers (McBSPi.MCBSPLP_RCERA_REG/McBSPi.MCBSPLP_RCERH_REG). Once enabled, they are masked unless they are also selected in the appropriate transmit channel enable registers (McBSPi.MCBSPLP_XCERA_REG/McBSPi.MCBSPLP_XCERH_REG). The McBSPi.MCBSPLP_MCR2_REG[9] XMCM bit determines whether 32 or 128 channels are selectable in the McBSPi.MCBSPLP_RCERA_REG/McBSPi.MCBSPLP_RCERH_REG registers and the McBSPi.MCBSPLP_XCERA_REG/McBSPi.MCBSPLP_XCERH_REG registers.

As an example of how the McBSP module behaves in a transmit multichannel selection mode, suppose that XMCM = 0b01 (all channels disabled unless individually enabled) and that only channels 0, 15, and 39 are enabled. Suppose also that the frame length is 40. The McBSP module:

1. Shifts data to the mcbspi\_dx pin in channel 0
2. Places the mcbspi\_dx pin in the high-impedance state in channels 1–14
3. Shifts data to the mcbspi\_dx pin in channel 15
4. Places the mcbspi\_dx pin in the high-impedance state in channels 16–38
5. Shifts data to the mcbspi\_dx pin in channel 39

#### 23.5.4.12.7.1 Disabling/Enabling Versus Masking/Unmasking

For transmission, a channel can be:

- Enabled and unmasked (transmission can begin and can be completed)
- Enabled but masked (transmission can begin but cannot be completed)
- Disabled (transmission cannot occur)

The definitions in [Table 23-355](#) explain the channel control options:

**Table 23-355. McBSP Channel Control Options**

<b>Enabled channel</b>	A channel that can begin transmission by passing data from the data transmit register (McBSPi.MCBSPLP_DXR_REG) to the XSR through the XB.
<b>Masked channel</b>	A channel that cannot complete transmission. The mcbspi_dx pin is held in high-impedance state; data cannot be shifted out on the mcbspi_dx pin. In systems where symmetric transmit and receive provide software benefits, this feature allows transmit channels to be disabled on a shared serial bus. A similar feature is not needed for reception because multiple receptions cannot cause serial bus contention.
<b>Disabled channel</b>	A channel that is not enabled. A disabled channel is also masked. Because no DXR-to-XB copy occurs, the McBSPi.MCBSPLP_SPCR2_REG[1] XRDY bit is not set. Therefore, no DMA synchronization event is generated, and if the transmit interrupt mode depends on XRDY (McBSPi.MCBSPLP_SPCR2_REG[5:4] XINTM = 00b), no interrupt is generated. The McBSPi.MCBSPLP_SPCR2_REG[2] XEMPTY bit is not affected.
<b>Unmasked channel</b>	A channel that is not masked. Data in the XSR(s) is shifted out on the mcbspi_dx pin.

#### 23.5.4.12.7.2 Activity on McBSP Pins for Different Values of XMCM

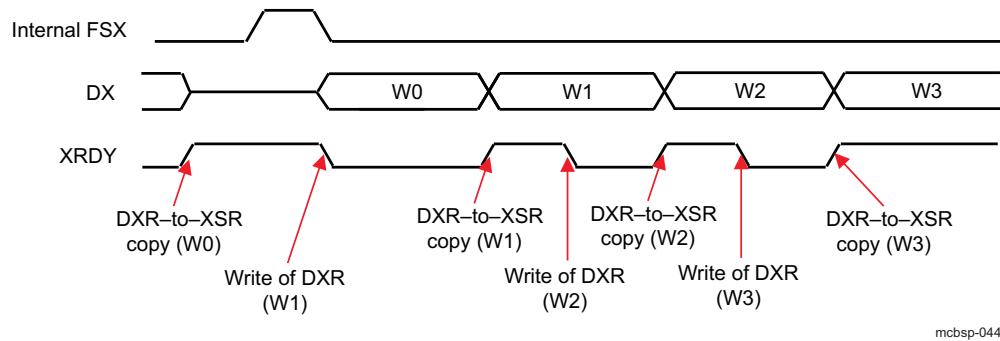

[Figure 23-154](#) shows the activity on the McBSP pins for the various values of the McBSPi.MCBSPLP\_MCR2\_REG[1:0] XMCM bit field. In all cases, the transmit frame is configured as follows:

- XPHASE = 0: Single-phase frame (required for multichannel selection modes)
- XFRLEN1 = 0b0000011: 4 words per frame
- XWDLEN1 = 0b000: 8 bits per word
- XMCME = 0: 2-partition mode (only partitions A and B are used)

In the case where McBSPi.MCBSPLP\_MCR2\_REG[1:0] XMCM = 0b11, transmission and reception are symmetric, which means the corresponding bits for the receiver (RPHASE, RFRLEN1, RWDLEN1, and RMCME) must have the same values as XPHASE, XFRLEN1, and XWDLEN1, respectively.

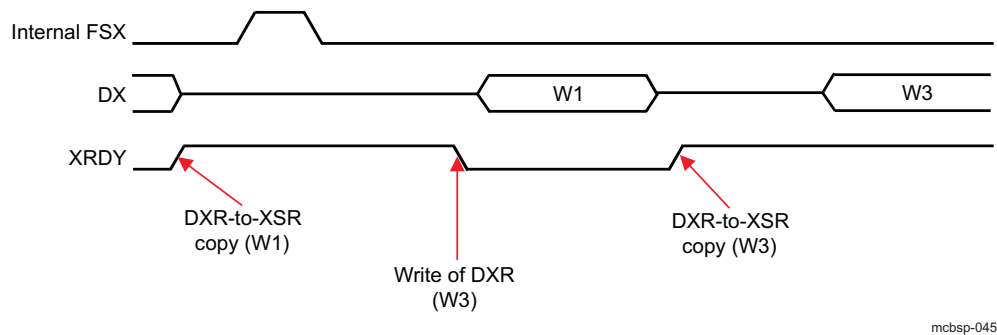

In [Figure 23-154](#), the arrows showing where the various events occur are only sample indications. Wherever possible, there is a time window in which these events can occur.

**Figure 23-154. Activity on McBSP Pins When XMCM = 0b00**

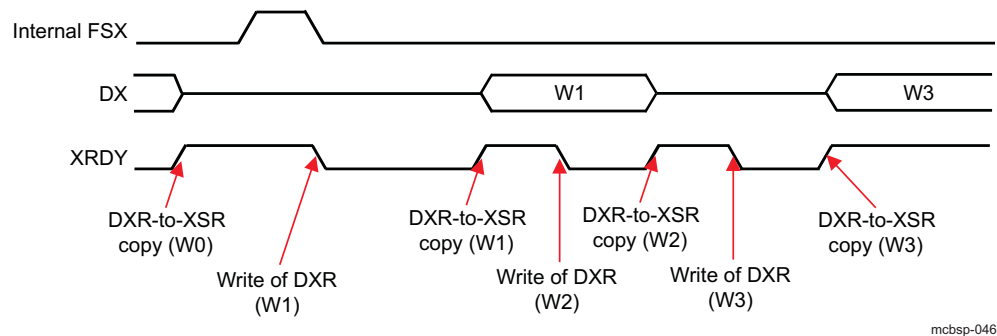

If XMCM = 0b00, all channels are enabled and unmasked. Words W0, W1, W2, and W3 are written to the XB, and then, from the XB, they are transferred by mcbspi\_dx.

**Figure 23-155. Activity on McBSP Pins When XMCM = 0b01**

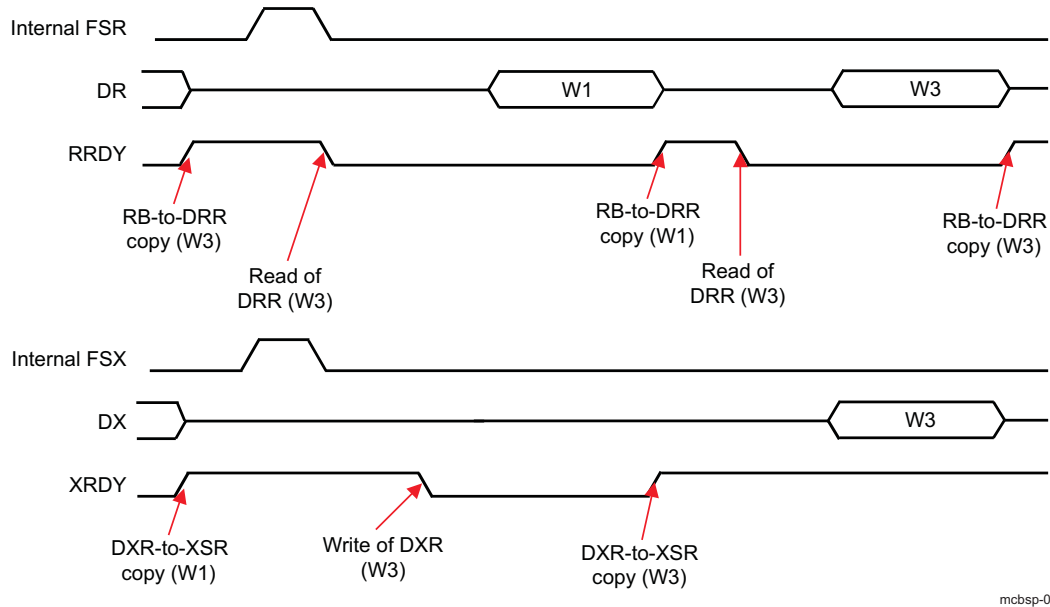

In [Figure 23-155](#) if XMCM = 0b01, XPABLK = 0b00, and XCERA = 0b1010, only channels 1 and 3 are enabled and unmasked. Words W1 and W3 are written to the XB, and then, from the XB, they are transferred by mcbspi\_dx.

**Figure 23-156. Activity on McBSP Pins When XMCM = 0b10**

In [Figure 23-156](#) if XMCM = 0b10, XPABLK = 0b00, and XCERA = 0b1010, all channels are enabled, and only 1 and 3 are unmasked. Words W0, W1, W2, and W3 are written to the XB, but only W1 and W3, from the XB, are transferred by mcbspi\_dx.

**Figure 23-157. Activity on McBSP Pins When XMCM = 0b11**

In [Figure 23-157](#) if XMCM = 0b11, RPABLK = 0b00, XPABLK = 0bX, RCERA = 0b1010, and XCERA = 0b1000, channels 1 and 3 are enabled in receive and transmit mode, but only 3 is unmasked. Words W1 and W3 are written to the XB, but only W3, from the XB, is transferred by mcbspi\_dx.

### **23.5.5 McBSP Basic Programming Model**

This section describes the programming model of a typical McBSP module.

#### **CAUTION**

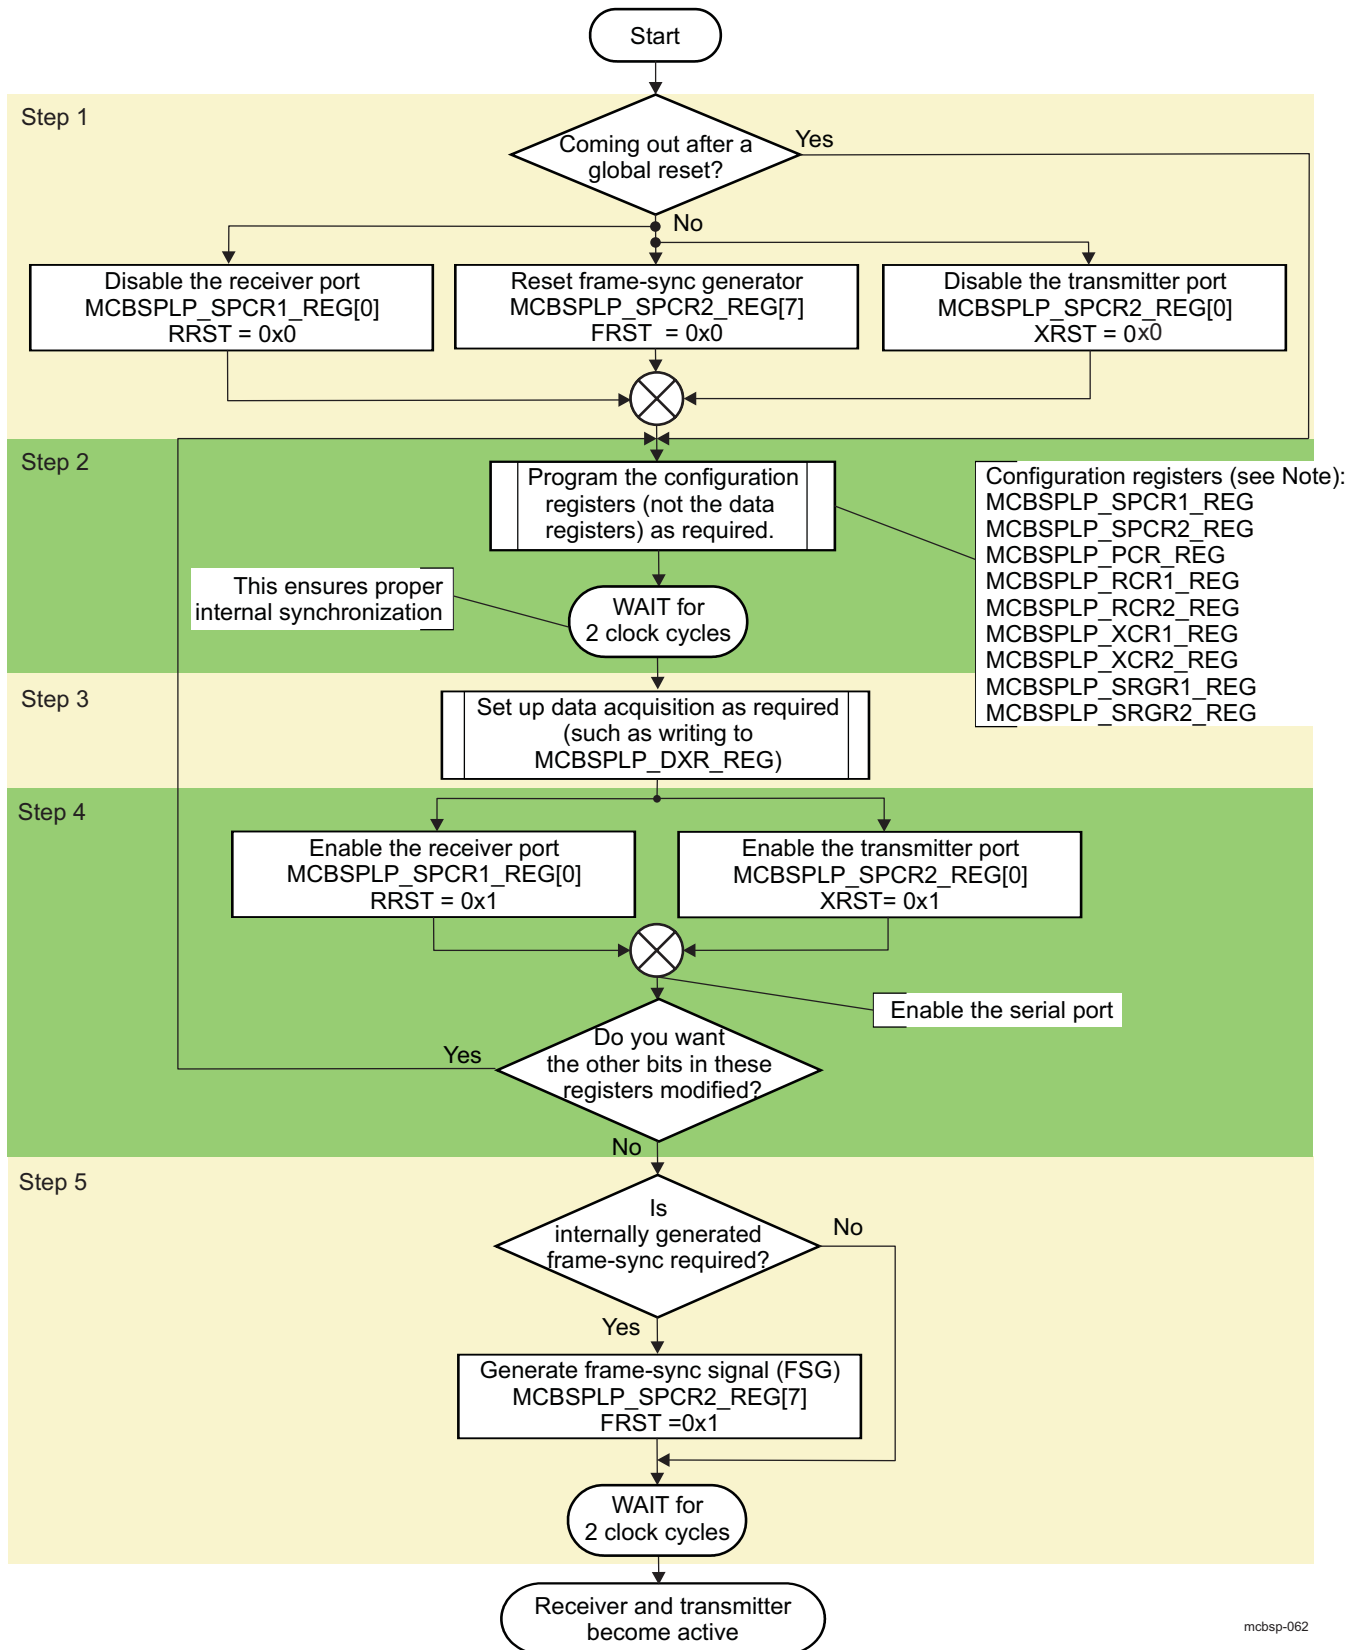

For all descriptions in this section, the McBSPi.MCBSPLP\_XCCR\_REG[11] XFULL\_CYCLE and McBSPi.MCBSPLP\_RCCR\_REG[11] RFULL\_CYCLE bits are their reset value (XFULL\_CYCLE is set to 0 and RFULL\_CYCLE is set to 1).

#### **23.5.5.1 McBSP Initialization Procedure**

This procedure for reset/initialization can be applied in general when the receiver or transmitter must be reset during its normal operation, and also when the SRG is not used for either operation.

[Figure 23-158](#) shows the serial port initialization procedure for master mode.

**Figure 23-158. Flow Diagram of McBSP Initialization Procedure for Master Mode**

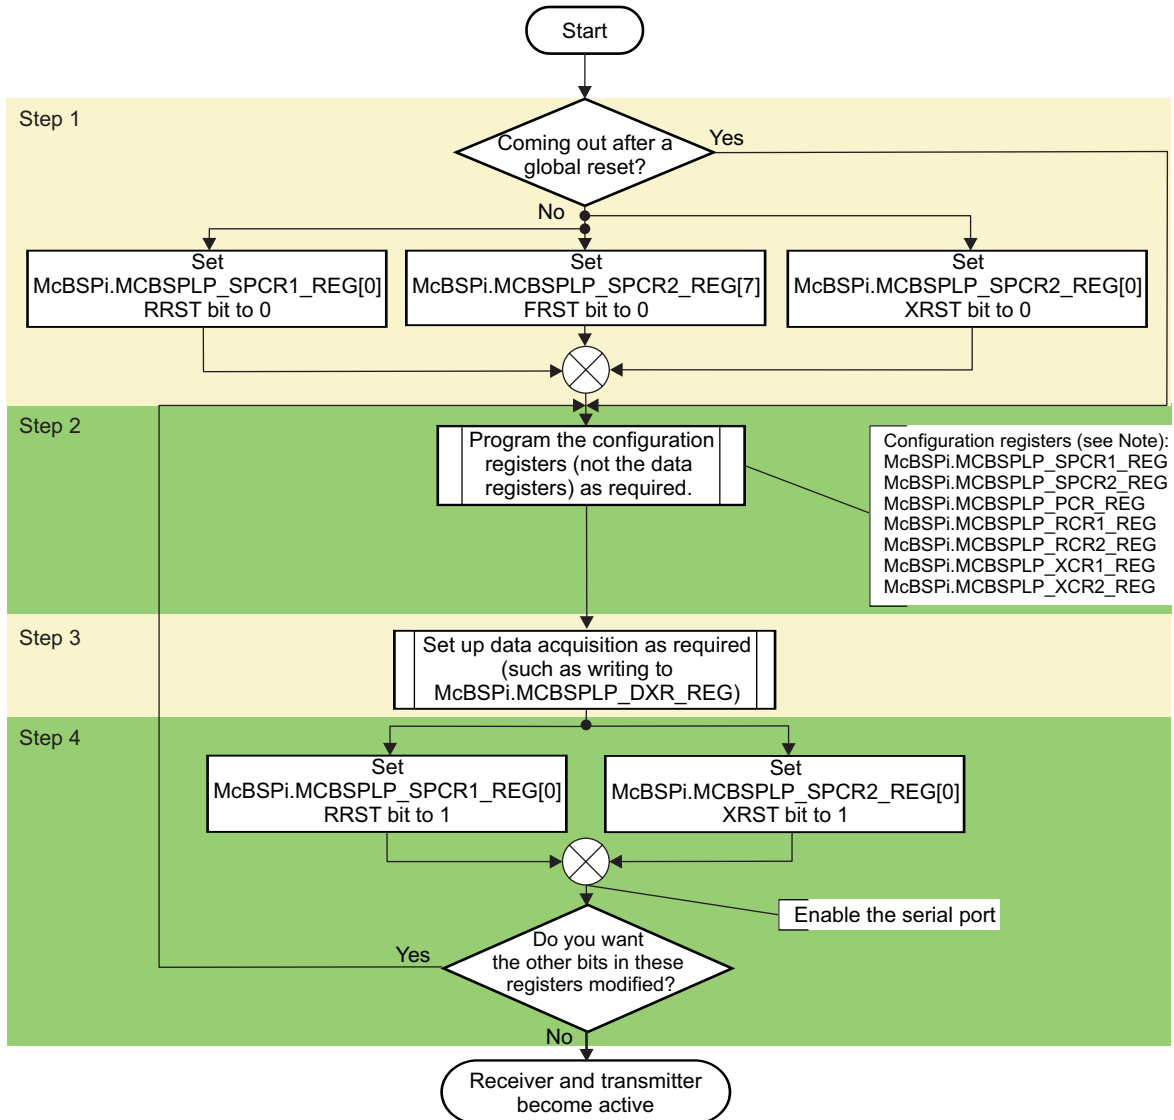

mcbasp-062

Alternatively, on write (Step 1 or Step 4), the transmitter and receiver can be placed in or taken out of reset by modifying the `McBSPi.MCBSPLP_SPCR2_REG[0]` XRST and `McBSPi.MCBSPLP_SPCR1_REG[0]` RRST bits, respectively.

Figure 23-159 shows the flow diagram of the McBSP initialization procedure for slave mode.

Figure 23-159. Flow Diagram of McBSP Initialization Procedure for Slave Mode

mcbsp-075

**NOTE:**

- Alternatively, on write (Step 1 or Step 4), the transmitter and receiver can be placed in or taken out of reset by modifying the McBSPi.MCBSPLP\_SPCR2\_REG[0] XRST and McBSPi.MCBSPLP\_SPCR1\_REG[0] RRST bits, respectively.
- The necessary duration of the active-low period of XRST or RRST is at least two CLKR/CLKX cycles.
- The appropriate bits in serial port configuration registers (McBSPi.MCBSPLP\_SPCR1\_REG, McBSPi.MCBSPLP\_SPCR2\_REG, McBSPi.MCBSPLP\_PCR\_REG, McBSPi.MCBSPLP\_RCR1\_REG, McBSPi.MCBSPLP\_RCR2\_REG, McBSPi.MCBSPLP\_XCR1\_REG, McBSPi.MCBSPLP\_XCR2\_REG, McBSPi.MCBSPLP\_THRSH2\_REG, McBSPi.MCBSPLP\_XCCR\_REG, McBSPi.MCBSPLP\_SYSCONFIG\_REG, McBSPi.MCBSPLP\_SRGR1\_REG and McBSPi.MCBSPLP\_SRGR2\_REG) should be modified only when the affected portion of the serial port is in its reset state.
- In most cases, the data transmit register (McBSPi.MCBSPLP\_DXR\_REG) should be loaded by the MPU/DSP subsystem or the sDMA controller only when the transmitter is enabled (McBSPi.MCBSPLP\_SPCR2\_REG[0] XRST = 1). An exception to this rule is when these registers are used for loopback internal data.
- The bits of the channel control registers (McBSPi.MCBSPLP\_MCR1\_REG, McBSPi.MCBSPLP\_MCR2\_REG, McBSPi.MCBSPLP\_RCER{A-H}\_REG and McBSPi.MCBSPLP\_XCER{A-H}\_REG) can be modified at any time as long as they are not being used by the current reception/transmission in a multichannel selection mode.
- The SRG is reset by setting the McBSPi.MCBSPLP\_SPCR2\_REG[6] GRST bit to 0.
- It is not necessary to wait if SRG is not used.
- The necessary duration of the active-low period of XRST or RRST is at least two
- Modification on-the-fly has no effect if a reset is not performed first.

**Table 23-356. Register Call Summary for Flow Diagram of McBSP Initialization Procedure**

Register Name	Register Name	Register Name
<a href="#">MCBSPLP_SPCR1_REG</a>	<a href="#">MCBSPLP_RCR1_REG</a>	<a href="#">MCBSPLP_XCR2_REG</a>
<a href="#">MCBSPLP_SPCR2_REG</a>	<a href="#">MCBSPLP_RCR2_REG</a>	<a href="#">MCBSPLP_SRGR1_REG</a>
<a href="#">MCBSPLP_PCR_REG</a>	<a href="#">MCBSPLP_XCR1_REG</a>	<a href="#">MCBSPLP_SRGR2_REG</a>

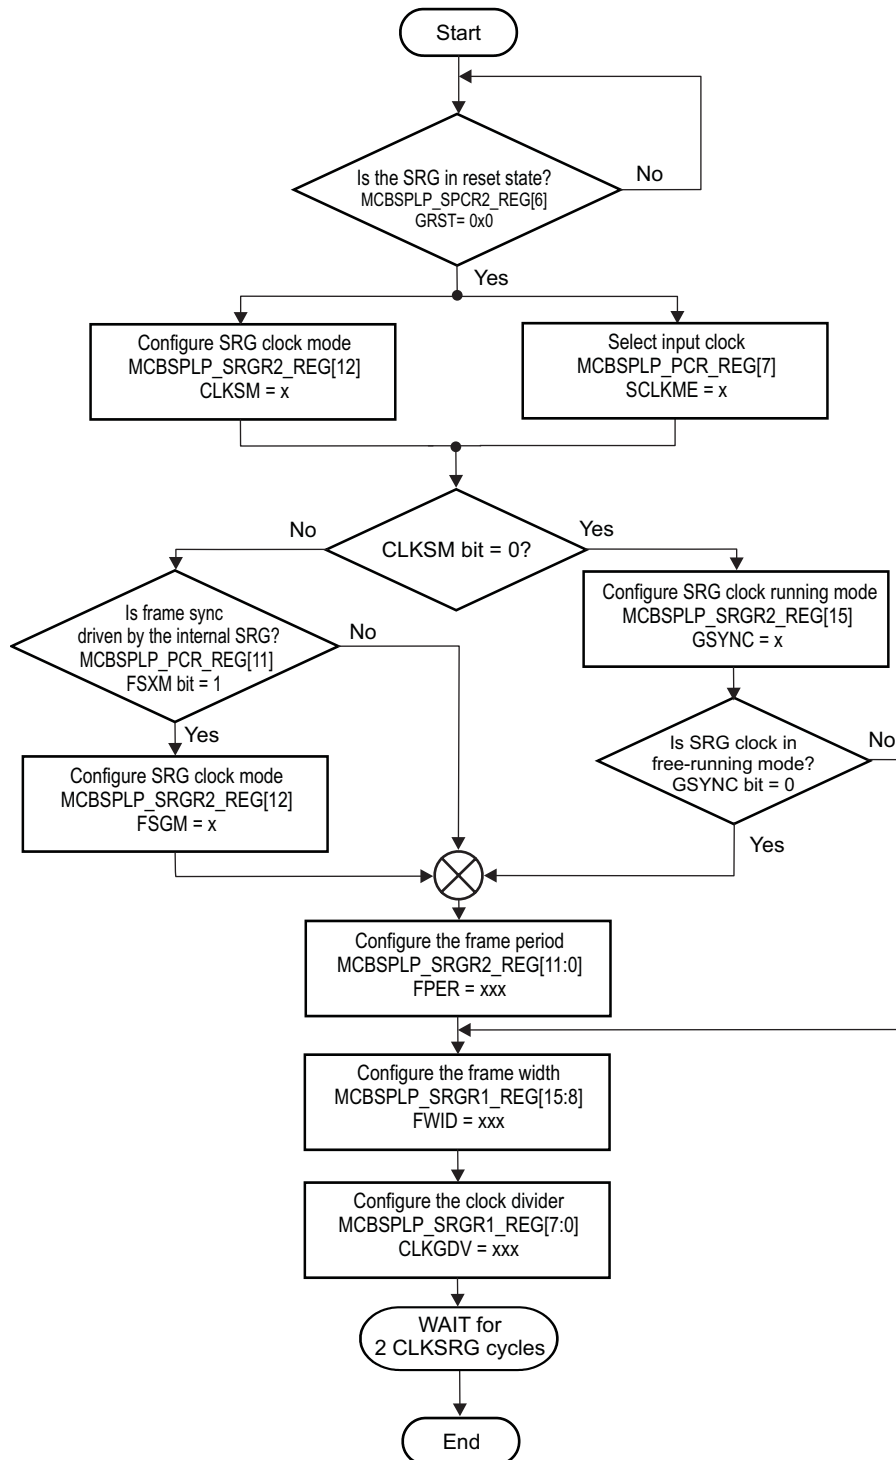

**23.5.5.2 Reset and Initialization Procedure for the SRG**

To reset and initialize the SRG:

1. Place the McBSP SRG in reset.
2. Program the registers that affect the SRG.
3. Enable the SRG (take it out of reset).
4. If necessary, enable the receiver and/or the transmitter.
5. If necessary, remove the receiver and/or transmitter from reset

[Figure 23-160](#) shows the flow diagram for programming the SRG registers.

Figure 23-160. Flow Diagram for the SRG Registers Programming

mcbsp-073

Table 23-357. Register Call Summary for Flow Diagram for the SRG Registers Programming

Register Name	Register Name
MCBSPLP_SPCR2_REG	MCBSPLP_PCR_REG
MCBSPLP_SRGR2_REG	MCBSPLP_SRGR1_REG

### 23.5.5.3 Data Transfer DMA Request Configuration

This procedure configures the McBSP receive/transmit data DMA requests (MCBSPi\_DMA\_RX and MCBSPi\_DMA\_TX) (see [Table 23-358](#)).

**Table 23-358. Data Transfer DMA Request Configuration**

Step	Register/Bit Field/Programming Model	Value
Write the required receive DMA request length.	MCBSPLP_THRSH1_REG[6:0] RTHRESHOLD	x..x
Write the required transmit DMA request length.	MCBSPLP_THRSH2_REG[6:0] RTHRESHOLD	x..x

**NOTE:**

- The length of the transfer is the same as the threshold value + 1
- In case of a number of transfers that exceed the number of the programmed DMA length, the McBSP module will respond to the command and will perform the transfer regardless of the receive buffer empty condition.
- In case of a number of transfers that exceed the number of the programmed DMA length, the McBSP module will respond to the command and will perform the transfer regardless of the transmit buffer full condition.

### 23.5.5.4 Interrupt Configuration

This procedure configures the common receive/transmit interrupt request line (see [Table 23-359](#)).

**Table 23-359. Interruption Configuration**

Step	Register/Bit Field/Programming Model	Value
Enable the required IRQ events.	MCBSPLP_IRQENABLE_REG	x..x

### 23.5.5.5 Receiver Configuration

To configure the McBSP receiver, perform the following steps:

- Step 1. Place the McBSP receiver in reset.
- Step 2. Program the McBSP registers for the desired receiver operation.
- Step 3. Take the receiver out of reset.

#### 23.5.5.5.1 Place the Receiver in Reset (Step 1)

**Table 23-360. Receiver Reset**

Step	Register/Bit Field/Programming Model	Value
Place the receiver in reset.	MCBSPLP_SPCR1_REG[0] RST	0x0

### 23.5.5.2 Programming the McBSP Registers for the Desired Receiver Configuration (Step 2)

This section describes the steps to be performed when software configures the McBSP receiver.

#### Global Configuration

Table 23-361 describes the steps to perform the global configuration.

**Table 23-361. Global Configuration**

Step	Register/Bit Field/Programming Model	Value
Set the receiver pins to operate as McBSP pins.	MCBSPLP_PCR_REG[12] RIOEN	0x0
Enable/disable DLB mode <sup>(1)</sup> .	MCBSPLP_XCCR_REG[5] DLB	0x0 or 0x1
Enable/disable ALB mode <sup>(1)</sup> .	MCBSPLP_SPCR1_REG[5] ALB	0x0 or 0x1
Select the clock used in synchronous transmit-receive mode (McBSP4 only) <sup>(1)</sup> .	CONTROL_MCBSPLP[30] ALBCTRLRX_CLKX	0x0 or 0x1
Select frame synchronization used in the synchronous transmit-receive mode (McBSP4 only) <sup>(1)</sup> .	CONTROL_MCBSPLP[31] ALBCTRLRX_FSX	0x0 or 0x1
Enable/disable the receive multichannel selection Mode <sup>(1)</sup> .	MCBSPLP_MCR1_REG[0] RCMC	0x0 or 0x1

<sup>(1)</sup> Software decision

---

**NOTE:** In DLB mode the SRG and frame-sync generator must be enabled to generate the CLKX and FSX signals.

---

#### Data Configuration

Table 23-362 describes the steps to perform the data configuration.

**Table 23-362. Data Configuration**

Step	Register/Bit Field/Programming Model	Value
Select single/dual-phase frame <sup>(1)</sup> .	MCBSPLP_RCR2_REG[15] RPHASE	0x0 or 0x1
Set the receive word length(s) for phase 1 <sup>(1)</sup> .	MCBSPLP_RCR1_REG[7:5] RWDLEN1	xxx
Set the receive word length(s) for phase 2 <sup>(1)</sup> .	MCBSPLP_RCR2_REG[7:5] XWDLEN2	xxx
Set the receive frame length*.	MCBSPLP_RCR1_REG[14:8] RFRLEN1 MCBSPLP_RCR2_REG[14:8] RFRLEN2	xxx
Set the receive reverse mode <sup>(1)</sup> .	MCBSPLP_RCR2_REG[4:3] RREVERSE	xx
Set the receive data delay <sup>(1)</sup> .	MCBSPLP_RCR2_REG[1:0] RDATLY	xx
Set the receive sign-extension and justification mode <sup>(1)</sup> .	MCBSPLP_SPCR1_REG[14:13] RJUST	xx
Enable the serial receiver port.	MCBSPLP_SPCR1_REG[0] RRST	0x1
Configure the receive buffer threshold value <sup>(1)</sup> .	MCBSPLP_THRSH1_REG[6:0] RTHRESHOLD	x..x

<sup>(1)</sup> Software decision

**NOTE:**

- When dual-phase frame is selected, the number of words per phase must be set to 1.
- If a single-phase frame is selected, RWDLEN1 selects the length for every serial word received in the frame. If a dual-phase frame is selected, RWDLEN1 and RWDLEN2 must be set to select both lengths. These bits can have different values.
- If a dual-phase frame is selected, the frame length must be two words.

#### Frame-Sync Configuration

Table 23-363 describes the steps to perform the frame-sync configuration.

**Table 23-363. Frame-Sync Configuration**

Step	Register/Bit Field/Programming Model	Value
Set the receive frame-sync mode <sup>(1)</sup> .	MCBSPLP_PCR_REG[10] FSRM	0x0 or 0x1
Select SRG synchronization <sup>(1)</sup> .	MCBSPLP_SRGR2_REG[15] GSYNC	0x0 or 0x1
Set the receive frame-sync polarity <sup>(1)</sup> .	MCBSPLP_PCR_REG[2] FSRP	0x0 or 0x1
Set the SRG frame-sync period <sup>(1)</sup> .	MCBSPLP_SRGR2_REG[11:0] FPER	x..x
Set the SRG frame-sync pulse width <sup>(1)</sup> .	MCBSPLP_SRGR1_REG[15:8] FWID	x..x

<sup>(1)</sup> Software decision

### Clock Configuration

Table 23-364 describes the steps to perform clock configuration.

**Table 23-364. Clock Configuration**

Step	Register/Bit Field/Programming Model	Value
Set the receive clock mode <sup>(1)</sup> .	MCBSPLP_PCR_REG[8] CLKRM	0x0 or 0x1
Set the receive clock polarity <sup>(1)</sup> .	MCBSPLP_PCR_REG[0] CLKRP	0x0 or 0x1
Set the SRG clock divide-down value <sup>(1)</sup> .	MCBSPLP_SRGR1_REG[7:0] CLKGDV	x..x
Set the SRG clock synchronization mode <sup>(1)</sup> .	MCBSPLP_SRGR2_REG[15] GSYNC	0x0 or 0x1
Set the SRG input clock mode <sup>(1)</sup> .	MCBSPLP_PCR_REG[7] SCKLME MCBSPLP_SRGR2_REG[13] CLKSM	0x0 or 0x1
Set the SRG input clock polarity <sup>(1)</sup> .	MCBSPLP_SRGR2_REG[14] CLKSP MCBSPLP_PCR_REG[1] CLKXP MCBSPLP_PCR_REG[0] CLKRP	0x0 or 0x1

<sup>(1)</sup> Software decision

**NOTE:** CLKRP = CLKXP in a system in which the same clock (internal or external) is used to clock the receiver and transmitter. The receiver uses the opposite edge as the transmitter to ensure valid setup and hold of data around this edge.

#### 23.5.5.5.3 Take the Receiver Out of Reset (Step 3)

**Table 23-365. Take the Receiver Out of Reset**

Step	Register/Bit Field/Programming Model	Value
Enable the receiver.	MCBSPLP_SPCR1_REG[0] RST	0x1

#### 23.5.5.6 Transmitter Configuration

To configure the McBSP transmitter, perform the following steps:

- Step 1. Place the McBSP transmitter in reset.
- Step 2. Program the McBSP registers for the desired transmitter operation.
- Step 3. Take the transmitter out of reset.

##### 23.5.5.6.1 Place the Transmitter in Reset (Step 1)

**Table 23-366. Transmitter Reset**

Step	Register/Bit Field/Programming Model	Value
Place the transmitter in reset.	MCBSPLP_SPCR2_REG[0] RST	0x0

### 23.5.5.6.2 Programming the McBSP Registers for the Desired Transmitter Operation (Step 2)

This section describes the steps to be performed when software configures the McBSP transmitter.

#### Global Configuration

Table 23-367 describes the steps to perform the global configuration.

**Table 23-367. Global Configuration**

Step	Register/Bit Field/Programming Model	Value
Set the transmitter pins to operate as McBSP pins.	MCBSPLP_PCR_REG[13] XIOEN	0x0
Enable/disable DLB mode <sup>(1)</sup> .	MCBSPLP_XCCR_REG[5] DLB	0x0 or 0x1
Enable/disable ALB mode <sup>(1)</sup> .	MCBSPLP_SPCR1_REG[5] ALB	0x0 or 0x1
Select clock used in the synchronous transmit-receive mode (McBSP4 only) <sup>(1)</sup> .	CONTROL_MCBSPLP[30] ALBCTRLRX_CLKX	0x0 or 0x1
Select frame synchronization used in the synchronous transmit-receive mode (McBSP4 only) <sup>(1)</sup> .	CONTROL_MCBSPLP[31] ALBCTRLRX_FSX	0x0 or 0x1
Enable/disable the transmit multichannel selection mode <sup>(1)</sup> .	MCBSPLP_MCR1_REG[0] RMCM	0x0 or 0x1

<sup>(1)</sup> Software decision

#### Data Configuration

Table 23-368 describes the steps to perform the data configuration.

**Table 23-368. Data Configuration**

Step	Register/Bit Field/Programming Model	Value
Select single/dual-phase frame <sup>(1)</sup> .	MCBSPLP_RCR2_REG[15] XPHASE	0x0 or 0x1
Set the transmit word length(s) for phase 1 <sup>(1)</sup> .	MCBSPLP_XCR1_REG[7:5] XWDLEN1	xxx
Set the transmit word length(s) for phase 2 <sup>(1)</sup> .	MCBSPLP_XCR2_REG[7:5] XWDLEN2	xxx
Set the transmit frame length <sup>(1)</sup> .	MCBSPLP_XCR1_REG[14:8] XFRLEN1 MCBSPLP_XCR2_REG[14:8] XFRLEN2	xxx
Set the transmit reverse mode <sup>(1)</sup> .	MCBSPLP_XCR2_REG[4:3] XREVERSE	xx
Set the transmit data delay <sup>(1)</sup> .	MCBSPLP_XCR2_REG[1:0] XDATLY	xx
Set the extra delay (DX delay) mode <sup>(1)</sup> .	MCBSPLP_SPCR1_REG[7] DXENA	xx
Select the inserted delay value <sup>(1)</sup> .	MCBSPLP_XCCR_REG[13:12] DXENDLY	xx
Set the interrupt line.	MCBSPLP_IRQENABLE_REG	x..x
Configure the transmit buffer threshold value <sup>(1)</sup>	MCBSPLP_THRSH2_REG[6:0] XTHRESHOLD	x..x

<sup>(1)</sup> Software decision

#### NOTE:

- When dual-phase frame is selected, the number of words per phase must be set to 1.
- If a single-phase frame is selected, XWDLEN1 selects the length for every serial word transmit in the frame. If a dual-phase frame is selected, XWDLEN1 and XWDLEN2 must be set to select both lengths. These bits can have different values.
- If a dual-phase frame is selected, the frame length must be two words.

The DXENA bit controls the delay enabler on the mcbasp\_dx pin. Set DXENA to enable an extra delay for turn-on time. Because this bit does not control the data itself, only the first bit is delayed (the delay is given by a combinatorial delay buffer). The inserted delay, 80 ps, 160 ps (default), 240 ps, or 320 ps, can be set using the McBSPi.MCBSPLP\_XCCR\_REG[13:12] DXENDLY bit field. If the mcbasp\_dx pins of multiple McBSP modules are tied together, ensure that DXENA is set to 1 to avoid having more than one McBSP at a time transmitting on the data line.

#### Frame-Sync Configuration

Table 23-369 describes the steps to perform the frame-sync configuration.

**Table 23-369. Frame-Sync Configuration**

Step	Register / Bit Field / Programming Model	Value
Set the transmit frame-sync mode <sup>(1)</sup> .	MCBSPLP_PCR_REG[11] FSXM MCBSPLP_SRGR2_REG[12] FSGM	0x0 or 0x1
Set the transmit frame-sync polarity <sup>(1)</sup> .	MCBSPLP_PCR_REG[3] FSXP	0x0 or 0x1
Set the SRG frame-sync period <sup>(1)</sup> .	MCBSPLP_SRGR2_REG[11:0] FPER	x..x
Set the SRG frame-sync pulse width <sup>(1)</sup> .	MCBSPLP_SRGR1_REG[15:8] FWID	x..x

<sup>(1)</sup> Software decision

### Clock Configuration

Table 23-370 describes the steps to perform the clock configuration.

**Table 23-370. Clock Configuration**

Step	Register / Bit Field / Programming Model	Value
Set the transmit clock mode <sup>(1)</sup> .	MCBSPLP_PCR_REG[9] CLKXM	0x0 or 0x1
Set the transmit clock polarity <sup>(1)</sup> .	MCBSPLP_PCR_REG[1] CLKXP	0x0 or 0x1
Set the SRG clock divide-down value <sup>(1)</sup> .	MCBSPLP_SRGR1_REG[7:0] CLKGDV	x..x
Set the SRG clock synchronization mode <sup>(1)</sup> .	MCBSPLP_SRGR2_REG[15] GSYNC	0x0 or 0x1
Set the SRG input clock mode <sup>(1)</sup> .	MCBSPLP_PCR_REG[7] SCKLME MCBSPLP_SRGR2_REG[13] CLKSM	0x0 or 0x1
Set the SRG input clock polarity <sup>(1)</sup> .	MCBSPLP_SRGR2_REG[14] CLKSP MCBSPLP_PCR_REG[1] CLKXP MCBSPLP_PCR_REG[0] CLKRP	0x0 or 0x1

<sup>(1)</sup> Software decision

**NOTE:** CLKRP = CLKXP in a system in which the same clock (internal or external) is used to clock the receiver and transmitter. The receiver uses the opposite edge as the transmitter to ensure valid setup and hold of data around this edge.

### 23.5.5.6.3 Take the Receiver Out of Reset (Step 3)

**Table 23-371. Take the Receiver Out of Reset**

Step	Register/Bit Field/Programming Model	Value
Enable the transmitter.	MCBSPLP_SPCR2_REG[0] RST	0x1

### 23.5.5.7 GPIO on the McBSP Pins (Legacy Only)

To use McBSP pins as GPIO pins rather than as serial port pins, follow these steps:

- For the receive pins (`mcbasp_clkr`, `mcbasp_fsr`, and `mcbasp_dr` as)

**Table 23-372. Use Serial Receive Pins as GPIO Pins**

Step	Register/Bit Field/Programming Model	Value
Place the receiver in reset.	MCBSPLP_SPCR1_REG[0] RRST	0x0
Enable GPIO for the serial port receiver.	MCBSPLP_PCR_REG[12] RIOEN	0x1

- For the transmitter pins (`mcbasp_clkx`, `mcbasp_fsx`, and `mcbasp_dx`)

**Table 23-373. Use Serial Transmit Pins as GPIO Pins**

Step	Register/Bit Field/ Programming Model	Value
Place the transmit in reset.	<a href="#">MCBSPLP_SPCR2_REG[0]</a> XRST	0x0
Enable GPIO for the serial port transmitter.	<a href="#">MCBSPLP_PCR_REG[12]</a> XIOEN	0x1

- **For the external clock pins (abe\_clks)**

For the `abe_clks` pin (common to all McBSP modules), all of the reset and I/O conditions must be met as follows:

**Table 23-374. Use External Clock Pin as GPIO Pin**

Step	Register/Bit Field/Programming Model	Value
Place the receiver in reset.	<a href="#">MCBSPLP_SPCR1_REG[0]</a> RRST	0x0
Place the transmit in reset.	<a href="#">MCBSPLP_SPCR2_REG[0]</a> XRST	0x0
Enable GPIO for the serial port receiver.	<a href="#">MCBSPLP_PCR_REG[12]</a> RIOEN	0x1
Enable GPIO for the serial port transmitter.	<a href="#">MCBSPLP_PCR_REG[12]</a> XIOEN	0x1

### 23.5.6 MCBSP Register Manual

Table 23-375 shows the base address and address space for the device module instances.

#### 23.5.6.1 MCBSP Instance Summary

**Table 23-375. MCBSP Instance Summary**

Module Name	Base Address L3 Interconnect	Base Address Cortex-A9 Private Access	Base Address DSP Private Access	Base Address L4-PER Interconnect	Size
MCBSP1	0x4902 2000	0x4012 2000	0x2 2000	N/A	4KB
MCBSP2	0x4902 4000	0x4012 4000	0x2 4000	N/A	4KB
MCBSP3	0x4902 6000	0x4012 6000	0x2 6000	N/A	4KB
MCBSP4	N/A	N/A	N/A	0x4809 6000	4KB

**NOTE:** Private access is an access that does not use the L3/L4 interconnects.

#### 23.5.6.2 MCBSP Registers

##### CAUTION

The McBSP registers are limited to 32-bit data accesses; 16- and 8-bit accesses are not allowed and can corrupt register content.

##### 23.5.6.2.1 MCBSP Register Summary

Table 23-376 through Table 23-379 summarize the MCBSP1, MCBSP2, MCBSP3, and MCBSP4 registers, respectively.

**Table 23-376. MCBSP1 Register Summary**

Register Name	Type	Register Width (Bits)	Address Offset	Physical Address L3 Interconnect	Physical Address Cortex-A9 Private Access	Physical Address DSP Private Access
<a href="#">MCBSPLP_DRR_REG</a>	R	32	0x0000 0000	0x4902 2000	0x4012 2000	0x2 2000

	0x4902 6010		MCBSP3_CORTEX-A9
	0x4012 6010		MCBSP3_DSP
	0x2 6010		
<b>Description</b>	McBSPLP serial port control register 2		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0							
RESERVED																							FREE	SOFT	FRST	GRST	XINTM	XSYNCERR	XEMPTY	XRDY	XRST							

Bits	Field Name	Description	Type	Reset
31:10	RESERVED	Reserved	R	0x000000
9	FREE	Free Running Mode (When this bit is set, the module ignores the Msuspend input)  0x0: Free running mode is disabled 0x1: Free running mode is enabled	RW	0
8	SOFT	Soft Bit  0x0: SOFT mode is disabled: the module stops its activity immediately following MSuspend assertion 0x1: SOFT mode is enabled: the module freezes its state after completion of the current operation when MSuspend is asserted	RW	0
7	FRST	Frame-Sync Generator Reset  0x0: Frame-sync logic is reset. Frame-sync signal FSG is not generated by the sample-rate generator 0x1: Frame-sync signal FSG is generated after (FPER+1) number of CLKG clocks; that is, all frame counters are loaded with their programmed values	RW	0
6	GRST	Sample-Rate Generator Reset  0x0: SRG is reset 0x1: SRG is pulled out of reset. CLKG is driven as per programmed value in SRG registers (SRGR[1,2])	RW	0

Bits	Field Name	Description	Type	Reset
5:4	XINTM	Transmit Interrupt Mode (legacy) 0x0: XINT is driven by XRDY 0x1: XINT generated by end-of-frame 0x2: XINT generated by a new frame synchronization 0x3: XINT generated by XSYNCERR	RW	0x0
3	XSYNCERR	Transmit Synchronization Error (writing 0 to this bit clear the legacy transmit interrupt if asserted due to XSYNCERR condition) 0x0: No synchronization error 0x1: Synchronization error detected by McBSP	RW	0
2	XEMPTY	Transmit Shift Register XSR Empty Read 0x0: XSR is empty Read 0x1: XSR is not empty	R	0
1	XRDY	Transmitter ready Read 0x0: Transmitter is not ready. Read 0x1: Transmitter is ready for new data in DXR	R	0
0	XRST	Transmitter reset. This resets and enables the transmitter. 0x0: The serial port transmitter is disabled and in reset state. 0x1: The serial port transmitter is enabled.	RW	0

RESERVED																GSYNC	CLKSP	CLKSM	FSGM	FPER												

Bits	Field Name	Description	Type	Reset
31:16	RESERVED	Reserved	R	0x0000
15	GSYNC	0x0: The SRG clock (CLKG) is free running. 0x1: The SRG clock (CLKG) is running. But CLKG is resynchronized and frame-sync signal (FSG) is generated only after detecting the receive frame-sync signal (FSR). Also, frame period, FPER, is a don't care because the period is dictated by the external frame-sync pulse.	RW	0
14	CLKSP	CLKS Polarity Clock Edge Select Only used when the external clock CLKS drives the SRG clock (CLKSM=0). 0x0: Rising edge of CLKG and FSG. 0x1: Falling edge of CLKG and FSG.	RW	0
13	CLKSM	McBSP1P Sample Rate Generator Clock Mode 0x0: SCLKME=0: SRG clock derived from the CLKS pin. SCLKME=1: SRG clock derived from the CLKRI pin. 0x1: SCLKME=0: SRG clock derived from the CPU clock. SCLKME=1: SRG clock derived from the CLKXI clock.	RW	1

Bits	Field Name	Description	Type	Reset
12	FSGM	Sample Rate Generator Transmit Frame-Synchronization Mode Used when FSXM=1 in the PCR.  0x0: Transmit frame-sync signal (FSX) is generated when transmit buffer is not empty When FSGM=0, FPER and FWID are used to determine the frame-sync period and width (external FSX is gated by the buffer empty condition).  0x1: Transmit frame-sync signal driven by the SRG frame-sync signal, FSG.	RW	0
11:0	FPER	Frame Period. This field plus 1 determines when the next frame-sync signal becomes active. Range: 1 to 4096 CLKG periods	RW	0x000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																IDLE_EN	XIOEN	RIOEN	FSXM	FSRM	CLKXM	CLKRM	SCLKME	CLKS_STAT	DX_STAT	DR_STAT	FSXP	FSRP	CLKXP	CLKRP	

Bits	Field Name	Description	Type	Reset
31:15	RESERVED	Reserved	R	0x00000
14	IDLE_EN	Idle enable. This bit allows stopping all the clocks in the MCBSP. (legacy) 0x0: The McBSP is running 0x1: The clocks in the McBSP are shut off when both IDLE_EN=1 and peripheral domain is in idle mode	RW	0
13	XIOEN	Transmit General Purpose I/O Mode only when XRST=0 in SPCR[1,2] (legacy) 0x0: DX, FSX and CLKX are configured as serial port pins and do not function as general-purpose I/Os. 0x1: DX pin is a general purpose output. FSX and CLKX are general purpose I/Os. These serial port pins do not perform serial port operation.	RW	0
12	RIOEN	Receive General Purpose I/O Mode when RRST=0 in SPCR[1,2] (legacy) 0x0: DR, FSR, CLKR and CLKS are configured as serial port pins and do not function as general-purpose I/Os. 0x1: DR and CLKS pins are general purpose inputs; FSR and CLKR are general purpose I/Os. These serial port pins do not perform serial port operation. The CLKS pin is affected by a combination of RRST and RIOEN signals of the receiver.	RW	0
11	FSXM	Transmit Frame-Synchronization Mode 0x0: Frame-sync signal derived from an external source 0x1: Frame synchronization is determined by the SRG frame-sync mode bit FSGM in SRGR2.	RW	0
10	FSRM	Receive Frame-Synchronization Mode 0x0: Frame-sync pulses generated by an external device. FSR is an input pin. 0x1: Frame synchronization generated internally by SRG. FSR is an output pin except when GSYNC=1 in SRGR.	RW	0
9	CLKXM	Transmitter Clock Mode 0x0: Transmitter clock is driven by an external clock with CLKX as an input pin. 0x1: CLKX is an output pin and is driven by the internal sample rate generator.	RW	0
8	CLKRM	Receiver Clock Mode 0x0: Case 1: Digital loopback mode not set (DLB=0) in SPCR1: Receive clock (CLKR) is an input driven by an external clock. Case 2: Digital loopback mode set (DLB=1) in SPCR1: Receive clock (not the CLKR pin) is driven by transmit clock (CLKX) which is based on the CLKXM bit in the PCR. CLKR pin is in high-impedance. 0x1: Case 1: Digital loopback mode not set (DLB=0) in SPCR1: CLKR is an output pin and is driven by the internal SRG. Case 2: Digital loopback mode set (DLB=1) in SPCR1: CLKR is an output pin and is driven by the transmit clock. The transmit clock is derived based on the CLKRM bit in the PCR.	RW	0

Bits	Field Name	Description	Type	Reset
7	SCLKME	The frequency of CLKG is: $CLKG \text{ frequency} = (\text{Input clock frequency}) / (\text{CLKGDV} + 1)$ SCLKME is used in conjunction with the CLKSM bit to select the input clock:  0x0: CLKSM = 0: Signal on CLKS pin CLKSM = 1: CPU clock  0x1: CLKSM = 0: Signal on CLKR pin CLKSM = 1: Signal on CLKX pin	RW	0
6	CLKS_STAT	CLKS pin status. Reflects value on CLKS pin when selected as a general purpose input. (legacy)  Read 0x0: The signal on the CLKS pin is low Read 0x1: The signal on the CLKS pin is high	R	0
5	DX_STAT	DX pin status. Reflects value driven on to DX pin when selected as a general purpose output. (legacy)  0x0: Drive the signal on the DX pin low 0x1: Drive the signal on the DX pin high	RW	0
4	DR_STAT	DR pin status. Reflects value on DR pin when selected as a general purpose input. (legacy)  Read 0x0: The signal on DR pin is low Read 0x1: The signal on DR pin is high	R	0
3	FSXP	Transmit Frame-Synchronization Polarity  0x0: Frame-sync pulse FSX is active high 0x1: Frame-sync pulse FSX is active low	RW	0
2	FSRP	Receive Frame-Synchronization Polarity  0x0: Frame-sync pulse FSR is active high 0x1: Frame-sync pulse FSR is active low	RW	0
1	CLKXP	Transmit Clock Polarity  0x0: Transmit data driven on rising edge of CLKX 0x1: Transmit data driven on falling edge of CLKX	RW	0
0	CLKRP	Receive Clock Polarity  0x0: Receive data sampled on falling edge of CLKR 0x1: Receive data sampled on rising edge of CLKR	RW	0

RESERVED																EXTCLKGATE	PPCONNECT	DXENDLY	XFULL_CYCLE	RESERVED								DLB	RESERVED	XDMAEN	RESERVED	XDISABLE

Bits	Field Name	Description	Type	Reset
31:16	RESERVED	Reserved	R	0x0000
15	EXTCLKGATE	External clock gating enable (CLKX and FSX master only). When this bit is set and the transmit clock and FSX are set as output, the CLKX is enabled when FSX is active plus 3 clock cycles after (clock is provided for FWID + 4 clock cycles, assuming that the FSX width, active, is FWID + 1 clock cycles); outside this window the external transmit clock is gated. The receive use the same gated transmit clock and transmit frame synchronization signals regardless of the CLKRM/FSRM settings. When using this mode the frame synchronization signal must be active during reception of the entire frame (FWID must be programmed accordingly) to ensure the proper receive process, which requires at least 3 cycles after the frame complete to transfer the data into the receive buffer.  0x0: External clock gating disabled. 0x1: External clock gating enable.	RW	0
14	PPCONNECT	Pair to pair connection. When set the DXENO pin is always set to 0 regardless of the frame boundary, setting the tree state buffer as output  0x0: Pair to pair connection. When set the DXENO pin is always set to 0 regardless of the frame boundary, setting the tree state buffer as output  0x1: Pair to pair connection. When set the DXENO pin is always set to 0 regardless of the frame boundary, setting the tree state buffer as output	RW	0

## 23.6 Multichannel PDM Controller

### 23.6.1 McPDM Overview

The multichannel pulse density modulation (McPDM) module consists in a proprietary audio module dedicated to mobile phone terminals. It is composed of audio uplink and downlink paths communicating with an external audio companion chip through a dedicated interface.

Figure 23-161 is an overview of the McPDM module.

Figure 23-161. McPDM Overview

The McPDM module can support the following features:

- Full-duplex communication:
  - Five audio downlink channels with up to 3.84 Mbps each
  - Three audio uplink channels with up to 3.84 Mbps each
  - One command channel with up to 3.84 Mbps
  - One status channel with up to 3.84 Mbps
- Uplink and downlink FIFO operations:
  - 16 × 96-bit words for FIFO uplink, where a 96-bit word contains three 24-bit words for the audio uplink channels (one 24-bit word per audio uplink channel) and one 16-bit word for status information
  - 16 × 144-bit words for FIFO downlink, where a 144-bit word contains five 24-bit words for the audio downlink channels (one 24-bit word per audio downlink channel) and one 16-bit word for the command data.
- Interrupt request to MPU and DSP subsystems
- DMA requests with programmable FIFO thresholds:
  - One DMA request for downlink path
  - One DMA request for uplink path
- Upsampling and pulse-density modulators for each audio downlink channel (five channels)
- Offset cancellation feature for audio downlink channels 1 and 2
- Decimation filter and downsampling for each audio uplink channel (three channels)

- IDLE state hardware handshake
- Wake-up request

### 23.6.2 McPDM Environment

This section describes the McPDM application fields from an environment point of view (external connections). It describes McPDM connectivity options, lists all possible interfaces, and describes the protocol and data format used in each case.

#### 23.6.2.1 McPDM Modes

Table 23-466 describes the modes and application fields of the McPDM module.

**Table 23-466. Modes**

Mode	Description
Normal mode	Up to five audio channels are transmitted to, and up to three audio channels are received from, the audio companion chip.
Command mode	In addition to the audio channels, commands are transmitted to the audio companion chip.
Status mode	In addition to the audio channels, status information is received from the audio companion chip.

#### 23.6.2.2 McPDM Signals

Table 23-467 describes the McPDM module signals and specifies their links to modes.

**Table 23-467. I/O**

Signal	I/O <sup>(1)</sup>	Description	Reset Value	Normal Mode	Command Mode	Status Mode
abe_clks	I	Clock received from the audio companion chip. The clock frequency is: <ul style="list-style-type: none"> <li>• 17.64 MHz for a sampling frequency of 88.2/176.4 kHz</li> <li>• 19.2 MHz for a sampling frequency of 96/192 kHz</li> </ul>	0	x	x	x
abe_pdm_lb_clk	O	Clock loopback to the audio companion chip from the abe_clks clock signal. The frequency is the same as abe_clks frequency. <sup>(2)</sup>	0	x	x	x
abe_pdm_frame	I/O	Frame synchronization and command/status data	Z	x	x	x
abe_pdm_ul_data	I	Audio uplink path data	Z	x	x	x
abe_pdm_dl_data	O	Audio downlink path data	0	x	x	x

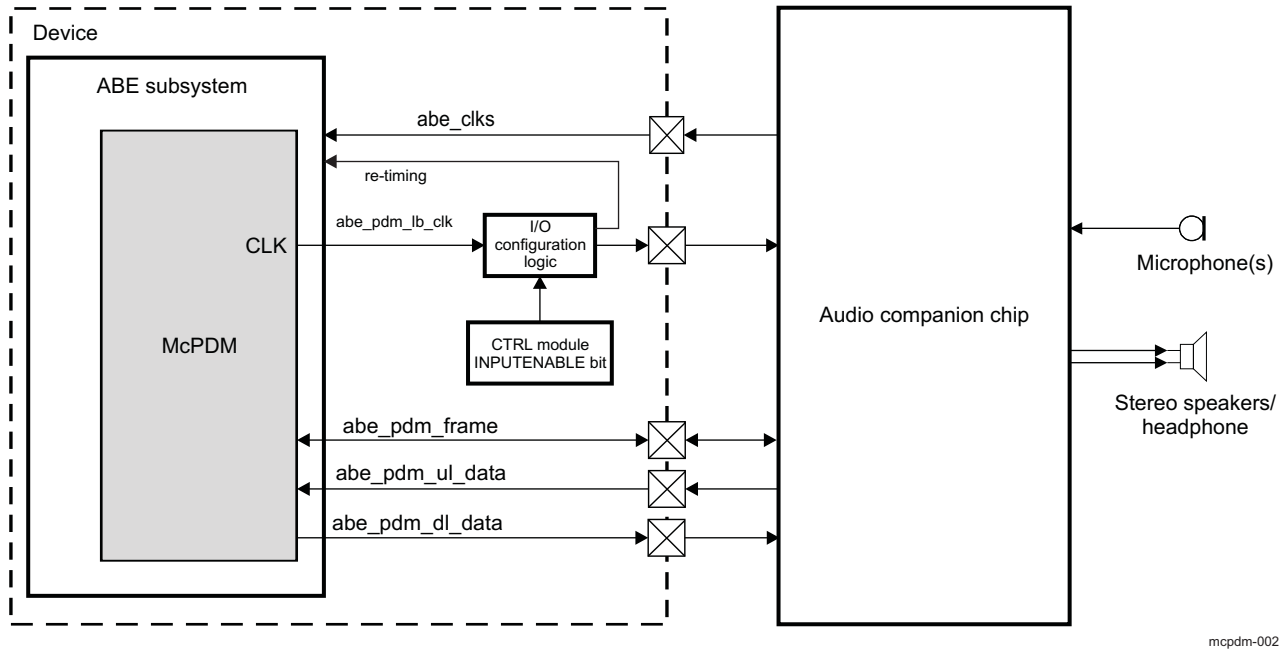

<sup>(1)</sup> I = Input; O = Output; I/O = Bidirectional

<sup>(2)</sup> This output signal is also used as retiming input (the INPUTENABLE bit in the corresponding pad configuration register must be set to 1).

### 23.6.2.3 McPDM Configurations

Figure 23-162 shows the McPDM generic configuration.

Figure 23-162. McPDM Generic Configuration

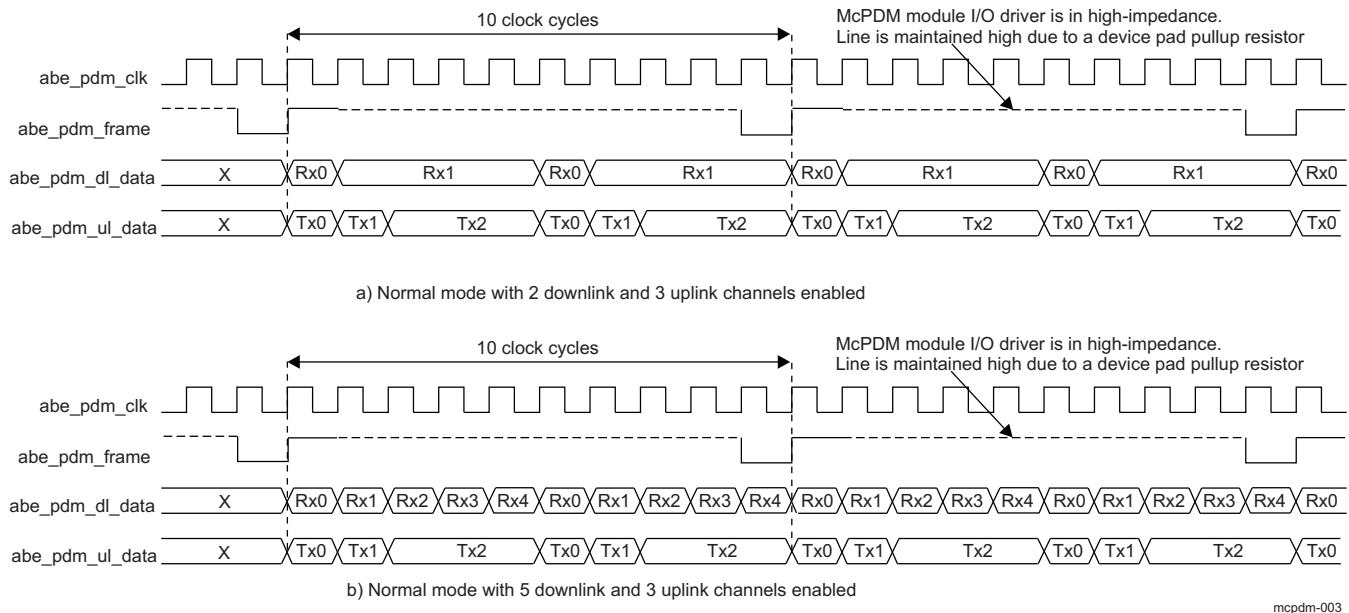

mcpdm-002

### 23.6.2.4 Protocols and Data Formats

#### 23.6.2.4.1 Protocols and Data Formats in Normal Mode

This section describes data transfer on the interface in normal mode. In this mode, the `abe_pdm_frame` signal is used only for frame synchronization purposes. Figure 23-163 shows the protocols and data formats in normal mode for two examples:

- (a) With two downlink and three uplink channels enabled
- (b) With five downlink and three uplink channels enabled

**Figure 23-163. Protocols and Data Formats in Normal Mode**

mcpdm-003

In normal mode, the frequency ratio between the `abe_pdm_frame` and `abe_pdm_lb_clk` signals is 10. This ratio is static and the `abe_pdm_frame` signal low-pulse width is one clock period longer than the `abe_pdm_lb_clk` signal.

The `abe_pdm_frame` signal is driven by the McPDM module in the device to the external audio companion chip. The McPDM module drives the `abe_pdm_frame` signal low during one clock period of the `abe_pdm_lb_clk` signal, then it drives it high during one clock period of the `abe_pdm_lb_clk` signal before releasing the `abe_pdm_frame` I/O driver in high-impedance state. The McPDM module pad internal pullup resistor allows keeping a high-level state on the `abe_pdm_frame` line when the `abe_pdm_frame` I/O driver is in high-impedance state.

A maximum of two samples  $\times$  five downlink channels (10 samples) can be transmitted by the McPDM module to the external audio companion chip during a frame period.

A maximum of two samples  $\times$  three uplink channels (six samples) can be received by the McPDM module from the external audio companion chip during a frame period.

Each downlink and uplink channel can be independently enabled or disabled by setting to 1 or clearing to 0 the corresponding bit in the `MCPDM_CTRL` register.

#### 23.6.2.4.2 Protocols and Data Formats in Command Mode

This section describes data transfer on the interface in command mode. In this mode, the `abe_pdm_frame` signal is used to transmit command words to the external audio companion chip. It allows configuring audio registers in the external audio companion chip (that is, amplifier gains) without using the legacy I<sup>2</sup>C interface, which may be busy and add latency to gain correction.

---

**NOTE:** In command mode, uplink channel samples are transmitted to and downlink channel samples are received from the external audio companion chip as in normal mode.

---

Figure 23-164 shows the protocols and data formats in command mode.

**Figure 23-164. Protocols and Data Formats in Command Mode**

#### 23.6.2.4.2.1 Entering Command Mode

Command mode can be entered when command data are pending and no status mode is ongoing or detected.

If both of these conditions are met and the `MCPDM_CTRL[9]` `CMD_INT` bit is set to 1, the McPDM module automatically enters command mode.

To enter command mode, the McPDM module must drive the `abe_pdm_frame` signal low during two periods of the `abe_pdm_lb_clk` clock signal.

The external audio companion chip detects a command mode request from the McPDM module when a low state is detected during two periods of the `abe_pdm_lb_clk` clock signal. Once a command mode request is detected, the external audio companion chip enters command mode. In this mode, the status mode cannot be entered during at least four frame cycles.

If a status mode is detected or ongoing while a command is ready to be sent, the command data are stored in an internal register.

If one or more command data are written before the previous one is sent, the previous one is overwritten with the new one and only the last stored 16-bit command data are sent.

If new command data are available while the system is already in command mode, the current command completes normally and exits before re-entering command mode and transmitting the new command data a frame period later.

#### 23.6.2.4.2.2 Command Data Transmission

The 16-bit command data are transmitted directly after the `abe_pdm_frame` signal is driven low during two periods of the `abe_pdm_lb_clk` clock signal.

When the `MCPDM_CTRL[9]` `CMD_INT` bit is set to 1, 16-bit command data must be written to the `MCPDM_DN_DATA` register. Only the 16 lower bits are significant. When no command must be transmitted on the `abe_pdm_frame` line, a null word (0x00000000) must be written as the command data.

When the `MCPDM_CTRL[9]` `CMD_INT` bit is cleared to 0, no 16-bit command data has to be written to the `MCPDM_DN_DATA` register.

#### 23.6.2.4.2.3 Exiting Command Mode

After the 16-bit command data is sent, the McPDM module drives the `abe_pdm_frame` signal high during one period of the `abe_pdm_lb_clk` clock signal before releasing the `abe_pdm_frame` I/O driver in high-impedance state. The McPDM module pad internal pullup resistor allows keeping a high-level state on the `abe_pdm_frame` line when the `abe_pdm_frame` I/O driver is in high-impedance state.

The McPDM module exits automatically from command mode one period of the `abe_pdm_lb_clk` clock signal after the last bit of the command data has been transmitted on the `abe_pdm_frame` line.

**NOTE:** Due to this protocol mechanism, frame synchronization is lost (replaced by the ninth bit of the command data) during one frame period. The external audio companion chip must internally emulate a frame synchronization to send uplink channel samples and received downlink channel samples as in normal mode while receiving command data on the `abe_pdm_frame` line.

---

#### 23.6.2.4.2.4 Multiple Command Data Access

As shown in [Figure 23-164](#), two consecutive command data can be sent every three frames. If no status mode is entered after a command data has been sent, the next command data is sent three frames after starting to send the current command data.

#### 23.6.2.4.3 Protocols and Data Formats in Status Mode

This section describes data transfer on the interface in status mode. In this mode, the `abe_pdm_frame` signal is used to receive status information from the external audio companion chip.

**NOTE:** In status mode, uplink channel samples are transmitted to and downlink channel samples are received from the external audio companion chip as in normal mode.

---

Figure 23-165 shows the protocols and data formats in status mode.

**Figure 23-165. Protocols and Data Formats in Status Mode**

### 23.6.2.4.3.1 Entering Status Mode

Status mode can be entered when no command mode is detected during the last frame low pulse and no command mode is ongoing.

If both of these conditions are met and the [MCPDM\\_CTRL\[10\]](#) STATUS\_INT bit is set to 1, the McPDM module automatically enters status mode when the command mode is complete.

In status mode, the status information data are sent by the external audio companion chip to the McPDM module. The status information is stored in an internal register.

If one or more status information packages are received before the previous status information is read, the status information stored in the internal register is overwritten with the new one.

In status mode, the external audio companion chip drives the `abe_pdm_frame` line low until the next frame synchronization low pulse. Then, it sends the 16-bit status information data on the `abe_pdm_frame` line. During the transmission of the status information, the McPDM module does not generate any frame-sync low pulse on the `abe_pdm_frame` line for one frame period.

### 23.6.2.4.3.2 Status Information Data Reception

The 16-bit status information data are received directly after the second frame-sync low pulse on the `abe_pdm_frame` line.

When the [MCPDM\\_CTRL\[10\]](#) STATUS\_INT bit is set to 1, 16 bits of status information data must be read from the [MCPDM\\_UP\\_DATA](#) register. Only the 16 lower bits are significant. When the value of the status information is a null word (0x00000000), it means that no status information has been sent by the external audio companion chip.

When the [MCPDM\\_CTRL\[10\]](#) STATUS\_INT bit is cleared to 0, no status information data has to be read from the [MCPDM\\_UP\\_DATA](#) register.

### 23.6.2.4.3.3 Exiting Status Mode

After the 16-bit status information data is sent, the external audio companion chip drives the `abe_pdm_frame` line high during one period of the `abe_pdm_lb_clk` clock signal before releasing its I/O driver in high-impedance state.

The McPDM module automatically exits the status mode one period of the `abe_pdm_lb_clk` clock signal after the last bit of the status information data has been transmitted on the `abe_pdm_frame` line. After exiting status mode, the McPDM module generates frame-sync low pulses.

---

**NOTE:** Due to the protocol mechanism, frame synchronization is lost during three frame periods. The external audio companion chip must internally emulate a frame synchronization to send uplink channel samples and received downlink channel samples as in normal mode while transmitting status information data on the `abe_pdm_frame` line.

---

### 23.6.2.4.3.4 Multiple Status Information Data Access

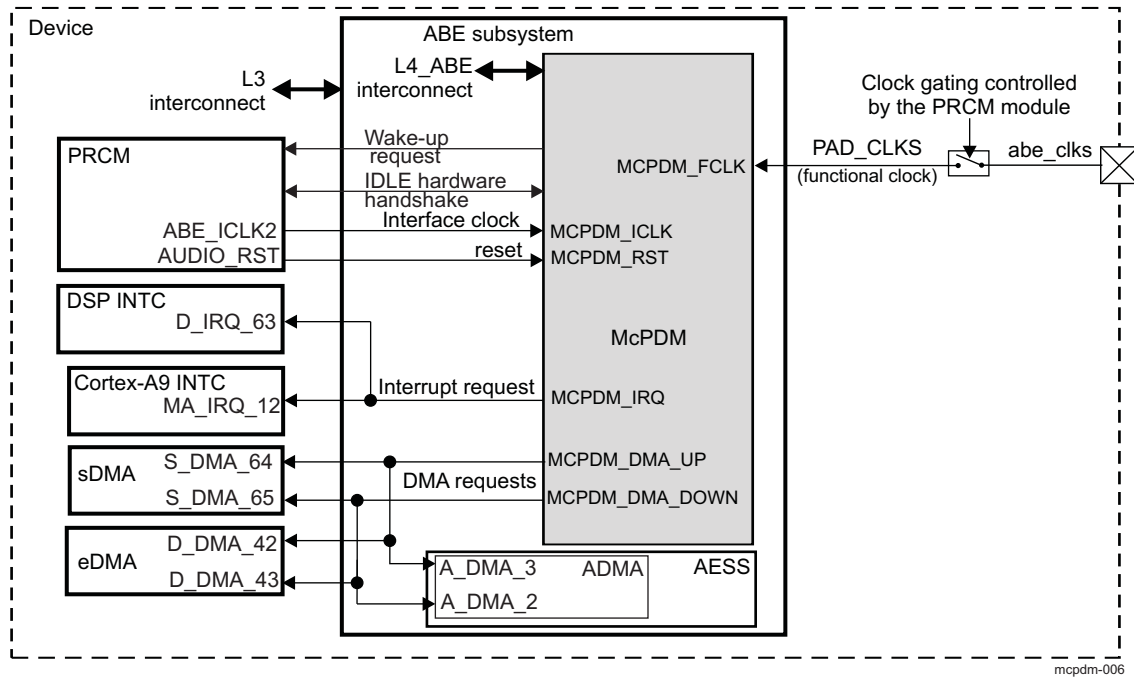

Multiple status information data can be sent by the external audio companion chip to the McPDM module every four frames.

### 23.6.3 McPDM Integration

This section describes the McPDM module integration in the device, including information about clocks, resets, and hardware requests.

Figure 23-166 shows the McPDM integration.

Figure 23-166. McPDM Integration

**NOTE:** For more information about the IDLE hardware handshake and the wake-up request, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

Table 23-468 through Table 23-470 summarize the integration of the module in the device.

Table 23-468. Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
McPDM	PD_AUDIO	Yes	L4_ABE

Table 23-469. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description

	MCPDM_DMA_UP	A_DMA_3	aDMA	McPDM uplink path DMA request to the aDMA
	MCPDM_DMA_DOWN	A_DMA_2	aDMA	McPDM downlink path DMA request to the aDMA

**NOTE:**

- For the description of the interrupt source, see [Section 23.6.4.5, Interrupt Requests](#).
- For the description of the DMA source, see [Section 23.6.4.6, DMA Requests](#).

### 23.6.4 McPDM Functional Description

#### 23.6.4.1 McPDM Block Diagram

Figure 23-167 shows the McPDM block diagram.

Figure 23-167. McPDM Block Diagram

#### 23.6.4.2 McPDM Clock Configuration

The functional clock MCPDM\_FCLK is provided by the external audio companion chip. Its frequency can be either 17.64 MHz for a sampling frequency of 88.2/176.4 kHz, or 19.2 MHz for a sampling frequency of 96/192 kHz.

The functional clock is also looped-back to the audio companion chip through ABE\_PDM\_LB\_CLK for resynchronization purposes.

#### 23.6.4.3 McPDM Software Reset

To perform a software reset of the McPDM module, the MCPDM\_SYSCONFIG[0] SOFTRESET bit must be set to 1. Reading the MCPDM\_SYSCONFIG[0] SOFTRESET bit gives the status of the software reset:

- Read 1: The software reset is ongoing.
- Read 0: The software reset is complete.

Software must ensure that the software reset completes before doing McPDM operations. Moreover, uplink and downlink paths can be independently software reset by setting the MCPDM\_CTRL[11] SW\_UP\_RST bit for the uplink path, and the MCPDM\_CTRL[12] SW\_DN\_RST bit for the downlink path to 1. The software reset is stopped by clearing the MCPDM\_CTRL[11] SW\_UP\_RST bit for the uplink path, and the MCPDM\_CTRL[12] SW\_DN\_RST bit for the downlink path to 0.

The software reset of the McPDM module, after completion, puts all McPDM registers in their default state. The downlink/uplink reset, resets only the downlink/uplink hardware logic (no registers are affected).

### 23.6.4.4 McPDM Power Management

Table 23-471 describes the power-management features available to the McPDM module.

**Table 23-471. Local Power-Management Features**

Feature	Registers	Description
Clock autogating	N/A	Feature not available
Slave idle modes	<a href="#">MCPDM_SYSCONFIG</a> [3:2] IDLEMODE bit field	Force-idle, no-idle, smart-idle, and smart-idle wake-up capable modes are available for the interface clock
Clock activity	N/A	Feature not available
Master standby modes	N/A	Feature not available
Global wake-up enable	N/A	Feature not available
Wake-up sources enable	<a href="#">MCPDM_IRQWAKEEN</a> and <a href="#">MCPDM_DMAWAKEEN</a> registers	Each register holds one active-high enable bit per event source able to generate wake-up signal
Audio channel enable	<a href="#">MCPDM_CTRL</a> [0] PDM_UP1_EN to <a href="#">MCPDM_CTRL</a> [2] PDM_UP3_EN bits for audio uplink channels <a href="#">MCPDM_CTRL</a> [3] PDM_DN1_EN to <a href="#">MCPDM_CTRL</a> [7] PDM_DN5_EN bits for audio downlink channels	Each of these bits allows enabling (set to 1) or disabling (clear to 0) the corresponding audio channel.
Status channel enable	<a href="#">MCPDM_CTRL</a> [10] STATUS_INT bit for the status channel	This bit allows enabling (set to 1) or disabling (clear to 0) the status channel
Command channel enable	<a href="#">MCPDM_CTRL</a> [9] CMD_INT bit for the command channel	This bit allows enabling (set to 1) or disabling (clear to 0) the command channel

The [MCPDM\\_ICLK](#) interface clock is controlled though the PRCM module by using IDLE request and acknowledge signals. The [MCPDM\\_SYSCONFIG](#)[3:2] IDLEMODE bit field allows controlling the interface clock gating in idle mode.

For the uplink path, the interface clock can be put in idle after the uplink path is enabled. Wakeup is available according to the settings of the [MCPDM\\_IRQWAKEEN](#) and [MCPDM\\_DMAWAKEEN](#) registers and the FIFO uplink threshold configured in the [MCPDM\\_FIFO\\_CTRL\\_UP](#)[3:0] UP\_TRESH bit field. The wake-up signal is asserted when the FIFO uplink level is equal to or greater than the FIFO uplink threshold value.

For the downlink path, the interface clock can be put in idle after the FIFO downlink level reaches the FIFO downlink threshold at least once. Wakeup is available according to the settings of the [MCPDM\\_IRQWAKEEN](#) and [MCPDM\\_DMAWAKEEN](#) registers and the FIFO downlink threshold configured in the [MCPDM\\_FIFO\\_CTRL\\_DN](#)[3:0] DN\_TRESH bit field. The wake-up signal is asserted when the FIFO downlink level is below the FIFO downlink threshold value.

### 23.6.4.5 McPDM Interrupt Requests

The McPDM can generate interrupt requests to the Cortex-A9 MPU and DSP INTCs through the [MCPDM\\_IRQ](#) signal.

[Table 23-472](#) lists the nonmaskable and maskable event flags and their mask that can cause the McPDM module to generate interrupts.

**Table 23-472. Interrupt Events**

Nonmaskable Event Flag <sup>(1)</sup>	Maskable Event Flag	Event Mask Bit	Event Unmask Bit	Description
<a href="#">MCPDM_IRQSTATUS_RAW</a> [11] UP_IRQ_FULL	<a href="#">MCPDM_IRQSTATUS</a> [11] UP_IRQ_FULL	<a href="#">MCPDM_IRQENABLE_CLR</a> [11] UP_IRQ_FULL_MASK	<a href="#">MCPDM_IRQENABLE_SET</a> [11] UP_IRQ_FULL_MASK	FIFO-uplink-full event. This event occurs when FIFO uplink is already full and a new word is written to the FIFO uplink by the uplink part of the McPDM module.
<a href="#">MCPDM_IRQSTATUS_RAW</a> [10] UP_IRQ_ALST_FULL	<a href="#">MCPDM_IRQSTATUS</a> [10] UP_IRQ_ALST_FULL	<a href="#">MCPDM_IRQENABLE_CLR</a> [10] UP_IRQ_ALST_FULL_MASK	<a href="#">MCPDM_IRQENABLE_SET</a> [10] UP_IRQ_ALST_FULL_MASK	FIFO-uplink-almost-full event. This event occurs when FIFO uplink contains (FIFO uplink size – 1) words and a new word is written to the FIFO uplink by the uplink part of the McPDM module.
<a href="#">MCPDM_IRQSTATUS_RAW</a> [9] UP_IRQ_EMPTY	<a href="#">MCPDM_IRQSTATUS</a> [9] UP_IRQ_EMPTY	<a href="#">MCPDM_IRQENABLE_CLR</a> [9] UP_IRQ_EMPTY_MASK	<a href="#">MCPDM_IRQENABLE_SET</a> [9] UP_IRQ_EMPTY_MASK	FIFO-uplink-empty event. This event occurs when FIFO uplink is already empty and a new word is read from the FIFO uplink by software.
<a href="#">MCPDM_IRQSTATUS_RAW</a> [8] UP_IRQ	<a href="#">MCPDM_IRQSTATUS</a> [8] UP_IRQ	<a href="#">MCPDM_IRQENABLE_CLR</a> [8] UP_IRQ_MASK	<a href="#">MCPDM_IRQENABLE_SET</a> [8] UP_IRQ_MASK	FIFO-uplink-read-request event. This event occurs when the number of words stored in the FIFO uplink is equal to or greater than the FIFO uplink threshold.
<a href="#">MCPDM_IRQSTATUS_RAW</a> [3] DN_IRQ_FULL	<a href="#">MCPDM_IRQSTATUS</a> [3] DN_IRQ_FULL	<a href="#">MCPDM_IRQENABLE_CLR</a> [3] DN_IRQ_FULL_MASK	<a href="#">MCPDM_IRQENABLE_SET</a> [3] DN_IRQ_FULL_MASK	FIFO-downlink-full event. This event occurs when FIFO downlink is already full and a new word is written to the FIFO downlink by software.
<a href="#">MCPDM_IRQSTATUS_RAW</a> [2] DN_IRQ_ALST_EMPTY	<a href="#">MCPDM_IRQSTATUS</a> [2] DN_IRQ_ALST_EMPTY	<a href="#">MCPDM_IRQENABLE_CLR</a> [2] DN_IRQ_ALST_EMPTY_MASK	<a href="#">MCPDM_IRQENABLE_SET</a> [2] DN_IRQ_ALST_EMPTY_MASK	FIFO-downlink-almost-empty event. This event occurs when FIFO downlink contains one word and a new word is read from the FIFO downlink by the downlink part of the McPDM module.
<a href="#">MCPDM_IRQSTATUS_RAW</a> [1] DN_IRQ_EMPTY	<a href="#">MCPDM_IRQSTATUS</a> [1] DN_IRQ_EMPTY	<a href="#">MCPDM_IRQENABLE_CLR</a> [1] DN_IRQ_EMPTY_MASK	<a href="#">MCPDM_IRQENABLE_SET</a> [1] DN_IRQ_EMPTY_MASK	FIFO-downlink-empty event. This event occurs when FIFO downlink is empty and a new word is read from the FIFO downlink by the downlink part of the McPDM module.
<a href="#">MCPDM_IRQSTATUS_RAW</a> [0] DN_IRQ	<a href="#">MCPDM_IRQSTATUS</a> [0] DN_IRQ	<a href="#">MCPDM_IRQENABLE_CLR</a> [0] DN_IRQ_MASK	<a href="#">MCPDM_IRQENABLE_SET</a> [0] DN_IRQ_MASK	FIFO-downlink-write-request event. This event occurs when the number of words stored in the FIFO downlink is less than the FIFO downlink threshold.

<sup>(1)</sup> The MCPDM\_IRQSTATUS\_RAW register is mainly used for debug purposes.

**CAUTION**

Once an event generating the interrupt request has been processed by software, this event must be cleared by writing a logical 1 to the corresponding bit of the [MCPDM\\_IRQSTATUS](#) register.

Writing a logical 1 in a bit of the [MCPDM\\_IRQSTATUS](#) register also clears the corresponding bit in the [MCPDM\\_IRQSTATUS\\_RAW](#) register to 0.

An event can generate an interrupt request when a logical 1 is written to the corresponding mask bit in the `MCPDM_IRQENABLE_SET` register. Events are reported in the `MCPDM_IRQSTATUS` and `MCPDM_IRQSTATUS_RAW` registers.

An event stops generating interrupt requests when a logical 1 is written to the corresponding mask bit in the `MCPDM_IRQENABLE_CLR` register. Events are reported only in the `MCPDM_IRQSTATUS_RAW` register.

In case of the `MCPDM_IRQSTATUS_RAW` register, the event is reported in the corresponding bit, even if the interrupt request generation is disabled for this event.

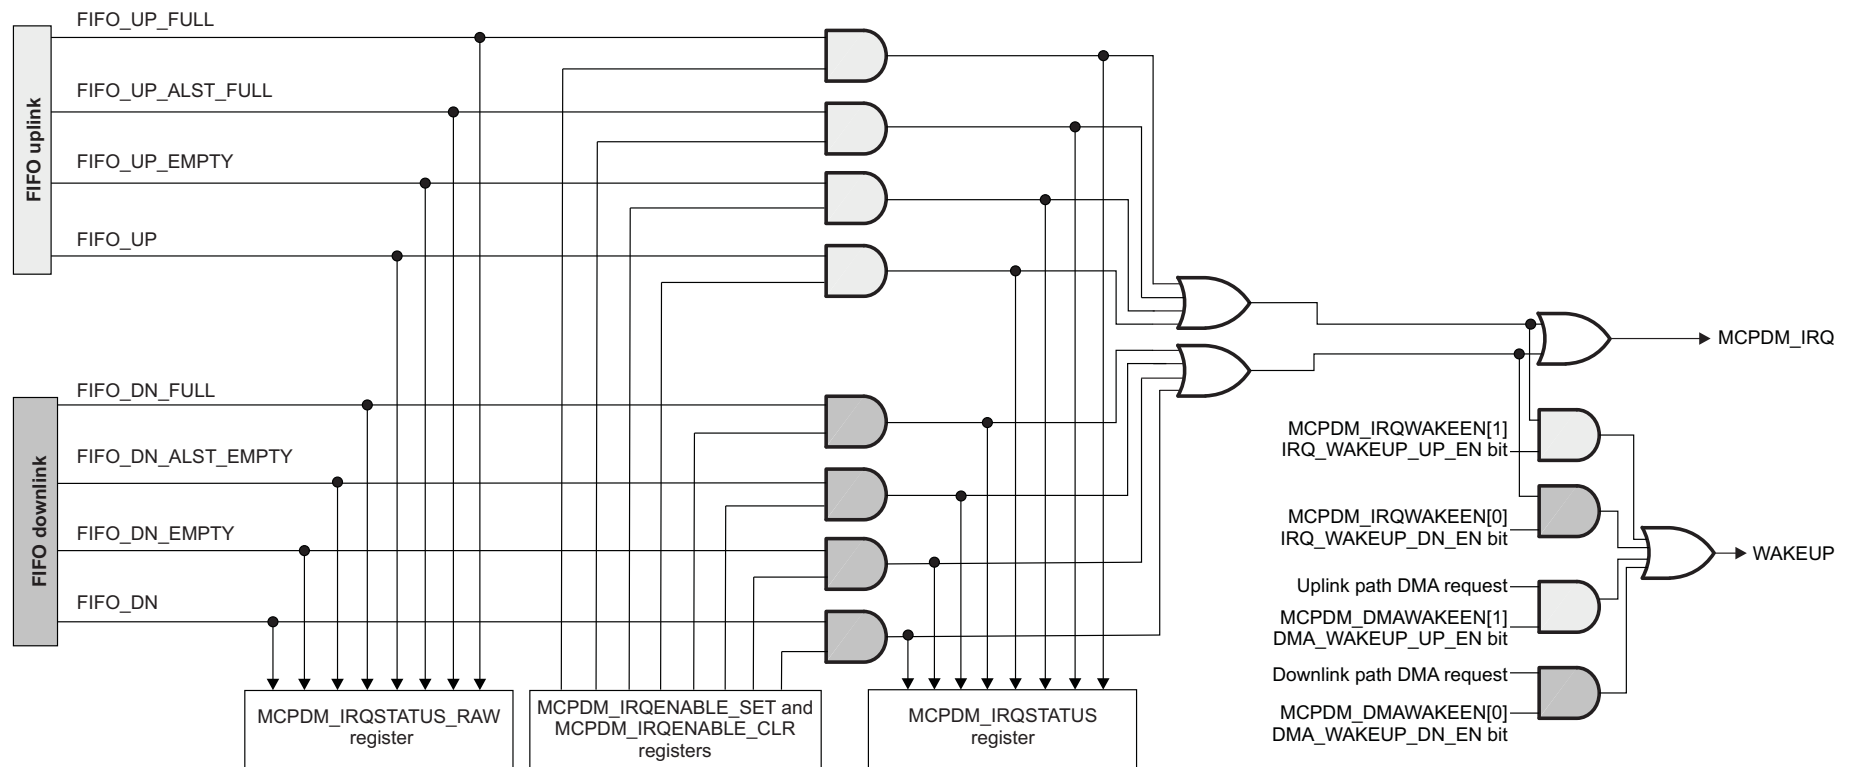

Writing a logical 1 in a bit of the `MCPDM_IRQSTATUS_RAW` register sets the corresponding bit in the `MCPDM_IRQSTATUS` register to 1.

The `MCPDM_IRQSTATUS_RAW` register is used primarily for debug purposes.

For more information about interrupt request signal mapping, see [Table 23-470](#).

[Figure 23-168](#) shows the interrupt tree of the McPDM module.

**Figure 23-168. Interrupt Tree**

mcpdm-008

### 23.6.4.6 McPDM DMA Requests

The McPDM module can generate two DMA requests to the sDMA, aDMA, and eDMA controllers:

- The uplink path can generate a DMA request through the MCPDM\_DMA\_UP signal.
- The downlink path can generate a DMA request through the MCPDM\_DMA\_DOWN signal.

Table 23-473 lists the DMA requests of the McPDM module.

**Table 23-473. McPDM DMA Requests**

DMA Request Signal	DMA Request Generation Enabling Bit	DMA Request Generation Disabling Bit	Description
MCPDM_DMA_UP	<a href="#">MCPDM_DMAENABLE_SET</a> [1] DMA_UP_ENABLE	<a href="#">MCPDM_DMAENABLE_CLR</a> [1] DMA_UP_ENABLE	Uplink path DMA request. This request is generated when the number of words in the FIFO uplink is equal to or above the FIFO uplink threshold.
MCPDM_DMA_DOWN	<a href="#">MCPDM_DMAENABLE_SET</a> [0] DMA_DN_ENABLE	<a href="#">MCPDM_DMAENABLE_CLR</a> [0] DMA_DN_ENABLE	Downlink path DMA request. This request is generated when the number of words in the FIFO downlink is below the FIFO downlink threshold.

To enable or disable the DMA request generation on the MCPDM\_DMA\_UP signal, one of the following actions must be performed:

- Write a logical 1 to the [MCPDM\\_DMAENABLE\\_SET](#)[1] DMA\_UP\_ENABLE bit to enable the DMA request generation on the MCPDM\_DMA\_UP signal.
- Write a logical 1 to the [MCPDM\\_DMAENABLE\\_CLR](#)[1] DMA\_UP\_ENABLE bit to disable the DMA request generation on the MCPDM\_DMA\_UP signal.

To enable or disable the DMA request generation on the MCPDM\_DMA\_DOWN signal, one of the following actions must be performed:

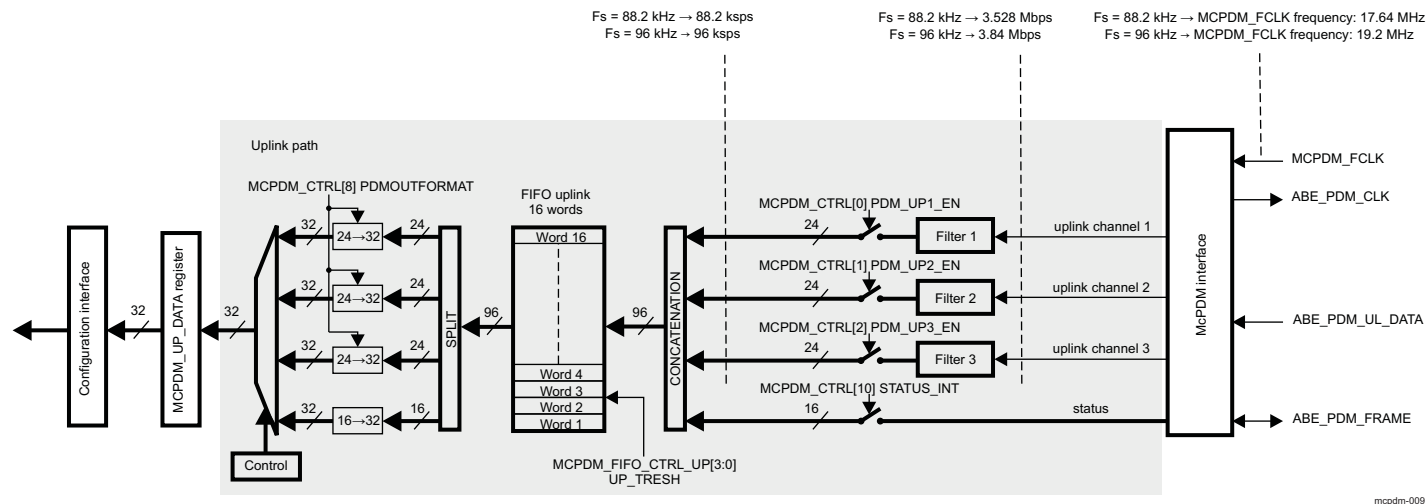

- Write a logical 1 to the [MCPDM\\_DMAENABLE\\_SET](#)[0] DMA\_DN\_ENABLE bit to enable the DMA request generation on the MCPDM\_DMA\_DOWN signal.
- Write a logical 1 to the [MCPDM\\_DMAENABLE\\_CLR](#)[0] DMA\_DN\_ENABLE bit to disable the DMA request generation on the MCPDM\_DMA\_DOWN signal.

For more information about DMA request signals mapping, see [Table 23-470](#).

### 23.6.4.7 Uplink Path

[Figure 23-169](#) is a detailed block diagram of the uplink path in the McPDM module.

Figure 23-169. Uplink Path Detailed Block Diagram

- The McPDM uplink input PDM data are provided by a 1 bit ADC Sigma-Delta (for each uplink channel).
- The McPDM uplink output PCM linear data format is equal to 24 bits signed format.
- It can be define 0dBpcm = maximum digital level allowed by the 24 bits data format is equal to amplitude peak ( $2^{23} - 1$ ).
- McPDM uplink gain is product from filter decimation factor and filter gain →  $G = 40^4 \times 4.89 = 12518400$  (decimal).
- 0dB pdm at McPDM uplink input (all PDM bits at '1' state) is not allowed on real silicon because it will overload the McPDM uplink output:
  - For 0dBpdm McPDM input follows McPDM uplink theoretical decimal output should be:  $12518400 = +3.48$  dBpcm. The result is calculated by →  $20\log(12518400/(2^{23} - 1))$ .
- -4dBpdm level at McPDM input will produce a McPDM uplink output equals to  $7898610 = -0.52$  dBpcm.

### **23.6.4.7.1 Uplink Path Features**

The uplink path has the following features:

- Three audio uplink channels
- One status channel
- Decimation filter for each audio uplink channel
- 16-word FIFO uplink with threshold setting
- Audio channel data formatting
- High-frequency sampling feature

### **23.6.4.7.2 Uplink Path Description**

#### **23.6.4.7.2.1 Uplink Data Received From the External Audio Companion Chip**

The McPDM interface receives audio uplink channel data and status information data from the external audio companion chip at a clock rate of 17.64 MHz for a sampling frequency of 88.2 kHz, or 19.2 MHz for a sampling frequency of 96 kHz. This low-frequency sampling feature is enabled by default. The uplink path supports a high-frequency sampling feature to work with an ultrasonic external microphone. This feature is enabled by setting the [MCPDM\\_CTRL\[13\] DIV\\_SEL](#) bit to 1. Thus, the McPDM interface receives audio uplink channel data and status information data from the external audio companion chip at a clock rate of 17.64 MHz for a sampling frequency of 176.4 kHz, or 19.2 MHz for a sampling frequency of 192 kHz.

The McPDM interface extracts each data bit related to audio and sends it to the decimation filter of the corresponding channel. Therefore, for each audio uplink channel, the McPDM interface generates one bit data flow to the corresponding decimation filter at a rate of 3.528 Mbps for a sampling frequency of 88.2 kHz, or 3.84 Mbps for a sampling frequency of 96 kHz.

Moreover, when status information data are detected on the frame-sync signal (`ABE_PDM_FRAME`), the status information data are recovered and sent to the status channel. When no status information data are detected on the frame-sync signal, a null word (0x0000) is sent on the status channel.

For more information about protocols and data formats in normal mode, see [Section 23.6.2.4.1, Protocols and Data Formats in Normal Mode](#). For more information about protocols and data formats in status mode, see [Section 23.6.2.4.3, Protocols and Data Formats in Status Mode](#).

#### **23.6.4.7.2.2 Decimation Filter**

Each bit data flow is related to an audio uplink channel and is provided by the McPDM interface is processed by a decimation filter. The purpose of this filter is to band-limit the noise and downsample the incoming bit data flow to generate a 24-bit-wide signed data flow at a rate of 88.2 kbps for a sampling frequency of 88.2 kHz, or 96 kbps for a sampling frequency of 96 kHz.

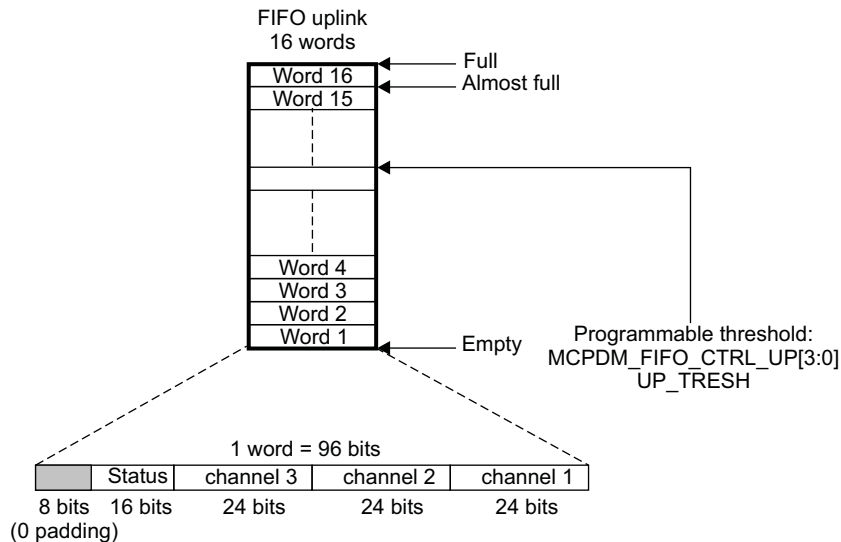

#### **23.6.4.7.2.3 FIFO Uplink Management**

##### **23.6.4.7.2.3.1 General Description**

The McPDM module implements a FIFO for the uplink path for communication with the host processor in the device. The FIFO uplink can store up to 16 words. Each word is 96 bits wide and is a combination of 24-bit-wide signed audio uplink channel data coming from decimation filters and 16-bit-wide status information data coming from the McPDM interface.

[Figure 23-170](#) shows the FIFO uplink overview.

**Figure 23-170. FIFO Uplink Overview**

mcpdm-010

### 23.6.4.7.2.3.2 FIFO Operations

The FIFO uplink is filled with audio uplink channel data coming from decimation filters and status information data from the McPDM interface. Once the FIFO uplink threshold ([MCPDM\\_FIFO\\_CTRL\\_UP\[3:0\] UP\\_TRESH](#) bit field) is reached and, depending on conditions, an event occurs and generates an interrupt or DMA request.

**NOTE:** For more information about events generating an interrupt request, see [Section 23.6.4.5, McPDM Interrupt Requests](#).

For more information about conditions for DMA request generation, see [Section 23.6.4.6, McPDM DMA Requests](#).

When an interrupt request upon a FIFO uplink read-request event or an MCPDM\_DMA\_UP request occurs, the host processor or the DMA controller must read the words from the FIFO uplink ([MCPDM\\_UP\\_DATA](#) register). The number of read accesses from the host/DMA is determined by the following equation:

$$\text{Num\_read\_access} = (\text{PDM\_UP1\_EN} + \text{PDM\_UP2\_EN} + \text{PDM\_UP3\_EN} + \text{STAT\_INT}) * (\text{UP\_THRESH}),$$
 where the PDM\_UP\_THRESHOLD is programmed through the [MCPDM\\_FIFO\\_CTRL\\_UP\[3:0\] UP\\_TRESH](#) bit field.

PDM\_UP1\_EN, PDM\_UP2\_EN, PDM\_UP3\_EN, and STAT\_INT are boolean values representing whether or not the corresponding channel is enabled.

For example, if audio uplink channels 1 and 3 are enabled, audio uplink channel 2 is disabled, the status channel is enabled, and the uplink threshold is programmed for one line only ([MCPDM\\_FIFO\\_CTRL\\_UP\[3:0\] UP\\_TRESH = 0x0](#)):

- Num\_read\_access = 3 because two audio uplink and the status channels are enabled.
- The first reading of the [MCPDM\\_UP\\_DATA](#) register should correspond to the audio uplink channel 1 data.
- The second reading of the [MCPDM\\_UP\\_DATA](#) register should correspond to the audio uplink channel 3 data.
- The third reading of the [MCPDM\\_UP\\_DATA](#) register should correspond to the status information data.

**NOTE:** No status information has been sent by the external audio companion chip if the status channel is enabled and the 16 lower bits of the corresponding data read from the [MCPDM\\_UP\\_DATA](#) register is 0x0000 .

The audio uplink and status channels cannot be enabled or disabled on the fly during uplink signaling. The uplink path must first be forced to reset by setting the [MCPDM\\_CTRL\[11\]](#) SW\_UP\_RST bit to 1 before enabling or disabling any channels.

---

Because the audio uplink channel data are 24 bits wide and the [MCPDM\\_UP\\_DATA](#) register is 32 bits wide, the [MCPDM\\_CTRL\[8\]](#) PDMOUTFORMAT bit allows selecting the justification of the 24-bit audio uplink channel data in the [MCPDM\\_UP\\_DATA](#) register:

- When the [MCPDM\\_CTRL\[8\]](#) PDMOUTFORMAT bit is cleared to 0, the 24-bit-wide signed audio uplink channel data are left-justified with eight 0 padding bits for the lower bits (24 bits data Left Justified + 8 bits pad).
  - When the [MCPDM\\_CTRL\[8\]](#) PDMOUT FORMAT is set to 1, the 24-bit-wide signed audio uplink channel data are right-justified and sign-extended (8 bits Pad + 24 bits data Right Justified). For both cases (right or left-justified), 24 bits data are MSB First format .
- 

**NOTE:** The [MCPDM\\_CTRL\[8\]](#) PDMOUTFORMAT bit does not affect the status information format. When the status information data are read from the [MCPDM\\_UP\\_DATA](#) register, only the 16 lower bits are significant.

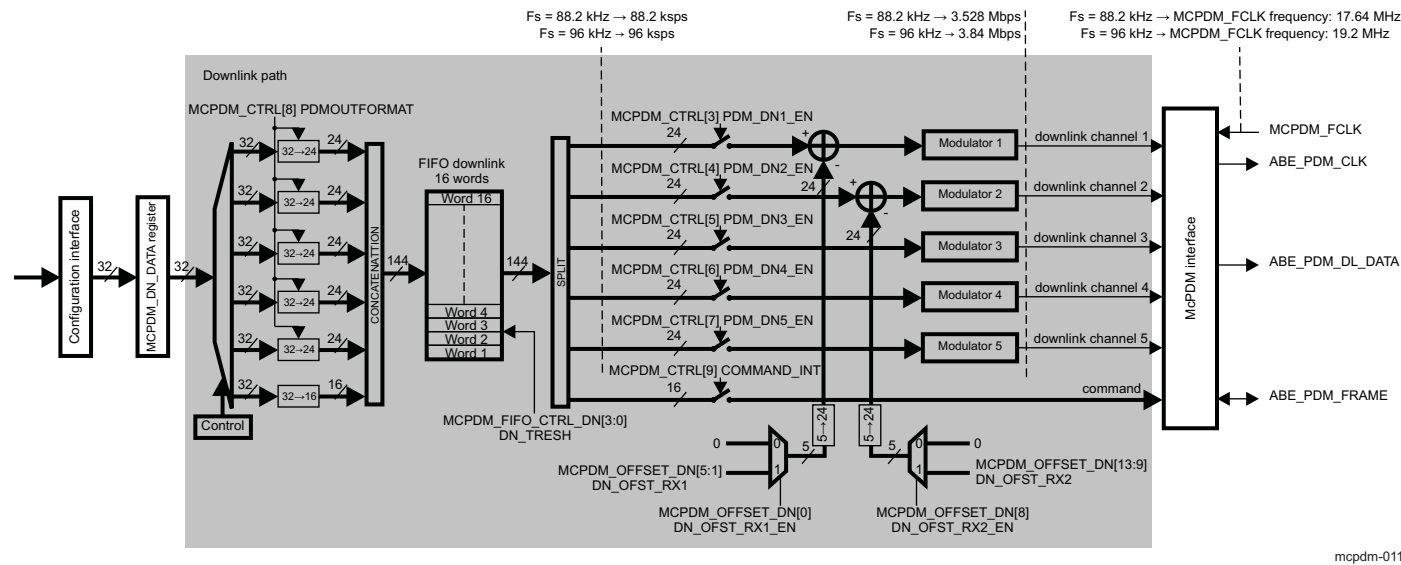

The setting of the [MCPDM\\_CTRL\[8\]](#) PDMOUTPUTFORMAT bit also affects the audio downlink channel data format.

---

### 23.6.4.8 Downlink Path

Figure 23-171 is a detailed block diagram of the downlink path in the McPDM module.

**Figure 23-171. Downlink Path Detailed Block Diagram**

- The McPDM downlink and dBpcm is relative to the 24 bits signed format (ABE data format): 0dBpcm amplitude peak is equal to  $(2^{23} - 1)$
- dBpdm is defined by the gain provided by the McPDM total gain is equal to  $-6.35\text{dB}$ 
  - There is a  $-6\text{dB}$  attenuation at the input of the Sigma-Delta modulator
  - The Sigma-Delta has an intrinsic gain of  $-0.35\text{dB}$

Then the gain between McPDM PDM output and McPDM PCM linear input is constant and equal to  $-6.35\text{dB}$ .

### 23.6.4.8.1 Downlink Path Features

The downlink path has the following features:

- Five audio downlink channels
- Offset cancellation for audio downlink channels 1 and 2
- One command channel
- Delta-sigma modulator for each audio downlink channel
- 16-word FIFO downlink with threshold setting
- Audio channel data formatting

### 23.6.4.8.2 Downlink Path Description

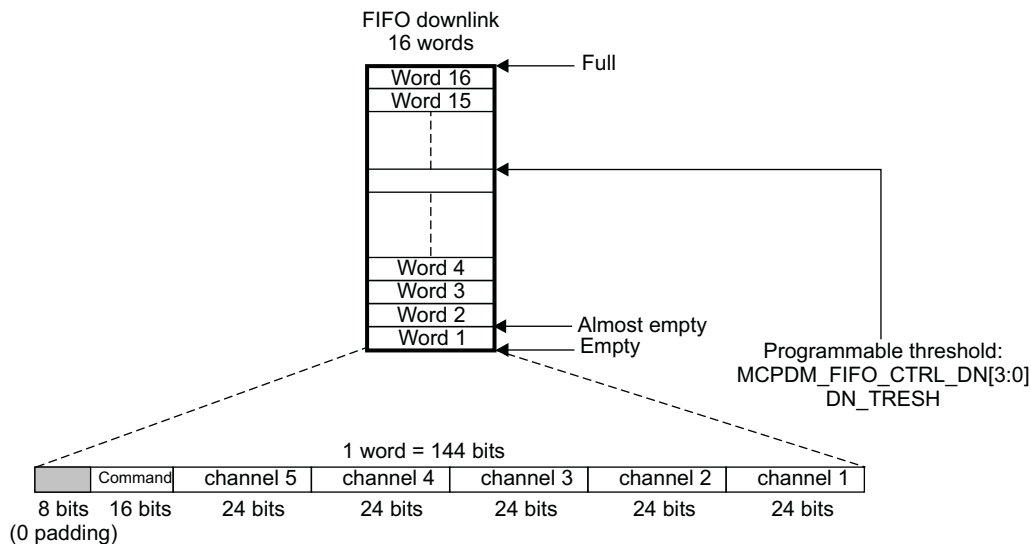

#### 23.6.4.8.2.1 FIFO Downlink Management

##### 23.6.4.8.2.1.1 General Description

The McPDM module implements a FIFO for the downlink path for communication with the host processor in the device. The FIFO downlink can store up to 16 words. Each word is 144 bits wide and is a combination of 24-bit-wide signed audio downlink channels data and 16-bit-wide command information data.

Figure 23-172 shows the FIFO downlink overview.

Figure 23-172. FIFO Downlink Overview

mcpdm-012

##### 23.6.4.8.2.1.2 FIFO Operations

The FIFO downlink is read by the McPDM module and data related to the audio downlink channels are sent to the delta-sigma modulators, while the data related to the command information is sent to the McPDM interface. Once the FIFO pointer goes below the programmed threshold (the [MCPDM\\_FIFO\\_CTRL\\_DN\[3:0\] DN\\_TRESH](#) bit field), a DMA or interrupt request is sent to the DMA or interrupt handler and, depending on conditions, an event occurs and generates an interrupt or DMA request.

**NOTE:** For more information about events generating an interrupt request, see [Section 23.6.4.5, McPDM Interrupt Requests](#).

For more information about conditions for DMA request generation, see [Section 23.6.4.6, McPDM DMA Requests](#).

When an interrupt request upon a FIFO downlink write-request event or a MCPDM\_DMA\_DOWN request occurs, it indicates that the next words are available to be written to the [MCPDM\\_DN\\_DATA](#) register. The minimum number of write accesses from the host/DMA is determined by the following equation:

$$\text{Num\_min\_write\_access} = \text{PDM\_DN1\_EN} + \text{PDM\_DN2\_EN} + \text{PDM\_DN3\_EN} + \text{PDM\_DN4\_EN} + \text{PDM\_DN5\_EN} + \text{CMD\_INT}$$

PDM\_DN1\_EN, PDM\_DN2\_EN, PDM\_DN3\_EN, PDM\_DN4\_EN, PDM\_DN5\_EN and CMD\_INT are boolean values representing whether the corresponding channel is enable or not.

The maximum number of write accesses (before overwriting the data in the FIFO still to be transmitted) from the host/DMA is determined by the following equation:

$$\text{Num\_max\_write\_access} = (\text{FIFO\_SIZE} - \text{DN\_THRESH} + 1) * (\text{PDM\_DN1\_EN} + \text{PDM\_DN2\_EN} + \text{PDM\_DN3\_EN} + \text{PDM\_DN4\_EN} + \text{PDM\_DN5\_EN} + \text{CMD\_INT})$$

FIFO\_SIZE is the size of the downlink FIFO, and DN\_THRESH is the downlink FIFO threshold, programmed through the [MCPDM\\_FIFO\\_CTRL\\_DN\[3:0\]](#) DN\_THRESHOLD bit field.

For example, if audio downlink channels 1, 2, and 3 are enabled, audio downlink channels 4 and 5 are disabled, and the command channel is enabled:

- Num\_min\_write\_access = 4, because three audio downlinks and the command channels are enabled.
- The first writing to the [MCPDM\\_DN\\_DATA](#) register should correspond to the audio downlink channel 1 data.
- The second writing to the [MCPDM\\_DN\\_DATA](#) register should correspond to the audio downlink channel 2 data.
- The third writing to the [MCPDM\\_DN\\_DATA](#) register should correspond to the audio downlink channel 3 data.
- The fourth writing to the [MCPDM\\_DN\\_DATA](#) register should correspond to the command information data.

**NOTE:** When the command channel is enabled and no command data need to be sent to the external audio companion chip, 0x0000 must be written to the 16 lower bits of the [MCPDM\\_DN\\_DATA](#) register as command data.

The audio downlink and command channels cannot be enabled or disabled on the fly during downlink signaling. The downlink path must first be forced to reset by setting the [MCPDM\\_CTRL\[12\]](#) SW\_DN\_RST bit to 1 before enabling or disabling any channels.

Because the audio downlink channel data are 24 bits wide and the [MCPDM\\_DN\\_DATA](#) register is 32 bits wide, the [MCPDM\\_CTRL\[8\]](#) PDMOUTFORMAT bit indicates the justification of the 24-bit audio downlink channel data in the [MCPDM\\_DN\\_DATA](#) register:

- When the [MCPDM\\_CTRL\[8\]](#) PDMOUTFORMAT is cleared to 0, the 24-bit-wide signed audio downlink channel data are left-justified with eight 0 padding bits for the lower bits (24 bits data Left Justified + 8 bits pad).
- When [MCPDM\\_CTRL\[8\]](#) PDMOUT FORMAT is set to 1, the 24-bit-wide signed audio downlink channel data are right-justified and sign-extended (8 bits Pad + 24 bits data Right Justified). For both cases (right or left-justified), 24 bits data transfer starts with MSB First format.

**NOTE:** The [MCPDM\\_CTRL\[8\]](#) PDMOUTFORMAT bit does not affect the command information format. When the command information data are written to the [MCPDM\\_DN\\_DATA](#) register, only the 16 lower bits are significant.

The setting of the [MCPDM\\_CTRL\[8\]](#) PDMOUTPUTFORMAT bit also affects the audio uplink channel data format.

#### **23.6.4.8.2.1.3 Offset Cancellation**

Because audio downlink channels 1 and 2 are related to the analog headset downlink path within the external audio companion chip, an offset cancellation feature is available for these channels to eliminate the offset of the analog headset downlink path.

When the offset cancellation feature is enabled, an offset value is subtracted from the audio data before being sent to the pulse-density modulator. The offset values are read from registers within the external audio companion chip and configured in the [MCPDM\\_DN\\_OFFSET\[5:1\]](#) DN\_OFST\_RX1 bit field for the audio downlink channel 1, and in the [MCPDM\\_DN\\_OFFSET\[13:9\]](#) DN\_OFST\_RX2 bit field for the audio downlink channel 2.

The offset cancellation feature is enabled or disabled by configuring the [MCPDM\\_DN\\_OFFSET\[0\]](#) DN\_OFST\_RX1\_EN bit for the audio downlink channel 1, and the [MCPDM\\_DN\\_OFFSET\[8\]](#) DN\_OFST\_RX2\_EN bit for the audio downlink channel 2 (00: Disabled, 10: Enabled).

#### **23.6.4.8.2.1.4 Pulse-Density Modulators**

Each 24-bit-wide data related to an audio downlink channel is processed by a pulse-density modulator. The purpose of this modulator is to upsample the incoming audio data and then perform a 1-bit pulse-density modulation to generate a 1-bit data flow at a rate of 3.528 Mbps for a sampling frequency of 88.2 kHz, or 3.84 Mbps for a sampling frequency of 96 kHz. The 1-bit pulse-density modulation allows using a 1-bit analog-to-digital converter (ADC) implemented in the external audio companion chip to convert the audio digital data into an audio analog signal.

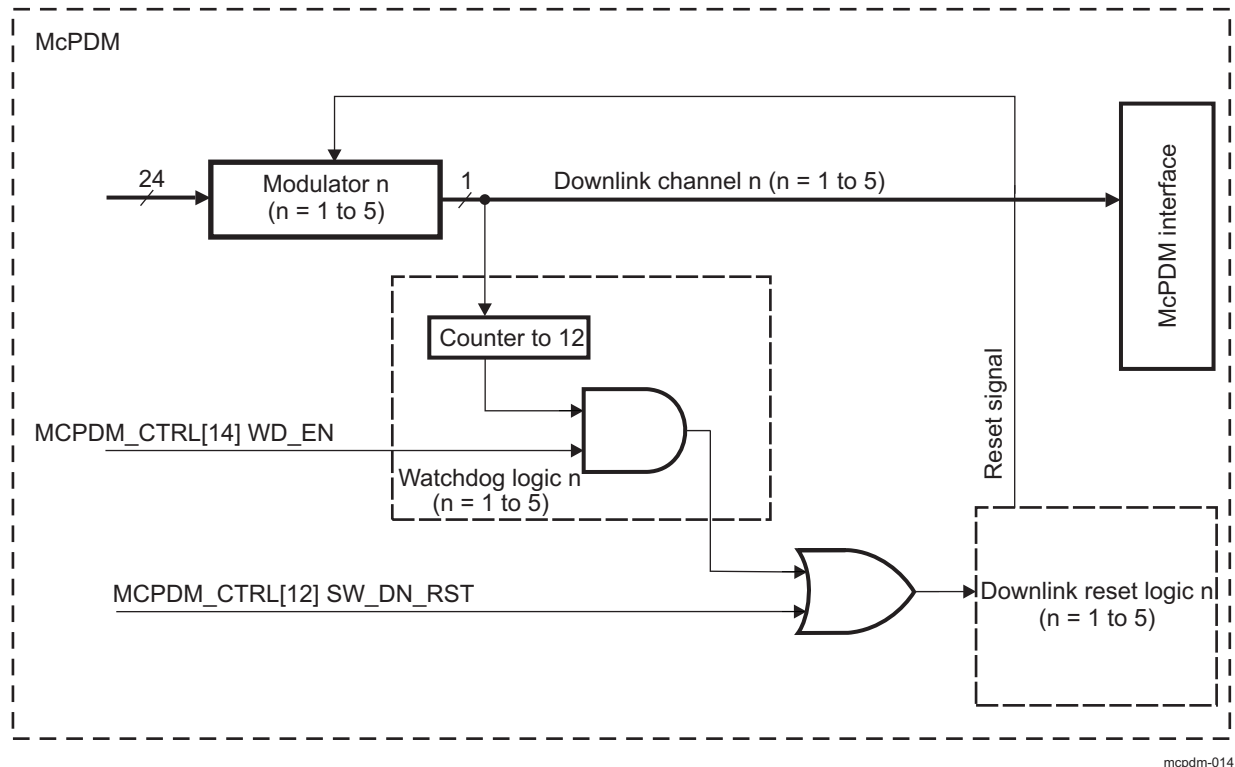

##### **23.6.4.8.2.1.4.1 Pulse-Density Modulators Watchdog Logic**

If the 1-bit data flow coming out of the pulse-density modulator has 12 or more consecutive 1s or 0s, the pulse-density modulator had entered into an unstable or saturated condition. An unstable or saturated condition leads to unpredictable behavior of the pulse-density modulator, thereby producing random noise. To prevent this unstable or saturated condition from occurring, a watchdog logic is used to monitor the 1-bit output of the pulse-density modulator for 12 consecutive 1s or 12 consecutive 0s. If entry to an unstable condition is detected, the watchdog logic asserts the reset of the McPDM downlink paths for one clock pulse to put the McPDM hardware logic, related to the downlink mechanism, to initial state.

The watchdog logic is disabled by default. To enable it, the [MCPDM\\_CTRL\[14\]](#) WD\_EN bit must be set to 0x1. If the watchdog logic is disabled, only the assertion of the downlink path reset [MCPDM\\_CTRL\[12\]](#) SW\_DN\_RST bit is allowed to reset the McPDM hardware logic, which is related to the downlink mechanism. If the watchdog logic is enabled, the downlink mechanism logic is reset when the downlink path reset or the watchdog reset is asserted.

[Figure 23-173](#) shows the McPDM watchdog logic mechanism.

Figure 23-173. McPDM Watchdog Logic

#### 23.6.4.8.2.1.5 Downlink Data Sent to the External Audio Companion Chip

The McPDM interface transmits the audio downlink channel data and command data to the external audio companion chip at a clock rate of 17.64 MHz for a sampling frequency of 88.2 kHz, or 19.2 MHz for a sampling frequency of 96 kHz.

The command data are sent on the frame-sync signal (ABE\_PDM\_FRAME) when the command channel is enabled. When the command channel is disabled or the command data is 0x0000, no command data is sent on the frame-sync signal.

**NOTE:** For more information about protocols and data formats in normal mode, see [Section 23.6.2.4.1, Protocols and Data Formats in Normal Mode](#).

For more information about protocols and data formats in command mode, see [Section 23.6.2.4.2, Protocols and Data Formats in Command Mode](#).

#### 23.6.4.9 Error Reporting

During normal operation, when interrupt and DMA requests are properly served, no FIFO-uplink-full and no FIFO-downlink-empty events should occur.
