Pin Name	Type <sup>(1)</sup>	Description
cvideo_rset	I/O	External resistor (Rset) shall be connected to this pin to set the reference current of the video DAC. The value of the resistor depends on the mode of operation (Normal or TVOUT Bypass). In Normal mode, the nominal value for Rset is 4700 $\Omega$ . In TVOUT Bypass mode, the nominal value for Rset is 10000 $\Omega$ .
vdda_vdac	Power	Analog supply voltage for the video DAC
vssa_vdac	Power	Analog ground for the video DAC

### CAUTION

- *cvideo\_tvout* is a very high-frequency analog signal and must be routed with extreme care. As a result, the path of this signal must be as short as possible, and as isolated as possible from other interfering signals.
- During board design, the onboard traces and parasites must be matched for the channel. *cvideo\_vfb* pin is the most sensitive pins in the TV out system. Low onboard resistance is required for the traces that connect the Rout to the *cvideo\_vfb* and *cvideo\_tvout* pins. The resistance on those trace affects output impedance matching. Therefore, Rout resistor is suggested to be placed as close as possible to the device pins. The onboard traces lead to the TV OUT pin must have a characteristic impedance of 75 Ohm starting from the closest possible place to the device pin output.
- If the TV output is not used, the following configuration for the VDAC pins must be applied:
  - vdda\_vdac (connected to the vdda\_hdmi\_vdac ball, commonly used with the HDMI module):
    - If the HDMI module is used, then the vdda\_hdmi\_vdac ball is supplied. Respectively, the vdda\_vdac pin is also supplied. The VDAC must be maintained in total power-down mode by software. For more information, see [Section 10.6.4.6.7, Video DAC Power Management](#).
    - If the HDMI module is not used, the vdda\_vdac pin must be grounded.
  - vssa\_vdac: Must be grounded
  - cvideo\_rset: Must be floating, left unconnected
  - cvideo\_tvout: Must be floating, left unconnected
  - cvideo\_vfb: Must be floating, left unconnected
- To avoid current leakage, the following bits must be set to 0:
  - DSS.DSS\_CONTROL[5] DAC\_POWERDN\_BGZ
  - [VENC\\_OUTPUT\\_CONTROL\[1\] COMPOSITE\\_ENABLE](#)
  - PRCM.CM\_DSS\_DSS\_CLKCTRL[11] OPTFCLKEN\_TV\_FCLK
  - CONTROL.CONTROL\_AVDAC[30] AVDAC\_TVOUTBYPASS

[Table 10-698](#) lists the typical values of the external components for different modes of the TV display interface.

**Table 10-698. Typical Values for Rout, Rset, Rload, and Cout**

	Composite, DC-Coupled	Composite, AC-Coupled	Bypass Mode	Unit
Rout	2700	2700	N/A	$\Omega$
Rset	4700	4700	10,000	$\Omega$

**Table 10-698. Typical Values for Rout, Rset, Rload, and Cout (continued)**

	Composite, DC-Coupled	Composite, AC-Coupled	Bypass Mode	Unit
Rload	N/A	N/A	1500	$\Omega$
Cout	N/A	$\geq 220$	N/A	$\mu\text{F}$

### 10.6.3 Video Encoder Integration

This section describes the integration of the display subsystem and details clocks, resets, hardware requests, and power modes.

Figure 10-183 shows the integration of the display subsystem in the device.

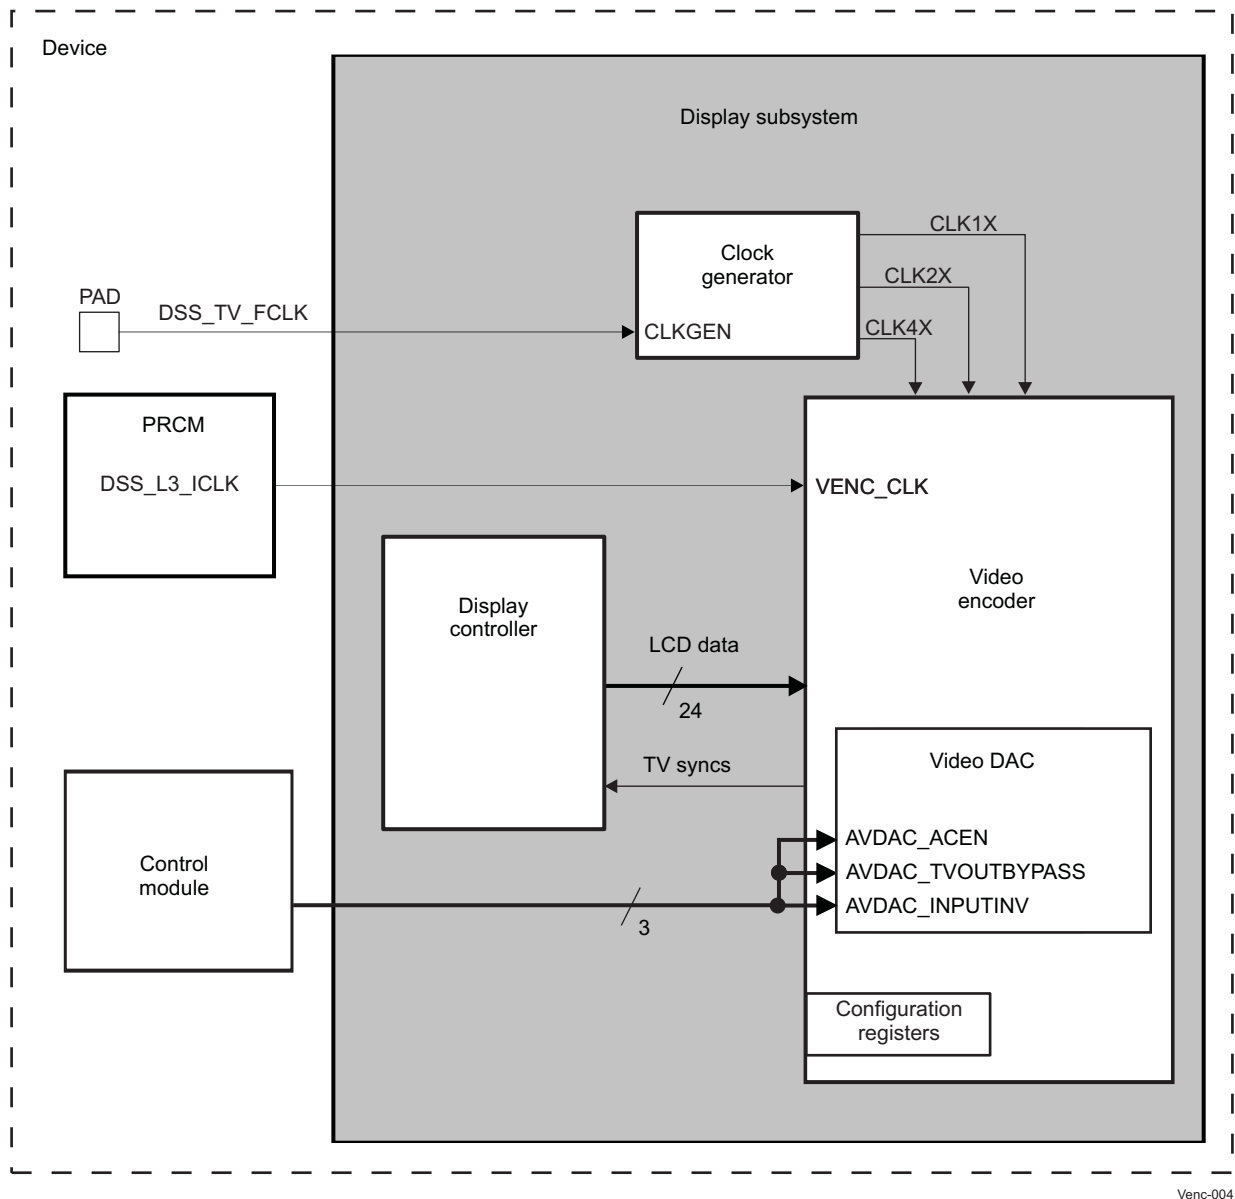

**Figure 10-183. Video Encoder Integration**

Table 10-699 describes the different clocks with their possible frequency values.

**Table 10-699. Clocks**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
Video encoder	VENC_CLK	DSS_L3_ICLK	PRCM	For information about PRCM clock gating and management, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Clock generator	CLKGEN	DSS_TV_FCLK	PAD	Functional clock provided on pad. Controlled by the PRCM module.

Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
Video encoder DAC	DSS_RST	DSS_RST	PRCM	Reset signal of the display subsystem power domain, from the PRCM module.

- Video encoder clock:  
The CLKGEN is divided into three balanced clocks (see [Table 10-700](#)), depending on the clock mode selected through the DSS.DSS\_CTRL[2] VENC\_CLOCK\_MODE bit (see [Section 10.1.3, DSS Register Manual](#)).

**Table 10-700. Digital Clock Division for the Video Encoder**

Clock Output	Clock Mode	
	Clock mode 0	Clock mode 1
CLK4X	DSS_TV_FCLK	DSS_TV_FCLK or 0 (gated)
CLK2X	DSS_TV_FCLK/2	DSS_TV_FCLK
CLK1X	DSS_TV_FCLK/4	DSS_TV_FCLK/2

**NOTE:** The DSS\_TV\_CLK clock is derived from the SYS\_ALTCLK clock.

The source for the SYS\_ALTCLK clock can be the `fref_xtal_in` or `fref_slicer_in` device pad.

An external clock generator must be connected to the `fref_slicer_in` or `fref_xtal_in` pad. A 54-MHz clock is needed for PAL or NTSC 601, a 49.04-MHz clock is needed for NTSC square pixel, and a 59-MHz clock is needed for the PAL square pixel.

The selection of the input source pad for the SYS\_ALTCLK clock:

- Depends on the configuration of the `sys_boot[7:6]` device pads. For more information, see [Section 27.2.4.1, Clock Source Selection](#), in [Chapter 27, Initialization](#).
- Depends on the required use case:
  - If DSS\_TV\_FCLK = 27 MHz is required, then the `fref_slicer_in` or `fref_xtal_in` pad can be used as the source for SYS\_ALTCLK.
  - If DSS\_TV\_FCLK = 49.04, 54 MHz, or 59 MHz is required, then the `fref_xtal_in` pad must be used as the source for SYS\_ALTCLK.

Gating control over SYS\_ALTCLK is provided in PRCM module registers. For more information, see [Section 3.6.14.4, Clock Domain Module Attributes](#), in [Chapter 3, Power, Reset, and Clock Management](#).

**NOTE:** Clock mode 1 can be used with both an external clock 27 MHz provided to VENC, but also with a 27-MHz clock generated internally by the HDMI PLL module. The source of the TV\_CLK can be either DSS\_TV\_FCLK or PLL3\_CLK1 clock signals (see [Section 10.1.2.1, DSS Clocks](#)).

After device reset, clock mode 0 is selected by default, and DSS\_TV\_FCLK clock is disabled.

For proper Video DAC configuration in both clock mode 0 or clock mode 1, clock output CLK4X shall always be active by setting the DSS.DSS\_CTR[3] VENC\_CLOCK\_4X\_ENABLE bit to 1 (see [Section 10.1.3, DSS Register Manual](#)).

The TV\_CLK/4 in clock mode 0, or TV\_CLK/2 in clock mode 1, is used into the DISPC to send data to the VENC.

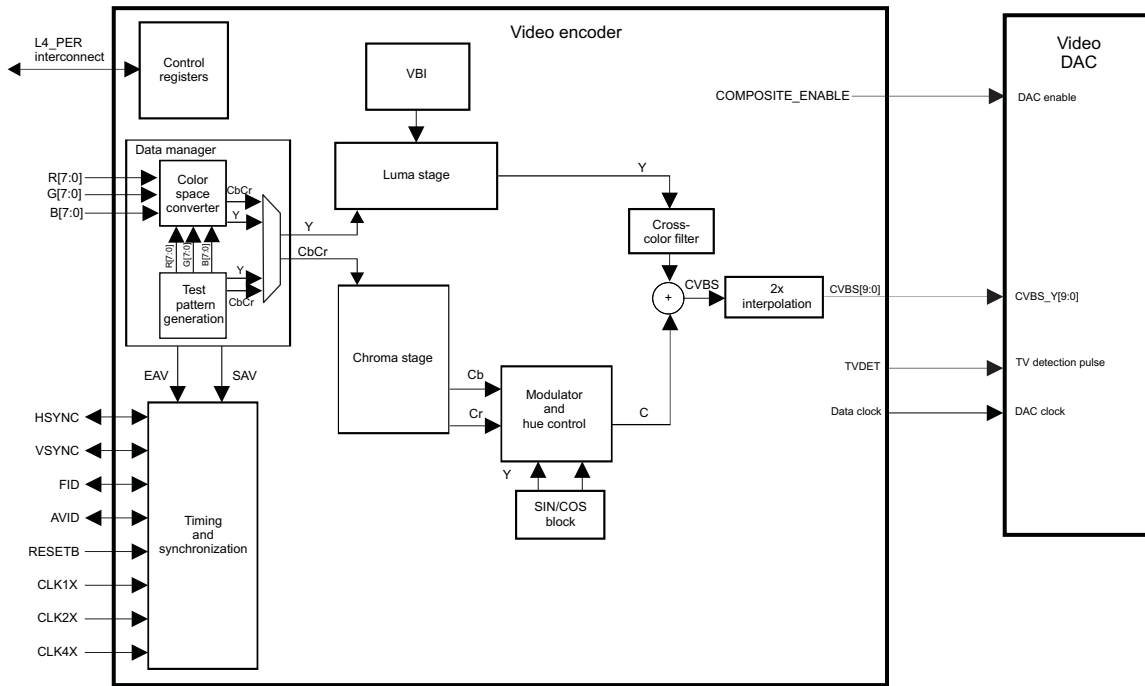

---

- Video DAC clocks:  
The video data are latched on the positive edge of the DSS\_TV\_FCLK clock.

### 10.6.4 Video Encoder Functional Description

Figure 10-184 shows an overview of the video encoder architecture.

Figure 10-184. Video Encoder Architecture Overview

venc-006

#### 10.6.4.1 Data Manager

The data manager allows user to select two sources of data inputs:

- Data coming from the Display Controller.
- Data coming from the test pattern generation.

The source is selected by programming SVDS field [VENC\\_F\\_CONTROL\[7:6\]](#).

##### 10.6.4.1.1 Color Space Converter

In the display subsystem, the input format from the display controller is always 24-bit RGB coming from the display controller or the test pattern generation. The RGB-to-YCbCr color space converter converts the 24-bit RGB pixel data into 16-bit YCbCr 4:2:2 data.

##### 10.6.4.1.2 Test Pattern Generation

For diagnostic purposes, the data manager can be forced to output 100/100 color bar RGB/YCbCr data. To use the test pattern generation, SVDS [VENC\\_F\\_CONTROL\[7:6\]](#) field shall be set to 0x1. If FMT field [VENC\\_F\\_CONTROL\[1:0\]](#) is set to 0x0 then the 24-bits RGB test pattern data will be converted into 16-bit YCbCr 4:2:2 data by the Color Space Converter. Otherwise if FMT field [VENC\\_F\\_CONTROL\[1:0\]](#) is set to 0x2 then 16-bit YCbCr 4:2:2 test pattern data are outputted directly, the color space converted is bypassed. [Table 10-701](#) resume the test pattern generator datas.

Table 10-701. 100/100 Color Bar Table

COLOR	R	G	B	Y	Cb	Cr
White	255	255	255	235	128	128
Yellow	255	255	0	210	16	146
Cyan	0	255	255	170	166	16

**Table 10-701. 100/100 Color Bar Table (continued)**

Green	0	255	0	145	54	34
Magenta	255	0	255	106	202	222
Red	255	0	0	81	90	240
Blue	0	0	255	41	240	110
Black	0	0	0	16	128	128

#### 10.6.4.2 Luma Stage

The luma stage includes a luma pipeline delay, luma shaping, 2x interpolation filter, and luma variable delay. The luma pipeline delay block is used to match luma path length to chroma path length. In the luma gain shaper, a programmable gain is first applied to the luminance data output. The luminance gain is defined by the [VENC\\_GAIN\\_Y](#) register. Horizontal sync, vertical sync, and setup insertion are then performed.

Black level and blank level are programmable through the [VENC\\_BLACK\\_LEVEL](#) and [VENC\\_BLANK\\_LEVEL](#) registers. All the transition edges of the luminance signal, such as sync edges and active video edges, are properly shaped and filtered to keep the bandwidth within the standards.

After all required components of the luminance signal are added, the resulting signal is low-passed and interpolated to 2x-pixel rate. This 2x interpolation simplifies the external analog reconstruction filter design and improves the signal-to-noise ratio.

#### 10.6.4.3 Chroma Stage

The chroma stage includes a low-pass filter, first-stage 2x interpolation, chroma gain shaper, and second-stage 2x interpolation. A pair of programmable gains adjusts the time-multiplexed U/V signal. The gains for U and V are independently controlled by the [VENC\\_GAIN\\_U](#) and [VENC\\_GAIN\\_V](#) register bits.

#### 10.6.4.4 Subcarrier and Burst Generation

The encoder uses a 32-bit subcarrier increment to synthesize the subcarrier. The value of the subcarrier increments required to generate the desired subcarrier frequency for NTSC and PAL format is found by:

$$S\_CARR = \text{ROUND} ([F_{sc}/F_{CLK2X}] \times 2^{32})$$

where:

$F_{sc}$  = Frequency of the subcarrier

$F_{CLK2X}$  = Frequency of the internal video encoder

The [VENC\\_S\\_CARR](#) register controls the subcarrier frequency. The [VENC\\_C\\_PHASE](#) register controls the phase of the subcarrier. The phase of the color subcarrier is reset to [VENC\\_C\\_PHASE](#). [Table 10-702](#) presents the [VENC\\_S\\_CARR](#) register values depending the standard and pixel type used.

**Table 10-702. VENC\_S\_CARR Register Recommended Values**

Standard	Pixel Type	Subcarrier Frequency (Fsc) (MHz)	Fclkenc (MHz)	VENC_S_CARR Register Value (hexa)
NTSC-M, J	ITU-R601	3.579545	27	0x21F07C1F
PAL-M	ITU-R601	3.5756083125	27	0x21E6EFE3
PAL-B, D, G, H, I	ITU-R601	4.43361875	27	0x2A098ACB
NTSC-M, J	Square pixel	3.579545	24.5454 <sup>(1)</sup>	0x25555555
PAL-M	Square pixel	3.579561149	24.5454 <sup>(1)</sup>	0x1F15C01E
PAL-B, D, G, H, I	Square pixel	4.43361875	29.50 <sup>(1)</sup>	0x26798C0C

<sup>(1)</sup> In square pixel mode, an external clock generator is needed to provide sampling frequencies (49.09 MHz for NTSC square pixel or 59 MHz for PAL square pixel).

The color subcarrier reset has four modes:

- No reset
- Reset every two lines
- Reset every two fields
- Reset every eight fields

The [VENC\\_C\\_PHASE](#) register can be used to adjust the SCH (subcarrier to horizontal sync phase). The [VENC\\_BSTAMP\\_WSS\\_DATA](#)[6:0] BSTAP bit field sets the amplitude of the color burst.

Phase alternation line refers to the encoding scheme in which the subcarrier alternates between two phases every scan line. Setting to 0x1, the [VENC\\_M\\_CONTROL](#)[1] PAL bit enables phase alternation line encoding. Otherwise, a normal subcarrier is generated. Two possible alternation sequences are possible by setting the [VENC\\_M\\_CONTROL](#)[5] PALPHS bit.

### 10.6.4.5 Vertical Blanking Interval

#### 10.6.4.5.1 Closed Caption Encoding

The encoder can be programmed to encode closed-caption data and extended data in the selected line. The closed-caption data are sent to the encoder through the L4\_PER interconnect. The data stream consists of 7-bit US-ASCII code and 1 odd-parity bit (see [Table 10-703](#)).

**Table 10-703. Closed-Caption Data Format**

MSB							LSB
Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Odd parity

The standard service encodes closed caption in both fields; the extended service encodes closed caption in even fields. When set to 1, the [VENC\\_L21\\_WC\\_CTL](#) L21EN[0] bit enables closed-caption encoding in odd fields. When set to 1, the [VENC\\_L21\\_WC\\_CTL](#) L21EN[1] bit enables closed-caption encoding in even fields.

To select the scan line where the CC data are encoded, program the [VENC\\_LN\\_SEL](#)[4:0] SLINE bit field.

#### CAUTION

The setting of the SLINE[4:0] bit field value depends on the video standard:

- PAL mode: Because there is a one-line offset, program the desired line number – 1. To activate the closed caption on line 21 (0x15), program the value  $0x15 - 1 = 0x14$ . The default value is  $0x15 + 1 = 0x16$  (line 22).
- NTSC mode: Because there is a four-line offset, program the desired line number – 4. To activate the closed caption on line 21 (0x15), program the value  $0x15 - 4 = 0x11$ . The default value is  $0x15 + 4 = 0x19$  (line 25).

The [VENC\\_LN\\_SEL](#)[25:16] LN21\_RUNIN bit field should be kept at reset value (0x10B). Four closed-caption data registers contain the data to be encoded. The [VENC\\_LINE21](#)[15:8] L21O and [VENC\\_LINE21](#)[7:0] L21O bit fields contain the first and the second bytes, respectively, of closed-caption data to be encoded in the odd field. The [VENC\\_LINE21](#)[31:24] L21E and [VENC\\_LINE21](#)[23:16] L21E bit fields contain the first and the second bytes, respectively, of data to be encoded in the even field.

Immediately after the closed-caption data is written to the registers, in either the odd field or even field, the corresponding closed-caption status bit ([VENC\\_STATUS](#)[4] CCE or [VENC\\_STATUS](#)[3] CCO) is reset to 0 to indicate that the closed-caption data is available in the closed-caption data registers and yet to be encoded.

Immediately after the closed-caption data is encoded, the [VENC\\_STATUS](#)[4] CCE bit or the [VENC\\_STATUS](#)[3] CCO bit is set to 1 to indicate that the closed-caption data has been encoded and is ready to accept new data. As seen in [Figure 10-185](#), a null character is automatically inserted if the closed-caption data is not written to the closed-caption data registers in time for encoding.

The running clock frequency is controlled by the [VENC\\_CC\\_CARR\\_WSS\\_CARR\[15:0\]](#) FCC bit field which should be kept at reset value (0x2631) to get 5034960.5Hz (32xline) for NTSC-601. The closed-caption running clock common frequencies are detailed in [Table 10-704](#).

**Table 10-704. Closed-Caption RunClock Frequency Settings**

	NTSC-601	PAL-601	NTSC Square Pixel	PAL Square Pixel
<a href="#">VENC_CC_CARR_WSS_CARR[15:0]</a> FCC bit field value	0x2631	0x25ED	0x2A03	0x22B6

The closed-caption data is encoded in nonreturn-to-zero (NRZ) format. Additionally, the data translates to the IRE scale as follows:

- 0 = 0 IRE
- Sync pulse = -40 IRE
- 1 = 50 IRE

[Figure 10-185](#) shows the parameters of closed-caption line data implemented in different standards.

**Figure 10-185. Closed Captioning Timing**

**Table 10-705. Closed-Caption Standard Timing Values**

Intervals	Description	Timing Values for Encoding			Timing Values for Decoding		
		Minimal	Nominal	Maximal	Lower Bound	Nominal	Upper Bound
A	HSYNC to clock running	10.250 $\mu$ s	10.500 $\mu$ s	10.750 $\mu$ s	10.000 $\mu$ s	10.500 $\mu$ s	11.000 $\mu$ s
B	Clock running		12.910 $\mu$ s			12.910 $\mu$ s	
C	Clock running to third start bit		3.972 $\mu$ s			3.972 $\mu$ s	
D	Start bit		1.986 $\mu$ s			1.986 $\mu$ s	
E	Data characters		31.778 $\mu$ s			31.778 $\mu$ s	

**NOTE:**

- The interval A is controlled by the [VENC\\_LN\\_SEL\[25:16\]](#) LN21\_RUNIN bit field.
- The interval B is controlled by [VENC\\_CC\\_CARR\\_WSS\\_CARR\[15:0\]](#) FCC bit field.

All timing values listed in [Table 10-705](#) are measured from the mid-point (half amplitude) on all edges.

For a complete description of closed-caption standard including CGMS-A copy protection, see the CEA-608-x standard.

#### 10.6.4.5.2 Wide-Screen Signaling (WSS) Encoding

The encoder can embed data, encoded in accordance with the IEC61880 and ITU-R 1119 data insertion standard, within the vertical blanking interval.

The encoder supports WSS data insertion on line 20 of every frame in the NTSC format. WSS data insertion is enabled by activating the [VENC\\_L21\\_WC\\_CTL\[14:13\]](#) EVEN\_ODD\_EN bit and by programming the [VENC\\_BSTAMP\\_WSS\\_DATA\[27:8\]](#) WSS\_DATA bit field.

The running clock frequency is controlled by the [VENC\\_CC\\_CARR\\_WSS\\_CARR\[31:16\]](#) FWSS bit field. The wide-screen signaling running clock common frequencies are detailed in [Table 10-706](#)

**Table 10-706. Wide-Screen Signaling RunClock Frequency Settings**

	NTSC-601	PAL-601	NTSC Square Pixel	PAL Square Pixel
<a href="#">VENC_CC_CARR_WSS_CARR[31:16]</a> FWSS bit field value	0x043F	0x2F72	0x04AC	0x2B6D

To select the line where the WSS data are encoded, program the [VENC\\_L21\\_WC\\_CTL\[12:8\]](#) LINE bit field.

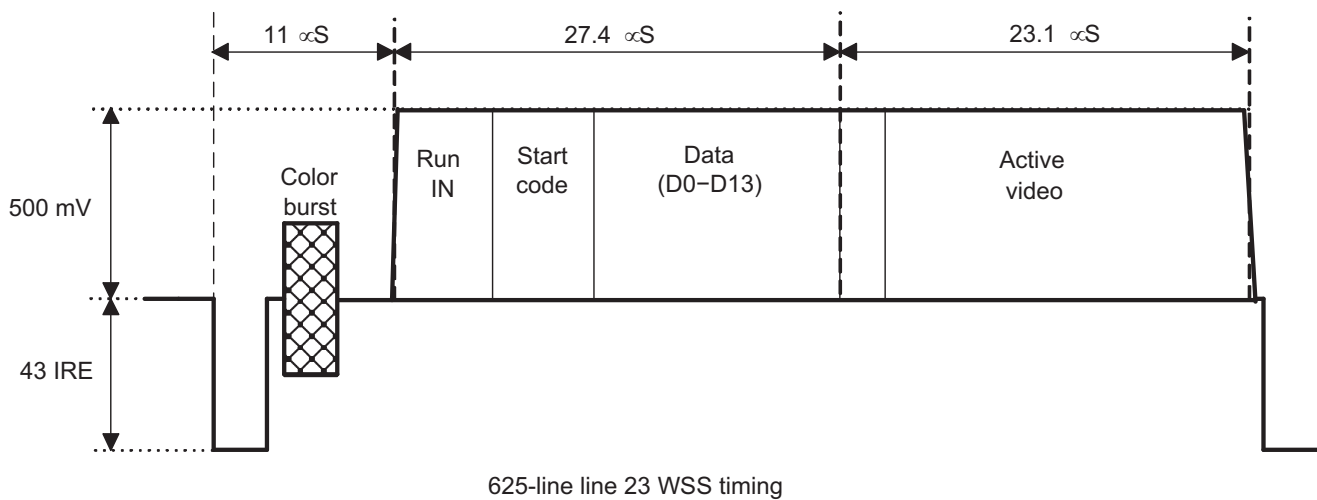

#### CAUTION

The setting of the LINE[12:8] bit field value depends on the video standard:

- PAL mode: Because there is a one-line offset, program the desired line number – 1. The recommended value on line 23 is  $0x16 + 1 = 0x17$ . The default value is  $0x14 + 1 = 0x15$  (line 21).
- NTSC mode: Because there is a four-line offset, program the desired line number – 4. The recommended value on line 20 is  $0x10 + 4 = 0x14$ . The default value is  $0x14 + 4 = 0x18$  (line 24).

The WSS encoding block assumes that a full 10-bit video range is used to determine the 70 percent of peak-white amplitude of a logic-1 bit. The encoder also supports WSS data insertion on line 23 in the PAL format. Both waveforms are shown in [Figure 10-186](#).

**Figure 10-186. WSS Timing**

Venc-007

**10.6.4.6 Video DAC**

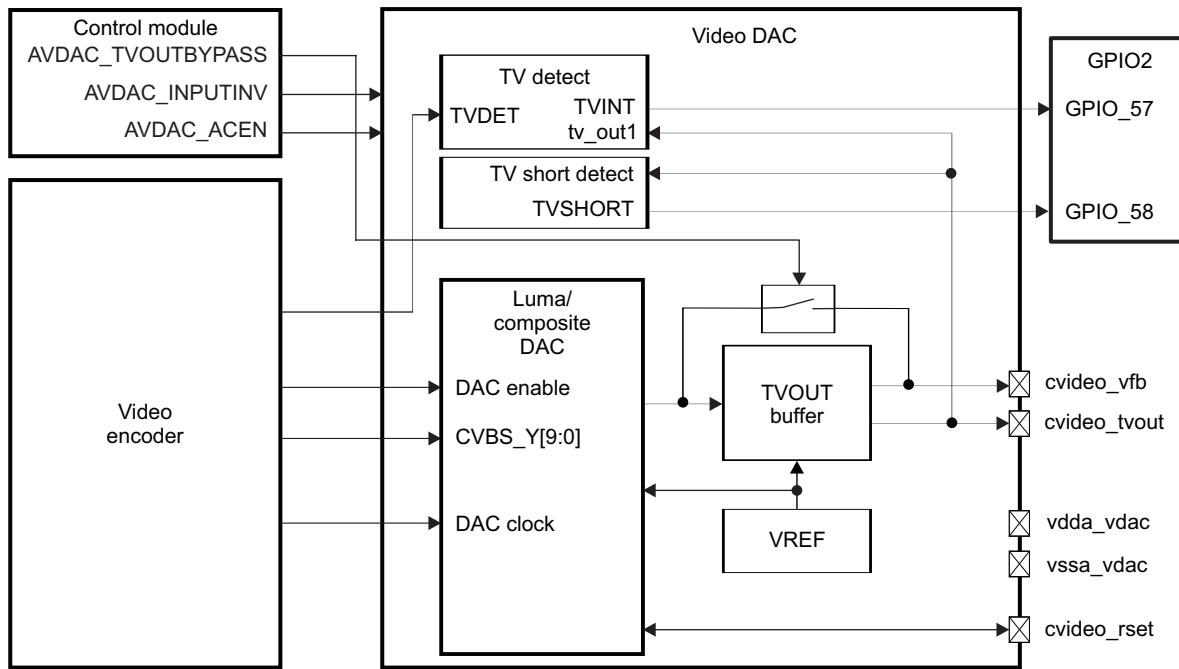

---

**NOTE:** The VDAC function is not supported.

---

Figure 10-187 shows the architecture of the 10-bit video DAC.

Figure 10-187. 10-Bit Video DAC Architecture

Venc-009

The display subsystem provides the necessary control signals to interface the memory frame buffer directly to external displays (TV sets). A 10-bit current steering DAC is used to generate the video analog signal. The video mode DAC also includes the TV detection/disconnection and power-down mode features.

#### 10.6.4.6.1 Video DC/AC Coupled TV Load

The 10-bit video DAC supports both dc-coupled and ac-coupled TV loads. The CONTROL.CONTROL\_AVDAC[31] AVDAC\_ACEN bit is used to define which output coupling is used. This bit is the first one to be programmed according to the TV load on the PCB board.

---

**NOTE:** When dc coupling is used, note that there is a 385-mV dc offset at the TVOUT output.

---

#### 10.6.4.6.2 TV Detection/Disconnection Pulse Generation and Use

##### 10.6.4.6.2.1 TV Detection/Disconnection Pulse Generation

The TV detect block is an integral part of the video DAC module.

**NOTE:**

- The TV detection/disconnection feature is supported on the video DAC.
  - The TV disconnection feature is recommended for power saving purpose. The TV detection/disconnection is only operational when video out is active. Therefore to detect cable connection automatically, it is necessary to periodically activate the video out to test for cable presence.
-

This block compares the output ( *cvideo\_tvout* ) to reference voltage, to sense the condition of the load. To operate, the TV detect requires two digital signals, TVACEN and TVDET. The TVACEN signal indicates to both TVOUT buffer and the TV detect circuit if the load is ac or dc coupling to adjust accordingly. TVDET is a digital pulse at the frequency of the TV sync pulses. The operation of the circuit is based on the difference in voltage levels in the output of the buffer depending of the load status. The TV detect block compares the output against a couple of references and the result is latched at the start of every sync pulse. The status is read later in with the TVDET pulse rising edge.

The following registers are used to set the TV detection/disconnection pulse:

- The [VENC\\_TVDETPGP\\_INT\\_START\\_STOP\\_X](#) register defines which pixels are used to start and stop the pulse inside their respective line.
- The [VENC\\_TVDETPGP\\_INT\\_START\\_STOP\\_Y](#) register defines which lines are used to start and stop the pulse.
- The [VENC\\_GEN\\_CTRL\[0\]](#) EN bit enables or disables the TVDET pulse (0: Disable; 1: Enable).
- The [VENC\\_GEN\\_CTRL\[16\]](#) TVDP bit sets the TVDET pulse polarity (0: Active low; 1: Active high).

#### 10.6.4.6.2.2 Recommended TV Detection/Disconnection Pulse Waveform

To enable the detection/disconnection of the load, the circuit requires that the TVDET pulse resembles the following waveform. By using the video encoder registers, the TVDET pulse polarity, start and stop is programmable. The only critical parameter is  $T_{dm}$ , which should be longer than the delay through the DAC and TVOUT buffer, which is at least 750 ns.

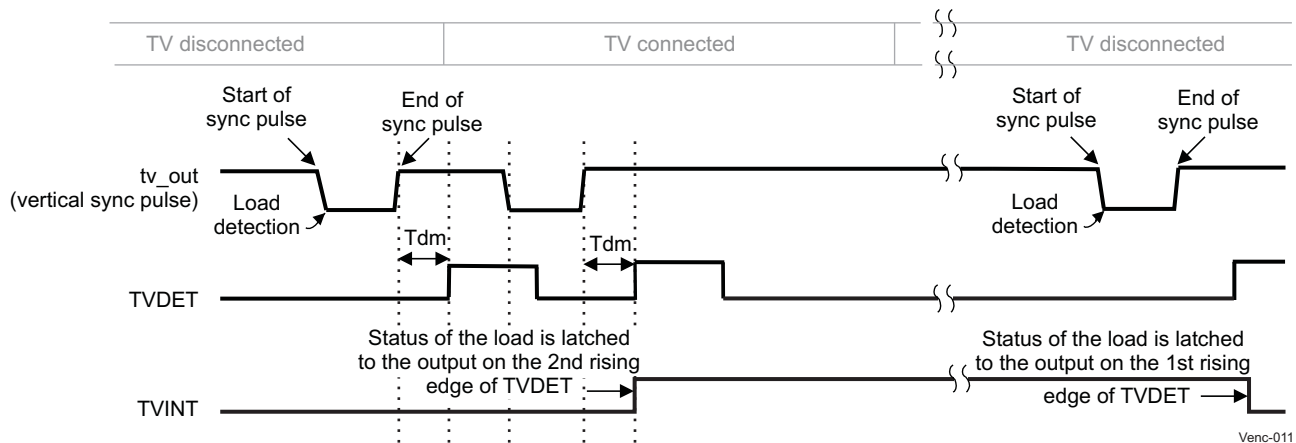

If dc-coupling is selected, the TVINT output signal for TV detection is latched at the rising edge of the first TVDET signal but the TVINT output signal for TV disconnection is latched after the next rising edge of the TVDET signal that happens during the next VSYNC timing. [Figure 10-188](#) shows the waveforms for the dc-coupling TV detect pulse (TVDET) when load is connected and disconnected.

**Figure 10-188. DC-Coupling TV Detect Waveforms for TV Connected and Disconnected**

If ac-coupling is selected, the TVINT output signal for TV detection is latched after the next rising edge of the TVDET signal that happens during the next VSYNC timing but the TVINT output signal for TV disconnection is latched at the rising edge of the first TVDET signal. [Figure 10-189](#) shows the waveforms for the ac-coupling TV detect pulse (TVDET) when load is connected and disconnected.

**Figure 10-189. AC-Coupling TV Detect Waveforms for TV Connected and Disconnected**

**NOTE:**

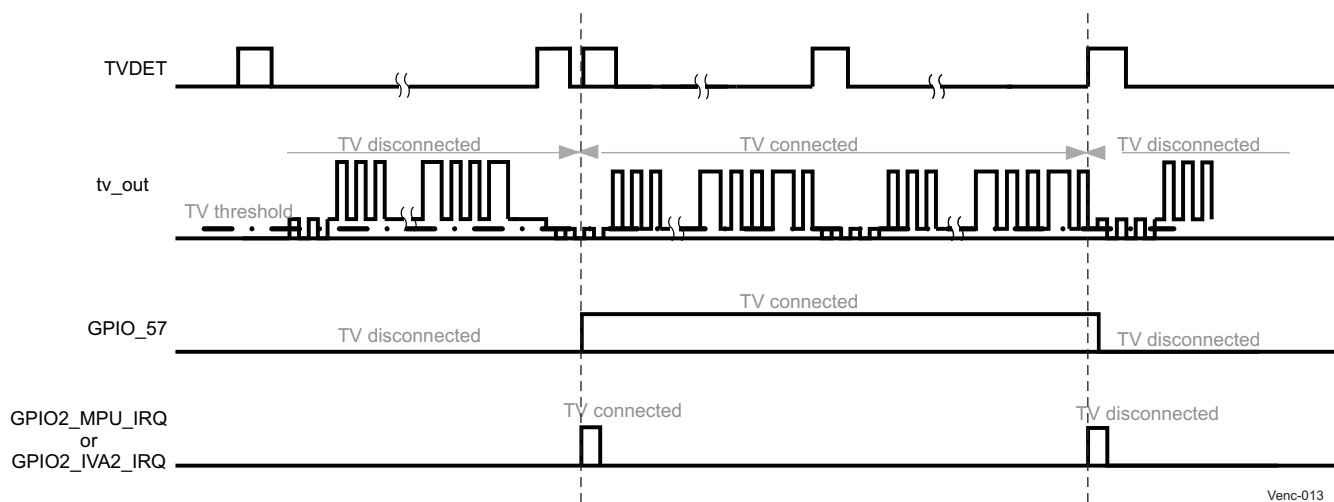

- When setting the [VENC\\_TVDETGPI\\_INT\\_START\\_STOP\\_X](#) register, software users must ensure that the TVDET signal is in the active area. To avoid any problem, the TVDET signal must not be longer than one line.
- The activation of the TVDET signal will not have a visual impact on the *cvideo\_tvout* output signal.

**10.6.4.6.2.3 TV Detection/Disconnection Use**

The TV-detection/TV-disconnection is based on the difference in voltage levels in the output of the TV buffer depending on the load status. The operation is slightly different for ac and for dc operation. For dc operation, the *cvideo\_tvout* voltage is compared against a voltage reference that makes the comparator trigger in each sync pulse while the load is connected. For ac operation, the *cvideo\_tvout* voltage is compared against a voltage reference that makes the comparator trigger in each sync pulse while the load is disconnected. In both cases, the TVINT output signal produces a logic 1 when a load is connected and a logic 0 when a load is disconnected.

For dc-coupling mode, see [Figure 10-190](#) and for ac-coupling mode, see [Figure 10-191](#)

- NOTE:** Because the video DAC and the video encoder must be awake for connection detection, consider that the video DAC can take up to 10  $\mu$ s to wake up.

**Figure 10-190. GPIO Signal Waveform Proposal for TV Detection/Disconnection in DC-Coupling Mode****Figure 10-191. GPIO Signal Waveform Proposal for TV Detection/Disconnection in AC-Coupling Mode**

### 10.6.4.6.3 TV Short Detection

A TV short-detection circuit, which can detect a short circuit condition at `cvideo_tvout` output during the vertical sync pulse, is integrated in the video DAC module (see [Figure 10-187](#)).

When the output is shorted to ground, the TVSHORT signal turns to logic high. The TVSHORT signal is internally mapped in the device to the GPIO\_58 signal (channel 26 of the GPIO2 module), which allows interrupt generation on this channel (see [Chapter 25, General-Purpose Interface](#)). TV short detection is valid after two video frames pass with the short/no-short condition.

TV short detection has priority over TV load detection (see [Section 10.6.4.6.2.2, TV Detection/Disconnection Pulse Generation and Use](#)). Whenever a short is detected (with load or no-load), TVINT output is masked as long as the short remains. When released, TV load detection resumes (see [Section 10.6.4.6.2.2, TV Detection/Disconnection Pulse Generation and Use](#)).

#### CAUTION

If TV short is detected, the video DAC must be powered down by setting the `DSS.DSS_CTRL[5] DAC_POWERDN_BGZ` bit to 0.

#### 10.6.4.6.4 Video DAC Normal Mode

The normal mode of operation (DAC + TVOUT buffer) is the default mode of the video DAC, with the CONTROL.CONTROL\_AVDAC[30] AVDAC\_TVOUTBYPASS bit set to 0 at device reset. The output of the DAC is internally connected to the TVOUT buffer, which can drive the composite video signal to 75 Ω load directly. For information about external connectivity, see Section 10.6.2, *Video Encoder Environment*.

In normal mode, higher input values of the DAC code result in lower output voltage levels by default, because of the inverting configuration of the TVOUT buffer. The CONTROL.CONTROL\_AVDAC[29] AVDAC\_INPUTINV bit provides inversion control over the data input of the DAC, to allow alignment of the output voltage with VENC data. If the AVDAC\_INPUTINV bit is set to 1, the DAC input code is inverted. Thus, higher DAC code values provided by the VENC result in higher output voltage.

#### 10.6.4.6.5 Video DAC Bypass Mode

The 10-bit video DAC has a TVOUT buffer bypass mode that turns off the TVOUT buffer and redirects directly the DAC output to the *cvideo\_vfb* pin.

This bypass mode is activated by setting the CONTROL.CONTROL\_AVDAC[30] AVDAC\_TVOUTBYPASS bit to 1. The reset value of the CONTROL.CONTROL\_AVDAC[30] AVDAC\_TVOUTBYPASS bit is 0 (that is, the TVOUT buffer is not bypassed).

**NOTE:** In bypass mode:

- *cvideo\_rset* pin requires a Rset resistor connected to the ground. The typical value of the Rset resistor is 10000 Ω.
- *cvideo\_vfb* pin require a Rload resistor connected to the ground. The typical value of the Rload resistor is 1500 Ω.

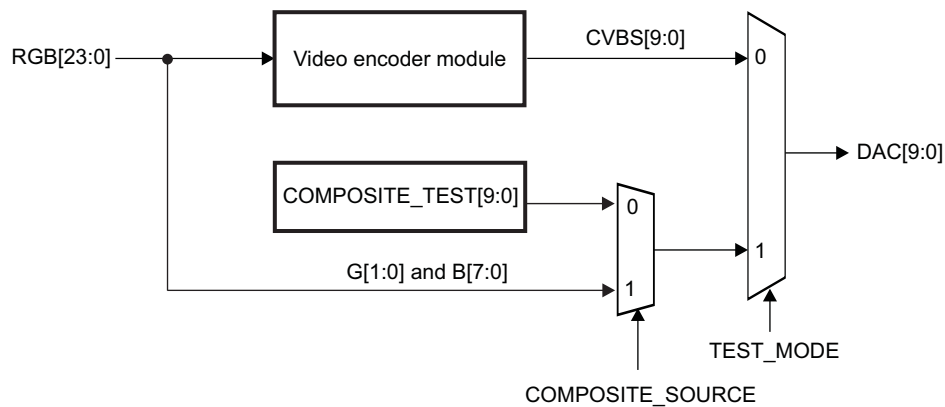

#### CAUTION

- The TV detect feature is not available in bypass mode.
- In bypass mode, an external amplifier is needed on the *cvideo\_vfb* pin.

#### 10.6.4.6.6 Video DAC Test Mode

10-bit external or internal datas values can be used to stimulate the DAC in debug, see Figure 10-192.

**Figure 10-192. DAC Test Mode in Composite Video Mode**

Venc-014

- Setting to 0x1 the VENC\_OUTPUT\_CONTROL[4] TEST\_MODE bit will place the DAC under test.
- By setting the value of the VENC\_OUTPUT\_CONTROL[6] COMPOSITE\_SOURCE bit to:
  - 0x0: the DAC input is coming from VENC\_OUTPUT\_TEST[9:0] COMPOSITE\_TEST bit field
  - 0x1: the DAC input is coming from the display controller G[1:0], B[7:0]. To perform this

configuration, the video encoder shall be configured to generate correct timing signals with the display controller even if the video encoder is bypassed from the data path perspective.

#### 10.6.4.6.7 Video DAC Power Management

After device reset, the DSS.DSS\_CTRL[5] DAC\_POWERDN\_BGZ bit is set to 0, and the video DAC is in power-down state.

Table 10-707 lists the possible power-management configurations and the corresponding register settings.

**Table 10-707. Video DAC Power-Management Configurations**

Power Management Controls				
DSS_CTRL[5] DAC_POWERDN_BGZ	VENC_OUTPUT_CONT ROL[1] COMPOSITE_ENABLE	CONTROL_AVDAC[30] AVDAC_TVOUTBYPAS S	CONTROL_AVDAC[31] AVDAC_ACEN	Power State
0	x	x	x	Total power down. Bandgap powered down.
1	0	x	x	Standby (analog in power down except bandgap/LDO)
1	1	0	0	Full power up in DC normal mode
1	1	0	1	Full power up in AC normal mode
1	1	1	x	Full power up in TVOUT bypass mode (DAC-only mode)

## 10.6.5 Video Encoder Programming Guide

### 10.6.5.1 Video Encoder Low-level Programming Models

#### 10.6.5.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the video emodule is to be used for the first time after a device reset. This initialization of the surrounding modules is based on the integration and environment of the video encoder (for more information, see [Section 10.6.2](#) and [Section 10.6.3](#)).

**Table 10-708. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	Module interface and functional clocks must be enabled. See <a href="#">Chapter 3, Power, Reset, and Clock Management</a>
Control module	Module-specific pad muxing and configuration must be set in the control module. See <a href="#">Chapter 18, Control Module</a> .
Display controller	See <a href="#">Section 10.2, Display Controller</a> , for more information about the configuration.

#### 10.6.5.1.2 Video Encoder Global Initialization

##### 10.6.5.1.2.1 Main Sequence—Start Video Encoder

[Table 10-709](#) details the procedure to initialize the video encoder after a power-on or software reset.

**Table 10-709. Start Video Encoder**

Step	Register/Bit Field/Programming Model	Value
Perform a video encoder reset.	See <a href="#">Section 10.6.5.1.2.3</a> .	
Save the DSS IRQ enable register value (DSS interrupts context).	DISPC_IRQENABLE	
Reset all DSS IRQ.	DISPC_IRQENABLE	0x00
Configure the video encoder registers for PAL 601 or NTSC 601.	See <a href="#">Table 10-716</a> .	0x--
Set the input video source and format.	<a href="#">VENC_F_CONTROL</a>	See <a href="#">Table 10-716</a> .
Set the synchronization modes.	<a href="#">VENC_SYNC_CTRL</a>	See <a href="#">Table 10-716</a> .
Configure the TV connection detection (optional).	See <a href="#">Section 10.6.5.1.2.4</a> .	
Enable the composite video signal output.	See <a href="#">Section 10.6.5.1.2.6</a> .	
Enable the display controller pipeline	See the display controller programming guide.	
Wait until the first VSYNC pulse signal.		
Clear the SYNCLOSTDIGITAL interrupt.	DISPC_IRQSTATUS[15] SYNCLOSTDIGITAL	0x1
Restore the DSS IRQ enable register.	DISPC_IRQENABLE	0x--

##### 10.6.5.1.2.2 Main Sequence—Stop Video Encoder

[Table 10-710](#) details the procedure to stop the output of the composite signal.

**Table 10-710. Start Video Encoder**

Step	Register/Bit Field/Programming Model	Value
Perform TV disconnection detection (optional).	See <a href="#">Section 10.6.5.1.2.5</a> .	
Disable the composite video signal output.	See <a href="#">Section 10.6.5.1.2.7</a> .	

### 10.6.5.1.2.3 Subsequence—Video Encoder Software Reset

Table 10-711 details the reset procedure.

**Table 10-711. Reset Video Encoder**

Step	Register/Bit Field/Programming Model	Value
Activate reset.	VENC_F_CONTROL[8] RESET	0x1
Wait until reset is complete.	VENC_F_CONTROL[8] RESET	0x0

**NOTE:** Before changing the standard (NTSC or PAL) and related registers, a software reset is required to properly initialize the VENC module.

### 10.6.5.1.2.4 Subsequence—TV Connection Detection

Table 10-712 details the TV connection detection procedure.

**Table 10-712. TV Connection Detection Subsequence**

Step	Register/Bit Field/Programming Model	Value
Set the pixel TV detection start and stop value.	VENC_TVDETPG_INT_START_STOP_X	0x--
Set the line TV detection start and stop value.	VENC_TVDETPG_INT_START_STOP_Y	0x--
Set the polarity of TV detection.	VENC_GEN_CTRL[16] TVDP	0x--
Enable TV detection.	VENC_GEN_CTRL[0] EN	0x1
Enable the composite video signal output.	See Section 10.6.5.1.2.6.	
Wait until TVINT = 1.	See the GPIO programming guide.	

#### CAUTION

- If ac coupling is selected, two TVDET pulses are required to set high the TVINT signal. Due to the internal logic of the video DAC, the TVINT signal is generated after the next positive edge of the TVDET signal that happens during the next VSYNC timing.
- If dc coupling is selected, only one TVDET pulse is required to set high the TVINT signal.

### 10.6.5.1.2.5 Subsequence—TV Disconnection Detection

Table 10-713 details the TV disconnection detection procedure.

**Table 10-713. TV Disconnection Detection Subsequence**

Step	Register/Bit Field/Programming Model	Value
Set the pixel TV detection start and stop value.	VENC_TVDETPG_INT_START_STOP_X	0x--
Set the line TV detection start and stop value.	VENC_TVDETPG_INT_START_STOP_Y	0x--
Set the polarity of TV detection.	VENC_GEN_CTRL[16] TVDP	0x--
Enable TV disconnection.	VENC_GEN_CTRL[0] EN	0x1
Wait until TVINT = 0.	See the GPIO programming guide.	

**CAUTION**

- If dc coupling is selected, two TVDET pulses are required to set low the TVINT signal. Because of the internal logic of the video DAC, the TVINT signal is generated after the next positive edge of the TVDET signal that happens during the next VSYNC timing.
- If ac coupling is selected, only one TVDET pulse is required to set low the TVINT signal.

**10.6.5.1.2.6 Subsequence—Enable Video Composite Signal Output**

Table 10-714 details the procedure to enable the video composite signal output.

**Table 10-714. Enable Video Composite Signal Output**

Step	Register/Bit Field/Programming Model	Value
Enable the composite video signal output.	VENC_OUTPUT_CONTROL	0x0000 000A
Power up the vdda_vdac voltage for VDAC and the TVOUT buffer.		

**10.6.5.1.2.7 Subsequence—Disable Video Composite Signal Output**

Table 10-715 details the procedure to enable the video composite signal output.

**Table 10-715. Disable Video Composite Signal Output**

Step	Register/Bit Field/Programming Model	Value
Disable the composite video signal output.	VENC_OUTPUT_CONTROL	0x00000000
Power down the vdda_vdac voltage for VDAC and the TVOUT buffer.		

**10.6.6 Video Encoder Use Case and Tips**
**10.6.6.1 Video Encoder Register Settings**

Table 10-716 lists the register values to use in typical video encoder applications.

These values are validated programming values only for NTSC 601 and PAL 601 standards with a TV display resolution of 720\*488 and 720\*576, respectively.

**Table 10-716. Video Encoder Register Programming Values**

Register Name	NTSC 601	PAL 601
VENC_F_CONTROL	0x00000000	0x00000000

VENC_OUTPUT_CONTROL	0x0000000A	0x0000000A
VENC_OUTPUT_TEST	0x00000000	0x00000000

**NOTE:** The following display controller fields must be programmed to the NTSC 601 video standard:

- DISPC\_SIZE\_DIG[10:0] PPL =  $720 - 1 = 719 = 0x2CF$
- DISPC\_SIZE\_DIG[26:16] LPP =  $(488/2) - 1 = 243 = 0xF3$

The following display controller fields must be programmed to the PAL 601 video standard:

- DISPC\_SIZE\_DIG[10:0] PPL =  $720 - 1 = 719 = 0x2CF$
- DISPC\_SIZE\_DIG[26:16] LPP =  $(576/2) - 1 = 287 = 0x11F$

For both standard, the base addresses should be handle as follow:

- DISPC\_GFX\_BA0 or DISPC\_VIDn\_BA0 = Base address of even bit field data
- DISPC\_GFX\_BA1 or DISPC\_VIDn\_BA1 = Base address of odd bit field data

## 10.6.7 Video Encoder Register Manual

### CAUTION

The main access to all Video Encoder registers is through the L3 interconnect.  
The access through L4\_PER interconnect is provided for back software compatibility.

### 10.6.7.1 Video Encoder Instance Summary

**Table 10-717. Video Encoder Instance Summary**

Module Name	L3 Base Address	L4_PER Base Address	Size
VENC	0x5800 3000	0x4804 3000	4 KB

### CAUTION

The VENC registers have no register data width access restriction and can be accessed in 8-bit, 16-bit and 32-bit access.

### 10.6.7.2 Video Encoder Registers

#### 10.6.7.2.1 Video Encoder Register Summary

Bits	Field Name	Description	Type	Reset
31:0	FSC	These four bytes' data are used to program color subcarrier frequency. These four bytes are determined by the following formula. S_CARR = ROUND((Fsc/Fclkenc) * 232) Where Fsc = Frequency of the subcarrier Fclkenc = Frequency of the internal video encoding clock = 2*LLEN *Fh LLEN = Number of pixels in a scan line Fh = Line frequency See the description of LLEN registers (subaddresses 0x42 and 0x43).	RW	0x21F0 7C1F

## 2D/3D Graphics Accelerator

---

---

---

This chapter describes the 2D/3D graphics accelerator (SGX) for the device.

---

**NOTE:** The SGX subsystem is an instantiation by Texas Instruments of the POWERVR™ SGX540 core from Imagination Technologies Ltd.

This document contains materials that are © Imagination Technologies Ltd.

## 11.1 SGX Overview

The 2D/3D graphics accelerator (SGX) subsystem accelerates 2-dimensional (2D) and 3-dimensional (3D) graphics applications. The SGX subsystem is based on the POWERVR® SGX core from Imagination Technologies. SGX is a new generation of programmable POWERVR graphics IP cores. The POWERVR SGX540 v1.2.0 architecture is scalable and can target all market segments from mainstream mobile devices to high-end desktop graphics. Targeted applications include feature phones, PDAs, and handheld gaming applications.

Figure 11-1 shows the SGX subsystem.

**Figure 11-1. SGX Overview**

The SGX graphics accelerator efficiently processes a number of various multimedia data types concurrently:

- Pixel data
- Vertex data
- General-purpose processing

The multithreaded architecture uses two levels of scheduling and data partitioning to enable zero overhead task switching.

### **11.1.1 POWERVR SGX Main Features**

- 3D graphics, vector graphics, and video supported on common hardware
- Tile-based architecture
- Universal scalable shader engine (USSE™): a multithreaded engine that incorporates pixel and vertex shader functionality and reduces die area
- Advanced shader feature set in excess of Microsoft VS3.0, PS3.0, and OpenGL™2.0
- Industry standard application programming interface (API) support: OpenGL ES 1.1 and 2.0, OpenVG v1.1
- Fine-grained task switching, load balancing, and power management
- Advanced geometry, direct memory access (DMA)-driven operation for minimum CPU interaction
- Programmable high-quality image antialiasing
- Fully virtualized memory addressing for operating system (OS) operation in a unified memory architecture

### **11.1.2 SGX 3D Features**

- Deferred pixel shading
- On-chip tile floating-point depth buffer
- 8-bit stencil with on-chip tile stencil buffer
- Scissor test
- Texture support:
  - Cube map
  - Projected textures
  - Nonsquare textures
- Texture formats:
  - RGBA 8888, 565, 1555
  - Monochromatic 8, 16, 16f, 32f, 32int
  - Dual channel, 8:8, 16:16, 16f:16f
  - Compressed textures PVR-TC1, PVR-TC2, ETC1
  - Programmable support for all YUV formats
- Resolution support:
  - Frame buffer maximum size = 2048 x 2048
  - Texture maximum size = 2048 x 2048
- Texture filtering:
  - Bilinear, trilinear
  - Independent minimum and maximum control
- Antialiasing:
  - 4x multisampling
  - Programmable sample positions
- Indexed primitive list support
  - Bus mastered
- Programmable vertex DMA
- Render to texture:
  - Including twiddled formats
  - Auto MipMap generation
- Multiple on-chip render targets (MRTs)

---

**NOTE:** Performance is limited when on-chip memory is not available for the SGX core.

---

### 11.1.3 SGX Universal Scalable Shader Engine – Key Features

The USSE is the engine core of the POWERVR SGX architecture and supports a broad range of instructions.

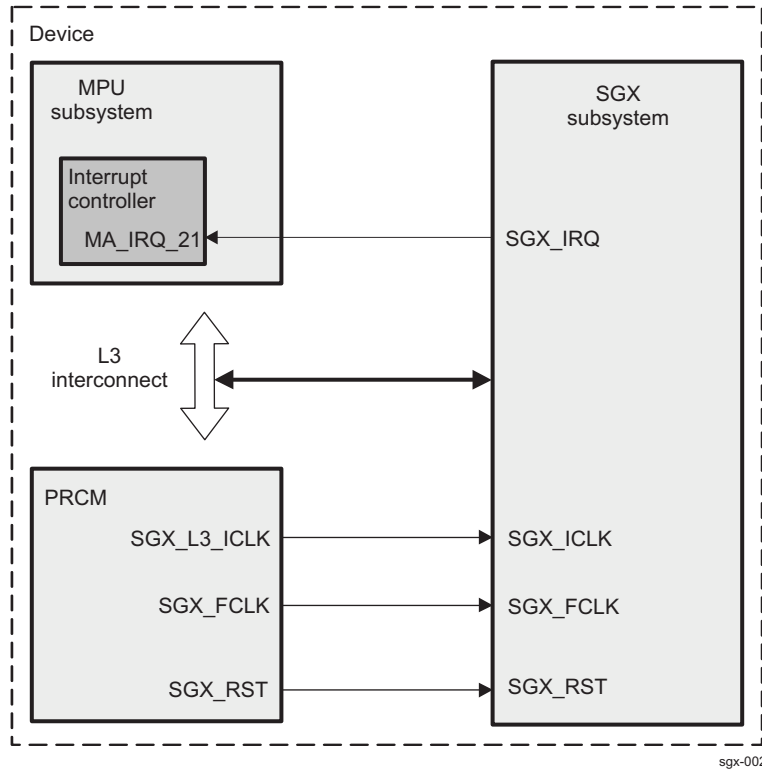

- Single programming model:
  - Multithreaded with 16 simultaneous execution threads and up to 64 simultaneous data instances
  - Zero-cost swapping in and out of threads
  - Cached program execution model
  - Dedicated pixel processing instructions
  - Dedicated vertex processing instructions
- SIMD execution unit supporting operations in:
  - 32-bit IEEE float
  - 2-way 16-bit fixed point
  - 4-way 8-bit integer
  - 32-bit bit-wise (logical only)
- Static and dynamic flow control:
  - Subroutine calls
  - Loops
  - Conditional branches
  - Zero-cost instruction predication
- Procedural geometry:
  - Allows generation of primitives
  - Effective geometry compression
  - High-order surface support
- External data access:
  - Permits reads from main memory using cache
  - Permits writes to main memory
  - Data fence facility
  - Dependent texture reads

## 11.2 SGX Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

Figure 11-2 shows SGX integration.

Figure 11-2. SGX Integration

The SGX subsystem is connected to the level 3 (L3) interconnect by a 128-bit master and a 64-bit slave interface.

Table 11-1 through Table 11-3 summarize the integration of the module in the device.

Table 11-1. Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
SGX	PD_GFX	L3

Table 11-2. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
SGX	SGX_ICLK	SGX_L3_ICLK	PRCM	SGX interface clock

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
SGX	SGX_IRQ	MA_IRQ_21	Cortex-A9 INTC	SGX interrupt request to the MPU interrupt controller (INTC)

---

**NOTE:**

- For a description of the interrupt source, see [Section 11.3.5, Interrupt Requests](#).
-

## 11.3 SGX Functional Description

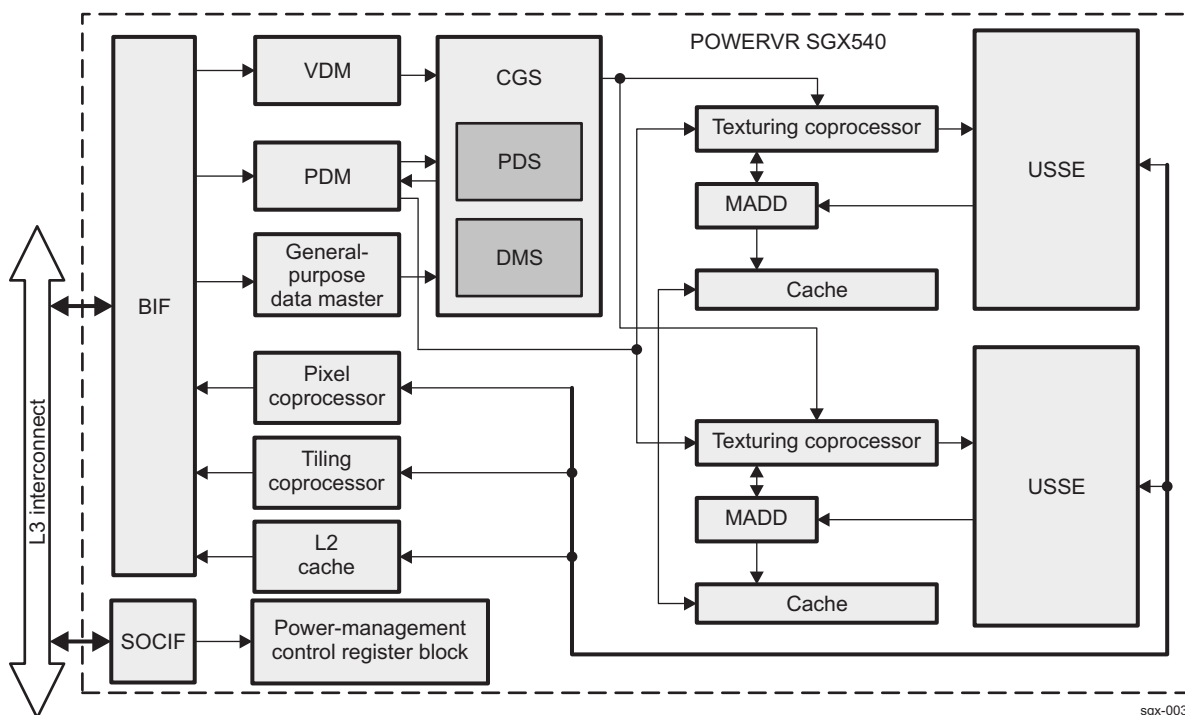

### 11.3.1 SGX Block Diagram

The SGX subsystem is based on the POWERVR SGX540 core from Imagination Technologies. The architecture uses both programmable and hard-coded pipelines to perform various processing tasks required in 2D, 3D, and video processing. The SGX architecture comprises the following elements:

- Coarse grain scheduler (CGS)
  - Programmable data sequencer (PDS)
  - Data master selector (DMS)
- Vertex data master (VDM)
- Pixel data master (PDM)
- General-purpose data master
- USSE
- Tiling coprocessor
- Pixel coprocessor
- Texturing coprocessor
- Multilevel cache

Figure 11-3 shows the SGX block diagram.

Figure 11-3. SGX Block Diagram

#### 11.3.1.1 CGS

The CGS is the main system controller for the POWERVR SGX architecture and consists of two stages: the DMS and the PDS. The DMS processes requests from the data masters and determines which tasks can be executed given the resource requirements. The PDS then controls the loading and processing of data on the USSE.

### 11.3.1.2 Data Masters

The SGX core includes three data masters:

- VDM: the initiator of transform and lighting processing within the system. The VDM reads an input control stream, which contains triangle index data and state data. The state data indicates the PDS program, the size of the vertices, and the amount of USSE output buffer resource available to the VDM. The triangle data is parsed to determine unique indices that must be processed by the USSE. These are grouped together based on the configuration provided by the driver and presented to the DMS.
- PDM: the initiator of the rasterization processing within the system. Each pixel pipeline processes pixels for a different half of a given tile, which allows for optimum efficiency within each pipe due to the locality of the data. For each task it determines the amount of resource required within the USSE. It merges this with the state address and issues a request for execution on the USSE to the DMS.
- General-purpose data master: responds to events within the system (such as the end of a pass of triangles from the ISP, end of a tile from the ISP, end of a render, or parameter stream breakpoint event). Each event causes either an interrupt to the host or the synchronized execution of a program on the PDS. The program might or might not cause a subsequent task to be executed on the USSE.

### 11.3.1.3 USSE

The USSE is a user-programmable processing unit. Although general in nature, its instructions and features are optimized for three types of task: processing vertices (vertex shading), processing pixels (pixel shading), and video/imaging processing.

### 11.3.1.4 Multilevel Cache

The multilevel cache is a 2-level cache consisting of two modules: the main cache and the mux/arbiter/demux/decompression unit (MADD). The MADD is a wrapper around the main cache module designed to manage and format requests to and from the cache as well as provide level 0 caching for texture and USSE requests.

The MADD can accept requests from the PDS, USSE, and texture address generator modules. Arbitration is performed between the three data streams; any required texture decompression is also performed.

### 11.3.1.5 Texturing Coprocessor

The texturing coprocessor performs texture address generation and formatting of texture data. It receives requests from the iterators or the USSE modules and translates these into requests to the multilevel cache. Data returned from the cache are then formatted based on the texture format selected and sent to the USSE for pixel-shading operations.

### 11.3.1.6 Tiling Coprocessor

To process pixels in a tiled manner, the screen is divided into tiles and arranged as groups of tiles by the tiling coprocessor. An inherent advantage of tiling architecture is that a large amount of vertex data can be rejected at this stage, thus reducing both the memory storage requirements and the amount of pixel processing performed.

### 11.3.1.7 Pixel Coprocessor

The pixel coprocessor is the final stage of the pixel-processing pipeline and controls the format of the final pixel data sent to the memory. It supplies the USSE with an address to the output buffer, and the USSE returns the relevant pixel data. The address order is determined by the mode of the frame buffer. The pixel coprocessor contains a dithering and packing function.

## 11.3.2 SGX Clock Configuration

The SGX subsystem operates from two clocks: an interface clock (SGX\_ICLK) and a functional clock (SGX\_FCLK). The power, reset, and clock management (PRCM) module generates and distributes both clocks inside the device.

- The SGX\_ICLK interface clock manages the data transfer on the L3 master and slave ports. The SGX\_ICLK frequency is selected based on the whole device L3 interconnect clock frequency. For more information on the interface clock, see [Section 3.6.12, CD\\_SGX Clock Domains](#). When no longer required by the SGX subsystem, SGX\_ICLK can be disabled by software at the PRCM level. For more information, see [Section 3.7.8, PD\\_SGX Description](#).

---

**NOTE:** SGX\_ICLK is cut only if the SGX is ready to go into IDLE state.

---

- SGX\_FCLK is the functional clock and is used inside the SGX subsystem to generate clock signals to multiple SGX clock domains. Depending on the clock source selection and the DPLL settings, SGX\_FCLK can support a frequency of up to 384 MHz. The SGX\_FCLK clock is provided by either the PRCM module or the peripheral DPLL, as described in [Section 3.6.12, CD\\_SGX Clock Domains](#). Selection is made at the PRCM level. When no longer needed by the SGX subsystem, SGX\_FCLK can be cut by software at the PRCM level, if the module is ready to enter the IDLE state. For more information, see [Section 3.7.8, PD\\_SGX Description](#).

### 11.3.3 SGX Software Reset

The SGX subsystem has its own reset domain. Global reset of the SGX is performed by activating the SGX\_RST signal in the SGX\_RST domain.

---

**NOTE:** The APIs delivered with the SGX provide a software reset functionally equivalent to a hardware reset.

---

### 11.3.4 SGX Power Management

The SGX subsystem has its own power domain (SGX power domain). For additional information about the SGX power domain, see [Section 3.7.8, PD\\_SGX Description](#), in [Chapter 3, Power, Reset, and Clock Management](#).

---

**NOTE:** The SGX handles automatic clock gating performed on the multiple internal module clock domains.

In addition, software-controlled clock gating is managed inside the SGX and handled by the related API delivered with the module.

---

### 11.3.5 SGX Interrupt Requests

The SGX subsystem can generate one interrupt signal to the MPU INTC mapped to SGX\_IRQ.

## 11.4 SGX Register Manual

### CAUTION

All SGX registers are limited to 32-bit data accesses; 8- and 16-bit accesses are not allowed because they can corrupt register content.

## **Audio Back End**

---

---

---

This chapter describes the audio back end (ABE) module.

Topic	Page
<b>12.1 ABE Overview .....</b>	<b>3071</b>

## 12.1 ABE Overview

The audio back end (ABE) module is a subsystem that manages various audio and voice uplink and downlink streams between the initiator (the Cortex™-A9 microprocessor unit [MPU], digital signal processor [DSP], or direct memory access [DMA] controller) and the peripheral physical interfaces (multichannel buffered serial port [McBSP], SLIMbus®, digital microcontroller [DMIC], multichannel pulse density modulation [McPDM], and multichannel audio serial port [McASP]).

The ABE module handles the audio processing for the applications. It receives voice or audio samples from the initiator or the external audio chip (TWL6040 or other) and sends them to the peripheral interfaces or memories after processing. The ABE can perform buffering of audio samples, mix audio with a voice down stream and/or a microphone up stream (sidetone), and can apply some post-processing.

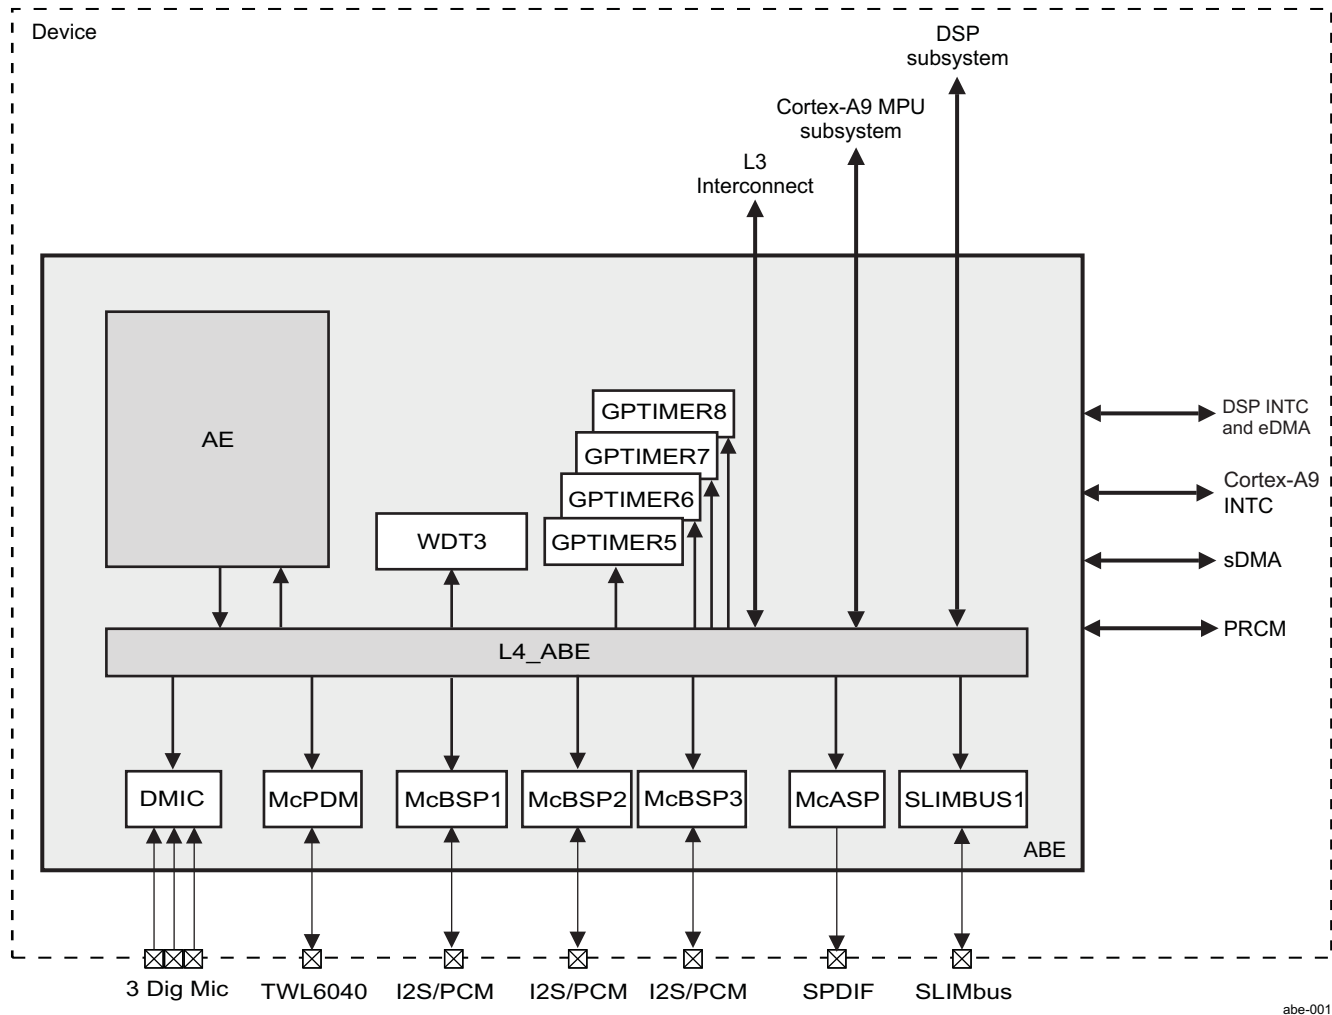

The ABE integrates the following modules:

- Peripheral physical interfaces:
  - Three McBSP modules
  - One McASP module
  - One mobile industry processor interface (MIPI) SLIMbus interface
  - One DMIC module to support up to six mono and up to three stereo digital microphones
  - One MCPDM module to support interconnect with an external audio chip.
- Audio engine (AE):
  - Performs real-time signal processing like sample rate conversion, filtering, equalizing, and side-tone
  - Audio traffic controller (ATC):
    - Performs data move in the ABE
    - Generates interrupt requests to the DSP and Cortex-A9 interrupt controllers
  - On-chip memory:
    - 64KB of RAM; 32-bit data memory (DMEM)
    - 6KB for coefficient memory RAM (CMEM)
    - 18KB for sample memory RAM (SMEM)
- Local L4 interconnect (L4\_ABE) to:
  - L3 interconnect
  - Cortex-A9 MPU
  - DSP

The Cortex-A9 MPU and the DSP have private access to the L4\_ABE interconnect. All other initiators (sDMA) can access the L4\_ABE only through the L3 interconnect.
- Timers:
  - Four general-purpose (GP) timers
  - One watchdog timer
- Clock and reset management: Receives clock and reset signals from the device PRCM module. The audio engine operates from the DPLL\_ABE, which is in the PRCM module. The ABE modules can be supplied with clock signals from the DPLL\_ABE or the DPLL\_PER. The ABE has its own hardware reset domain (AUDIO\_RST).
- Power management: The ABE module is power-independent. It has its own dedicated power domain (PD\_ABE) and can execute audio processing with the rest of the device in retention or in off mode.
- Each peripheral in the ABE can be accessed directly by the initiator when the AE is bypassed (legacy mode, for old software compatibility).

Figure 12-1 is a high-level overview of the ABE.

Figure 12-1. Audio Back End

### 12.1.1 AE Subsystem

The AE is the core of the ABE subsystem. It performs the real-time audio processing within the ABE: mixing, muxing, volume control, smooth muting, sampling rate conversion, and side-tone equalization. The AE subsystem also processes and executes all data transfers. To optimize the global processing, the ATC moves the data. An IRQ/DMA controller controls system IRQ and DMA requests. Input DMA requests come from the ABE peripherals, and output DMA requests and IRQ are generated and sent to the system (Cortex-A9 MPU interrupt controller, DSP interrupt controller, system DMA [sDMA], and the DSP enhanced direct memory access controller [eDMA]).

The AE subsystem contains:

- AE: processes the sample in SMEM with help of CMEM.
  - SMEM
  - CMEM
- DMEM contains the audio buffer and communication circular buffer.
- ATC: Transfers data between all modules in the ABE
- IRQ DMA controller

For more information about the audio engine, see the *Hardware Abstraction Layer (HAL) Addendum*.

### 12.1.2 Local Audio Interconnect

The ABE has its own audio local interconnect (L4\_ABE), which interconnects and manages the data flow among all ABE modules.

L4\_ABE main features are:

- Initiator ports: Cortex-A9 MPU, DSP, L3 interconnect, and AE subsystem. The sDMA operates with the L4\_ABE interconnect through the L3 interconnect initiator port. The eDMA operates with the L4\_ABE interconnect through the DSP initiator port.
- Target ports: AE subsystem, McBSP1/2/3, DMIC, McPDM, McASP, GPTIMER5/6/7/8, WDT3, and SLIMBUS1
- 8-, 16-, or 32-bit data, single access
- 4-bit x 32-bit initiator ports for each interconnect instance
- Auto clock-gating feature
- Little-endian transaction assumed for all packing/unpacking operations
- Nonblocking architecture with fair arbitration between threads
- Target interconnect interfaces support fully synchronous and divided synchronous accesses.

For more information, see [Chapter 13, Interconnect](#).

### 12.1.3 GP Timers

The ABE embeds four GP timers: GPTIMER5 through GPTIMER8. All GP timers have interrupts connected to the Cortex-A9 MPU, DSP, and AE subsystems.

GP timer controllers have the following functions:

- Interconnect slave interface (L4) supports:
  - 32-bit data bus width
  - 16-/32-bit access supported
  - 10-bit address bus width
  - Burst not supported
  - WNP (Write-Non-Posted) supported
- Interrupts generated on overflow, compare, and capture
- Free-running 32-bit upward counter
- Supported modes:
  - Compare and capture modes
  - Auto-reload mode
  - Start-stop mode
- Programmable divider clock source
- Dedicated input trigger for capture mode and dedicated OUT trigger/PWM signal
- On-the-fly read/write register
- Supports disconnect protocol

For more information, see [Section 22.2, General-Purpose Timers](#).

### 12.1.4 Watchdog Timer

The ABE embeds one watchdog timer, WDT3, that generates an interrupt condition to the Cortex-A9 MPU on overflow, which can be used by the application software through the PRCM module to indirectly trigger a global warm reset.

WDT3 main features are:

- Interconnect slave interface (L4) supports:
  - 32-bit data bus width

- 16- and 32-bit access supported
- 11-bit address bus width
- Burst not supported
- WNP supported
- Free-running 32-bit upward counter
- Programmable divider clock source
- Watchdog is reset on power up or after a warm reset and then starts counting.
- Reset or interrupt actions on a timer overflow condition and according to the watchdog timer source
- Support of disconnect protocol

For more information, see [Section 22.3](#), *Watchdog Timers*.

### 12.1.5 Digital Microphone Controller

The DMIC allows support of up to three digital stereo microphones that send it a pulse-density modulated stream of bits, transferred on one period or one half-period of the clock (over-sampling clock) provided to the DMIC. Each microphone is directly connected to the TX filter decimator to extract the audio samples with a maximum OF 96 db SNR with a frequency sampling set to 96 kHz.

The DMIC has the following features:

- Six external pin connections (three data lines and three clock lines)
- Delivers one common clock (on the three clock lines) for all digital microphones
- Supports idle request/acknowledge protocol
- Supports stereo and mono digital microphones (up to three)
- Rising or falling edge configuration for the clock signal sampling
- DMIC-clock-programmable
- Interconnect slave interface (internal interconnect) supports 32-bit data bus width.
- One DMA request capability on a programmable FIFO threshold
- One RX FIFO (16-bit x 24-bit word depth) per microphone
- Complies with PRCM interrupts to the Cortex-A9 MPU and DSP subsystems
- Interconnect sample format: 32 bits (only 24 are significant)
- Supports idle request/acknowledge PRCM protocol

For more information, see [Section 23.7](#), *DMIC*.

### 12.1.6 SLIMbus

There is one SLIMbus module instantiation inside the ABE, SLIMbus1. The SLIMbus controller provides a bidirectional, multidrop, multichannel 2-line serial interface between the ABE and up to seven off-chip components in a system such as an audio codec, a Bluetooth® module, or an FM radio receiver/transmitter. Because of its versatility, SLIMbus can accommodate a wide range of peripherals and clocked frame-oriented protocols (I2S, pulse code modulation [PCM], time division multiplexing [TDM]).

SLIMbus has the following features:

- Supports idle request/acknowledge PRCM protocol
- Complies with MIPI SLIMbus standard version 1.0
- Interconnect slave interface (L4) supports:
  - 32-bit data bus width
  - 8-, 16-, and 32-bit access supported
  - 11-bit address bus width
  - Burst not supported
  - WNP supported
- Support of seven SLIMbus devices:

- One manager
- One framer
- One interface
- Four generic
- Message protocol partially implemented in SLIMbus module hardware:
  - Information elements are not stored in the module.
  - Message interpretation is not processed in the module.
  - FIFO size: 32 bytes for TX, 32 bytes for RX
- Support for eight TX and eight RX independent ports (data channels):
  - Supported transport protocols: Isochronous, pulled, pushed, asynchronous
  - Programmable segment data length (sample size) from 8 to 32 bits (8, 12, 16, 20, 24, 28, 32), including DATA and AUX
  - Programmable FIFO sizes
  - Programmable port assignment to any of the four generic devices
  - One DMA request line per port
- Operating frequencies of 0 to 24.576 MHz
- Supports disconnect protocol

For more information, see [Section 23.9](#), *Serial Low-Power Inter-Chip Media Bus Controller*.

### **12.1.7 Multichannel Audio Serial Port**

The multichannel audio serial port (McASP) is a GP audio serial port. It is useful for intercomponent (DIT) transmission. The McASP is intended to be flexible enough so that it may connect gluelessly to audio A/D, D/A, CODEC and SPDIF transmit physical layer components.

McASP has the following features:

- 2-interconnect slave interface supports:
  - One interconnect configuration slave interface
  - One interconnect DMA slave interface
  - 32-bit data bus width
  - 16- and 32-bit access
  - 10-bit address bus width
  - Burst not supported
  - WNP
- Supports idle request/acknowledge protocol
- Buffers for transmit/receive operations
- DMA requests (one per direction) link with the 32-bit register
- Up to four transmit channels
- Four serializers implemented
- Support of disconnect protocol

For more information, see [Section 23.8](#), *McASP*.

### **12.1.8 Multichannel Buffered Serial Port**

There are three McBSP instantiations: McBSP1 through McBSP3. They provide a full-duplex direct serial interface between the ABE and external devices, such as other modems, BT chips, or codecs. Because of its versatility, a McBSP can accommodate a wide range of peripherals and clocked frame-oriented protocols (I2S, PCM, TDM).

List of recommended usage per McBSP:

- MCBSP1: BT voice/audio data
- MCBSP2: Digital baseband (DBB) voice data
- MCBSP3: MIDI FM data

The McBSP has the following features:

- Interconnect slave interface (internal interconnect) supports:
  - 32-bit data bus width
  - 8-, 16-, and 32-bit access
  - 10-bit address bus width
  - Burst not supported
  - WNP
- Buffers for transmit/receive operations: 128/128 32-bit words (McBSP1, 2, 3)
- Interrupts configurable in legacy mode (two requests) or PRCM-compliant (one request)
- DMA requests (one per direction) triggered with programmable FIFO thresholds
- Multidrop support
- Serial interface description
- Four-pin configuration (McBSP1, 2, 3)
- Full-duplex communication
- Multichannel selection modes
- Support to enable or block transfers in each channel
- Up to 128 channels for transmission and for reception
- Supported protocols
- Direct interface to industry-standard codecs, analog interface chips (AICs), and other serially connected A/D and D/A devices:
  - I2S-compliant devices
  - TDM bus devices
  - PCM devices
- A wide selection of data sizes: 8, 12, 16, 20, 24, and 32 bits
- Supports idle request/acknowledge protocol
- Clock generation support:
  - Independent clocking and framing for reception and for transmission up to 48 MHz
  - Support for external generation of clock signals and frame-synchronization (frame-sync) signals
  - A programmable sample rate generator for internal generation and control of clock signals and frame-sync signals
- Support of disconnect protocol

For a complete description, see [Section 23.5](#), *Multichannel Buffered Serial Port*.

### 12.1.9 Multichannel Pulse Density Modulation Module

The McPDM is a proprietary interface based on multichannel pulse density modulation. The module consists of five downlinks and three uplinks. Two other uplink channels are reserved for status communication.

The McPDM has the following features:

- Interconnect slave interface (L4\_ABE internal interconnect) supports:
  - 32-bit data bus width
  - 10-bit address bus width
  - Burst not supported
  - WNP

- Full-duplex communication:
  - Five audio downstream channels
  - three audio upstream channels
- RX/TX FIFO operations: 32-bit words per channels
- Complies with PRCM interrupts:
  - One to the MPU subsystem
  - One to the DSP subsystem
- DMA requests (one per direction) triggered with programmable FIFO thresholds; depending on the FIFO implementation, one per channel or one per direction
- Decimation filter for embedded uplink paths (five paths if two status paths)
- Oversampling for embedded uplinks (five paths)
- Sigma delta for embedded downlinks (three paths)
- Deserializers for the two status upstream channels
- Support of disconnect protocol

For more information, see [Section 23.6](#), *Multichannel PDM Controller*.

## Interconnect

---

---

This chapter describes the device interconnect.

<b>13.1 Interconnect Overview</b> .....	<b>3079</b>
<b>13.2 L3 Interconnect</b> .....	<b>3087</b>
<b>13.3 L4 Interconnects</b> .....	<b>3207</b>

## 13.1 Interconnect Overview

### 13.1.1 Terminology

The following terminology is critical to understanding the interconnect:

- Initiator: Module able to initiate read and write requests to the chip interconnect (typically: processors, direct memory access [DMA], etc.).
- Target: Unlike an initiator, a target module cannot generate read/write requests to the chip interconnect, but it can respond to these requests. However, it may generate interrupts or a DMA request to the system (typically: peripherals, memory controllers).

---

**NOTE:** A module can have several separate ports; therefore, a module can be an initiator and a target.

---

- Agent: Each connection of one module to one interconnect is done using an agent, which is an adaptation (sometimes configurable) between the module and the interconnect. A target module is connected by a target agent (TA), and an initiator module is connected by an initiator agent (IA).
- Interconnect: The decoding, routing, and arbitration logic that enables the connection between multiple initiator modules and multiple target modules connected on it.
- Register target (RT): Special TA used to access the interconnect internal configuration registers
- Data-flow signal: Any signal that is part of a clearly identified transfer or data flow (typically: command, address, byte enables, etc.). Signal behavior is defined by the protocol semantics.
- Sideband signal: Any signal whose behavior is not associated to a precise transaction or data flow.
- Out-of-band error: Any signal whose behavior is associated to a device error-reporting scheme, as opposed to in-band errors.

---

**NOTE:** Interrupt requests and DMA requests are not routed by the interconnect in the device.

---

- Firewall: A programmable feature integrated in a TA or L4 interconnect to prevent unauthorized access to or from a module. A firewall can be configured using three criteria:
  - Initiator requesting access
  - Address space access
  - Type of access
- ConnID: Any transaction in the system interconnect is tagged by an in-band qualifier ConnID, which uniquely identifies the initiator at a given interconnect point. A ConnID is transmitted in band with the request and is used for firewall and error-logging mechanism.
- Firewall comparison mechanism: A comparison made in the firewall between access in-band qualifiers and access permissions that are programmed in the firewall configuration registers. If the comparison is successful, access is allowed; otherwise, access is denied.
- MCcmd qualifier: Command bus that indicates the type of transfer requested. [Table 13-1](#) lists the commands encoded. For information specific to L3 Interconnect error logging, see [Table 13-26](#).

**Table 13-1. MCcmd Qualifier Description**

MCcmd[2:0]	Transaction Type
0 0 0	Idle
0 0 1	Write
0 1 0	Read
0 1 1	ReadEx
1 0 0	Not used
1 0 1	Write nonposted
1 1 0	Not used
1 1 1	Not used

- MReqInfo qualifier: Three MReqInfo qualifiers describe the access during the use of the firewall comparison mechanism, as described in [Table 13-2](#).

**Table 13-2. MReqInfo Qualifier Description**

Qualifiers	Description
MReqType	0: Data access
	1: Opcode fetch
MReqSupervisor	0: User mode
	1: Supervisor mode
MReqDebug	0: Functional access
	1: Debug access

- Register that configures the combination of the MReqInfo, allowing access permission to the TM based on the MReqInfo in-band qualifier values.
- SError: Target that indicates an error condition to the initiator.
- SResp qualifier: Response from the target to the initiator concerning the transaction, as described in [Table 13-3](#).

**Table 13-3. SResp Qualifier Description**

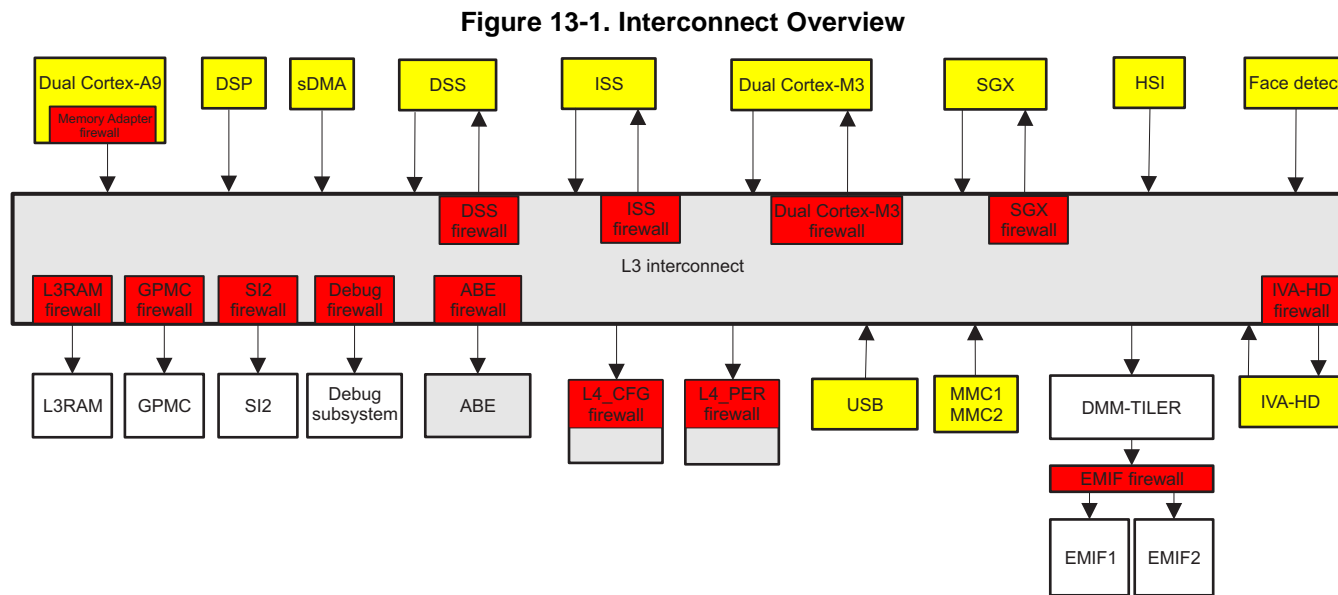

SResp[1:0]	Description
0 0	No response
0 1	Data valid/accept
1 0	Not used
1 1	Error

### 13.1.2 Architecture Overview

The device memory hierarchy includes four levels:

- Level 1 (L1) is internal to the central processing units (CPUs). It concerns data exchange with the internal Level 1 cache memory subsystem, and it is the closest memory to the microprocessor unit (MPU) core and the IVAHD core.
- Level 2 (L2) is included in the IVAHD subsystem and the MPU subsystem.
- The chip-level interconnect consists of one level 3 (L3) interconnect and four level 4 (L4) interconnects. It enables communication among the modules and subsystems in the device.

Figure 13-1 shows an overview of the L3 and L4 interconnect architecture.

i3-012

- L3 handles many types of data transfers, especially exchanges with system-on-chip (SoC)/external memories. L3 transfers data with a maximum width of 128 bits from the initiator to the target. The L3 interconnect is a little-endian platform.
- The L4 is composed of the following:
  - L4\_CFG: Includes the majority of the configuration interface for L3 system modules and peripheral interconnect; L4\_PER: Includes the main peripherals that require system direct memory access (sDMA).
  - L4\_WKUP: Includes peripherals attached to the WKUP power domain.

Modules are connected to the interconnect through an IA for the initiator module and a TA for target modules. Each module/subsystem connection is statically configured to tune the access, depending on the characteristics of the module.

To unauthorize a module or L4 interconnect access, some TAs include configurable firewalls (FWs). A firewall restricts or filters the accesses allowed to an initiator according to different access criteria. The firewalls can usually be configured by software.

The L3 and L4 interconnect default settings are fully functional; they enable all possible functional data paths and a minimal default protection setting. However, the interconnect parameters can be modified to fit user expectations.

### 13.1.3 Module Distribution

IAs and TAs provide the interface to connect the different modules and the interconnect.

Table 13-4 through Table 13-11 list the device modules, subsystems, and associated agents. The agents are listed for each interconnect domain:

- L3 initiator (master network interface units [NIUs] – MN) and target (slave NIUs – SN) agents
- L4\_PER initiator and target agents
- L4\_CFG initiator and target agents
- L4\_WKUP initiator and target agents

#### 13.1.3.1 L3 Interconnect Module Distribution

Table 13-4 and Table 13-5 list the IAs and TAs, respectively, of the L3 interconnect.

**Table 13-4. Master NIUs**

Master NIU Name	Description
L3_MN_CORTEXA9	Cortex™-A9 microprocessor unit subsystem
L3_MN_DSP	DSP subsystem
L3_MN_DSS	Display subsystem
L3_MN_MMC1/2	Multimedia controller
L3_MN_IVAHD	Video accelerator subsystem
L3_MN_SGX	Graphic accelerator
L3_MN_ISS	Imaging accelerator subsystem
L3_MN_CORTEXM3	Cortex™-M3 microprocessor subsystem
L3_MN_FACEDETECT	Face detection module
L3_MN_SDMA_rd	sDMA
L3_MN_SDMA_wr	sDMA
L3_MN_HSI	High-speed synchronous serial interface controller
L3_MN_FSUSB	Full-speed USB host controller
L3_MN_HSUSBOTG	High-speed (HS) on-the-go (OTG) USB controller
L3_MN_HSUSBHOST	Multiport USB host controller
L3_MN_DAP	JTAG®/emulation access to system resources

**Table 13-5. Slave NIUs**

Slave NIU Name	Description
L3_SN_OCM_RAM	On-chip memory controller
L3_SN_GPMC	General-purpose memory controller (GPMC)
L3_SN_DMM1	Dynamic memory management
L3_SN_DMM2	Dynamic memory management
L3_SN_SGX	Graphic accelerator

**Table 13-5. Slave NIUs (continued)**

Slave NIU Name	Description
L3_SN_ISS	Imaging accelerator subsystem
L3_SN_IVAHD_CFG	Video accelerator subsystem configuration
L3_SN_IVAHD_SL2	Video accelerator subsystem shared memory
L3_SN_DSP	DSP subsystem
L3_SN_CORTEXM3	Cortex-M3 MPU subsystem
L3_SN_DSS	Display subsystem
L3 interconnect	L3 internal registers
L3_SN_ABE	Audio back end
L3_SN_L4_CFG	L4 interconnect configuration
L3_SN_L4_PER0/1/2/3	L4 interconnect peripherals
L3_SN_L4_EMU	L4 interconnect EMU subsystem

### 13.1.3.2 L4 Interconnect Module Distribution

IAs and TAs provide the interface to connect the different modules to their associated interconnect.

[Table 13-6](#) through [Table 13-11](#) list all modules and subsystems with their associated agents. The agents are listed for each L4 interconnect domain.

#### 13.1.3.2.1 L4\_PER Interconnect Agents

The L4\_PER interconnect handles transfers only to peripherals in the PER power domain. [Table 13-6](#) lists the PER TAs.

**Table 13-6. L4\_PER TAs**

Module Target Name	Description
PER_TA_UART1	Universal asynchronous receiver transmitter (UART) port 1 module
PER_TA_UART2	UART port 2 module
PER_TA_UART3	UART port 3 module
PER_TA_UART4	UART port 4 module
PER_TA_GPTIMER2	General-purpose timer 2 (GPTIMER2) module
PER_TA_GPTIMER3	GPTIMER3 module
PER_TA_GPTIMER4	GPTIMER4 module
PER_TA_GPTIMER9	GPTIMER9 module
PER_TA_GPTIMER10	GPTIMER10 module
PER_TA_GPTIMER11	GPTIMER11 module
PER_TA_DSS	Display subsystem configuration module
PER_TA_GPIO2	General-purpose input/output 2 (GPIO2) module
PER_TA_GPIO3	GPIO3 module
PER_TA_GPIO4	GPIO4 module
PER_TA_GPIO5	GPIO5 module
PER_TA_GPIO6	GPIO6 module
PER_TA_I2C1	Multimaster inter-integrated circuit 1 (I2C1) module
PER_TA_I2C2	Multimaster I2C2 module
PER_TA_I2C3	Multimaster I2C3 module
PER_TA_I2C4	Multimaster I2C4 module
PER_TA_SLIMBUS2	Silmbus 2 module
PER_TA_ELM	Error location module

**Table 13-6. L4\_PER TAs (continued)**

Module Target Name	Description
PER_TA_MCBSP4	Multichannel buffered serial port 4 (McBSP4) module
PER_TA_MCSP1	Multichannel serial peripheral interface 1 (McBSP1) module
PER_TA_MCSP2	McSPI2 module
PER_TA_MCSP3	McSPI3 module
PER_TA_MCSP4	McSPI4 module
PER_TA_HSMMC1	Multimedia card (MMC) controller 1 module
PER_TA_HSMMC2	MMC controller 2 module
PER_TA_HSMMC3	MMC controller 3 module
PER_TA_HSMMC4	MMC controller 4 module
PER_TA_HSMMC5	MMC controller 5 module
PER_TA_HDQ	Single-wire serial link low-rate module

Four ports communicate between the L3 interconnect and the L4\_PER interconnect to allow the L3 initiators to access the L4\_PER targets. [Table 13-7](#) lists the L4\_PER initiator TAs.

For the list of initiators authorized to access the L4 peripheral peripherals, see [, Connectivity Matrix](#).

**Table 13-7. L4\_PER IAs**

Module Initiator Name	Description
PER_IA_0	L3 sDMA RD interconnect port
PER_IA_1	L3 sDMA WR interconnect port
PER_IA_2	L3 MPU subsystem interconnect port
PER_IA_3	L3 others interconnect port

### 13.1.3.2.2 L4\_CFG Interconnect Agents

The L4\_CFG interconnect handles only transfers to peripherals in the CORE power domain. [Table 13-8](#) lists the TAs.

**Table 13-8. L4\_CFG TAs**

Module Target Name	Description
CFG_TA_SYSCTRL_GENERAL_CORE	System control general core module
CFG_TA_SYSCTRL_PADCONF_CORE	System control padconf core module
CFG_TA_CM1	Clock manager 1 module
CFG_TA_CM2	Clock manager 1 module
CFG_TA_SDMA	sDMA module
CFG_TA_HSI	HS synchronous serial interface (SSI) module
CFG_TA_SAR_ROM	Save-and-restore ROM
CFG_TA_HSUSBOTG	HS universal serial bus (USB) OTG module
CFG_TA_FSUSBHOST	FS USB OTG module
CFG_TA_HSUSBHOST	HS USB host module
CFG_TA_HSUSBPHY	HS USB PHY module
CFG_TA_HSUSBTLL	USB TTL module
CFG_TA_DSP	Digital signal processor (DSP) subsystem
CFG_TA_SR1	SmartReflex1 module
CFG_TA_SR2	SmartReflex2 module
CFG_TA_SR3	SmartReflex3 module

**Table 13-8. L4\_CFG TAs (continued)**

Module Target Name	Description
CFG_TA_MAILBOX	Mailbox module
CFG_TA_SPINLOCK	Spinlock module
CFG_TA_FACEDETECT	Face detect module
CFG_TA_EMIFFW	EMIF firewall
CFG_TA_GPMCFW	GPMC firewall
CFG_TA_OCMRAMFW	RAM firewall
CFG_TA_SGXFW	SGX firewall
CFG_TA_ISSF	ISS firewall
CFG_TA_CORTEXM3FW	Cortex-M3 firewall
CFG_TA_DSSF	Display subsystem (DSS) firewall
CFG_TA_SL2FW	SL2 firewall
CFG_TA_IVAHDFW	Image and video accelerator high-definition (IVA-HD) firewall
CFG_TA_EMUSSFW	EMU subsystem firewall
CFG_TA_ABEFW	Audio back-end (ABE) firewall
CFG_TA_L4WKUP	L4_WKUP connection

A unique port, CFG\_IA\_0, communicates between the L3 interconnect and the L4\_CFG interconnect to allow the L3 initiators to access the L4\_CFG targets (see [Table 13-9](#)).

For the list of initiators authorized to access the L4\_CFG peripherals, see , *Connectivity Matrix*.

**Table 13-9. L4\_CFG IAs**

Module Initiator Name	Description
CFG_IA_0	L3 interconnect port

### 13.1.3.2.3 L4\_WKUP Interconnect Agents

The L4\_WKUP interconnect handles transfers only to peripherals in the WKUP power domain. [Table 13-10](#) lists the TAs. [Table 13-11](#) lists the L4\_WKUP IAs.

**Table 13-10. L4\_WKUP TAs**

Module Target Name	Description
WKUP_TA_GPIO1	GPIO1 module
WKUP_TA_32KTIMER	32-kHz timer module
WKUP_TA_SAR_RAM	Save-and-restore RAM
WKUP_TA_KEYBOARD	Keyboard module
WKUP_TA_SYSCTRL_GENERAL_WKUP	System control general WKUP module
WKUP_TA_SYSCTRL_PADCONF_WKUP	System control padconf WKUP module
WKUP_TA_PRM	Power reset management module
WKUP_TA_SCRM	System clock and reset management module
WKUP_TA_WDTIMER2	WDTIMER2 module

**Table 13-11. L4\_WKUP IAs**

Module Initiator Name	Description
WKUP_IA_0	L4_CFG interconnect port

### 13.1.4 Connectivity Matrix

Figure 13-2 shows the functional paths between the L3 interconnect initiator modules and the L3 and L4 TAs. The functional paths are indicated by the use of the following:

- A cell contains a + sign when a functional path exists.
- A cell is blank when a functional path does not exist.

**Figure 13-2. L3 Connectivity Matrix**

Master NIU (MN)	Slave NIU (SN)

## **13.2 L3 Interconnect**

This section describes the L3 interconnect and its components. With the exception of register points, each component includes functions for the request and response networks.

### **13.2.1 L3 Interconnect Overview**

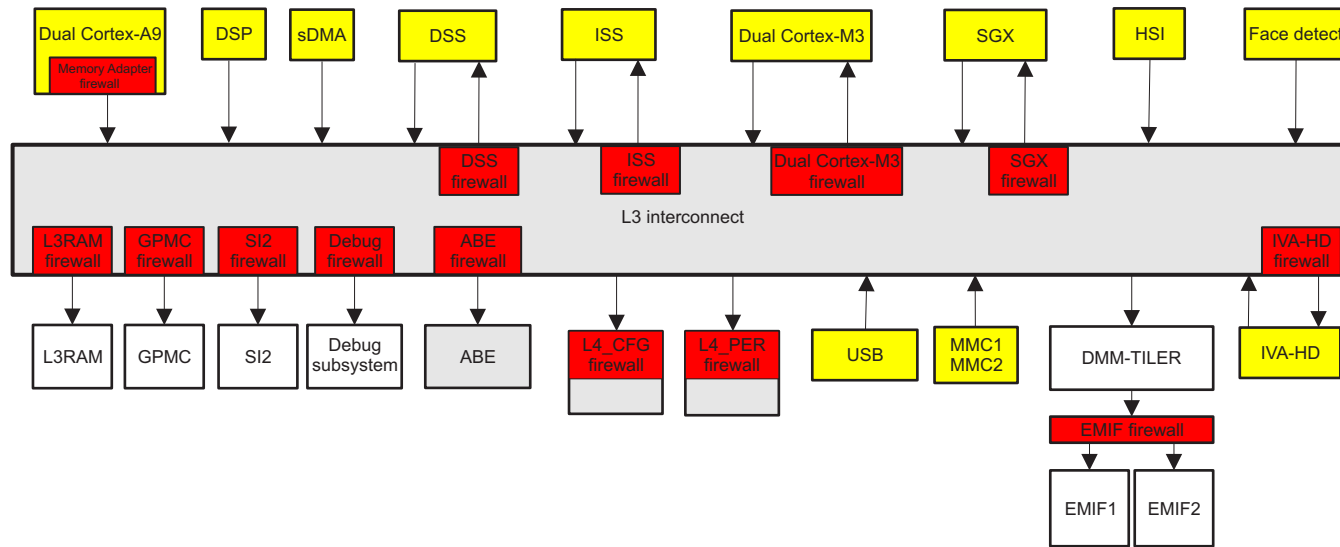

The L3 interconnect links cores in a flexible topology that couples low power with high performance. Innovative physical structures and advanced protocols ensure bandwidth and latency to individual IP cores, providing dedicated connections between IP cores and logical connections over a shared interconnect.

The main features of the L3 interconnects are:

- NIUs: Master NIUs for the IAs and slave NIUs for the TAs
- A partially depleted crossbar exchange network
- A special internal slave NIU for accessing L3 interconnect configuration registers
- True little-endian platform
- Transaction errors tracking and logging registers
- All signaling support for chip-level power-management infrastructure

[Figure 13-3](#) is an overview of the L3 interconnect and the peripherals attached to it.

Figure 13-3. L3 Interconnect Overview

i3-012

### 13.2.2 L3 Interconnect Integration

Table 13-12 through Table 13-14 summarize the integration of the module in the device.

**Table 13-12. Integration Attributes**

Module Instance	Attributes
	Power Domain
L3	PD_CORE

**Table 13-13. Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L3	L3_CLK2	L3_ICLK2	PRCM	Functional and interface clock
	L3_CLK1	L3_ICLK1	PRCM	Functional and interface clock
	L3_CLK3	INSTR_L3_ICLK	PRCM	Functional and interface clock
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L3	L3_CORE_RET_RST	CORE_RET_RST	PRCM	Reset of L3_PER interconnect retention registers
	L3_CORE_RST	CORE_RST	PRCM	Reset of L3_PER interconnect

**Table 13-14. Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
L3	L3_DBG_IRQ	MA_IRQ_9	Cortex-A9 INTC	Interrupt to the Cortex-A9
	L3_APP_IRQ	D_IRQ_84	DSP INTC	Interrupt to the DSP
	L3_APP_IRQ	MA_IRQ_10	Cortex-A9 INTC	Interrupt to the Cortex-A9

### 13.2.3 L3 Interconnect Functional Description

#### 13.2.3.1 Module Use in L3 Interconnect

The L3 interconnect network components have ConnID values for each master NIU or slave NIU. The ID uniquely identifies the master NIU or the slave NIU for an interconnect transfer. The interconnect uses ConnIDs for a number of purposes, including the following:

- Slave NIUs for error logging
- Power disconnect slave NIU for error logging
- FLAGMUX to mask interrupts: Three, one for each clock domain
- STATCOLL for configuring and monitoring: The STATCOLL components compute the traffic statistics within a user-defined window and periodically report to the user through the debug interface.
- Bandwidth regulator for configuration: The bandwidth critical masters are IVAHD, ISS, DSS, and SGX.
- Some rate adapters for configuration of throughput ratio

#### 13.2.3.2 Module Distribution

Master NIUs and slave NIUs provide the interface to connect the different modules to their associated interconnect.

[Table 13-15](#) and [Table 13-16](#) list all the modules and subsystems with their associated agents. The agents are listed for each L3 interconnect domain.

##### 13.2.3.2.1 L3 Interconnect Agents

Any initiator or target core is connected to the L3 interconnect through an NIU. NIUs act as entry points to the L3 interconnect, and also include various programming registers. [Table 13-15](#) lists the supported master NIU ports.

**Table 13-15. Master NIUs**

Master NIU	Description
L3_MN_CORTEXA9	Cortex-A9 MPU subsystem
L3_MN_DSP	DSP subsystem
L3_MN_DSS	Display subsystem
L3_MN_MMC1/2	Multimedia controller
L3_MN_IVAHD	Video accelerator subsystem
L3_MN_SGX	Graphic accelerator
L3_MN_ISS	Imaging accelerator subsystem
L3_MN_CORTEXM3	Cortex-M3 MPU subsystem
L3_MN_FACEDETECT	Face detection module
L3_MN_SDMA_rd	sDMA
L3_MN_SDMA_wr	sDMA
L3_MN_HSI	HS synchronous serial interrupt controller (INTC)
L3_MN_FSUSB	Full-speed USB host controller
L3_MN_HSUSBOTG	HS OTG USB controller
L3_MN_HSUSBHOST	Multiport USB host controller
L3_MN_DAP	JTAG/emulation access to system resources

[Table 13-16](#) lists the supported slave NIU ports.

**Table 13-16. Slave NIUs**

<b>Slave NIU</b>	<b>Description</b>
L3_SN_OCM_RAM	On-chip memory controller
L3_SN_GPMC	GPMC
L3_SN_DMM1	Dynamic memory management
L3_SN_DMM2	Dynamic memory management
L3_SN_SGX	Graphic accelerator
L3_SN_ISS	Imaging accelerator subsystem
L3_SN_IVAHD_CFG	Video accelerator subsystem configuration
L3_SN_IVAHD_SL2	Video accelerator subsystem shared memory
L3_SN_DSP	DSP subsystem
L3_SN_CORTEXM3	Cortex-M3 MPU subsystem
L3_SN_DSS	Display subsystem
L3 interconnect	L3 internal registers
L3_SN_ABE	Audio back end
L3_SN_L4_CFG	L4 interconnect configuration
L3_SN_L4_PER0/1/2/3	L4 interconnect peripherals
L3_SN_L4_EMU	L4 interconnect EMU subsystem

### 13.2.3.2.2 L3 Connectivity Matrix

The L3 interconnect is divided into three subclock domains:

- L3\_CLK1: Low-power domain
- L3\_CLK2: Peripherals and multimedia
- L3\_CLK3: Instrumentation (debug)

Each is implemented in a different clock domain.

#### 13.2.3.2.2.1 Clock Domain Mapping of the L3 Interconnect Modules

Each clock domain (CLK1, CLK2, and CLK3) has its own host, flag mux, slave NIUs, and bandwidth regulators.

**Table 13-17. L3 Clock Domains and Elements**

<b>Domain</b>	<b>Elements</b>
CLK1	HOST_CLK1 DMM1/2 ABE L4_CFG FLAGMUX DSS_BW PWR_DISK
CLK2	HOST_CLK2 GPMC OCM_RAM DSS ISS CORTEXM3 SGX IVAHD SL2

**Table 13-17. L3 Clock Domains and Elements (continued)**

Domain	Elements
	L4_PER0/1/2/3 FLAGMUX ISS_BW ISS_BW IVAHD_BW SGX_BW
CLK3	HOST_CLK3 L4_EMU FLAGMUX STATCOLL

Figure 13-4 lists the functional paths between the L3 interconnect master NIUs and the L3 and L4 slave NIU agents. The functional paths in the figure are indicated by the following:

- A cell contains a plus sign when a functional path exists.
- A cell is blank when a functional path does not exist.

Figure 13-4. L3 Connectivity Matrix

13.2.3.2.3 Master NIU Identification

An master NIU ID (ConnID) is assigned to every module in the device. The ID uniquely identifies the master NIU for an interconnect transfer (see Table 13-18). The interconnect uses ConnID values for a number of purposes, including:

- Master source identification for the protection mechanism
- Response route generation
- Firewall error logging
- L3 interconnect error logging

**Table 13-18. ConnID Values**

ConnID	Master NIU
0x0	Cortex-A9
0x4	DAP
0x8	DSP
0xC	IWAHD
0x10	ISS
0x11	Cortex-M3
0x12	FaceDetect
0x14	sDMA_rd
0x15	sDMA_wr
0x18	SGX
0x1C	DSS
0x20	Reserved
0x22	Reserved
0x23	Reserved
0x24	HSI
0x28	MMC1
0x29	MMC2
0x2C	Reserved
0x30	HSUSBHOST
0x31	HSUSBOTG
0x32	FSUSB
0x34	Reserved

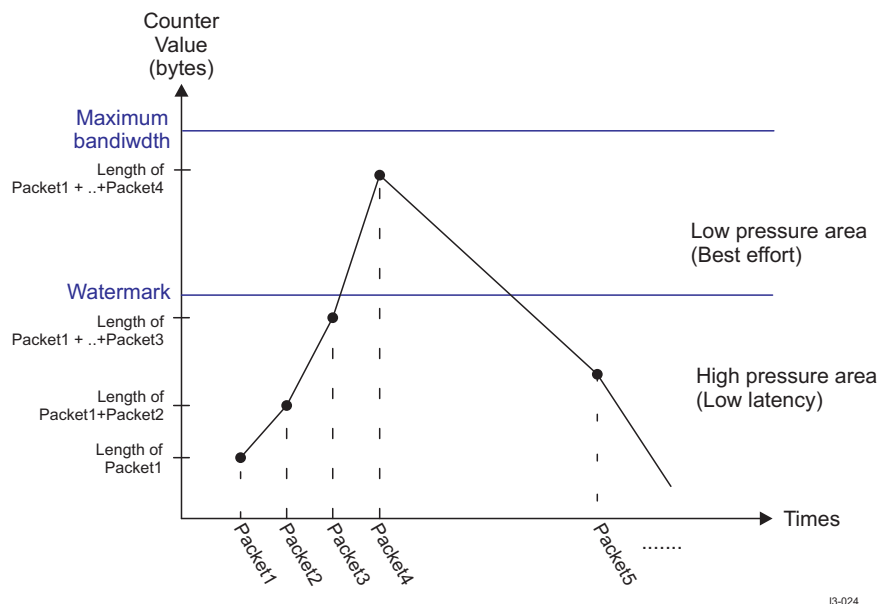

### 13.2.3.3 Bandwidth Regulators

The bandwidth regulators prevent master NIUs from consuming too much bandwidth of a link, or a slave NIU that is shared between several data flows: packets are then transported at a slower rate. The value of a bandwidth can be programmed in the bandwidth regulator. When the bandwidth is below the programmed value, the pressure bit is set to 1, giving priority to this master. When the bandwidth is above the programmed value, the pressure bit is set to 0 and the concerned master has the same weight as others.

A counter is used to store the sum of data lengths (in bytes) of each packet passing through the bandwidth regulator, and a value equal to the expected bandwidth is subtracted from the counter at each clock cycle. The value of the counter is compared to a programmable threshold (called Watermark), and this comparison determines whether the packet is processed with high pressure for minimum latency or low pressure for best effort processing.

The bandwidth regulator monitors the traffic using open connections between the initiators and the targets. If there is insufficient bandwidth allocated to the connection, the bandwidth regulator can increase the pressure on connections. Generally, the connection is a dataflow between master and slave NIUs. In some cases, the bandwidth regulator is attached to the master and monitors single dataflow to a target (single connection).

Figure 13-5. Bandwidth Regulator Pressure Settings

When Counter Value (bytes) falls below Watermark, the pressure bit is assigned to 1

The bandwidth regulator effective resolution is set to 12.5 MBps. The maximum average bandwidth (max watermark value) computed in a moving window is set to up to 4096 bytes of payload. These settings are implemented by hardware.

The following is an example of bandwidth regulator settings:

The bandwidth regulator is set to run at 200 MHz and the application (DSS bandwidth consumption of HD panel for 1280x720 in RGB24) requires an expected bandwidth of 165.888 MBps ( $\pm 5$  MBps), computed through a moving window of 5  $\mu$ s (1000 cycles). To attribute high pressure on all DSS packet requests, the watermark could be set to the maximum bandwidth needed in the 5- $\mu$ s window.

Considering this example, the settings of the bandwidth regulator are:

- **L3\_BW\_R\_WATERMARK**[11:0] WATERMARK = moving window  $\times$  expected bandwidth = 829.44 bytes = 0x33D
- **L3\_BW\_R\_BANDWIDTH**[15:0] BANDWIDTH = 165.888 MBps / effective resolution = 13,271 = 0xD

The bandwidth registers regulate the packet flow by applying flow control on the RX port, thus ensuring that the traffic does not exceed the allocated bandwidth. The next packet is sent only when an internal timer expires. The registers in this group are:

- **L3\_BW\_R\_WATERMARK**: Gives the amount of data allowed to exceed the average bandwidth during a short time period
- **L3\_BW\_R\_PRESS**: Describes the pressure applied to outgoing packets
- **L3\_BW\_R\_CLEARHISTORY**: Resets the traffic counter when set to 1. It is used after an update in the **L3\_BW\_R\_BANDWIDTH** and **L3\_BW\_R\_WATERMARK** registers (see [Section 13.2.5.1.6, L3 BW Regulator Register Summary and Description](#)).

### 13.2.3.4 Flag Mux Generators

The flag mux generator collects information such as errors and interrupts from slave NIUs and the interconnect firewall. The result signals are then sent to the MPU INTC without interfering with the interconnect traffic. The L3\_FLAGMUX\_MASK registers can be used to prevent the flag mux from seeing certain events.

The unit has a standard COREREG register for identification of the attached core type. The [L3\\_FLAGMUX\\_STDHOSTHDR\\_VERSIONREG](#) register identifies the characteristics of the attached core. The unit-specific registers (MASK bit 0 or bit 1 of the flag inputs, and L3\_FLAGMUX\_REGERR bit 0 or bit 1) are used to read the input errors. Each register is dedicated to reporting the bit corresponding to the register number; for example, [L3\\_FLAGMUX\\_REGERR0](#) reports on bit 0, and [L3\\_FLAGMUX\\_REGERR1](#) reports on bit 1. Any given L3\_FLAGMUX\_REGERR register reports the same bit for all flag source inputs (see [Table 13-162](#)).

### 13.2.3.5 Rate Adapter Generators

The rate adapter generators give the option to configure the L3 interconnect to work in auto-adaptive mode or pipeline mode for sending the packets by using the CNF register. The rate adapter can be configured in store-and-forward mode when the throughput ratio is not well defined, or in auto-adaptive mode when the throughput ratio is predictable. Because the ratios are predictable in the L3 interconnect, the rate adapters are always used in auto-adaptive mode, except for the rate adapter on the L4\_CFG and L4\_ABE responses path. L4\_CFG and L4\_ABE are configured in store-and-forward mode. The main rate adapt registers are:

- CLK1\_RATE\_ADAPT\_RESP\_32TO128\_CLK1: Removes WAIT cycles on responses coming from ABE, L4CFG, and power disconnect to host
- CLK2\_RATE\_ADAPT\_RESP\_32TO128\_CLK2: Removes WAIT cycles on responses coming from CLK2 32-bit slaves (see [Table 13-192](#))

### 13.2.3.6 Statistic Collectors Group

Statistic collectors are internal masters that share the same master address as the master NIUs. These components compute the traffic statistics within a defined window and periodically report through the DEBUG interface. The key features of the statistic collector are:

- Nonintrusive monitoring
- Programmable filters and counters
- Results collected at a programmable time interval

Event detectors are programmed through the [L3\\_STCOL\\_REQEVT](#) and [L3\\_STCOL\\_RSPEVT](#) configuration registers for request and response ports, respectively. The following events can be identified:

- Word transfer
- WAIT cycles
- Flow control
- Payload transfers
- Latency measurements

Performance monitoring is enabled through the [L3\\_STCOL\\_EN](#) register. The [L3\\_STCOL\\_SOFTEN](#) register enables software to monitor the performance. Event muxes are programmed through the [L3\\_STCOL\\_EVTMUX\\_SELO](#) configuration register, which determines which port will be monitored by a filter configured by the filter registers (see ).

Filters are programmed through the configuration register, along with additional selection criteria programmed through the mask/match registers (see [Table 13-201](#)). A filter can be configured to accept or reject:

- Read operations
- Write operations
- Errors
- Addresses

Filter operations are programmed through the L3\_STCOL\_OP registers (see [Table 13-201](#)).

### 13.2.3.7 L3 Protection and Firewalls

Device protection relies on L3 firewalls and their configuration.

### 13.2.3.7.1 L3 Firewall Reset

The values of L3 firewall registers on reset are tied in hardware or exported from the control module registers.

Values exported from the control module are intended to give defined rights to the firewalls at reset and thus ensure the content after going out of reset. Because the control module consists of retention flip-flops (RFFs), which immunize it against register content loss during retention power state, the registers of the control module storing the exported values are not subject to a soft reset.

The L3 firewall registers are also retention-capable and are immune against content loss during CORE RETENTION power state. The control module registers are reset only by a cold reset, whereas the L3 firewall registers are reset by clearing the [REGUPDATE\\_CONTROL\[1\] FW\\_LOAD\\_REQ](#) bit. When the [REGUPDATE\\_CONTROL\[1\] FW\\_LOAD\\_REQ](#) bit comes back automatically to 1, the exported values are loaded.

#### CAUTION

Before reprogramming the firewall registers and/or before using the FW\_LOAD\_REQ mechanism, the request must be asserted by configuring the [REGUPDATE\\_CONTROL\[0\] BUSY\\_REQ](#) bit.

To load the exported values at run time:

1. Set the [REGUPDATE\\_CONTROL\[0\] BUSY\\_REQ](#) bit to 0x1 to ensure that no transaction can reach the slave NIU (suspend).
2. Clear the [REGUPDATE\\_CONTROL\[1\] FW\\_LOAD\\_REQ](#) bit by writing 0x1 to it.
3. Wait until the [REGUPDATE\\_CONTROL\[1\] FW\\_LOAD\\_REQ](#) bit is reset to 0x1 by hardware.
4. Set the [REGUPDATE\\_CONTROL\[0\] BUSY\\_REQ](#) bit to 0x0 to allow transactions to reach the slave NIU (resume).

To reprogram the firewall registers at run time:

1. Set the [REGUPDATE\\_CONTROL\[0\] BUSY\\_REQ](#) bit to 0x1 to ensure that no transaction can reach the slave NIU (suspend).
2. Upload the new values to all firewall registers.
3. Set the [REGUPDATE\\_CONTROL\[0\] BUSY\\_REQ](#) bit to 0x0 to allow transactions to reach the slave NIU (resume).

---

**NOTE:** Hardware reset values can be modified by exported values from the control module at reset.

---

#### 13.2.3.7.1.1 L3 Firewall – Exported Reset Values

Table 13-19 and Table 13-20 list the exported reset values and mapping, respectively.

**Table 13-19. L3 Firewall Exported Reset Values**

<a href="#">MRM_PERMISSION_REGION_LOW_j</a> [15:12]	<a href="#">MRM_PERMISSION_REGION_LOW_j</a> [11:0]

[8] and [24]	IVA-HD
[11] and [27]	EMIF
[12] and [28]	DEBUG
[13] and [29]	L4 AUDIO

For more information, see [Chapter 18, Control Module](#).

### 13.2.3.7.2 Power Management

As part of the system-wide power-management scheme, the L3 interconnect goes into IDLE state after receiving a request from the power, reset, and clock management (PRCM) module after all commands are serviced. This function is handled by hardware.

To reduce power consumption, the L3 interconnect automatically performs internal clock autogating. This is managed by hardware; no software configurations or settings are required.

Retention is performed on all software-accessible registers:

- Statistic collectors
- Internal rate adapters
- Bandwidth regulators
- TAs
- Firewalls

This process prevents reconfiguration after a clock domain switches off.

### 13.2.3.7.3 L3 Firewall Functionality

The access to the slave NIUs is granted only to master NIUs according to in-band attributes sent in each transaction crossing the L3 interconnect, such as:

- MCMD: Specifies the type of access (read or write) required by the master NIU
- ConnID: Used to determine the permission of the master NIU
- MReqInfo: Transaction attribute adding information about the access type

[Table 13-21](#) lists the MReqInfo Values.

**Table 13-21. MReqInfo Values**

Qualifier	Access Definition	Access Description
MReqType	0: Data 1: Opcode	Indicates whether the request is for instruction fetch or data access
MReqDebug	0: Functional 1: Debug	When set, indicates that the request has been issued by a master NIU in DEBUG state
MReqSupervisor	0: User 1: Privilege	When set, indicates that the request is qualified with the supervisor attribute. It can be provided by a processor running in supervisor mode or by a module that inherited this attribute from the processor (DMA channel with a supervisor attribute).

The firewall comparison mechanism enables access to a protected slave NIU only when a correct combination of three MReqInfo in-band parameters is transmitted.

MReqInfo is a combination of a fixed 3-bit pattern that corresponds to a combination of the parameters MReqDebug, MReqType, and MReqSupervisor. See [Table 13-22](#).

**Table 13-22. L3 ReqInfo Mapping**

	ReqInfo Name	MReqDebug	MReqType	MReqSupervisor

	L3_SN_SL2			

### 13.2.3.7.3.1 Protection Regions

Each slave NIU address space is subdivided into protection regions (maximum of 10). The regions are configurable with a size of 4-KB granularity. The firewalls can also be multiport while using the description of the same regions for dual access memories or to support interleaving mechanisms on several memories.

[Table 13-23](#) lists the number of protected regions and ports for each slave NIU.

**Table 13-23. Slave NIU Firewall and Region Configuration**

Slave NIU	Firewall	Number of Regions	Number of Ports
L3 RAM	L3 RAM	10	1
GPMC	GPMC	8	1

**Table 13-23. Slave NIU Firewall and Region Configuration (continued)**

Slave NIU	Firewall	Number of Regions	Number of Ports
SL2	SL2	1	1
SGX	SGX	1	1
ISS	ISS	1	1
Dual Cortex-M3 subsystem	Dual Cortex-M3	1	1
DSS	DSS	1	1
IVA-HD	IVA-HD	1	1
DEBUG subsystem	DEBUG	2	1
ABE	ABE	1	1
EMIF	EMIF	8	3

Two types of regions are distinguished in a slave NIU firewall:

- Default region: Available in all slave NIUs. It covers the entire slave NIU address range and must be reset or overlaid by other firewall configured regions, because it always has the lowest priority.
- Normal region: The number of normal regions varies in a slave NIU; they have identical capabilities (see [Table 13-23](#)).

Each region has the following characteristics:

- Start address: Physical slave NIU start address
- End address: Physical slave NIU end address
- Specific access rights (see [Section 13.2.3.7.3.3](#), *Protection Mechanism per Region Examples*)
- Priority level from 0 (lowest) to 10 (highest)

Depending on its priority level, a region can override the settings of another region; the access rights of the region with the highest priority apply. All regions have a fixed (not configurable) priority level that corresponds to their number: Region 1 has priority level 1, region 2 has priority level 2, and so on.

[Figure 13-6](#) shows the priority level with associated regions. This priority level scheme allows multiplying the flexibility and capability of the firewall. [Figure 13-6](#) shows a 7-region firewall setting that creates 13 regions (twice the number of regions created than originally available).

Figure 13-6. L3 Interconnect Region Overlay and Priority Level Overview

13-003

The address range covered by the regions is defined in the [START\\_REGION\\_i](#) and [END\\_REGION\\_i](#) registers. The boundary checks are done on a minimum size of 4-KB pages; thus, bits [11:0] of those 32-bit registers are not checked.

The address space size of the slave NIUs ([bits [31:12]]) depends on the size of the slave NIU to protect (that is, if a memory is only 48KB, then the size is defined through bits [16:12] of the slave NIU start/end address registers of the firewall region ([START\\_REGION\\_i\[16:12\]](#) and [END\\_REGION\\_i\[16:12\]](#)).

On multiport firewalls (EMIF), the checking of each REGION {0, n} can be activated on one or several ports at the same time. However, if interleaving is not desired on some parts of the protected memory space, it is possible to apply or not apply region checking on selected ports using the region enable/disable on port instance capability of the [END\\_REGION\\_i](#) register.

Most slave NIUs support only one input port (port 0) except:

- The EMIF module protected by the EMIF firewall has three ports:
  - Port 0 for Cortex-A9 accesses
  - Port 1 for the first L3 interconnect accesses
  - Port 2 for the second L3 interconnect accesses

A region can be applied or not to each port independently. To enable and disable the regions:

- For port 0: Set/clear the [END\\_REGION\\_i\[0\]](#) REGION\_ENABLE\_PORT0 bit (for all L3 firewalls).
- For port 1: Set/clear the [END\\_REGION\\_i\[1\]](#) REGION\_ENABLE\_PORT1 bit (only for EMIF firewalls).
- For port 2: Set/clear the [END\\_REGION\\_i\[2\]](#) REGION\_ENABLE\_PORT2 bit (only for EMIF firewalls).

### 13.2.3.7.3.2 L3 Firewall Registers Overview

Table 13-24 and Table 13-25 list the L3 firewall permission-setting registers.

**Table 13-24. L3 Firewall Read/Write Permission-Setting Register**

Register Name	Bits	Field Name	Description (see Table 13-18)	Field Modifiability
MRM_PERMISSION_REGION_HIGH_j	31	RESERVED	Reserved	–
	30	RESERVED	Reserved	–
	29	RESERVED	Reserved	–
	28	RESERVED	Reserved	–
	27	RESERVED	Reserved	–
	26	RESERVED	Reserved	–
	25	W12	ConnID = 12 write permission	RW
	24	R12	ConnID = 12 read permission	RW
	23	RESERVED	Reserved	–
	22	RESERVED	Reserved	–
	21	W10	ConnID = 10 write permission	RW
	20	R10	ConnID = 10 read permission	RW
	19	W9	ConnID = 9 write permission	RW
	18	R9	ConnID = 9 read permission	RW
	17	W8	ConnID = 8 write permission	RW
	16	R8	ConnID = 8 read permission	RW
	15	W7	ConnID = 7 write permission	RW
	14	R7	ConnID = 7 read permission	RW
	13	W6	ConnID = 6 write permission	RW
	12	R6	ConnID = 6 read permission	RW
	11	W5	ConnID = 5 write permission	RW
	10	R5	ConnID = 5 read permission	RW
	9	W4	ConnID = 4 write permission	RW
	8	R4	ConnID = 4 read permission	RW
	7	W3	ConnID = 3 write permission	RW
	6	R3	ConnID = 3 read permission	RW
	5	W2	ConnID = 2 write permission	RW
	4	R2	ConnID = 2 read permission	RW
	3	W1	ConnID = 1 write permission	RW
	2	R1	ConnID = 1 read permission	RW
	1	W0	ConnID = 0 write permission	RW
	0	R0	ConnID = 0 read permission	RW

**Table 13-25. L3 Firewall Permission-Setting Register**

Register name	Type of Permission	Bits	Field Name	Description	Field Modifiability
MRM_PERMISSION_REGION_LOW_j	DEBUG	15	PUB_PRV_DEBUG	Privilege debug allowed	RW
		14	PUB_USR_DEBUG	User debug allowed	RW
	Access	13:12	Reserved	Reserved	RW
		11	PUB_PRV_WRITE	Privilege write allowed	RW
		10	PUB_PRV_READ	Privilege read allowed	RW
		9	PUB_PRV_EXE	Privilege exe allowed	RW
		8	PUB_USR_WRITE	User write access allowed	RW
		7	PUB_USR_READ	User read access allowed	RW

**Table 13-25. L3 Firewall Permission-Setting Register (continued)**

Register name	Type of Permission	Bits	Field Name	Description	Field Modifiability
		6	PUB_USR_EXE	User exe access allowed	RW

### 13.2.3.7.3.3 Protection Mechanism per Region Examples

The access permission of each region is configurable and defined through the [MRM\\_PERMISSION\\_REGION\\_HIGH\\_j](#) and [MRM\\_PERMISSION\\_REGION\\_LOW\\_j](#) registers (see [Section 13.2.3.7.3.2, L3 Firewall Registers Overview](#)).

#### Master NIU permissions:

- To give read access to the master NIU with ConnID = n, set the [MRM\\_PERMISSION\\_REGION\\_HIGH\\_j\[n \\* 2\]](#) Rn bit.
- To give write access to the master NIU with ConnID = n, set the [MRM\\_PERMISSION\\_REGION\\_HIGH\\_j\[n \\* 2 + 1\]](#) Wn bit.

#### Debug permissions:

- To give privilege debug access, set the [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[15\]](#) PUB\_PRV\_DEBUG bit.
- To give user debug access, set the [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[14\]](#) PUB\_USR\_DEBUG bit.

#### User, read/write/executable permissions:

- To give privilege write access, set the [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[11\]](#) PUB\_PRV\_WRITE bit.
- To give privilege read access, set the [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[10\]](#) PUB\_PRV\_READ bit.
- To give privilege exe access, set the [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[9\]](#) PUB\_PRV\_EXE bit.
- To give user write access, set the [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[8\]](#) PUB\_USR\_WRITE bit.
- To give user read access, set the [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[7\]](#) PUB\_USR\_READ bit.
- To give user exe access, set the [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[6\]](#) PUB\_USR\_EXE bit.

Example: To provide debug write privilege access to the master NIU ConnID = 7, the following bits must be set:

- [MRM\\_PERMISSION\\_REGION\\_HIGH\\_j\[15\]](#) W7
- [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[15\]](#) PUB\_PRV\_DEBUG

### 13.2.3.7.3.4 L3 Firewall Error Logging

If a protection violation error is detected, the following signals are generated:

- An in-band error is generated to the master NIU of the access.
- An interrupt is generated to the Cortex-A9 and DSP INTCs.

The L3 interconnect does not differentiate errors generated by firewalls from all other supported types of errors.

An in-band error is generated by modules each time an access is not allowed. When an in-band error is sent back into the transaction it is seen as an external prefetch or data abort by the initiator, depending on whether the transaction was an instruction fetch or a data access.

Information about in-band errors is logged into two registers:

- [ERROR\\_LOG\\_k](#): Logs the information about the start/end address of the hit region and the qualifiers of the transaction
- [LOGICAL\\_ADDR\\_ERRLOG\\_k\[31:12\]](#): Logs the address of the failed access

---

**NOTE:** When a multiport firewall is implemented, these registers are duplicated for each port.

---

Table 13-26 lists the L3 firewall error-logging registers.

**Table 13-26. L3 Firewall Error-Logging Registers**

Register Name	Register Field Name	Field Modifiability	Parameter Comments
ERROR_LOG_k	RESERVED[31:24]	Read only	Reads return 0s.
	BLK_BURST_VIOLATION[23]	Read/write	Read 0x1: 2D burst not allowed or exceeds allowed size. Write to clear the ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers.
	RESERVED[22]	Read only	Reads return 0s.
	REGION_START_ERRLOG[21:17]	Read/write	Read: Wrong access hit this region number. Write to clear the ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers.
	REGION_END_ERRLOG[16:12]	Read/write	Read: Wrong access hit this region number. Write to clear the ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers.
	REQINFO_ERRLOG[11:0]	Read/write	Mapping of the error according to the reqinfo vector: [11:8] ConnID [3:0] [7] MCMD [0] [3] MReqDebug [1] MReqSupervisor [0] MReqType

L3 firewall errors can be cleared by writing to the ERROR\_LOG\_k register in the firewall that recorded the error. Clearing the ERROR\_LOG\_k register deasserts the corresponding error if it exists.

The L3 firewall register ERROR\_LOG\_k must be cleared before clearing the CONTROL\_CORE\_SEC\_ERR\_STATUS\_FUNC and CONTROL\_CORE\_SEC\_ERR\_STATUS\_DEBUG registers in the control module.

When a protection violation occurs, an interrupt is sent to the MPU and IVAHD INTC (if enabled). An in-band error is sent back, and an error is logged in the CONTROL\_SEC\_ERR\_STATUS\_FUNC and CONTROL\_SEC\_ERR\_STATUS\_DEBUG registers, depending on the functional mode:

- In application mode:
  - CONTROL\_SEC\_ERR\_STATUS\_FUNC[01] – L3 RAM protection violation
  - CONTROL\_SEC\_ERR\_STATUS\_FUNC[02] – GPMC protection violation
  - CONTROL\_SEC\_ERR\_STATUS\_FUNC[03] – EMIF protection violation
  - CONTROL\_SEC\_ERR\_STATUS\_FUNC[04] – IVAHD protection violation
  - CONTROL\_SEC\_ERR\_STATUS\_FUNC[05] – Cortex-M3 protection violation
  - CONTROL\_SEC\_ERR\_STATUS\_FUNC[06] – SL2 protection violation
  - CONTROL\_SEC\_ERR\_STATUS\_FUNC[13] – SGX protection violation
  - CONTROL\_SEC\_ERR\_STATUS\_FUNC[14] – DSS protection violation
  - CONTROL\_SEC\_ERR\_STATUS\_FUNC[15] – ISS protection violation
  - CONTROL\_SEC\_ERR\_STATUS\_FUNC[18] – DEBUG protection violation
  - CONTROL\_SEC\_ERR\_STATUS\_FUNC[19] – ABE protection violation
- In debug mode:
  - CONTROL\_SEC\_ERR\_STATUS\_DEBUG[01] – L3 RAM protection violation
  - CONTROL\_SEC\_ERR\_STATUS\_DEBUG[02] – GPMC protection violation
  - CONTROL\_SEC\_ERR\_STATUS\_DEBUG[03] – EMIF protection violation
  - CONTROL\_SEC\_ERR\_STATUS\_DEBUG[04] – IVAHD protection violation
  - CONTROL\_SEC\_ERR\_STATUS\_DEBUG[05] – Cortex-M3 protection violation
  - CONTROL\_SEC\_ERR\_STATUS\_DEBUG[06] – SL2 protection violation
  - CONTROL\_SEC\_ERR\_STATUS\_DEBUG[13] – SGX protection violation

- CONTROL\_SEC\_ERR\_STATUS\_DEBUG[14] – DSS protection violation
- CONTROL\_SEC\_ERR\_STATUS\_DEBUG[15] – ISS protection violation
- CONTROL\_SEC\_ERR\_STATUS\_DEBUG[18] – DEBUG protection violation
- CONTROL\_SEC\_ERR\_STATUS\_DEBUG[19] – ABE protection violation

For more information, see [Chapter 18, Control Module](#).

### 13.2.3.7.3.5 L3 Firewall Default Configuration

[Table 13-27](#) summarizes the configuration of the L3 firewalls.

**Table 13-27. L3 Firewalls Default Configurations**

Device/Region: 0						
Permission Type	Reset Value	Reset Value	Reset Type	Run Time	Firewall Register (where j = 0)	Control Module Register
ACCESS_PERMISSION	All	0xFFFF	Exported	Configurable	MRM_PERMISSION_REGION_LOW_j[11:0]	CONTROL_CORE_L3_HW_FW_EXPORTED_VALUES_CONF[k]
DEBUG_PERMISSION	All	0xF	Exported	Configurable	MRM_PERMISSION_REGION_LOW_j[15:12]	CONTROL_CORE_L3_HW_FW_EXPORTED_VALUES_CONF[l] CONTROL_CORE_L3_HW_FW_EXPORTED_VALUES_CONF[k]
INITIATOR_PERMISSION	All	0xFFFF FFFFF	Tied	Configurable	MRM_PERMISSION_REGION_HIGH_j[31:0]	N/A

**NOTE:** For the values of k and l, see [Table 13-28](#).

**Table 13-28. Control Module Register – Factorization**

Variable Value		Module Name	Regions
k	l		
3	19	L3 RAM firewall	Regions 1 to 9
0	16	GPMC firewall	Regions 1 to 7
7	23	SL2 firewall	Regions 1 to 7
6	22	SGX firewall	Regions 1 to 7
5	21	ISS firewall	Regions 1 to 7
5	21	Cortex-M3 firewall	Regions 1 to 7
4	20	DSS firewall	Regions 1 to 7
8	24	IVAHD firewall	Regions 1 to 7
12	28	DEBUG firewall	Region 1
13	29	ABE firewall	Region 1
11	27	EMIF firewall	Regions 1 to 7

### 13.2.3.8 L3 Interconnect Error Handling

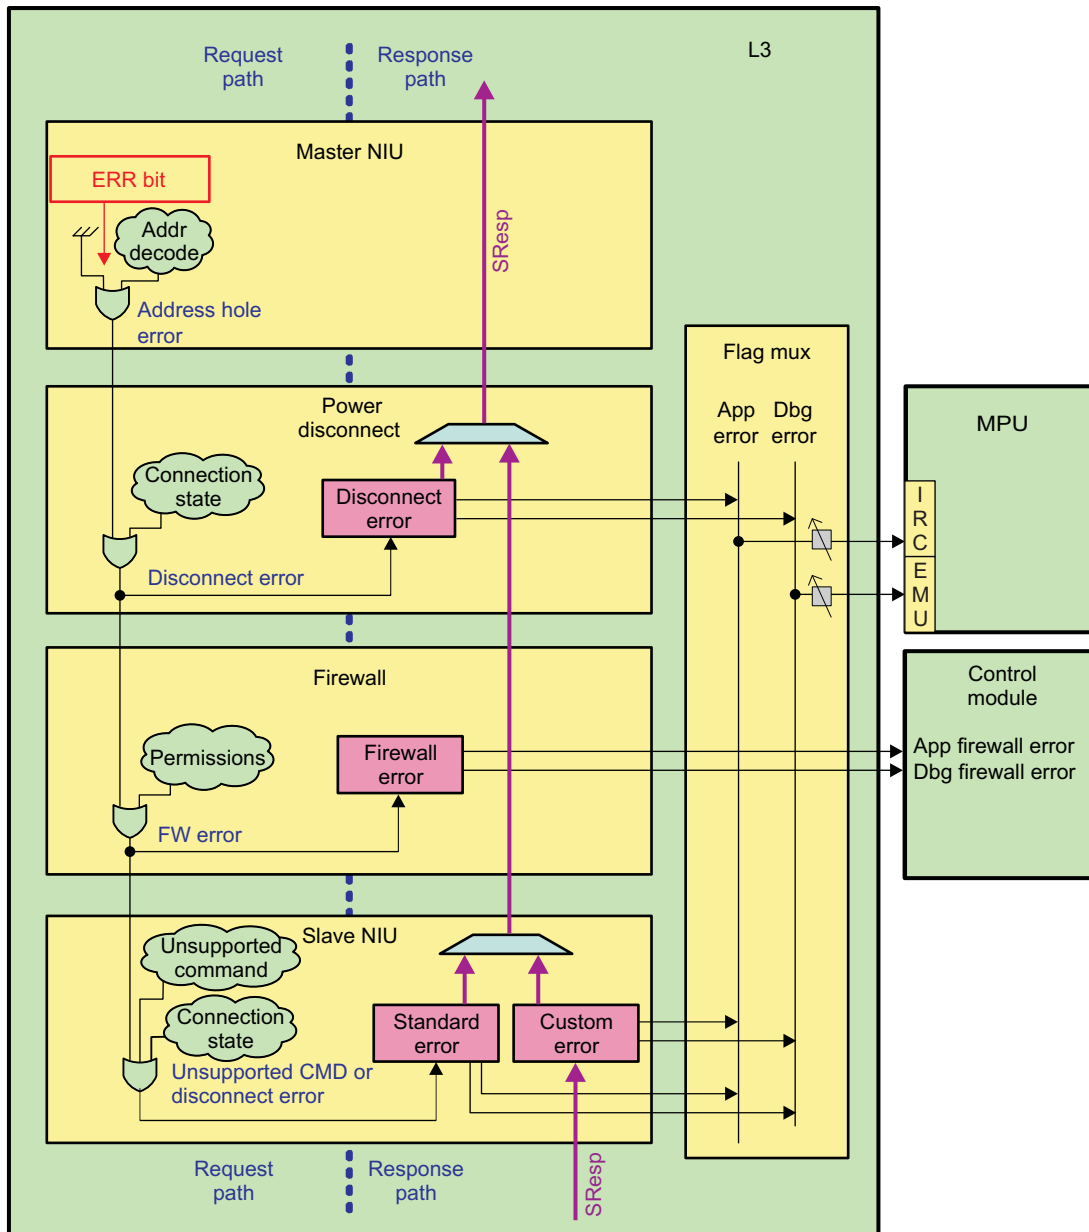

Error logging is enabled in the L3 interconnect. The three major types of errors are:

- Slave NIU errors
- Firewall errors (see [Section 13.2.3.7.3.4, L3 Firewall Error Logging](#))
- Flag mux errors

#### 13.2.3.8.1 Global Error-Routing Scheme

[Figure 13-7](#) shows the L3 global error-routing scheme.

Figure 13-7. L3 Global Error-Routing Scheme

13-005

### 13.2.3.8.2 Slave NIU Error Logging

Error logging is implemented only at slave NIUs. Because the interconnect does not support master NIU error logging, an erroneous packet must be created and sent to one of the slave NIUs. The slave NIU that receives an erroneous packet is predictable but can change per master (see [Table 13-29](#)).

**Table 13-29. L3 Connectivity and Holes Error Routing**

Master	Connectivity and Hole Errors Logged Into Slave NIUs
L3_MN_DAP	L3_SN_GPMC
L3_MN_CORTEXM3	
L3_MN_CORTEXA9	
L3_MN_SDMA_RD	
L3_MN_SDMA_WR	
L3_MN_DSP	L3_SN_DMM1
L3_MN_IVANHD	
L3_MN_MMC1	
L3_MN_MMC2	
L3_MN_SGX	L3_SN_DMM2
L3_MN_DSS	
L3_MN_ISS	
L3_MN_FACEDETECT	
L3_MN_FSUSB	L3_SN_OCM_RAM
L3_MN_HSUSBOTG	
L3_MN_HSI	L3_SN_ABE
L3_MN_HSUSBHOST	

The slave NIU can be configured to report standard errors (errors generated within the interconnect):

- Firewall error: Protection violation; this error indicates that a request was rejected by a firewall and is reported to the control module. For more information, see [Section 13.2.3.7.3.4, L3 Firewall Error Logging](#).
- Address hole: This error reports an unknown address for a request. The address map is local to each master NIU; therefore, an address hole error is reported each time a master NIU requests an access to a slave NIU to which it is not logically connected, even if this address exists in the global L3 address map. This error is detected only once per burst.
- Unsupported commands: This error reports that the master NIU sent a command that cannot be processed, because the slave NIU cannot accept it and no conversion to another command is possible. This error is detected only once per burst.
- Report custom errors: Basically, when the slave answer is SResp = ERR
- Report severity level, for standard error and custom errors:
  - None: Error logging for this type of error is disabled.
  - Error: Error is logged for this type of error.
  - Fault: Error is logged and interrupt is generated for this type of error.
- Generate interrupt on 2 bits depending on the MReqDebug qualifier:
  - Application error -> Fault[0]
  - Debug error -> Fault[1]

By default, all slave NIUs are configured with standard and custom error levels set to FAULT. The errors are reported on the two flag muxes (see [Figure 13-7](#)), depending on the access type, application or debug. For more information, see [Section 13.2.3.8.3, Flag Mux Error Logging](#).

The slave NIU power-disconnect component also has error logging enabled. This is because the slave NIU in this case is in a clock domain that is switched off and therefore cannot catch the error. By nature, this component can generate only standard errors. By default, it is configured with the error level set to FAULT.

Wake up on demand: If an error packet reaches a slave NIU that is set with MDiscBehave = 1 (wake up on demand), then the active signal is asserted and L3 processes the error generation when the slave is awake. This is inefficient but it simplifies NIU implementation and should not be a problem, because errors are supposed to occur only during software debug.

### 13.2.3.8.3 Flag Mux Error Logging

All fault signals are sent to a flag mux component. There are four important FLAGMUX registers:

- [L3\\_FLAGMUX\\_MASK0](#): Masks application error sources
- [L3\\_FLAGMUX\\_MASK1](#): Masks debug error sources
- [L3\\_FLAGMUX\\_REGERR0](#): Checks which application error sources are active
- [L3\\_FLAGMUX\\_REGERR1](#): Checks which debug error sources are active

The two L3\_FLAGMUXMASK registers mask bit 0 or bit 1 of the flag inputs, and the L3\_FLAGMUX\_REGERR registers read input errors. Each register is dedicated to reporting the bit corresponding to the register number.

[Table 13-30](#) describes the mapping of the flags to the corresponding sources.

**Table 13-30. Interconnect Flag Mapping**

	Flag Mux Input	Source
CLK1 flag mux	0	L3_SN_DMM1
	1	L3_SN_DMM2
	2	L3_SN_ABE
	3	L3_SN_L4CFG
	4	CLK2 PWR DISC
CLK2 flag mux	0	L3_SN_Cortex-M3
	1	L3_SN_DSS
	2	L3_SN_GPMC
	3	L3_SN_ISS
	4	L3_SN_IVAHD
	5	Reserved
	6	L3_SN_L4PER0
	7	L3_SN_OCMCRAM
	8	L3_SN_GPMC
	9	L3_SN_SGX
	10	L3_SN_SL2
	11	Reserved
	12	CLK1 PWR DISC
	13	Reserved
	14	Reserved
	15	L3_SN_L4PER3
	16	L3_SN_L4PER1
17	L3_SN_L4PER2	
CLK3 flag mux	0	DEBUGSS

### 13.2.3.8.4 Severity Level of Standard and Custom Errors

The slave NIU registers are important for error logging.

- The [L3\\_TARG\\_STDERRLOG\\_SVRTSTDLVL](#) register shows the severity level for standard errors. According to the severity level, error logging is disabled, enabled with level ERROR, or enabled with level ERROR and flag FAULT.
- The [L3\\_TARG\\_STDERRLOG\\_SVRTCUSTOMLVL](#) register shows the severity level for custom errors (see ).
- The [L3\\_TARG\\_STDERRLOG\\_MAIN](#) register is the main register for error-logging management. It shows the validity of the logged information, standard or custom.
- The [L3\\_TARG\\_STDERRLOG\\_HDR](#) register stores packets in case of a standard error.

- The [L3\\_TARG\\_STDERRLOG\\_MSTADDR](#) register returns the MSTADDR field of the logged packet.
- The [L3\\_TARG\\_STDERRLOG\\_SLVADDR](#) register returns the SLVADDR field of the stored packet.
- The [L3\\_TARG\\_STDERRLOG\\_INFO](#) register saves the information field of the logged packet.

## 13.2.4 L3 Interconnect Programming Guide

### 13.2.4.1 L3 Interconnect Low-Level Programming Models

This section describes the low-level hardware programming sequences for configuring and using the L3 interconnect module.

#### 13.2.4.1.1 Global Initialization

##### 13.2.4.1.1.1 Global Initialization of Surrounding Modules

This section identifies the requirements for initializing the surrounding modules when the L3 interconnect module is to be used for the first time after a device reset. The initialization of surrounding modules is based on the integration and environment of the L3 interconnect. For more information, see [Section 13.2.2, L3 Interconnect Integration](#).

**Table 13-31. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	For information about the configuration of the PRCM module, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Control module	For information about the configuration of the control module, see <a href="#">Chapter 18, Control Module</a> .
MPU INTC	The MPU INTC must be configured to enable interrupts from the L3 interconnect module. See <a href="#">Chapter 17, Interrupt Controllers</a> .
sDMA	For information about the configuration of the sDMA, see <a href="#">Chapter 16, sDMA</a> .
L3 interconnect	For information about the configuration of the interconnect, see <a href="#">Chapter 13, Interconnect</a> .

### 13.2.4.2 Operational Modes Configuration

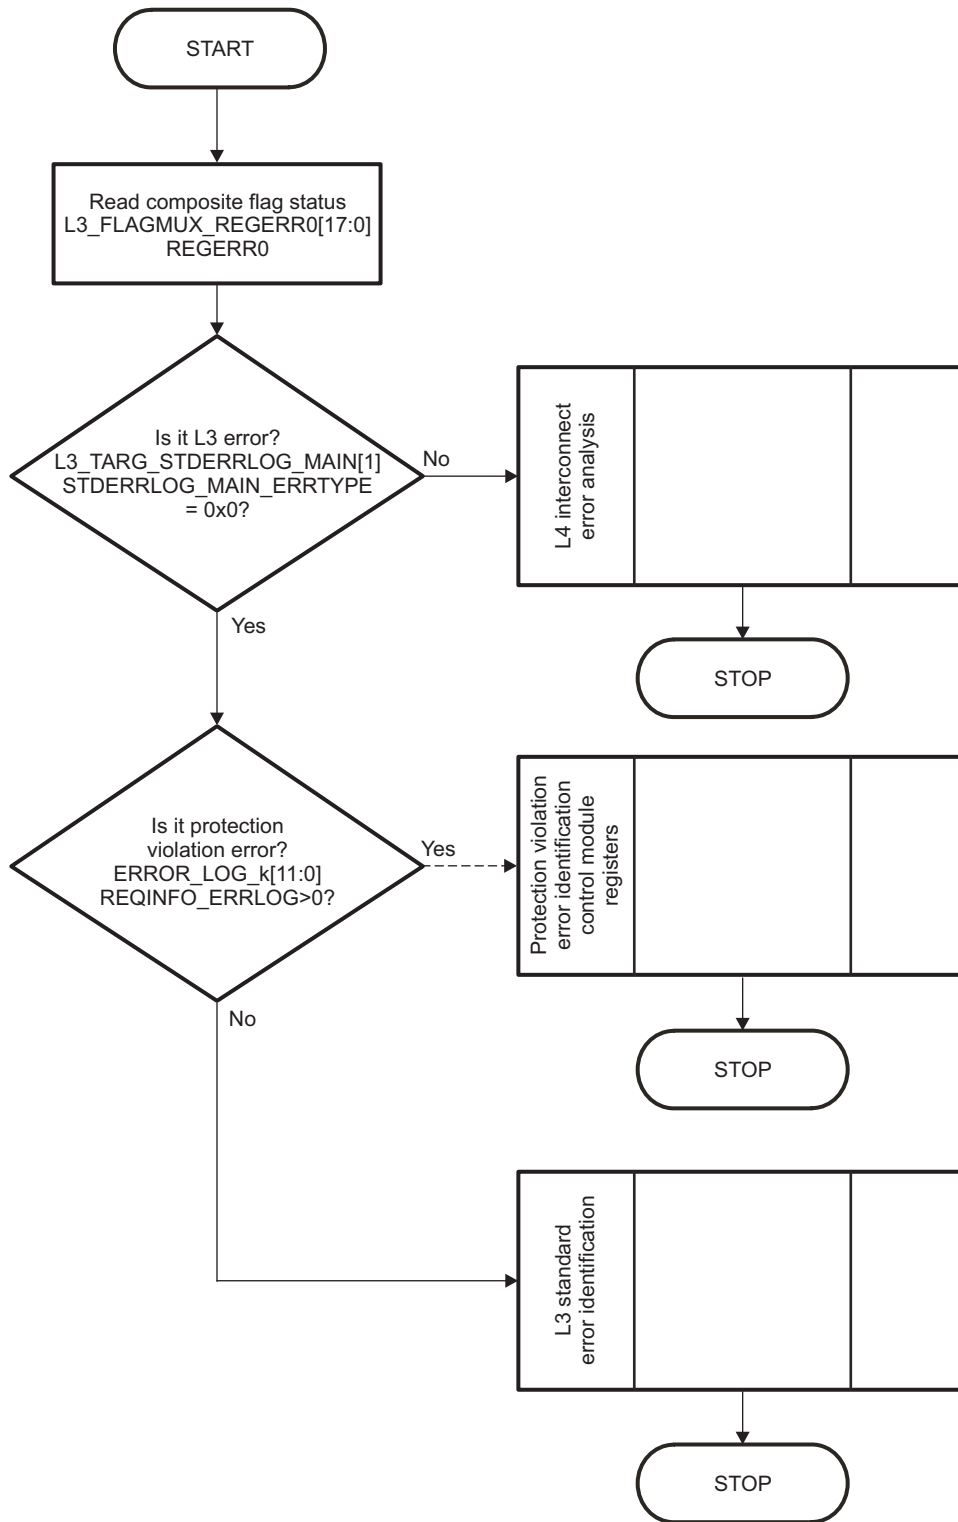

#### 13.2.4.2.1 L3 Interconnect Error Analysis Mode

##### 13.2.4.2.1.1 Main Sequence: L3 Interconnect Error Analysis Mode

The information required to analyze an error source is logged in several registers. The number of registers to access depends on the error source.

[Figure 13-8](#) shows the software sequence required in most cases.

Figure 13-8. Typical Error Analysis Sequence

I3-013

Table 13-32 lists the register call summary for error analysis mode in the main sequence.

**Table 13-32. Register Call Summary: Main Sequence – Error Analysis Mode**

Register Name	Register Name	Register Name
<a href="#">ERROR_LOG_k</a>	<a href="#">L3_FLAGMUX_REGERR0</a>	<a href="#">L3_FLAGMUX_REGERR1</a>
<a href="#">L3_TARG_STDERRLOG_MAIN</a>	CONTROL.CONTROL_SEC_ERR_STAT US_FUNC	CONTROL.CONTROL_SEC_ERR_STAT US_DEBUG

[Table 13-33](#) lists the subprocess call summary for error analysis mode in the main sequence.

**Table 13-33. Subprocess Call Summary for Main Sequence – Error Analysis Mode**

Subprocess	Cross-Reference
L4 interconnect error analysis	See <a href="#">Section 13.2.4.2.1</a> , <i>L4 Interconnect Error Analysis Mode</i> .
L3 interconnect protection violation error identification	See <a href="#">Section 13.2.4.2.1.1.2</a> , <i>Subsequence: L3 Interconnect Protection Violation Error Identification</i> .
L3 interconnect unsupported command/address hole error identification	See <a href="#">Section 13.2.4.2.1.1.3</a> , <i>Subsequence: L3 Interconnect Unsupported Command/Address Hole Error Identification</i> .
L3 interconnect reset FLAGMUX and module	See <a href="#">Section 13.2.4.2.1.1.4</a> , <i>Subsequence: L3 Interconnect Reset FLAGMUX and Module</i> .

### 13.2.4.2.1.1.1 L3 Custom Error Identification

[Table 13-34](#) demonstrates custom error identification.

**Table 13-34. Custom Error Identification**

Step	Register	Value
IF: Is CustomError detected?	<a href="#">L3_TARG_STDERRLOG_MAIN</a> [1] STDERRLOG_MAIN_ERRTYPE	= 0x1
Read info field of the response packet.	<a href="#">L3_TARG_STDERRLOG_CUSTOMINFO_INFO</a> [7:0] STDERRLOG_CUSTOMINFO_INFO	xxx
Read the address of the initiator that caused the error.	<a href="#">L3_TARG_STDERRLOG_CUSTOMINFO_MSTADDR</a> [7:0] STDERRLOG_CUSTOMINFO_MSTADDR	xxx
Read the type of the operation (read/write).	<a href="#">L3_TARG_STDERRLOG_CUSTOMINFO_OPCODE</a> [1:0] STDERRLOG_CUSTOMINFO_OPCODE	xxx
ENDIF		

**NOTE:** To understand why the target IP has returned an error, the user must read the target IP registers.

### 13.2.4.2.1.1.2 Subsequence: L3 Interconnect Protection Violation Error Identification

The procedure listed in [Table 13-35](#) describes protection violation error identification and where it is logged in the control module registers. Two types of errors are logged: application errors and debug errors.

**Table 13-35. Protection Violation Error Identification**

Step	Register/Bit Field/Programming Model	Value
Read the burst violation.	<a href="#">ERROR_LOG_k</a> [23] BLK_BURST_VIOLATION	xxx
Read the initiator ID.	<a href="#">ERROR_LOG_k</a> [11:8] CONNID	xxx
Read the command that caused the error.	<a href="#">ERROR_LOG_k</a> [7] MCMD	xxx
Read the address of the request that caused the error.	<a href="#">LOGICAL_ADDR_ERRLOG_k</a> [31:12] SLVOFS_LOGICAL	xxx
<b>IF:</b> Is it an application error?	<a href="#">L3_FLAGMUX_REGERR0</a> [17:0] REGERROR0	= 0x0
Read the status bits to see which module firewall has worked.	CONTROL.CONTROL_SEC_ERR_STATUS_FUNC[20:0]	xxx
Clear the status bits.	CONTROL.CONTROL_SEC_ERR_STATUS_FUNC[20:0]	xxx

**Table 13-35. Protection Violation Error Identification (continued)**

Step	Register/Bit Field/Programming Model	Value
Clear the status bit.	<a href="#">L3_TARG_STDERRLOG_MAIN</a> [31] STDERRLOG_MAIN_CLRLOG	0x0
<b>ELSE IF</b>	<a href="#">L3_FLAGMUX_REGERR1</a> [17:0] REGERROR1	= 0x1
Read the status bits to see the module.	CONTROL.CONTROL_SEC_ERR_STATUS_DEBUG[20:0]	xxx
Clear the status bits.	CONTROL.CONTROL_SEC_ERR_STATUS_DEBUG[20:0]	xxx
Clear the status bit.	<a href="#">L3_TARG_STDERRLOG_MAIN</a> [31] STDERRLOG_MAIN_CLRLOG	0x0
<b>ENDIF</b>		
Clear the burst violation.	<a href="#">ERROR_LOG_k</a> [23] BLK_BURST_VIOLATION	0x0
Clear the error status.	<a href="#">ERROR_LOG_k</a> [21:17] REGION_START_ERRLOG	0x00

#### 13.2.4.2.1.1.3 Subsequence: L3 Interconnect Standard Error Identification

The procedure listed in [Table 13-36](#) describes the identification of standard errors inside the L3 interconnect. The standard errors are: unsupported command, address hole, and disconnect.

**Table 13-36. L3 Standard Error Identification**

Step	Register/Bit Field/Programming Model	Value
<b>IF:</b> Is an error detected?	<a href="#">L3_TARG_STDERRLOG_MAIN</a> [18] STDERRLOG_MAIN_ERRCNT	= 0x1
Read the corresponding flag.	<a href="#">L3_FLAGMUX_REGERR0</a> [17:0] REGERROR0	xxx
Read the corresponding flag.	<a href="#">L3_FLAGMUX_REGERR1</a> [17:0] REGERROR1	xxx
Localize the slave NIU that generated the error.	See <a href="#">Table 13-30</a> , <i>Interconnect Flag Mapping</i> .	
<b>ELSE</b>		
Clear the error log.	<a href="#">L3_TARG_STDERRLOG_MAIN</a> [31] STDERRLOG_MAIN_CLRLOG	0x0
Clear the severity error status.	<a href="#">L3_TARG_STDERRLOG_SVRTSTDLVL</a> [1:0] STDERRLOG_SVRTSTDLVL_0	0x2
<b>ENDIF</b>		

#### 13.2.4.2.1.1.4 Subsequence: L3 Interconnect FLAGMUX Configuration

The procedure listed in [Table 13-37](#) gives information about the configuration of FLAGMUX masks.

**Table 13-37. FLAGMUX Configuration**

Step	Register/Bit Field/Programming Model	Value
Set the FLAGMUX masks to mask an event.	<a href="#">L3_FLAGMUX_MASK0</a> [17:0] MASK0 <a href="#">L3_FLAGMUX_MASK1</a> [17:0] MASK1	xxx
Read the REGERR bits to see if an error is recorded.	<a href="#">L3_FLAGMUX_REGERR0</a> [17:0] REGERR0 <a href="#">L3_FLAGMUX_REGERR1</a> [17:0] REGERR1	xxx
Clear the slave NIU error log and the FLAGMUX error.	<a href="#">L3_TARG_STDERRLOG_MAIN</a> [31] STDERRLOG_SVRTSTDLVL_0	0x2

## 13.2.5 L3 Interconnect Register Manual

### 13.2.5.1 L3 Register Group Summary

The registers in the L3 interconnect are divided into eight groups:

- Firewall registers [Table 13-39](#)
- HOST registers [Table 13-61](#)
- TARG registers [Table 13-97](#)
- PWR\_DISK registers [Table 13-139](#)
- FLAGMUX registers [Table 13-163](#)
- BW registers [Table 13-178](#)
- RA registers [Table 13-193](#)
- STATCOLL registers [Table 13-201](#)

#### 13.2.5.1.1 L3 Firewall Registers Summary and Description

**Table 13-38. L3 Firewall Instance Summary**

Module Name	Base Address	Size
MA Firewall	0x4A20 A000	4KB
EMIF Firewall	0x4A20 C000	4KB
GPMC Firewall	0x4A21 0000	4KB
L3 RAM Firewall	0x4A21 2000	4KB
SGX Firewall	0x4A21 4000	4KB
ISS Firewall	0x4A21 6000	4KB
Dual Cortex-M3 Firewall	0x4A21 8000	4KB
DSS Firewall	0x4A21 C000	4KB
SL2 Firewall	0x4A21 E000	4KB
IVA-HD Firewall	0x4A22 0000	4KB
Debug Firewall	0x4A22 6000	4KB
L4-ABE Firewall	0x4A22 8000	4KB

#### 13.2.5.1.1.1 L3 Firewall Registers Summary

**Table 13-39. L3 Firewall Registers Summary**

Register Name	Type	Register Width (Bits)	Address Offset	MA Firewall L3 Physical Address	EMIF Firewall L3 Physical Address	GPMC Firewall L3 Physical Address	L3 RAM Firewall L3 Physical Address

STDERRLOG_SLVOFSLSB																															

Bits	Field Name	Description	Type	Reset
31:0	STDERRLOG_SLVOFSLSB	LSB of the slave offset field, concatenated with start offset field of the logged packet. Type: Status. Reset value: X.	R	0x0000 0000

<b>Description</b>			
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																RESERVED	STDHOSTHDR_MAINCTLREG_CM	STDHOSTHDR_MAINCTLREG_FLT	RESERVED	STDHOSTHDR_MAINCTLREG_EN											

Bits	Field Name	Description	Type	Reset
31:5	RESERVED	Reserved	R	0x00000000
4	RESERVED	Reserved	R	0
3	STDHOSTHDR_MAINCTLREG_CM	Reserved for internal testing. Must be set to 0. Type: Control. Reset value: 0x0.	R	0
2	STDHOSTHDR_MAINCTLREG_FLT	Asserted when a Fault condition is detected: if the unit includes Error Logging, Flt is asserted when the FltCnt register field indicates a Fault, and deasserted when FltCnt is reset. If no Error Logging is implemented, this bit becomes unit-dependent. In all cases, Flt bit and Flt pin (service network) have the same logical level. Type: Status. Reset value: X.	R	0
1	RESERVED	Reserved	R	0
0	STDHOSTHDR_MAINCTLREG_EN	Sets the global core enable. Note: A disabled master does not generate any NTPP requests, and a disabled slave replies with an error packet to any request it receives. Type: Control. Reset value: 0x1.	RW	1

### 13.3 L4 Interconnects

This section details the device L4 interconnects.

#### 13.3.1 L4 Interconnect Overview

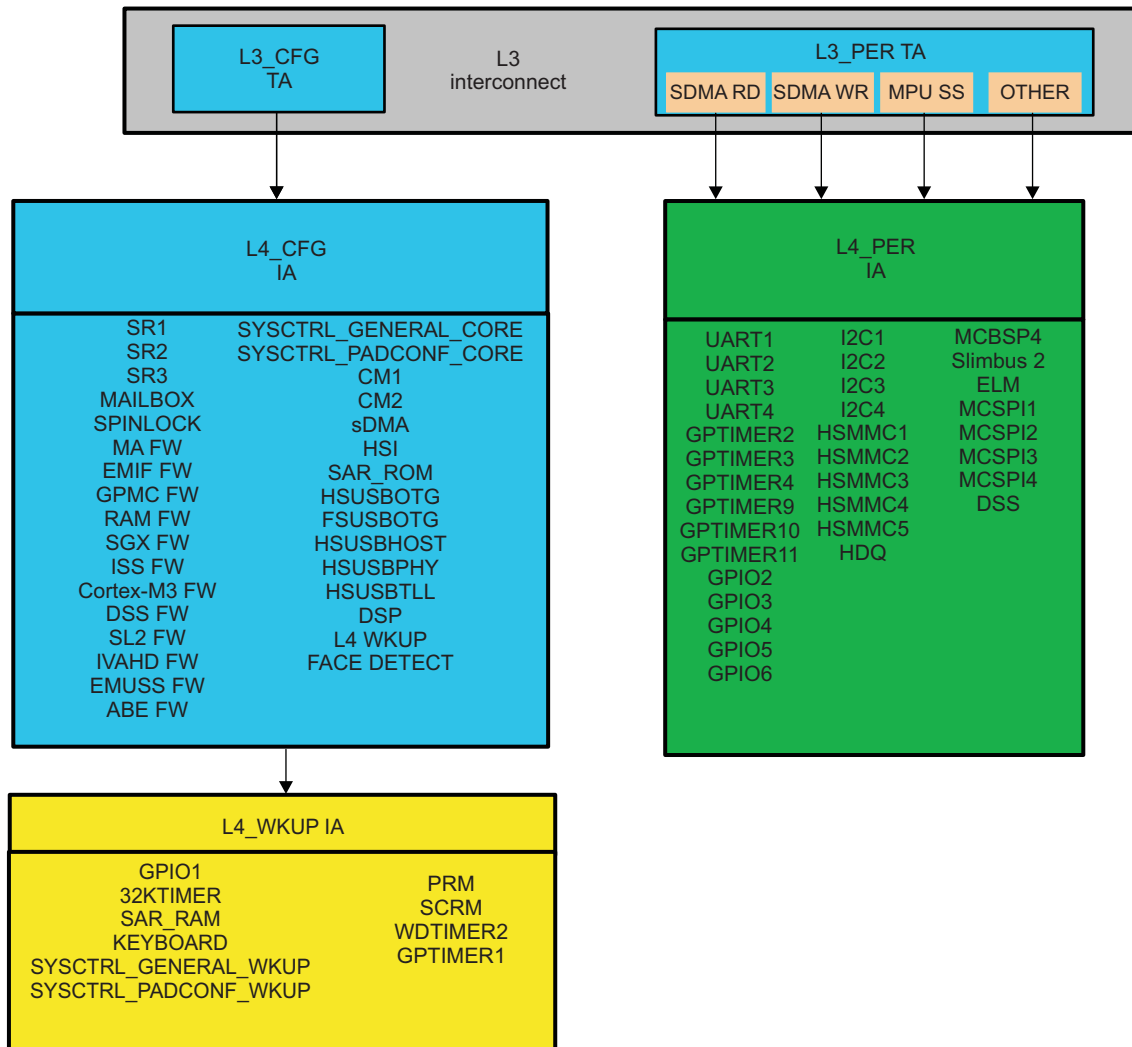

The device uses three separate L4 interconnect structures to connect peripheral modules. All L4s handle transfers with peripherals but are located in distinct power domains.

Figure 13-9 is an overview of the L4 interconnects and the peripherals attached to them.

The L4 interconnect is composed of the following interconnects:

- L4\_CFG: Includes the majority of the configuration interface for L3 system modules and peripheral interconnect
- L4\_PER: Includes the main peripherals that require sDMA access
- L4\_WKUP: Includes peripherals attached to the WKUP power domain

Figure 13-9. L4 Interconnect Overview

icnt-013

The main features of the L4 interconnects are:

- From one to four 32-bit initiator ports for each L4 interconnect instance.
- 8-, 16-, or 32-bit data, single, or burst transactions
- Little endian

- Nonblocking architecture with fair arbitration between threads
- Target interfaces: Fully synchronous or divided synchronous
- L4\_CFG and L4\_PER frequency equal half of L3 frequency
- Protection logic that provides user-configurable access control to targets by each initiator
- Implementation of RFFs to support low-voltage dynamic power switching

### 13.3.2 L4 Interconnect Integration

Table 13-278 and Table 13-279 summarize the integration of the module in the device.

**Table 13-278. Integration Attributes**

Module Instance	Attributes
	Power Domain
L4_PER	PD_L4_PER
L4_CFG	PD_CORE
L4_WKUP	PD_WKUP

**Table 13-279. Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L4_PER	L4_PER_CLK	PER_L4_ICLK	PRCM module	Functional and interface clock
L4_CFG	L4_CFG_CLK	CFG_L4_ICLK	PRCM module	Functional and interface clock
L4_WKUP	L4_WKUP_CLK	WKUP_L4_ICLK 2	PRCM module	Functional and interface clock
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L4_PER	L4_PER_RST	L4_PER_RST	PRCM module	Reset of L4_PER interconnect
	L4_PER_RET_RST	L4_PER_RET_RST	PRCM module	Reset of L4_PER interconnect retention registers. For information about retention reset, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
L4_CFG	L4_CFG_RST	CORE_RST	PRCM module	Reset of L4_CFG interconnect
	L4_CFG_RET_RST	CORE_RET_RS T	PRCM module	Reset of L4_CFG interconnect retention registers. For information about retention reset, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
L4_WKUP	L4_WKUP_RST	WKUP_RST	PRCM module	Reset of L4_WKUP interconnect

### 13.3.3 L4 Interconnect Functional Description

#### 13.3.3.1 Module Distribution

IAs and TAs provide the interface to connect the different modules to their associated interconnect.

[Table 13-280](#) through [Table 13-285](#) list all the modules and subsystems with their associated agents. The agents are listed for each L4 interconnect domain.

##### 13.3.3.1.1 L4\_PER Interconnect Agents

The L4\_PER interconnect handles transfers only to peripherals in the PER power domain. [Table 13-280](#) lists the PER TAs.

**Table 13-280. L4 PER TAs**

Module Target Name	Description
PER_TA_UART1	UART port 1 module
PER_TA_UART2	UART port 2 module
PER_TA_UART3	UARTport 3 module
PER_TA_UART4	UART port 4 module
PER_TA_GPTIMER2	GPTIMER2 module
PER_TA_GPTIMER3	GPTIMER3 module
PER_TA_GPTIMER4	GPTIMER4 module
PER_TA_GPTIMER9	GPTIMER9 module
PER_TA_GPTIMER10	GPTIMER10 module
PER_TA_GPTIMER11	GPTIMER11 module
PER_TA_DSS	Display subsystem configuration module
PER_TA_GPIO2	General-purpose input/output 2 (GPIO2) module
PER_TA_GPIO3	GPIO3 module
PER_TA_GPIO4	GPIO4 module
PER_TA_GPIO5	GPIO5 module
PER_TA_GPIO6	GPIO6 module
PER_TA_I2C1	I2C1 module
PER_TA_I2C2	Multimaster I2C2 module
PER_TA_I2C3	Multimaster I2C3 module
PER_TA_I2C4	Multimaster I2C4 module
PER_TA_SLIMBUS2	Silmbus 2 module
PER_TA_ELM	Error location module
PER_TA_MCBSP4	McBSP4 module
PER_TA_MCSPI1	McSPI1 module
PER_TA_MCSPI2	MCSP12 module
PER_TA_MCSPI3	MCSP13 module
PER_TA_MCSPI4	MCSP14 module
PER_TA_HSMMC1	MMC controller 1 module
PER_TA_HSMMC2	MMC controller 2 module
PER_TA_HSMMC3	MMC controller 3 module
PER_TA_HSMMC4	MMC controller 4 module
PER_TA_HSMMC5	MMC controller 5 module
PER_TA_HDQ	Single-wire serial link low-rate module

Four ports communicate between the L3 interconnect and the L4\_PER interconnect to allow the L3 initiators to access the L4\_PER targets. [Table 13-281](#) lists the L4\_PER initiator TAs.

For the list of initiators authorized to access the L4 peripheral peripherals, see , *Connectivity Matrix*.

**Table 13-281. L4\_PER IAs**

Module Initiator Name	Description
PER_IA_0	L3 system direct memory access (sDMA) RD interconnect port
PER_IA_1	L3 sDMA WR interconnect port
PER_IA_2	L3 MPU subsystem interconnect port
PER_IA_3	L3 others interconnect port

### 13.3.3.1.2 L4\_CFG Interconnect Agents

The L4\_CFG interconnect handles only transfers to peripherals in the core power domain. [Table 13-282](#) lists the TAs.

**Table 13-282. L4\_CFG TAs**

Module Target Name	Description
CFG_TA_SYSCTRL_GENERAL_CORE	System control general core module
CFG_TA_SYSCTRL_PADCONF_CORE	System control padconf core module
CFG_TA_CM1	Clock manager 1 module
CFG_TA_CM2	Clock manager 1 module
CFG_TA_SDMA	sDMA module
CFG_TA_HSI	HS SSI module
CFG_TA_SAR_ROM	Save-and-restore ROM
CFG_TA_HSUSBOTG	HS USB OTG module
CFG_TA_FSUSBHOST	FS USB OTG module
CFG_TA_HSUSBHOST	HS USB host module
CFG_TA_HSUSBPHY	HS USB PHY module
CFG_TA_HSUSBTLL	USB TTL module
CFG_TA_DSP	DSP subsystem
CFG_TA_SR1	SmartReflex1 module
CFG_TA_SR2	SmartReflex2 module
CFG_TA_SR3	SmartReflex3 module
CFG_TA_MAILBOX	Mailbox module
CFG_TA_SPINLOCK	Spinlock module
CFG_TA_FACEDETECT	Face detect module
CFG_TA_MAFW	Memory Adapter firewall
CFG_TA_EMIFFW	EMIF firewall
CFG_TA_GPMCFW	GPMC firewall
CFG_TA_OCMRAMFW	RAM firewall
CFG_TA_SGXFW	SGX firewall
CFG_TA_ISSF	ISS firewall
CFG_TA_CORTEXM3FW	Cortex-M3 firewall
CFG_TA_DSSFW	Display subsystem (DSS) firewall
CFG_TA_SL2FW	SL2 firewall
CFG_TA_IVAHDFW	IVA-HD firewall
CFG_TA_EMUSSF	EMU subsystem firewall
CFG_TA_ABEFW	ABE firewall
CFG_TA_L4WKUP	L4_WKUP connection

A unique port, CFG\_IA\_0, communicates between the L3 interconnect and the L4\_CFG interconnect to allow the L3 initiators to access the L4\_CFG targets (see [Table 13-283](#)).

For the list of initiators authorized to access the L4\_CFG peripherals, see [Connectivity Matrix](#).

**Table 13-283. L4\_CFG IAs**

Module Initiator Name	Description
CFG_IA_0	L3 interconnect port

### 13.3.3.1.3 L4\_WKUP Interconnect Agents

The L4-WKUP interconnect handles transfers only to peripherals in the WKUP power domain. [Table 13-284](#) lists the TAs. [Table 13-285](#) lists the L4 WKUP initiator agents.

**Table 13-284. L4\_WKUP TAs**

Module Target Name	Description
WKUP_TA_GPIO1	GPIO1 module
WKUP_TA_32KTIMER	32-kHz timer module
WKUP_TA_SAR_RAM	Save-and-restore RAM
WKUP_TA_KEYBOARD	Keyboard module
WKUP_TA_SYSCTRL_GENERAL_WKUP	System control general WKUP module
WKUP_TA_SYSCTRL_PADCONF_WKUP	System control padconf WKUP module
WKUP_TA_PRM	Power reset management module
WKUP_TA_SCRM	System clock and reset management module
WKUP_TA_WDTIMER2	WDTIMER2 module
WKUP_TA_GPTIMER1	GPTIMER1 module

**Table 13-285. L4\_WKUP IAs**

Module Initiator Name	Description
WKUP_IA_0	L4_CFG interconnect port

### 13.3.3.2 Power Management

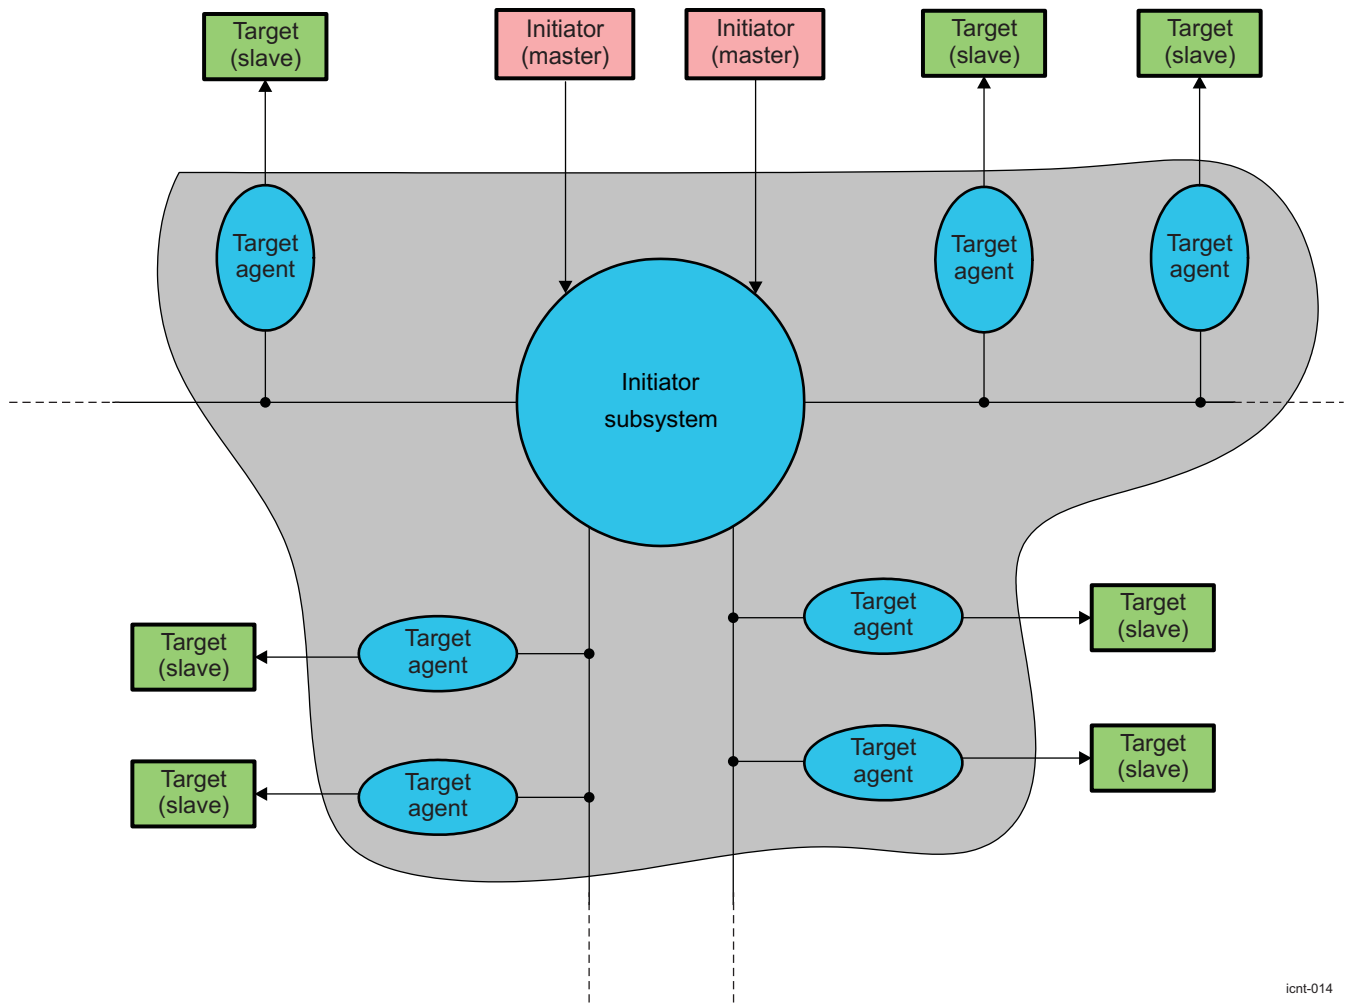

As part of the system-wide power-management scheme, the L4 interconnects go into IDLE state after receiving a request from the PRCM module after all commands are serviced. This function is handled by hardware. For more information, see [Chapter 3, Power, Reset, and Clock Management](#).

To reduce power consumption, each L4 interconnect automatically performs internal clock autogating. This is managed by hardware; no software configurations or settings are required.

Retention is performed on all software-accessible registers at IAs, TAs, and firewalls. This process prevents reconfiguration after a clock domain switches off. For more information, see [Chapter 3, Power, Reset, and Clock Management](#).

### 13.3.3.3 L4 Firewalls

[Figure 13-10](#) is an internal view of the L4 interconnects in the overall interconnect. This architecture, with one initiator subsystem centralizing all initiator master requests and distributing them to all target modules (peripherals), enables the L4 interconnect firewall functions to be centralized at the L4 initiator subsystem level. The L4 firewall filters the accesses based on the configurable protection groups defined in the L4 address protection (AP) registers. Each module or TA is assigned to a protection group. The configuration is also defined in the L4 AP and is programmable on a module-per-module basis.

**Figure 13-10. L4 Initiator-Target Connectivity**

icnt-014

**NOTE:** As Figure 13-10 shows, targets are attached to branches. Branches do not impact the function of the L4 interconnect but are present to simplify timing closure and reduce active power consumption.

Because of the large address spaces and the number of peripherals connected to an L4 interconnect, two parameters are used to set up access permission:

- Programmable groups for initiators
  - Eight protection groups for L4\_PER and L4\_CFG interconnect
- Segments divided into regions of 4KB
  - 100 regions for the L4\_PER interconnect
  - 104 regions for the L4\_CFG interconnect

**NOTE:**

- Regions and segments are present for the L4\_WKUP interconnect but cannot be programmed.
- L4\_WKUP protection is done through the L4\_CFG interconnect.

Protection group members are TAs with the same protection settings. A region is programmed to allow access to a unique selectable protection group. For better protection, different regions are grouped into protection group regions and associated with a protection group member.

All L4 interconnect information, such as numbers of protection groups, regions, and segments, is available in the [L4\\_LA\\_INITIATOR\\_INFO\\_L](#) register.

### 13.3.3.1 Protection Group

A protection group is defined by its initiators and REQ\_INFO is allowed. Two registers define these two settings:

- The CONNID\_BIT\_VECTOR field [L4\\_AP\\_PROT\\_GROUP\\_MEMBERS\\_k\\_L](#) is a 1-bit vector that defines which initiator belongs to a group. A protection group is accessible by an initiator when the bit position corresponding to its ConnID is set to 1 in the CONNID\_BIT\_VECTOR field. [Table 13-286](#) lists all the ConnID available at the L4 levels.
- The ENABLE field [L4\\_AP\\_PROT\\_GROUP\\_ROLES\\_k\\_L](#) lists all possible REQ\_INFO combinations associated with the [L4\\_AP\\_PROT\\_GROUP\\_MEMBERS\\_k\\_L](#) register. Setting a Req bit in this register determines the initiators type of access. For more information, see , *L3 Firewall Functionality*. Two REQ\_INFOS are used in L4 interconnects: MReqDebug and MReqSupervisor.

---

**NOTE:** Permissions are identical for read and write accesses in L4 interconnect.

k indicates the protection group number.

L indicates the region number.

---

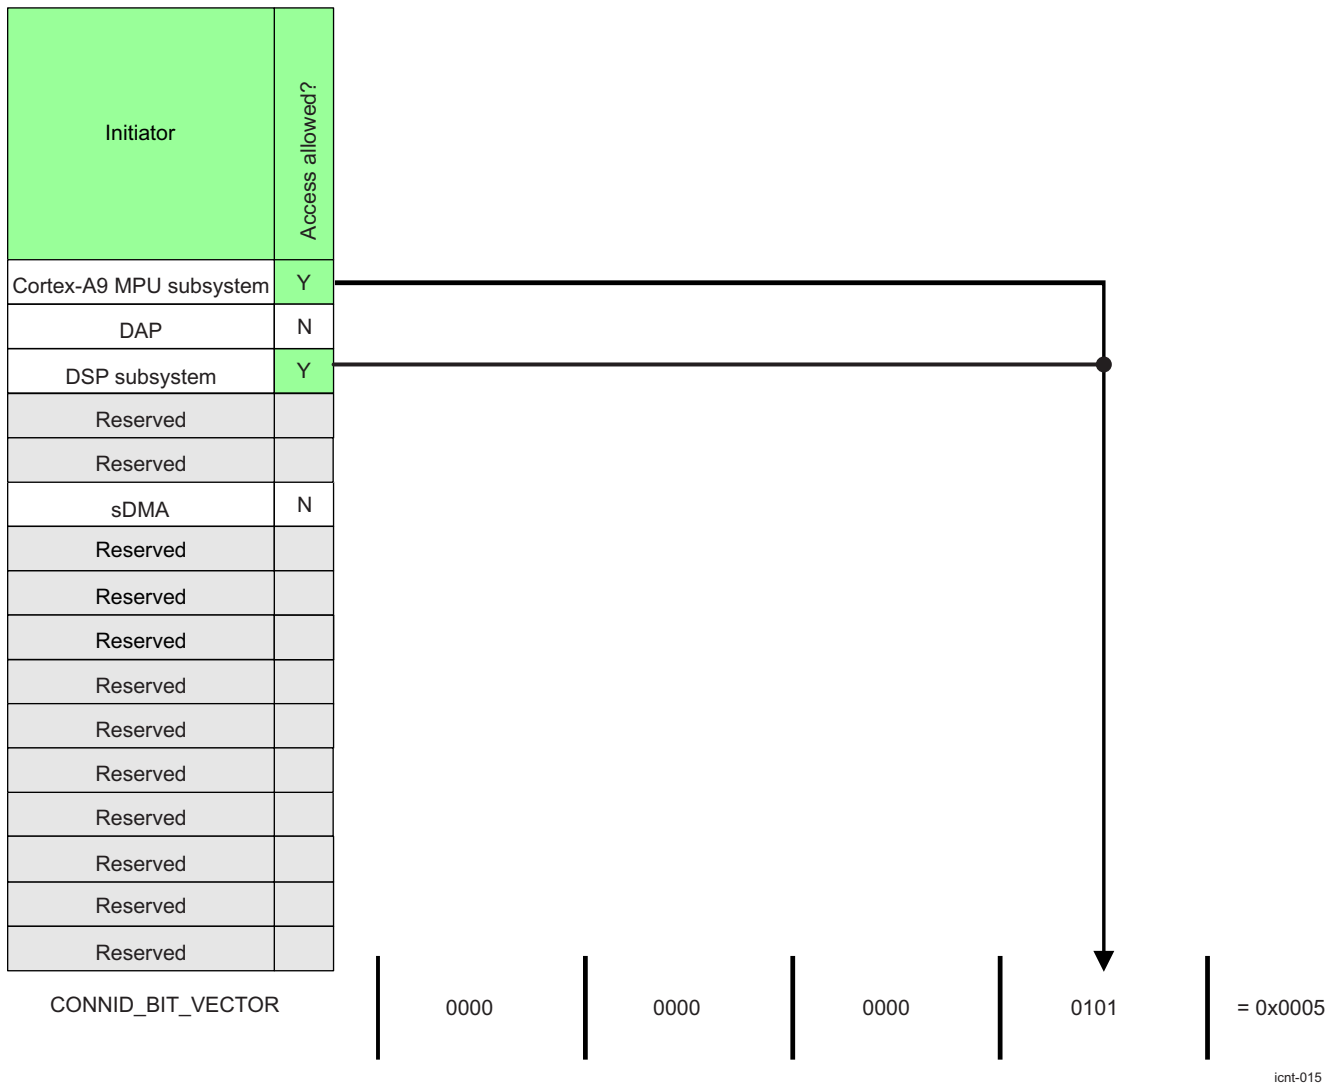

**Table 13-286. L4 ConnID Definition**

ConnID	Initiator
0	Cortex™-A9 MPU subsystem
1	DAP
2	DSP subsystem

B	Reserved
C	Reserved
D	Reserved
E	Reserved
F	Reserved

Figure 13-11 is an example of CONNID\_BIT\_VECTOR.

**Figure 13-11. Example of CONNID\_BIT\_VECTOR L4\_AP\_PROT\_GROUP\_MEMBERS\_k**

Setting bits 0 and 2 in the PROT\_GROUP\_ID\_1 register defines a group initiator that can access targets in protection group 1, and includes the following:

- Cortex-A9 MPU subsystem
- DSP subsystem

Protection group 1 can be applied to multiple protection regions with no limitation. Each protection region that is configured with protection group 1 enables permission access only to the two initiators.

The L4\_AP\_REGION\_I\_H PROT\_GROUP\_ID field determines the region to which the protection group member is attached.

The values of some CONNID\_BIT\_VECTOR and ENABLE fields are exported by the SCM at reset or are user writable (see Table 13-409 for more information).

Table 13-287 and Table 13-288 list the default configuration of the various groups for each L4 interconnect. For each group, some modules/regions are associated with it with default initiator members.

**Table 13-287. L4\_PER Firewall Default Configuration**

Group	Default Modules Associated With Group	Register	Modifiability	Default Value
Group 0 AP registers	AP registers	L4_AP_PROT_GROUP_ROL ES_0_L	No	0xFFFF FFFF (all)

### 13.3.3.2 Segments and Regions

The protection mechanism for L4 interconnects is based on a hierarchical segmentation, as shown in [Figure 13-12](#). By default, some regions are attached to specific protection group members. This specificity lets users set up the permission access to certain types of modules requiring the same access protection without managing region allocation.

Figure 13-12. L4 Segmentation

All interconnect address spaces are covered by regions. Table 13-289 through Table 13-291 list the module mapping with their addresses, region numbers, and default protection group allocated to them.

**NOTE:** Module refers to the configuration registers of the module.

TA refers to the interconnect configuration registers of the TA associated with the module.

### 13.3.3.3 L4 Firewall Address and Protection Register Settings

Table 13-292 lists the settings of the AP registers relative to an L4 interconnect firewall. These values are computed based on the physical implementation of each L4 interconnect.

**Table 13-292. L4 Firewall Register Description Overview**

Register Type	Register Name	Bits	Field	Description
Segment	L4_AP_SEGMENT_i_L <sup>(1)</sup>	23:0	BASE	Segment base address
	L4_AP_SEGMENT_i_H <sup>(1)</sup>	4:0	SIZE	Segment size equals to 2 <sup>SIZE</sup>
Protection groups	L4_AP_PROT_GROUP_MEMBERS_k_L <sup>(2)</sup>	15:0	CONNID_BIT_VECTOR	For L4ConnID, see <a href="#">Table 13-286</a> .
	L4_AP_PROT_GROUP_ROLES_k_L <sup>(2)</sup>	31:0	ENABLE	See for REQ_INFO description <sup>(3)</sup>
Region setting	L4_AP_REGION_l_L <sup>(4)</sup>	23:0	BASE	Defines the base address of region with respect to its segment base address
	L4_AP_REGION_l_H <sup>(4)</sup>	27:24	SEGMENT_ID	Segment ID number of the region
		22:20	PROT_GROUP_ID	Protection group member attached to the region
		19:17	BYTE_DATA_WIDTH_EXP	Determines the number of byte in an access
		5:1	SIZE	Size of the region equals to 2 <sup>SIZE</sup>
		0	ENABLE	Enables the region protection

<sup>(1)</sup> i = 0 to 1 for PER\_AP  
i = 0 to 6 for CFG\_AP

<sup>(2)</sup> k = 0 to 7 for PER\_AP  
k = 0 to 7 for CFG\_AP

<sup>(3)</sup> For L interconnects, only MReqDebug and MReqSupervisor are available.

<sup>(4)</sup> l = 0 to 96 for PER\_AP  
l = 0 to 113 for CFG\_AP

### 13.3.3.4 L4 Error Detection and Reporting

#### 13.3.3.4.1 IA and TA Error Detection and Logging

The L4 interconnect provides mechanisms for handling internally detected errors or errors reported by modules attached to the L4 target ports.

**NOTE:** L4\_IA denotes the IA for all L4 interconnects: L4\_PER, L4\_CFG, and L4\_WKUP.

L4\_TA denotes the TA for all L4 interconnects: L4\_PER, L4\_CFG, and L4\_WKUP.

The L4 interconnects handle four types of errors:

- No target core found or address hole, detected and logged at IA
- Unsupported command, detected and logged at IA
- Protection violation, detected and logged at IA (see [Section 13.3.3.3, L4 Firewalls](#))
- Target does not service a request before a time-out expires. The error is detected and logged at TA (see [Section 13.3.3.4.2, Time-Out](#)).

[Table 13-293](#) lists the value of the L4\_IA\_ERROR\_LOG\_L[25:24] CODE bit field stored when an error occurs.

**Table 13-293. L4 CODE Bit Field Definition**

CODE (bits 1:0)	Error Type	REQ_INFO	Secondary	ConnID	CMD
0	No error				
1	Unsupported command	x	x	x	x
2	Address hole	x	x	x	x
3	Protection violation	x		x	x

- No target core found/address hole: This error indicates that a request was addressed to a hole in the L4 address map. When this error occurs, an in-band error response is returned to the L3 level. The error is also logged into the [L4\\_IA\\_AGENT\\_STATUS\\_L\[27\]](#) INBAND\_ERROR bit. Additionally, an address hole error code is logged to the [L4\\_IA\\_ERROR\\_LOG\\_L\[25:24\]](#) CODE bit field.
- Unsupported command: This error indicates that the command type of the request is not supported by the accessed target register. The error is logged into the [L4\\_IA\\_AGENT\\_STATUS\\_L\[27\]](#) INBAND\_ERROR bit. An unsupported command error code is written to the [L4\\_IA\\_ERROR\\_LOG\\_L\[25:24\]](#) CODE bit field for the initiator interface.
- Protection violation: This error indicates that a request is not issued from an allowed initiator member or is issued with the inappropriate ReqInfo qualifiers associated with the target region. This error is reported using an in-band error and is written to the [L4\\_IA\\_AGENT\\_STATUS\\_L\[27\]](#) INBAND\_ERROR bit. A protection violation error code is saved into the [L4\\_IA\\_ERROR\\_LOG\\_L\[25:24\]](#) CODE bit field for the same initiator interface. A protection violation is also logged in the [L4\\_IA\\_AGENT\\_STATUS\\_L\[31\]](#) PROT\_ERROR\_SECONDARY or [30] PROT\_ERROR\_PRIMARY bit when in debug or applicative mode, respectively.

The [L4\\_IA\\_ERROR\\_LOG\\_L\[30\]](#) SECONDARY bit indicates whether the error occurred in application or debug.

The [L4\\_IA\\_ERROR\\_LOG\\_H\[15:0\]](#) REQ\_INFO bit field returns the type access (REQ\_INFO qualifier) that caused the error.

The [L4\\_IA\\_ERROR\\_LOG\\_L\[11:8\]](#) CONNID bit field returns the ID of the initiator that caused the error.

The [L4\\_IA\\_ERROR\\_LOG\\_ADDR\\_L\[31:0\]](#) register logs the address for error conditions.

A [L4\\_IA\\_ERROR\\_LOG\\_L\[31\]](#) MULTI bit is asserted when multiple errors are detected. In this case, the error code corresponds to the first error that occurs.

### 13.3.3.4.2 Time-Out

A time-out mechanism can be enabled at the interconnect level and on a per-target basis. If the mechanism is enabled for a TA and interconnect and commands are not accepted or responses are not returned within the expected delay, the L4 interconnect generates an error event.

**NOTE:** The time-out mechanism is not available on the L4\_WKUP interconnect, but L4\_WKUP timeouts are detected in CFG\_TA\_L4WKUP of the L4\_CFG interconnect.

The error is logged in the [L4\\_TA\\_AGENT\\_STATUS\\_L\[8\]](#) REQ\_TIMEOUT bit. The affected TA enters an error state that causes it to send an error response to any new request targeted at it. To recover from this state, the TA must be reset by the system software. The time-out is counted starting from the moment a command is presented to the target, regardless of the target response to this command.

The L4 interconnect implements a centralized time-base circuit that broadcasts a set of four periodic pulse signals to all connected TAs. The time-base circuit offers four possible sets of four time-base signals. Selection is done by programming the [L4\\_LA\\_NETWORK\\_CONTROL\\_L\[10:8\]](#) TIMEOUT\_BASE bit field.

The selected time-base signals are available at any TA. Each TA can be programmed to refer to one of these four time-base signals, using the [L4\\_TA\\_AGENT\\_CONTROL\\_L\[10:8\]](#) REQ\_TIMEOUT bit field. These four signals are referred to as 1X time-base, 4X time-base, 16X time-base, and 64X time-base.

Table 13-294 lists all values in number of L4 clock cycles.

**Table 13-294. L4 Time-Out Link and TA Programming**

		<a href="#">L4_TA_AGENT_CONTROL_L</a> REQ_TIMEOUT[2:0]			
<a href="#">L4_LA_NETWORK_CONTROL_L</a> TIMEOUT_BASE[2:0]	0	1	2	3	4
0	All L4 time-out features are disabled.				

**Table 13-294. L4 Time-Out Link and TA Programming (continued)**

L4_LA_NETWORK_CONTROL_L TIMEOUT_BASE[2:0]	L4_TA_AGENT_CONTROL_L REQ_TIMEOUT[2:0]				
	0	1	2	3	4
1	Locally disabled	64	256	1024	4096
2		256	1024	4096	16,384
3		1024	4096	16,384	65,536
4		4096	16,384	65,536	262,144

The default reset value is 0x2 for REQ\_TIMEOUT and 0x4 for TIMEOUT\_BASE, implying 16,384 clock cycles.

A time-out condition is detected when the command acceptance or the response is not received after a delay of from one to three time-base periods.

**Example:**

- L4 frequency = 65 MHz
- TIMEOUT\_BASE = 4 in the [L4\\_LA\\_NETWORK\\_CONTROL\\_L](#) register
- REQ\_TIMEOUT = 2 in the [L4\\_TA\\_AGENT\\_CONTROL\\_L](#) for TA A
- REQ\_TIMEOUT = 4 in the [L4\\_TA\\_AGENT\\_CONTROL\\_L](#) for TA B

At agent A, the time-base unit is 16,384 cycles. A time-out is issued when a request to the attached module is not accepted, or no response is sent after a delay of 252  $\mu$ s to 756  $\mu$ s.

At agent B, the time-base unit is 262,144 cycles. A time-out is issued when a request to the attached module is not accepted or no response is sent after a delay of 4 ms to 12 ms.

On detection of a time-out condition, the TA logs the error in the [L4\\_TA\\_AGENT\\_STATUS\\_L\[8\]](#) REQ\_TIMEOUT bit, and it also reports the error to the IA, which forward it to the L3 interconnects.

After the time-out is detected and logged, the behavior of the attached module is ignored. A new request targeting the module arriving at the timed-out TA receives an error response. If the request is addressed to the agent internal registers, it is processed normally.

To recover from a time-out error, software is assumed to first reset the faulty module and then the TA using the [L4\\_TA\\_AGENT\\_CONTROL\\_L\[0\]](#) OCP\_RESET bit.

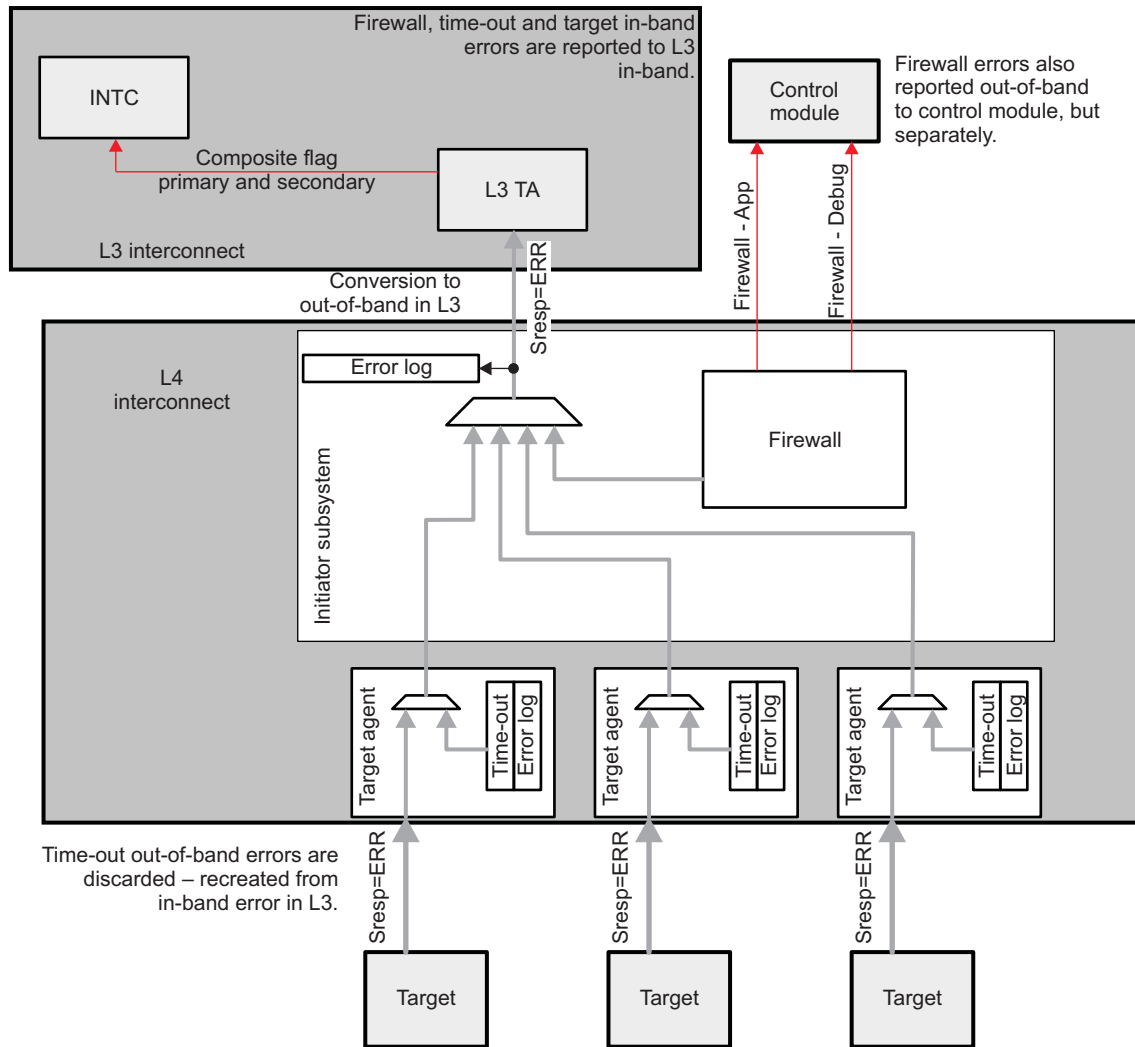

**13.3.3.4.3 Error Reporting**

[Figure 13-13](#) shows the error-reporting scheme used in the L4 interconnects. All L4 in-band errors are reported to their respective L3 TA, where errors are converted in an out-of band error signal (the L3 applicative and debug composite flags) going to the L3 Interrupt controllers.

Two levels of mask are present to report the error at INTC level:

- At the applicative and debug composite flag, to enable interrupt reporting, the following bits must be set:
  - L4 CFG in L3\_CLK1\_FLAG\_MASK\_0[3] and L3\_CLK1\_FLAG\_STATUS\_1[3]
  - L4 PER in L3\_CLK2\_FLAG\_MASK\_0[17][16][15][6] and L3\_CLK2\_FLAG\_STATUS\_1[17][16][15][6]
- At the L3 TA level, see , [L3 Interconnect](#).

Figure 13-13. L4 Error Reporting

icnt-017

#### 13.3.3.4.4 Error Recovery

Writing 1 to the `L4_TA_AGENT_CONTROL_L[0] OCP_RESET` bit initiates the software reset period. Software reset must be asserted for at least 16 cycles of the target module interface clock, which can be a divided clock with respect to the L4 clock.

During the software reset period:

- Requests sent to the target module receive error responses. Therefore, if the faulty request is part of a DMA transfer, it is necessary to stop the DMA to prevent unwanted errors.
- Requests sent to the TA register block are processed as usual.
- The `L4_TA_AGENT_STATUS_L[8] REQ_TIMEOUT` status bit is cleared.

Writing 0 to the `L4_TA_AGENT_CONTROL_L[0] OCP_RESET` bit terminates the software reset period.

The attached module must then be reset to complete the recovery.

### 13.3.3.4.5 Firewall Error Logging in the Control Module

When a protection violation occurs, an interrupt is sent to the INTCs (if enabled). An in-band error is sent back to L3 IA and an out-band error can also be logged in the CONTROL.CONTROL\_SEC\_ERR\_STATUS register in the system control module (SCM). These out-band errors are enabled/disabled at the L4 IA level by setting the L4\_IA\_AGENT\_CONTROL\_L[31][30] PROT\_ERROR\_SECONDARY\_REP or PROT\_ERROR\_PRIMARY\_REP bit to 1 for debug and application mode, respectively.

At the control module level, two logging registers are used, depending on the mode:

- In application mode or primary error reporting:
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS\_FUNC[16] = L4\_CFG protection violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS\_FUNC[17] = L4\_PER protection violation
- In debug mode or secondary error reporting:
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG[16] = L4\_CFG protection violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG[17] = L4\_PER protection violation

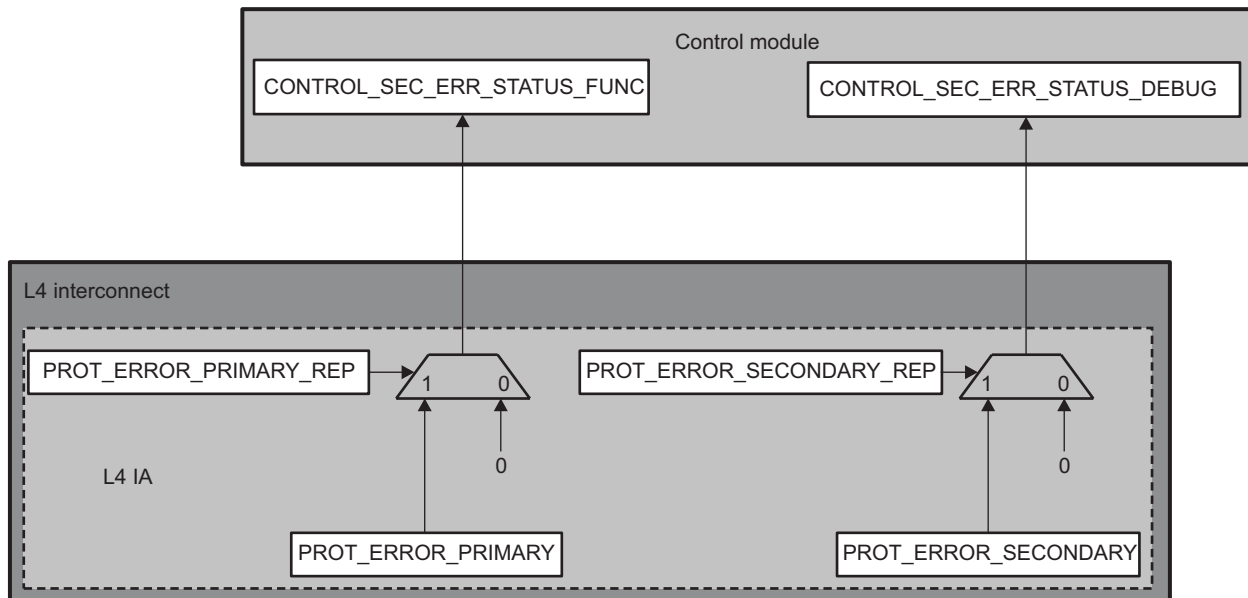

---

**NOTE:** The CONTROL.CONTROL\_SEC\_ERR\_STATUS\_XXX registers are only readable.

---

Figure 13-14 shows the global protection error reporting to at the control module.

**Figure 13-14. Protection Violation Out-of-Band Error Reporting**

icnt-018

### 13.3.4 L4 Interconnect Programming Guide

#### 13.3.4.1 L4 Interconnect Low-level Programming Models

This section describes the low-level hardware programming sequences for configuring and using the L4 interconnect module.

##### 13.3.4.1.1 Global Initialization

###### 13.3.4.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the L4 interconnect module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the L4 interconnect. For more information, see [Section 13.3.2, L4 Interconnect Integration](#).

**Table 13-295. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	For more information about the configuration of the module, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Control module	For more information about the configuration of the module, see <a href="#">Chapter 18, Control Module</a> .
MPU INTC	The MPU INTC must be configured to enable the interrupts from L4 interconnect module. See <a href="#">Chapter 17 Interrupt Controllers</a> .
sDMA	For more information about the configuration of the sDMA, see <a href="#">Chapter 16, sDMA</a> .
L3 interconnect	For more information about the interconnect configuration, see <a href="#">Chapter 13, Interconnect</a> .

##### 13.3.4.1.2 Operational Modes Configuration

###### 13.3.4.1.2.1 L4 Interconnect Error Analysis Mode

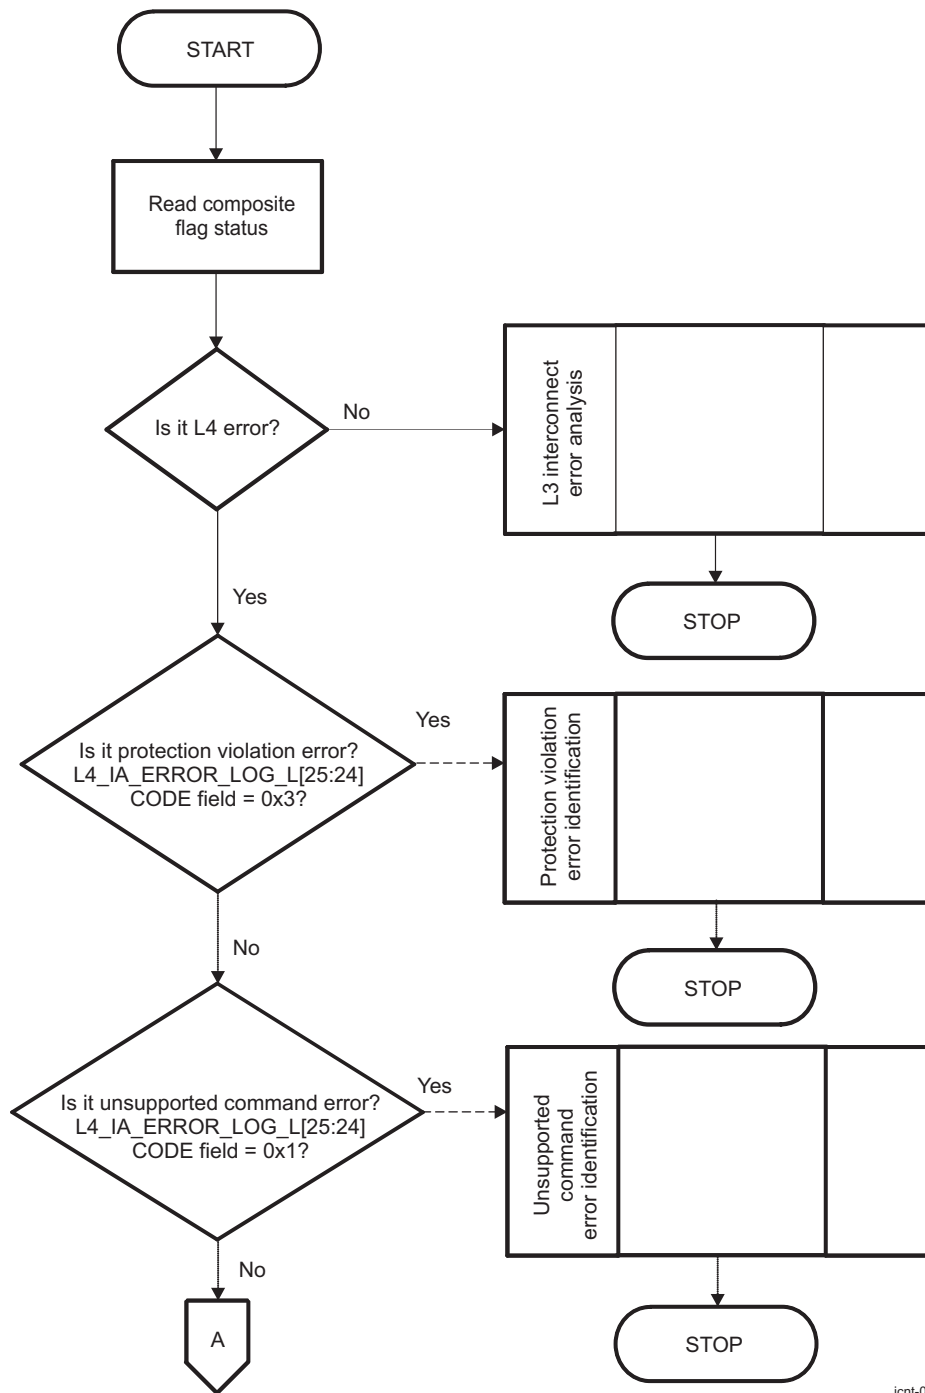

###### 13.3.4.1.2.1.1 Main Sequence: L4 Interconnect Error Analysis Mode

The information required to analyze an error source is logged in several registers. The number of registers to access depends on the error source.

[Figure 13-15](#) and [Figure 13-16](#) show the software sequence required in most cases.

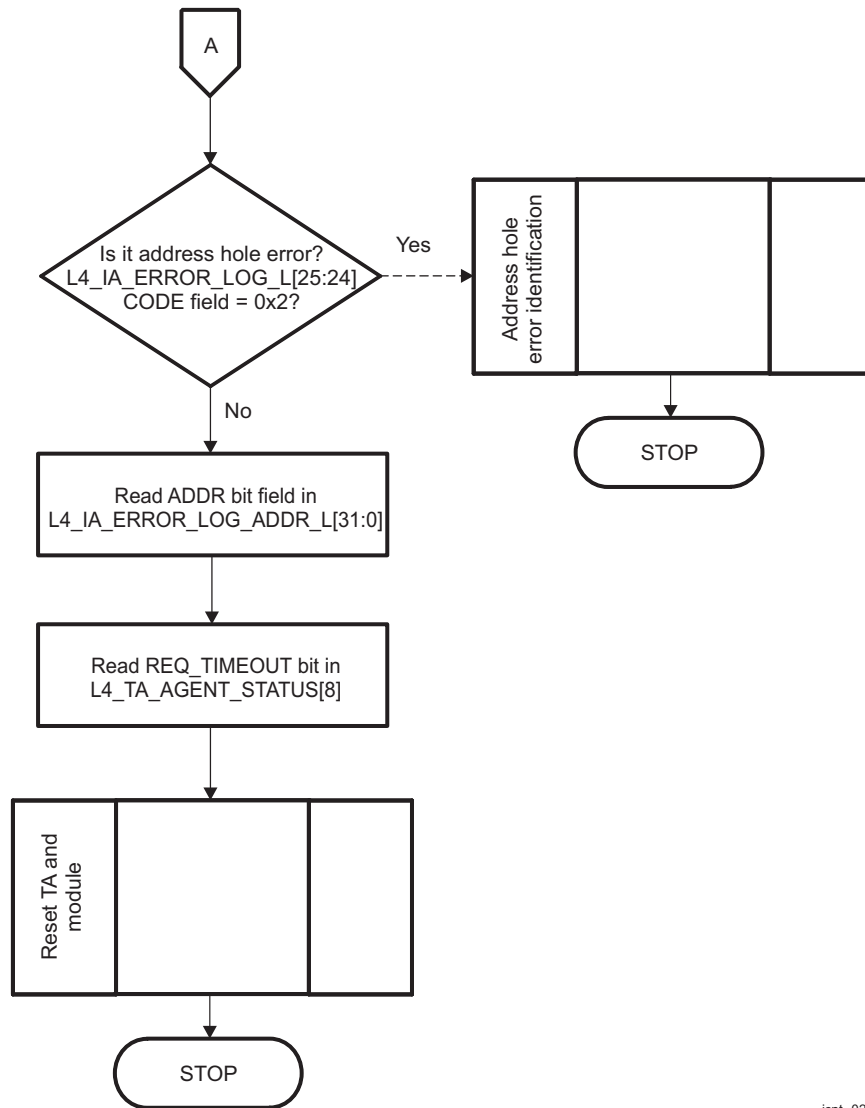

[Table 13-296](#) and [Table 13-297](#) show the main sequence for error analysis mode and its subprocess call summary, respectively.

**Figure 13-15. Typical Error Analysis Sequence**

icnt-019

Figure 13-16. Typical Error Analysis Sequence

<a href="#">L4_TA_AGENT_STATUS_L</a>		

Table 13-297. Subprocess Call Summary for Main Sequence – Error Analysis Mode

Subprocess	Cross-Reference
L3 interconnect error analysis	, <a href="#">L3 Interconnect Error Handling</a>
L4 interconnect protection violation error identification	<a href="#">Section 13.3.4.1.2.1.2, Subsequence: L4 Interconnect Protection Violation Error Identification</a>
L4 interconnect unsupported command/address hole error identification	<a href="#">Section 13.3.4.1.2.1.3, Subsequence: L4 Interconnect Unsupported Command/Address Hole Error Identification</a>
L4 interconnect reset TA and module	<a href="#">Section 13.3.4.1.2.1.4, Subsequence: L4 Interconnect Reset TA and Module</a>

### 13.3.4.1.2.1.2 Subsequence: L4 Interconnect Protection Violation Error Identification

This procedure describes the protection violation error identification (see [Table 13-298](#)).

**Table 13-298. Protection Violation Error Identification**

Step	Register/Bit Field/Programming Model	Value
Read multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	
Read initiator ID.	L4_IA_ERROR_LOG_L[11:8] CONNID	
Read command that cause the error.	L4_IA_ERROR_LOG_L[2:0] CMD	
Read address of request that caused the error.	L4_IA_ERROR_LOG_ADDR_L[31:0] ADDR	
<b>IF:</b> Is it a primary error?	L4_IA_AGENT_STATUS_L[30] PROT_ERROR_PRIMARY	=0x1
Read status bits.	CONTROL.CONTROL_SEC_ERR_STATUS_FUN C[17:16]	
Write 1 to clear status bits.	CONTROL.CONTROL_SEC_ERR_STATUS_FUN C[17:16]	0x3
Write 1 to clear IA status bit.	L4_IA_AGENT_STATUS_L[30] PROT_ERROR_PRIMARY	0x1
<b>ELSE</b>		
Read status bits.	CONTROL.CONTROL_SEC_ERR_STATUS_DEB UG[17:16]	
Write 1 to clear status bits.	CONTROL.CONTROL_SEC_ERR_STATUS_DEB UG[17:16]	0x3
Write 1 to clear IA status bit	L4_IA_AGENT_STATUS_L[31] PROT_ERROR_SECONDARY	0x1
<b>ENDIF</b>		
Write 1 to clear multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x1
Write 1 to clear in-band error status.	L4_IA_AGENT_STATUS_L[24] INBAND_ERROR	0x1

### 13.3.4.1.2.1.3 Subsequence: L4 Interconnect Unsupported Command/Address Hole Error Identification

This procedure describes the identification of unsupported command/address hole error (see [Table 13-299](#)).

**Table 13-299. Unsupported Command/Address Hole Error Identification**

Step	Register/Bit Field/Programming Model	Value
Read multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	
Read initiator ID.	L4_IA_ERROR_LOG_L[11:8] CONNID	
Read command that caused the error.	L4_IA_ERROR_LOG_L[2:0] CMD	
Read address of request that caused the error.	L4_IA_ERROR_LOG_ADDR_L[31:0] ADDR	
Read secondary status.	L4_IA_ERROR_LOG_L[30] SECONDARY	
Write 1 to clear secondary status.	L4_IA_ERROR_LOG_L[30] SECONDARY	0x1
Write 1 to clear multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x1
Write 1 to clear inband error status.	L4_IA_AGENT_STATUS_L[24] INBAND_ERROR	0x1

### 13.3.4.1.2.1.4 Subsequence: L4 Interconnect Reset TA and Module

This procedure resets the TA and module (see [Table 13-300](#)).

**Table 13-300. Reset TA and Module**

Step	Register/Bit Field/Programming Model	Value
Reset TA.	L4_TA_AGENT_CONTROL_L[0] OCP_RESET	0x1
Wait until target module clock = 16 cycles.		

**Table 13-300. Reset TA and Module (continued)**

Step	Register/Bit Field/Programming Model	Value
Write 0 to clear TA time - out status.	L4_TA_AGENT_CONTROL_L[10:8] REQ_TIMEOUT	0x0
Write 0 to clear TA reset.	L4_TA_AGENT_CONTROL_L[0] OCP_RESET	0x0
Reset the attached module. <sup>(1)</sup>		

<sup>(1)</sup> For more information, see the respective module chapter.

### 13.3.4.1.2.2 L4 Interconnect Time-Out Configuration Mode

#### 13.3.4.1.2.2.1 Main Sequence: L4 Interconnect Time-Out Configuration Mode

This procedure describes the time-out configuration sequence (see [Table 13-301](#)).

**Table 13-301. Time-Out Configuration**

Step	Register/Bit Field/Programming Model	Value
Disable time-out.	L4_LA_NETWORK_CONTROL_L[10:8] TIMEOUT_BASE	0x0
Clear TA time-out error status. <sup>(1)</sup>	L4_TA_AGENT_STATUS_L[8] REQ_TIMEOUT	0x1
Set time-out at TA level. <sup>(1)</sup>	L4_TA_AGENT_CONTROL_L[10:8] REQ_TIMEOUT	xxx
Set time-out base.	L4_LA_NETWORK_CONTROL_L[10:8] TIMEOUT_BASE	xxx

<sup>(1)</sup> Must be done for each TA.

### 13.3.4.1.2.3 L4 Interconnect Firewall Configuration Mode

#### 13.3.4.1.2.3.1 Main Sequence: L4 Interconnect Firewall Configuration Mode

This procedure describes the firewall configuration sequence (see [Table 13-302](#)).

**Table 13-302. Firewall Configuration**

Step	Register/Bit Field/Programming Model	Value
Define the members of protection group k. <sup>(1)</sup>	L4_AP_PROT_GROUP_MEMBERS_k_L[15:0] CONNID_BIT_VECTOR	xxx
Define the access type of a protection group k. <sup>(1)</sup>	L4_AP_PROT_GROUP_ROLES_k_L[15:0] ENABLE	xx
Set region affiliation to protection group. <sup>(2)</sup>	L4_AP_REGION_I_L[22:20] PROT_GROUP_ID	xxx

<sup>(1)</sup> Must be done for each protection group.

<sup>(2)</sup> Must be done for each region.

### 13.3.5 L4 Interconnects Register Manual

Table 13-303 through Table 13-305 list all L4 register blocks for IA, TA, AP, and LA. Each module instance is shown with the module register mapping and bit and bit field definitions.

#### 13.3.5.1 L4 Interconnects Instance Summary

**Table 13-303. L4\_PER Instance Summary**

Module Name	L3 Base Address	Size

<b>Address Offset</b>	0x0000 0058
<b>Physical Address</b>	0x4800 1058 0x4A00 1058 0x4A30 1058
<b>Description</b>	Log information about error conditions. The CODE field logs any protection violation or address hole errors detected by the initiator subsystem while decoding a request.
<b>Type</b>	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MULTI	SECONDARY	RESERVED				CODE	RESERVED									CONNID				RESERVED			CMD								

Bits	Field Name	Description	Type	Reset
31	MULTI	Multiple errors detected	RW W1toClr	0
30	SECONDARY	Indicates whether protection violation was a primary or secondary error	RW W1toClr	0
29:26	RESERVED	Read returns 0.	R	0x0
25:24	CODE	The error code of an initiator request. 0x00: No errors 0x01: Reserved 0x10: Address hole 0x11: Protection violation	RW W1toClr	0x0
23:14	RESERVED	Read returns 0.	R	0x000
13:8	CONNID	ConnID of request causing the error, refer to <a href="#">Table 13-286</a>	R	0x00
7:3	RESERVED	Read returns 0.	R	0x00
2:0	CMD	Command that caused error	R	0x0

<b>Address Offset</b>	0x0000 0024
<b>Physical Address</b>	0x4800 0824 0x4A00 0824 0x4A30 0824
<b>Description</b>	Control interconnect global power control
<b>Type</b>	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								CLOCK_GATE_DISABLE	RESERVED			THREAD0_PRI	RESERVED								EXT_CLOCK	RESERVED									

Bits	Field Name	Description	Type	Reset
31:25	RESERVED	Read returns 0.	R	0x00
24	CLOCK_GATE_DISABLE	When set to 1 this field disables all clock gating.	RW	0
23:21	RESERVED	Read returns 0.	R	0x0
20	THREAD0_PRI	Sets thread priority. If the field is set to 0, the default, all initiator threads are treated the same. Setting the THREAD0_PRI field to 1 assigns a higher arbitration priority to thread 0 of the first initiator OCP interface. To avoid starvation, arbitration is imposed by the initiator subsystem. When multiple requests from different initiator threads are dispatched to targets simultaneously, the oldest request is dispatched first. If thread 0 is assigned a higher priority, a request on thread 0 always wins arbitration. Assigning thread 0 of the first initiator OCP the highest priority on a request or response can result in the starvation of other threads.	R	1
19:9	RESERVED	Read returns 0.	R	0x000
8	EXT_CLOCK	When set to 1, the ext_clk_off_i signal on the initiator subsystem instructs the entire L4 to shut off.	R	1
7:0	RESERVED	Read returns 0.	R	0x00

## Memory Subsystem

---

---

---

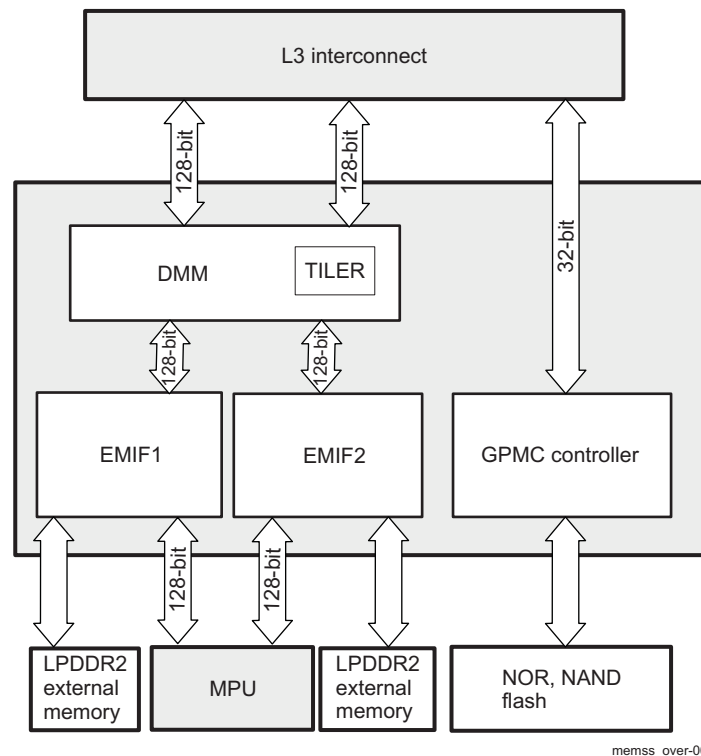

This chapter introduces the memory subsystem of the device.

Topic	Page
15.1 Memory Subsystem Overview .....	3276
15.2 Dynamic Memory Manager .....	3281
15.3 EMIF Controller .....	3362
15.4 General-Purpose Memory Controller .....	3434
15.5 Error Location Module .....	3575
15.6 On-Chip Memory (OCM) Subsystem .....	3602

## 15.1 Memory Subsystem Overview

Figure 15-1 shows a functional diagram of all memory subsystems in the device.

**Figure 15-1. Memory Subsystem Functional Diagram**

### 15.1.1 DMM Overview

The dynamic memory manager (DMM) module is typically located immediately in front of the synchronous dynamic random access memory (SDRAM) controller (SDRC), as shown in Figure 15-1.

In a broad sense, the DMM manages various aspects of memory accesses such as:

- Initiator-indexed priority generation
- Multizone SDRAM interleaving configuration
- Block object transfer optimization – tiling
- Centralized low-latency page translation – MMU-like feature

The dynamic qualifier for memory management highlights the software configurability, and hence the runtime nature, of the four aspects of memory management handled by the DMM.

#### 15.1.1.1 DMM Features

From a functional perspective, the role of the DMM is to:

- Add initiator-based priority to any incoming requests
- Perform to/from tiling conversions of tiled requests
- Make on-the-fly basic transforms, such as quadrant rotations and mirroring
- Optionally, provide a low-latency page-based translation to handle memory fragmentation – MMU
- Distribute the traffic on all attached memory controllers according to the interleaving configuration

The main features of the DMM are:

- Programmable multizone DRAM mapping and interleaving configuration
- Programmable initiator-based request priority extension

- Multichannel memory transfer optimization
- Single SDRAM page request generation
- Low-latency interconnect port
- Page-grained address translation to manage memory fragmentation
- Automatic synchronized reloading of the address translation table

### 15.1.2 TILER Overview

The tiling and isometric lightweight engine for rotation (TILER) is a submodule of the DMM (see [Figure 15-1](#)) and is therefore described in [Section 15.2, Dynamic Memory Manager](#).

The TILER is intended to improve bidimensional (tiled) block transfer efficiency. It is, therefore, a module aimed at:

- Primarily, efficient handling of 2-dimension (2D) data mapped in tiles, such as video or graphics macroblocks
- Optionally, managing the memory fragmentation and zero-copy physical frame-buffer swapping through a page-grained translation
- Making isometric (distance preserving) transforms, such as 90-, 180-, or 270-degree rotations, with a horizontal or vertical reflection

The lightweight qualifier of this engine highlights its limited support of isometric transforms, as:

- Rotation performs only basic quadrant rotations by some multiple of 90 degrees.
- Reflection is limited to horizontal and vertical flip.
- Translation is restricted to a 4-KB page granularity.

Written differently, the functionality of the TILER is to map a 2D virtually addressed interconnect request into one or more physically addressed interconnect requests by:

- Transforming the virtual address, data, and byte-enable to match the requested 0-, 90-, 180-, or 270-degree orientation in a tiled 2D addressing space
- Optionally, translating the oriented tiled address by a page-specific vector to manage memory fragmentation and physical object aliasing

#### 15.1.2.1 TILER Features

The main features of the TILER are:

- Efficiency improvement of 2D block access on SDRAMs
- Optimized interlaced access on tiled frames
- 2D virtual-to-physical address translation of SDRAM bidimensional objects to handle rotation
- Page-grained address translation to manage memory fragmentation and physical buffer aliasing
- Unlimited number of 2D tiled objects supported in any ( 0, 90, 180, or 270 degrees) orientation
- Full bandwidth use by minimizing the size of raster-based initiator buffers
- Optimization of multichannel memory transfers
- Interconnect request granularity balance (in X and Y directions)

### 15.1.3 EMIF Overview

The extended memory interface (EMIF) module is typically located near the DMM module, as shown in [Figure 15-1](#).

The EMIF provides connectivity between the device and LPDDR2-type memory. It manages data bus read/write accesses between external memories, the microprocessor unit (MPU), and the direct memory access (DMA) controller. It acts as the primary interface between SDRAM and all functional blocks, such as the ARM®, IVA-HD, imaging subsystem (ISS), GFX, and DMA controllers.

### 15.1.3.1 Main Features

The EMIF has the following capabilities:

- Supports JEDEC standard-compliant LPDDR2-SDRAM (S2 and S4) devices
- 2-GB SDRAM address range over two chip selects (CSs) (configurable with the DMM; see [Section 15.2, Dynamic Memory Manager](#), for more information)
- Supports two independent CSs, with their corresponding register sets, and independent page tracking
- Both CSs must have the same memory type and size.
- Flexible address muxing scheme that permits choosing different bank-mapping allocation by configuring the bank, column, and row-address decoding ordering
- 16- or 32-bit data path to external SDRAM
- Supports LPDDR2 devices with 1, 2, 4, or 8 internal banks
- Supports the following data bus widths:
  - 128-bit level 3 (L3) interconnect data bus width
  - 16- and 32-bit SDRAM data bus width
- Supports the following CAS latencies: 3, 4, 5, 6, 7, and 8
- Supports 256-, 512-, 1024-, and 2048-word page sizes
- Supports the following burst lengths: 8
- Supports sequential burst type
- SDRAM auto-initialization from reset or configuration change
- Supports bank interleaving across both CSs if same memory type
- Supports self-refresh and precharge power-down modes for low power (per CS, manual entry/exit self-refresh, and deep power-down modes)
- Supports deep power-down mode for low power
- Supports partial array self-refresh and temperature-controlled self-refresh modes for low power. Temperature-controlled self-refresh is supported only for mobile SDRAM having an on-chip temperature sensor.
- Supports prioritized refresh
- Programmable SDRAM refresh rate and backlog counter
- Supports ZQ calibration
- Supports temperature monitoring

### 15.1.4 GPMC Overview

The general-purpose memory controller (GPMC) is a unified memory controller dedicated to interfacing external memory devices:

- Asynchronous SRAM-like memories and application-specific integrated circuit (ASIC) devices
- Asynchronous, synchronous, and page mode (available only in nonmuxed mode) burst NOR flash devices
- NAND flash
- Pseudo-SRAM devices

#### 15.1.4.1 GPMC Features

The GPMC is the external memory controller of the device. The GPMC data access engine provides a flexible programming model for communication with all standard memories. The GPMC supports various accesses:

- Asynchronous read/write access
- Asynchronous read page access (4, 8, and 16 Word16)
- Synchronous read/write access
- Synchronous read/write burst access without wrap capability (4, 8, and 16 Word16)

- Synchronous read/write burst access with wrap capability (4, 8, and 16 Word16)
- Address/data-multiplexed access
- Little- and big-endian access

The GPMC can communicate with a wide range of external devices:

- External asynchronous or synchronous 8-bit wide memory or device (nonburst device)
- External asynchronous or synchronous 16-bit wide memory or device
- External 16-bit nonmultiplexed device with limited address range (2KB)
- External 16-bit address/data-multiplexed NOR flash device
- External 8-bit and 16-bit NAND flash device
- External 16-bit pseudo-SRAM (pSRAM) device

The main features of the GPMC are:

- 8- or 16-bit-wide data path to external memory device
- Supports up to eight CS regions of programmable size and programmable base addresses in a total address space of 1GB
- Supports transactions controlled by a firewall
- On-the-fly error code detection using the Bose-Chaudhuri-Hocquenghem (BCH) ( $t = 4, 8, \text{ or } 16$ ) or Hamming code to improve the reliability of NAND with a minimum effect on software (NAND flash with 512-byte page size or greater)
- Fully pipelined operation for optimal memory bandwidth use
- External device clock provided from the L3 clock divided by 1, 2, 3, or 4
- Supports programmable autoclock gating when no access is detected
- Independent and programmable control signal timing parameters for setup and hold time on a per-chip basis. Parameters are set according to the memory device timing parameters, with a timing granularity of one L3 clock cycle.
- Flexible internal access time control (WAIT state) and flexible handshake mode using external WAIT pin monitoring
- Support bus keeping
- Support bus turnaround
- Prefetch and write posting engine associated with system DMA (sDMA) to achieve full performance from the AND device with minimum effect on NOR/SRAM concurrent access

---

**NOTE:** Page mode is available only in nonmultiplexed mode.

---

### 15.1.5 ELM Overview

NAND flash memories are dense and nonvolatile, but error-prone. Whenever NAND flash memories are read from, some level of error correction is required. In the case of NAND modules with no internal correction capability, sometimes referred to as bare NAND, the correction process is delegated to the memory controller.

The error location module (ELM) must be used in conjunction with the GPMC. The GPMC probes data read from an external NAND flash and uses them to compute checksum-like information, called syndrome polynomials, on a per-block basis. Each syndrome polynomial gives a status of the read operations for a full block, including 512 bytes of data, parity bits, and an optional spare area data field, with a maximum block size of 1023 bytes. Computation is based on the BCH algorithm. The ELM extracts error addresses from these syndrome polynomials.

Based on the syndrome polynomial value, the ELM can detect errors, compute the number of errors, and give the location of each error bit. The actual data is not required to complete the error correction algorithm. Errors can be reported anywhere in the NAND flash block, including in the parity bits.

The maximum acceptable number of errors that can be corrected depends on a configuration parameter. Error correction levels of 4, 8, and 16 bits are supported. The ELM relies on a static definition of the generator polynomial for each error correction level that corresponds to the generator polynomials defined in the GPMC. A larger number of errors can be detected, but the ELM cannot correct them all. The offending block is then tagged as uncorrectable.

When the error location process completes, an interrupt is triggered to inform a central processing unit (CPU) that its status can be checked. The error locations for the NAND page can be retrieved from the module through register accesses.

#### 15.1.5.1 ELM Features

The ELM features:

- 4, 8, and 16 bits per 512-byte block error location based on BCH algorithm
- Eight simultaneous processing contexts
- Page-based and continuous modes
- Interrupt generation when error location process completes:
  - When the full page has been processed in page mode
  - For each syndrome polynomial in continuous mode

#### 15.1.6 OCM Overview

The on-chip memory (OCM) subsystem consists of the following OCM controllers: one connected to an on-chip ROM (SAR ROM), one connected to an on-chip RAM (SAR RAM), and one connected to an on-chip SRAM (L3 SRAM). Each memory controller has its own dedicated interface to the L3 interconnect.

##### 15.1.6.1 SAR ROM

This on-chip ROM contains 4KB of memory and a linked list of descriptors used by sDMA during the restore context operation (when the device transitions from off to on mode).

The device-embedded SAR ROM has the following characteristics:

- 4-KB ROM
- 32-bit access per cycle
- Support for single- and burst-access transactions

##### 15.1.6.2 SAR RAM

The on-chip SAR RAM contains 8KB and is mapped as four blocks with irregular region sizes. This memory content is preserved when the device goes into off mode (as long as the wake-up voltage domain remains supplied). It is used as context-saving memory to be written by software so that sDMA restores its saved content when the device transitions from off to on mode.

The device-embedded SAR RAM has the following characteristics:

- Support for single-access transactions
  - Operates at full L4-PER interconnect clock frequency
  - 32-bit access per cycle

##### 15.1.6.3 L3 OCM\_RAM

The on-chip L3 OCM\_RAM contains 56KB of RAM, and partitioning is defined by the L3 firewall logic. The device-embedded L3 OCM\_RAM has the following characteristics:

- Support for single and burst access transactions:
  - Operates at full L3 interconnect clock frequency
  - Fully pipelined, one 32-bit access per cycle
- Restricted access support

## 15.2 Dynamic Memory Manager

### 15.2.1 DMM Overview

This section describes the dynamic memory manager (DMM) and its tiling and isometric lightweight engine for rotation (TILER) submodule.

The DMM is introduced in [Section 15.1, Memory Subsystem Overview](#) in [Chapter 15, Memory Subsystem](#).

The function of the DMM is to:

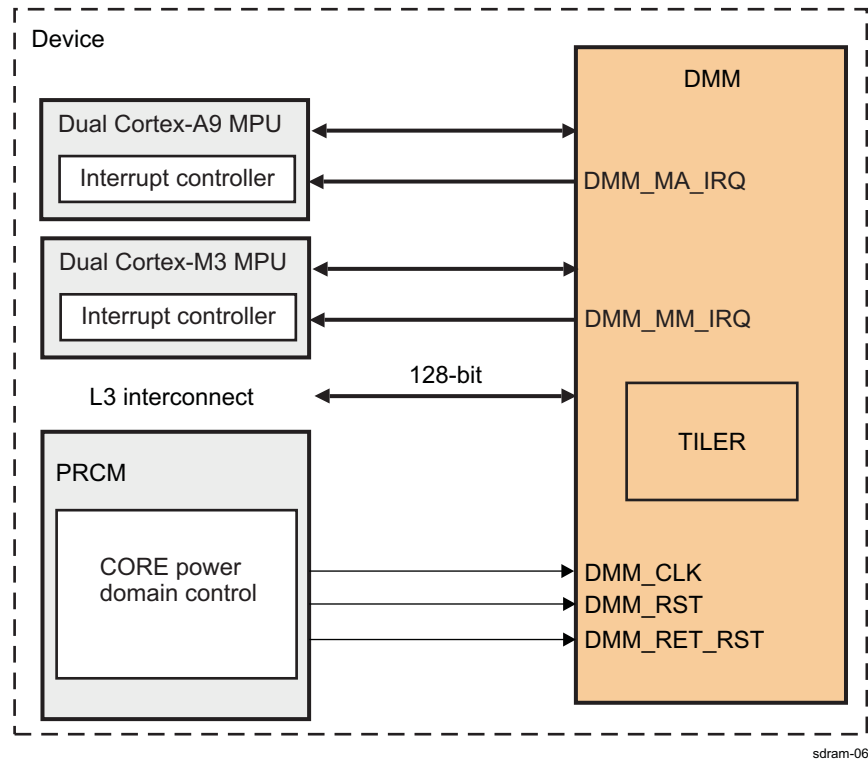

- Add initiator-based priority to any incoming requests
- Perform to-and-from tiling conversions of tiled requests
- Make on-the-fly basic transforms, such as quadrant rotations and mirroring
- Optionally provide a low-latency page-based translation to handle memory fragmentation – memory management unit (MMU)
- Distribute the traffic on all attached memory controllers according to the interleaving configuration

The TILER is also introduced in [Section 15.1, Memory Subsystem Overview](#) in [Chapter 15, Memory Subsystem](#).

The functions of the TILER are:

- Primary handling efficiently 2-dimensional (2D) data mapped in tiles, such as video or graphics macroblocks
- Optionally managing the memory fragmentation and zero-copy physical frame buffers swapping through a page-grained translation
- Allowing optimized interlaced accesses on tiled frames
- Making (distance preserving) transforms, such as 90-, 180-, or 270-degree rotations, with a horizontal or vertical reflection
- Interleaving the memory accesses among the two memory controllers (also called EMIF). For more information, see [Section 15.3, EMIF Controller](#).

[Figure 15-2](#) is an overview of the DMM and TILER in the device.

**Figure 15-2. DMM and Tiler Overview**

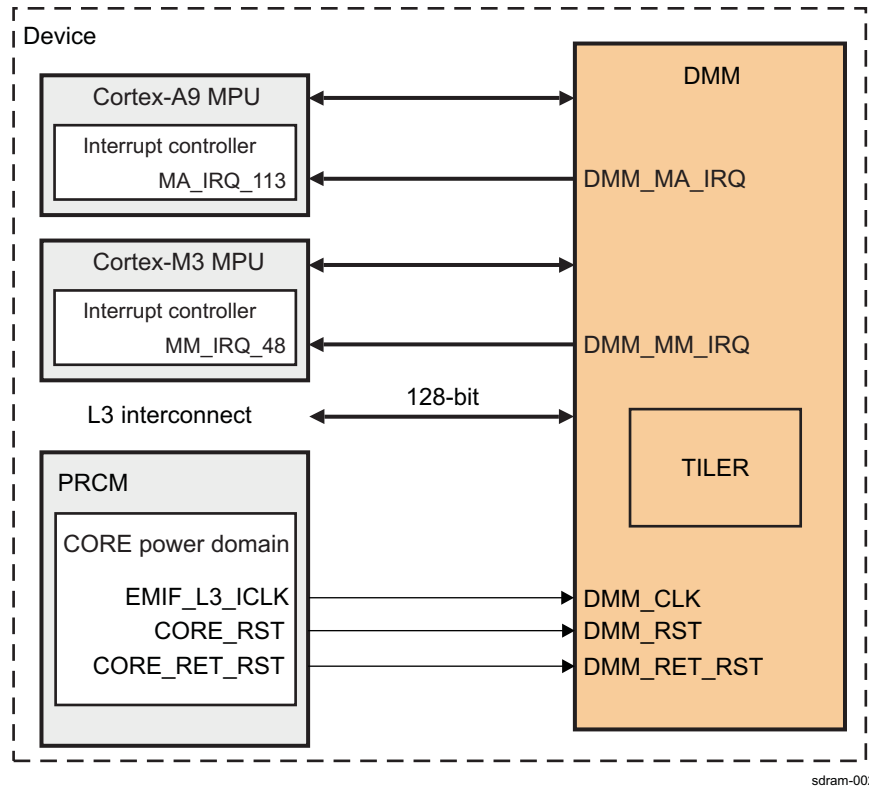

### 15.2.2 DMM Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

- IDLE hardware handshake (the DMM supports only smart-idle mode)
- No STANDBY hardware handshake
- No wake-up request
- No system direct memory access (sDMA) requests
- One interrupt line for interrupt request (IRQ)
- One functional clock

Figure 15-3 shows the integration of DMM in the device.

Figure 15-3. DMM Integration

**NOTE:** For more information about the IDLE hardware handshake, see [Chapter 3, Power, Reset, and Clock Management](#).

Table 15-1 through Table 15-3 summarize the integration of DMM in the device.

Table 15-1. DMM Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
DMM	PD_CORE	No	N/A

Table 15-2. DMM Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DMM	DMM_CLK	EMIF_L3_ICLK	PRCM	DMM interface and functional clock. For information about power, reset, and clock management (PRCM) module clock gating and management, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DMM	DMM_RST	CORE_RST	PRCM	Functional reset. For information about PRCM reset sources and distribution, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .

### 15.2.3 DMM Functional Description

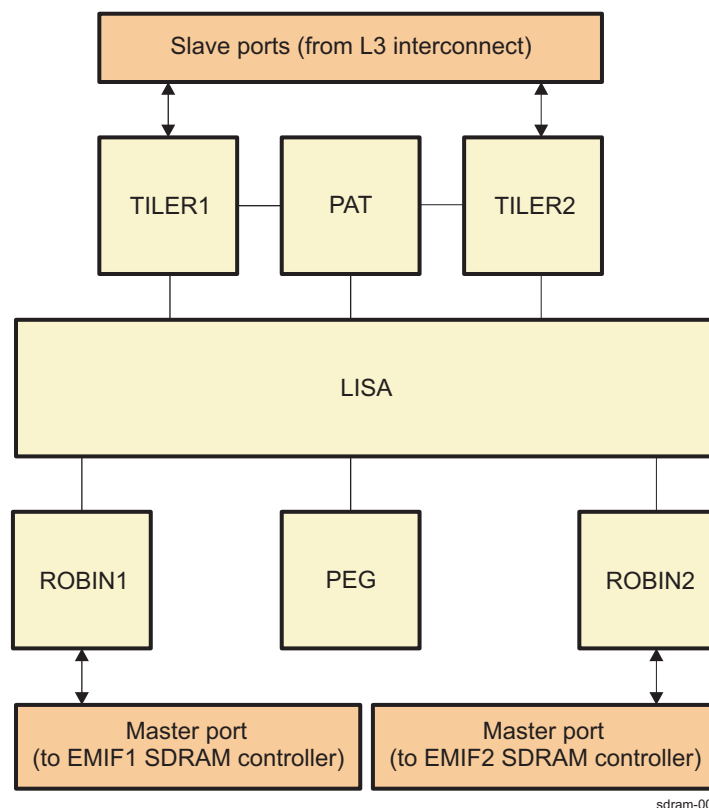

#### 15.2.3.1 DMM Block Diagram

Figure 15-4 shows the DMM macro architecture. The DMM consists of six blocks:

- Two TILERS, each with its own interconnect slave port for converting requests back and forth between the input virtual addressing mode and the output physical tiled addressing mode. The tiling conversions of requests, write data, and responses is performed entirely in the TILER blocks.
- Two reordering buffer and initiator nodes (ROBINs), each with its own interconnect master port to initiate requests to the SDRC and allow tiled data, tiled response, and split response reconstruction. The ROBIN block manages only the reordering buffer and performs data reordering due to the orientation.
- A physical address translator (PAT) for managing the memory fragmentation
- A priority extension generator (PEG) to generate priorities required by the SDRC; these priorities are not used in the DMM.
- A local interconnect and synchronization agent (LISA) to synchronize all DMM subsystems and provide access to their configuration registers

Figure 15-4 is a block diagram of the DMM.

Figure 15-4. DMM Block Diagram

#### CAUTION

The interconnect must ensure that virtually addressed requests target only a TILER port.

#### 15.2.3.2 DMM Clock Configuration

Table 15-5 describes the DMM clocks.

**Table 15-5. DMM Clocks**

Signal	I/O <sup>(1)</sup>	Description
DMM_CLK	I	Functional and interface clock

<sup>(1)</sup> I = Input; O = Output

The DMM is concerned with SDRC management and is in the MEMIF clock domain among the SDRCs. The DMM is a fully synchronous module, which uses the clock and clock-enable signals provided in the MEMIF clock domain to generate its interface and functional clocks.

To configure DMM\_CLK control and settings, see [Table 15-2](#).

### 15.2.3.3 DMM Power Management

DMM power is supplied by the CORE power domain, and DMM power management complies with system power-management guidelines.

[Table 15-6](#) describes the power-management features available for the DMM module.

**Table 15-6. DMM Local Power-Management Features**

Feature	Registers	Description
Clock auto gating	N/A	Feature not available
Slave idle modes	<a href="#">DMM_SYSCONFIG</a> [3:2] SIDLEMODE bit field	Only smart-idle wake-up mode is available.
Clock activity	N/A	Feature not available
Master standby modes	N/A	Feature not available
Global wake-up enable	N/A	Feature not available
Wake-up sources enable	N/A	Feature not available

Some of the DMM module registers are affected by the save-and-restore (SAR) mechanism. For more information about SAR, see [Chapter 3, Power, Reset, and Clock Management](#).

### 15.2.3.4 DMM Interrupt Requests

Errors in PAT area refill registers are reported through the [DMM\\_PAT\\_STATUS\\_i](#)[15:10] ERROR bit field (see [Table 15-7](#)).

**Table 15-7. DMM Hardware Status Features**

Feature	Type	Register	Description
PAT error flags	Read-only	<a href="#">DMM_PAT_STATUS_i</a> [15:10] ERROR (i = 0 to 3)	Unexpected update of the PAT area refill registers

[Table 15-8](#) lists the event flags, and their masks, that can cause module interrupts.

**Table 15-8. Events**

Interrupt	Event Flag	Event Mask
ERR_LUT_MISS3	<a href="#">DMM_PAT_IRQSTATUS</a> [31] EVENT0 <a href="#">DMM_PAT_IRQSTATUS_RAW</a> [31] EVENT0	<a href="#">DMM_PAT_IRQENABLE_SET</a> [31] EVENT0 <a href="#">DMM_PAT_IRQENABLE_CLR</a> [31] EVENT0

## 15.2.3.5 DMM

### 15.2.3.5.1 DMM Concepts

The DMM introduces the concepts of dynamic mapping and DMM atomic units.

#### 15.2.3.5.1.1 Dynamic Mapping

The DMM manages its internal memory space as an ordered set of up to four sections. [Figure 15-5](#) shows the DMM sections and memory mapping.

**Figure 15-5. DMM Sections and Memory Mapping**

sdram\_004

In the DMM, a section is:

- A segment of 16MiB to 2GiB, which is power-of-two in size and aligned to that size in the system map
- An area with a constant interleaving scheme: constant interleaving granularity on a constant set of SDRC (EMIF) targets
- Given a priority equal to its index: the higher the index, the higher the priority

---

**NOTE:** Whenever a request hits more than one DMM section, it follows the interleaving scheme of the section having the highest index.

---

The interleaving configuration of the DMM, its section-based dynamic memory mapping, is shown on the right in [Figure 15-5](#). In this example, a request at the system address Addr follows the interleaving scheme of section 3, although it hits sections 1, 2, and 3. Similarly, the DMM configuration given in this example prevents any request from using the interleaving scheme of section 0, because section 0 is fully masked by section 1, which has a higher priority.

Each of the four sections is configured through a [DMM\\_LISA\\_MAP\\_i](#) register, where  $i = 0$  to 3.

---

**NOTE:** The DMM and SDRC registers ([Table 15-89](#) and EMIF registers; see [EMIF Controller](#)) are declared in two extra static DMM sections of the highest priority so that they cannot be masked by any standard programmable DMM section.

---

**NOTE:** The DMM atomic size is:

- 1kiB in noninterleaved sections
- Equal to the interleaving granularity (128, 256, or 512 bytes) in interleaved sections

### 15.2.3.5.1.2 Address Mapping

The address mapping inside the DMM is configurable through up to four sections. A DMM section description fits in a single register (DMM\_LISA\_MAP\_i). Each section is defined based on:

- Its system address: The base address of the decoding range for the section
- Its size: The encoding is the number of bits used in the upper 8 bits of the incoming system address
- Its physical address: The base address of the memory range access in the external memory controller
- Its address space: The address space used on the external (for the DMM) memory controller when hitting this section. For details, see [Section 15.3.4.1.1, L3 Interface](#).
- The target memory controller. A section may hit a single or pair of controllers.
- Its interleaving definition

The address decoding is priority-based. In case of overlapping sections, only the highest-order one is hit. Register memory spaces have priority over regular memory sections. In case of four sections, the priority order is therefore:

1. Registers
2. DMM\_LISA\_MAP\_3
3. DMM\_LISA\_MAP\_2
4. DMM\_LISA\_MAP\_1
5. DMM\_LISA\_MAP\_0

All register-related addresses are reserved and fixed in the overall address mapping:

- DMM registers: 0x4E00\_0000 to 0x4FFF\_FFFF
- EMIF1 registers: 0x4C00\_0000 to 0x4CFF\_FFFF
- EMIF2 registers: 0x4D00\_0000 to 0x4DFF\_FFFF

There is no overlapping between register sections.

**NOTE:** Section decoding happens after PAT address translation in the case of TILER. In non-bypass mode, the system address considered for TILER accesses is the virtual address computed based on the PAT translation tables.

The [DMM\\_LISA\\_LOCK](#) register is used to lock the configuration once set. If written to 1, the LOCK bit prevents further writes to all [DMM\\_LISA\\_MAP\\_i](#) registers. The LOCK bit cannot be written back to 0. A reset is required to reprogram the sections.

### 15.2.3.5.1.3 Address Translation

The PAT engine of the DMM is composed of a 32-k entry physical address translation vector table and one or two refill engines. The refill engine is a specialized DMA for refilling the content of the PAT table.

The address translation mechanism is available only when the incoming request hits a page mode or tiled mode container; that is, when the incoming address targets the TILER or its aliased view in the system addressing space. Otherwise, the PAT logic is bypassed so that the resulting physical address corresponds to the input address.

The PAT engine supports multiple address translation schemes, called views, which can be bound to one or more initiators through a view mapping mechanism.

### 15.2.3.5.1.3.1 PAT View Mappings

The PAT engine can have up to 16 groups of initiators that share a set of four PAT views. The connection from an initiator to a PAT view is made through the DMM\_PAT\_VIEW register. Given that each PAT view index is coded on 4 bits, the DMM\_PAT\_VIEW register is a 64-bit register split into two 32-bit registers (DMM\_PAT\_VIEW0 for the first eight PAT view indexes and DMM\_PAT\_VIEW1 for the last eight PAT view indexes).

The PAT view index that corresponds to the initiator having the value  $i$  as the 4 most-significant bits (MSBs) of its L3 ConnID uses the view referenced in entry  $i$  of the DMM\_PAT\_VIEW. For example, the initiator 0xC4 uses the thirteenth view index of the DMM\_PAT\_VIEW register, the fifth view index in the DMM\_PAT\_VIEW1 register.

The PAT view index of the initiator  $i$  is found in the  $V_i$  field. The  $W_i$  field is aimed at writing the corresponding  $V_i$ . When writing to the DMM\_PAT\_VIEW registers, the only  $V_i$  view indexes that are updated are those having their corresponding  $W_i$  bit, and byte enable, set. The  $W_i$  bits are always read as 0. For instance, to set the PAT view indexes  $V_3$  and  $V_7$  to 2 and 1, respectively, the DMM\_PAT\_VIEW0 register must be written with 5000 6000h.

### 15.2.3.5.1.3.2 PAT View Map Base Address

The PAT view map base address defines the base address of all PAT translated addresses.

Bit [31] of all PAT translated addresses is set to BASE\_ADDR. For example, if the DMM\_PAT\_VIEW\_MAP\_BASE register is set to 8000 0000h, all PAT translated addresses will have bit [31] set to 1 so that the translated addresses range from 8000 0000h to FFFF FFFFh. All reserved bits of this DMM PAT base address register are read to 0.

### 15.2.3.5.1.3.3 PAT Views

A PAT view defines the kind of physical address translation to perform for each mode accesses (page, 8-bit, 16-bit and 32-bit). Each mode of each PAT view can be configured to use a container-grained translation or page-mode translation.

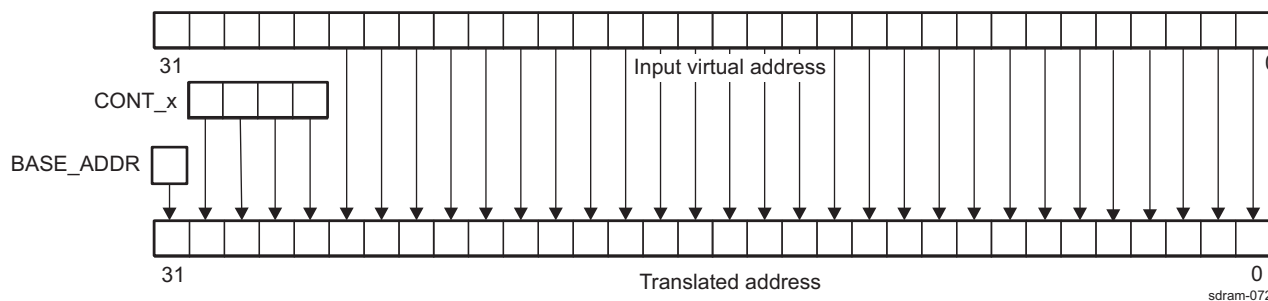

#### 15.2.3.5.1.3.3.1 PAT Direct Access Translation

The container-grained translation is named the direct access. In this mode, the translation vector is given directly by the CONT\_x bit field that corresponds to the accessed mode.

- A page mode access uses the vector contained in the DMM\_PAT\_VIEW\_MAP\_i[27:24] CONT\_PAGE bit field.
- A 32-bit mode access uses the vector contained in the DMM\_PAT\_VIEW\_MAP\_i[19:16] CONT\_32 bit field.
- A 16-bit mode access uses the vector contained in the DMM\_PAT\_VIEW\_MAP\_i[11:8] CONT\_16 bit field.
- An 8-bit mode access uses the vector contained in the DMM\_PAT\_VIEW\_MAP\_i[3:0] CONT\_8 bit field.

See Figure 15-6.

**Figure 15-6. PAT Direct Access Translation**

sdr-am-072

**15.2.3.5.1.3.3.2 PAT Indirect Access Translation**

The page-grained translation is named the indirect access. In this mode the translation vector is found in the internal 32-k entry physical address translation vector table at the index given by bits [26:12] of the input virtual address, and the `DMM_PAT_VIEW_MAP_i` `CONT_x` bit field references the internal physical address translation table to use. Because the DMM uses only one such table, in this mode the `CONT_x` bit field must be written as 0. See Figure 15-7.

**Figure 15-7. PAT Indirect Access Translation**

Each entry of the PAT lookup table (LUT) is a 19-bit vector that replaces bits [30:12] of the input virtual address. The PAT index aimed at selecting the vector in the table consists of bits [26:12] of the input virtual address.

**15.2.3.5.1.3.3.3 PAT View Configuration**

There are four different views in a DMM, each with its own `DMM_PAT_VIEW_MAP_i` register for defining the kind of address translation to perform.

The PAT view type of each mode is selected by the `ACCESS_x` bit field in the `DMM_PAT_VIEW_MAP_i` register, `i` being the index of the considered view. When this field is set to 1, the indirect access scheme is used; otherwise, the PAT performs the address translation in a direct way with the corresponding `CONT_x` vector.

When configuring a mode in a view to use the indirect access, the corresponding `CONT_x` bit field must be filled with 0.

**15.2.3.5.1.3.3.4 PAT Address Translation LUT**

The PAT LUT has the same geometry as the DMM container. It has 128 lines of 256 entries of 19-bit each. See Figure 15-8.

**Figure 15-8. Physical Address Translation Table**

$E_{0,0}$	$E_{1,0}$	$E_{2,0}$	$E_{3,0}$	$E_{4,0}$	$E_{251,0}$	$E_{252,0}$	$E_{253,0}$	$E_{254,0}$	$E_{255,0}$
$E_{0,1}$	$E_{1,1}$	$E_{2,1}$	$E_{3,1}$	$E_{4,1}$	$E_{251,1}$	$E_{252,1}$	$E_{253,1}$	$E_{254,1}$	$E_{255,1}$
$E_{0,2}$	$E_{1,2}$	$E_{2,2}$	$E_{251,126}$	$E_{4,2}$	$E_{251,2}$	$E_{254,2}$	$E_{253,2}$	$E_{254,2}$	$E_{255,2}$
$E_{0,125}$	$E_{1,125}$	$E_{2,125}$	$E_{3,125}$	$E_{4,127}$	$E_{251,125}$	$E_{252,125}$	$E_{253,125}$	$E_{254,125}$	$E_{255,125}$
$E_{0,126}$	$E_{1,126}$	$E_{2,126}$	$E_{3,126}$	$E_{4,126}$	$E_{251,126}$	$E_{6,126}$	$E_{253,126}$	$E_{254,126}$	$E_{255,126}$
$E_{0,127}$	$E_{1,127}$	$E_{2,127}$	$E_{3,127}$	$E_{4,127}$	$E_{251,127}$	$E_{6,127}$	$E_{253,127}$	$E_{254,127}$	$E_{255,127}$

$E_{x,y}$	4-KB page entry
-----------	-----------------

sdram-074

Each entry of the PAT address corresponds to the page in the DMM container that has the same location. The entry (74, 42) in the table corresponds to the page (74, 42) in any DMM container.

#### 15.2.3.5.1.3.3.5 Direct Access to the PAT Table Vectors

The PAT table is typically refilled with specialized DMA called refill engines. Some direct read and write access to the content of this table is granted when disabling the use of one or the other refill engine by writing 1 in the MODE<sub>i</sub> field of the [DMM\\_PAT\\_CONFIG](#) register that corresponds to the refill engine *i* to disable.

In this mode, often called the debug mode, the data read in or written to the [DMM\\_PAT\\_DATA<sub>i</sub>](#) register corresponds to the vector in the PAT table, whose index is in the X0 and Y0 fields of the [DMM\\_PAT\\_AREA<sub>i</sub>](#) register.

#### 15.2.3.5.1.3.3.6 Automatic Refill Through the Refill Engines

See [Section 15.2.4.1, PAT Use Cases](#).

### 15.2.3.5.2 DMM Transaction Flows

#### 15.2.3.5.2.1 Nontiled Transaction Flow

Each nontiled interconnect transaction that reaches the DMM on a TILER port is subject to the same processing.

The TILER blocks consider separated request, data, and response paths. An overview of each path follows and more detailed information is in [Section 15.2.3.5.3, DMM Internal Macro-Architecture](#).

On the request path, the flow consists of:

- Allocating a TILER response context for the timely generation of the appropriate responses
- Splitting 2D requests in a collection of 1D requests – TILER ports
- Splitting requests at DMM unit boundaries; the split granularity is provided by the LISA mapping registers
- Allocating an available buffer in the appropriate ROBIN, for both read and write requests
- In case of a write request, allocating and updating a TILER write context to direct the incoming write data into the relevant reordering buffer

- Generating the initiator-indexed priority extension by use of the PEG block

On the write data path, the flow consists of forwarding incoming data to the relevant reordering buffer in accordance with the corresponding TILER write context.

On the response path, responses are returned when:

- At least one response has entered each related buffer, in case of read requests
- All related responses have returned from the SDRC, in case of write requests
- AND no other previous pending response with the same tag exists

#### **15.2.3.5.2.2 Tiled Transaction Flow**

Similarly, each tiled interconnect transaction that reaches the DMM is subject to the same processing.

The TILER blocks consider separated request, data, and response paths. An overview of each path follows, and more detailed information is in [Section 15.2.3.5.3, DMM Internal Macro-Architecture](#).

On the request path, the processing phase consists of:

- Decoding the address to qualify whether the request targets the TILER or the memory directly
- Transforming TILER-specific requests to their natural representation; the address, width, and height are modified accordingly

On the request path, the generation phase consists of:

- Allocating a TILER response context for the timely generation of the appropriate responses
- Splitting malformed: The request stride differs from the container stride and from the double of this container stride – tiled 2D requests in a collection of 1D requests
- Splitting tiled requests at tile boundaries
- Performing the page-based address translation by use of the PAT block
- Allocating an available buffer in the appropriate ROBIN, for read and write requests
- In case of a write request, allocating and updating a TILER write context to direct the incoming write data into the relevant reordering buffer
- Generating the initiator-indexed priority extension by use of the PEG block

On the data path, any incoming data is transformed in accordance with the corresponding TILER write context and sent to the appropriate reordering buffer.

On the response path, responses are returned when:

- A minimal number of responses have entered the corresponding buffers, in case of read requests
- All related responses have returned from the SDRCs, in case of write requests
- No other previous pending response with the same tag exists

#### **15.2.3.5.3 DMM Internal Macro-Architecture**

This section describes the DMM internal macro-architecture, specifically:

- Input request decoding
- PAT and synchronized translation table reloading
- Output request and response generation
- Memory mapping in the system addressing space, including interleaving
- Tag management
- Priority handling
- Contexts
- Maximum allowed burst size
- Reconstruction buffer dimensioning

### 15.2.3.5.3.1 LISA Description

The LISA is a full crossbar aimed at setting priorities, managing tag, and mapping memory.

The interconnect routes are:

- TILER requests on the ROBIN initiator nodes
- TILER write data on the ROBIN write buffers
- ROBIN read data to the relevant TILER initiators

The LISA block registers are [DMM\\_LISA\\_MAP\\_i](#) (where  $i = 0$  to 3) and [DMM\\_LISA\\_LOCK](#).

When two ROBINS are in use, the two ports are interleaved at a programmable boundary from 128 bytes or more (configurable with the [DMM\\_LISA\\_MAP\\_i\[19:18\]](#) SDRG\_INTL bit field).

### 15.2.3.5.3.2 PAT Description

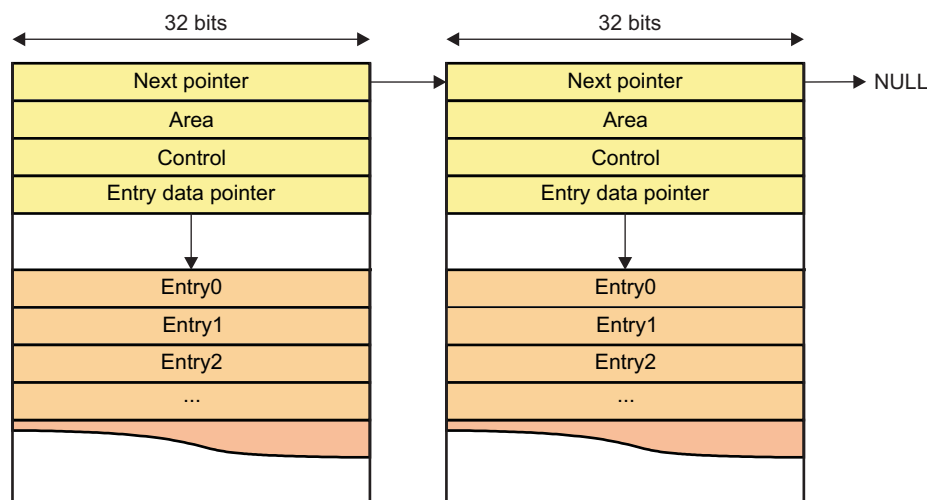

The PAT block maps physical pages to each TILER container page. The internal address translation memories used in the PAT block are designed with RFFs. It consists of:

- A memory-based LUT which has the same geometry as the container pages
- A refill engine for modifying entries in a given area of the internal LUT

A PAT descriptor is a singly-linked list node (see [Figure 15-9](#)) that contains:

- A description of the LUT area to reload
- A description of how to reload the defined LUT area
- A pointer to the location where the corresponding LUT entries are stored

**Figure 15-9. PAT Descriptors**

sdram-065

PAT descriptors are chained and processed until a NULL pointer is encountered. The PAT bank allocation scheme allows the updating of four consecutive entries of a line in a single cycle regardless of the refilling orientation.

The PAT descriptor structure directly maps the following registers (where  $i = 0$  to 3):

- [DMM\\_PAT\\_DESCR\\_i](#)
- [DMM\\_PAT\\_AREA\\_i](#)
- [DMM\\_PAT\\_CTRL\\_i](#)
- [DMM\\_PAT\\_DATA\\_i](#)

The PAT refill engine can be started by:

- Filling manually all the necessary registers:
  - [DMM\\_PAT\\_AREA\\_i](#) with the  $(x_0, y_0)$   $(x_1, y_1)$  area definition

- [DMM\\_PAT\\_DATA\\_i](#) with the physical address of the corresponding area entry table
- [DMM\\_PAT\\_CTRL\\_i\[6:4\]](#) DIRECTION bit field with the relevant (S, Y, X) direction of the area refill
- [DMM\\_PAT\\_CTRL\\_i\[0\]](#) START bit with 1
- Writing the physical address of a memory-mapped PAT descriptor in [DMM\\_PAT\\_DESCR\\_i](#), which updates:
  - [DMM\\_PAT\\_AREA\\_i](#) with the area value of the descriptor
  - [DMM\\_PAT\\_DATA\\_i](#) with the data value of the descriptor
  - [DMM\\_PAT\\_CTRL\\_i](#) with the control value of the descriptor
  - [DMM\\_PAT\\_DESCR\\_i](#) with the next value of the descriptor
- The data part of the PAT refill starts only when the [DMM\\_PAT\\_CTRL\\_i\[0\]](#) START bit is asserted.

The [DMM\\_PAT\\_STATUS\\_i](#) register can be used to see whether the process has completed without errors.

### 15.2.3.5.3.3 PEG Description

The PEG is a dynamic software-programmable, initiator-ConnID-indexed table of priorities. Its role is to change on the fly the priority of an initiator. The mapping of each initiator to the table (split into eight registers) is based on its 6-MSB group ConnID (see [Table 28-20, ConnID Mapping \(Debug View\)](#), in [Chapter 28, On-Chip Debug Support](#)).

When an interconnect request enters the DMM, its priority is extracted from the PEG LUT and set in its MReqInfo field.

The 64 priority entries are software-programmable with eight [DMM\\_PEG\\_PRIO](#) registers ([DMM\\_PEG\\_PRIO\\_k](#)).

These eight registers are each split into eight 4-bit fields, each field mapping an entry of the LUT with:

- The 3-bit priority coded on the 3 least-significant bits (LSBs): P<sub>x</sub> field. A priority of 0 defines the highest priority and a priority of 7 defines the lowest priority. At reset, all priorities are set to 4. The priority of a request with ConnID equal to y is written in (8.k + x) P field, where k is the number of the priority register (k = 0 to 7) and x is the number of the P field in the corresponding register (x = 0 to 7). For example, if the ConnID is 0x16, its priority is written in the third priority register (where k = 2), in the P6 bit field ([26:24]), because x = 6.

**Table 15-9. ConnIDs Vs PEG Priority Register Fields**

RegisterField	P0	P1	P2	P3	P4	P5	P6	P7
DMM_PEG_PRIO_0	0	1	2	3	4	5	6	7
DMM_PEG_PRIO_1	8	9	10(0xA)	11(0xB)	12(0xC)	13(0xD)	14(0xE)	15(0xF)
DMM_PEG_PRIO_2	16(0x10)	17(0x11)	18(0x12)	19(0x13)	20(0x14)	21(0x15)	22(0x16)	23(0x17)
DMM_PEG_PRIO_3	24(0x18)	25(0x19)	26(0x1A)	27(0x1B)	28(0x1C)	29(0x1D)	30(0x1E)	31(0x1F)
DMM_PEG_PRIO_4	32(0x20)	33(0x21)	34(0x22)	35(0x23)	36(0x24)	37(0x25)	38(0x26)	39(0x27)
DMM_PEG_PRIO_5	40(0x28)	41(0x29)	42(0x2A)	43(0x2B)	44(0x2C)	45(0x2D)	46(0x2E)	47(0x2F)
DMM_PEG_PRIO_6	48(0x30)	49(0x31)	50(0x32)	51(0x33)	52(0x34)	53(0x35)	54(0x36)	55(0x37)
DMM_PEG_PRIO_7	56(0x38)	57(0x39)	58(0x3A)	59(0x3B)	60(0x3C)	61(0x3D)	62(0x3E)	63(0x3F)

- A  $\overline{W}$  field-specific active-low local write enable bit, always read as 0, on the most-significant bit (MSB). The role of the  $\overline{W}$  bit is to allow the modification of a single entry without requiring a read-modify-write sequence. Because its  $\overline{W}$  bits are always read as 0, writing back the modified register updates all priority fields of the register.

Although this priority information is generated before entering the LISA block, it is not used internally in the local interconnect arbitration but is forwarded to the EMIF as an MReqInfo, where it indicates the command priority.

It is also possible to give a priority for the internal PAT engine through the [DMM\\_PEG\\_PRIO\\_PAT](#) register.

#### 15.2.3.5.3.4 **ROBIN Description**

The ROBIN is a block that provides some working buffering for converting data and responses to-and-from between raster and tiled organizations, and a master port to connect to the SDRC.

The ROBIN block:

- Forwards requests
- Writes data and buffers responses
- Keeps write data ordering
- Performs intraword tiling and orientation transforms
- Handles tags

#### 15.2.3.5.3.5 **TILER Description**

The main function of the TILER is request conversion caused by tiling.

The TILER block:

- Decodes the address to qualify whether the request targets the TILER or the memory directly
- Converts TILER-specific requests to their natural representation; address, width, and height are modified accordingly
- Allocates an internal response context for the timely generation of appropriate responses
- Splits tiled requests at tile boundaries and not-tiled requests at DMM atomic section boundaries
- Requests the page-based address translation
- Requests buffer allocation in the appropriate ROBIN
- In case of a write request, allocates and updates an internal write context to direct the incoming write data into the relevant reordering buffer

The interdependent tiling and isometric transform concepts introduced in the TILER are described in the following section.

### 15.2.3.6 **TILER**

#### 15.2.3.6.1 **TILER Concepts**

This section describes the concepts behind the TILER transforms, through a top-down approach starting from the main object container.

##### 15.2.3.6.1.1 **TILER Rationale**

This section is a synthesis of all TILER concepts, giving one rule per TILER structure level.

[Figure 15-10](#) shows the TILER address space structure for tiled modes.

Figure 15-10. TILER Address Space Structure for Tiled Modes

sdram-005\_public

15.2.3.6.1.1.1 The TILER is a 4-GB Virtual Address Space Composed of Eight Views

There is one view for each of the eight possible ways of scanning a frame-buffer:

- From left to right then from top to bottom

- From right to left then from top to bottom
- From left to right then from bottom to top
- From right to left then from bottom to top
- From top to bottom then from left to right
- From top to bottom then from right to left
- From bottom to top then from left to right
- From bottom to top then from right to left

#### **15.2.3.6.1.1.2 A View is a 512-MB Virtual Address Space Composed of Four Containers**

There is one container per element size to allow correct access patterns in any of the eight possible orientations. The container is the entity where all objects of a given element type are allocated.

The element is the entity of maximum size (8, 16, 32 bits or page-sized), which is invariant in any orientation.

#### **15.2.3.6.1.1.3 A Container is a 128-MB Virtual Address Space**

A container is composed of an array of 128 lines of 256 pages of 4 KB each.

The page defines the granularity of physical memory allocation through a PAT unit – MMU.

#### **15.2.3.6.1.1.4 A Page is a 4-KB Virtual Address Space**

A page is composed of two lines. Each line consists of two tiles.

#### **15.2.3.6.1.1.5 A Tile is a 1-KB Address Space**

The tile is designed to offer bidimensional data locality in a single SDRAM page. In this respect, it is sized to 1 KB; that is, to the size of the smallest SDRAM page.

#### **15.2.3.6.1.2 TILER Modes**

The TILER supports three major modes, bypass, page, and tiled. Each mode has a specific output request generation.

##### **15.2.3.6.1.2.1 Bypass Mode**

This mode is transparent from the TILER perspective. However, from the DMM perspective:

- 2D block bursts are broken down on a line basis in a set of incremental bursts.
- Incremental bursts, including those issued by a 2D block burst breakdown, are split at the DMM atomic unit of the section hit by the burst at:
  - The interleaving granularity of the section (128, 256, or 512 bytes) in interleaved sections
  - 1-KB boundary in noninterleaved sections

##### **15.2.3.6.1.2.2 Page Mode**

This mode uses the DMM address translation mechanism for nontiled accesses. In this respect it is similar to bypass mode:

- 2D block bursts are broken down on a line basis in a set of incremental bursts.
- Incremental bursts, including those issued by a 2D block burst breakdown, are split at:
  - The interleaving granularity of the section (128, 256, or 512 bytes) in interleaved sections
  - 1-KB boundary in noninterleaved sections

##### **15.2.3.6.1.2.3 Tiled Mode**

Tiled mode has two major breakdown algorithms:

- One for well-formed 2D block requests that conform to the orientation, mode, and stride listed in [Table 15-10](#)
- One for 1D incremental requests and ill-formed 2D block requests

**Table 15-10. Well-Formed Tiled Mode 2D Block Requests**

Orientation			Mode		Stride (bytes)	Description
S	$\nabla$	$\bar{x}$	M1	M0		
0	x	x	0	0	16,384	Plain access to an 8-bit progressive frame in 0 or 180 degrees
					32,768	Field access to an 8-bit interlaced frame 0 or 180 degrees
			0	1	32,768	Plain access to a 16-bit progressive frame in 0 or 180 degrees
					65,536	Field access to a 16-bit interlaced frame 0 or 180 degrees
			1	0	32,768	Plain access to a 32-bit progressive frame in 0 or 180 degrees
					65,536	Field access to a 32-bit interlaced frame 0 or 180 degrees
1	x	x	0	0	8192	Plain access to an 8-bit progressive frame in 90 or 270 degrees
					16,384	Field access to an 8-bit interlaced frame 90 or 270 degrees
			0	1	8192	Plain access to a 16-bit progressive frame in 90 or 270 degrees
					16,384	Field access to a 16-bit interlaced frame 90 or 270 degrees
			1	0	16,384	Plain access to a 32-bit progressive frame in 90 or 270 degrees
					32,768	Field access to a 32-bit interlaced frame 90 or 270 degrees

Similar to the bypass and page modes, ill-formed 2D block requests are broken down on a line basis in a set of incremental bursts. In tiled mode, however, these incremental virtual bursts do not translate to 1D physical burst requests.

### 15.2.3.6.1.3 Object Container Definition

The object container is the unique addressable entry point of the TILER. It is a 128-MB virtual address space, where all objects of a same kind and orientation are allocated.

Four main types of containers are present in the TILER, each referred by a mode:

- 8-bit element mode, for efficiently accessing bidimensional arrays of 8-bit data
- 16-bit element mode, for efficiently accessing bidimensional arrays of 16-bit data
- 32-bit element mode, for efficiently accessing bidimensional arrays of 32-bit data
- Page mode, for efficient 1D accesses

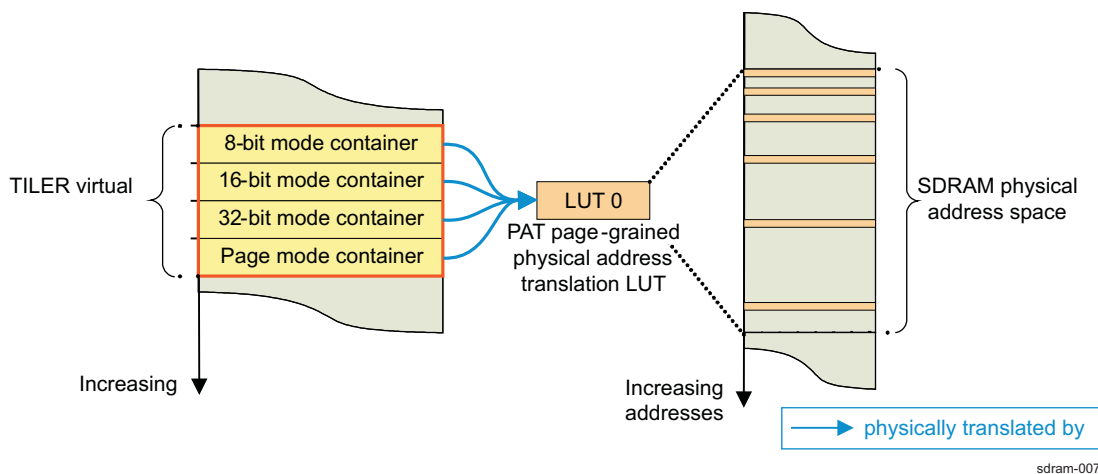

[Figure 15-11](#) shows the TILER object containers and views.

**Figure 15-11. TILER Object Containers and Views**

The 512-MB virtual address space composed of four 128-MB object containers of different modes is called a view. Because eight orientations are available per mode, the TILER actually manages 32 kinds of containers.

The physical memory footprint of a 512-MB TILER view is directly subject to the nature of the PAT unit.

A unique PAT LUT is instantiated in the DMM. This table is shared by all TILER modes. Hence, each of the four modes cannot be given its own private page-grained PAT LUT. A maximum of 128MB of objects among all TILER modes can be managed as shown in [Figure 15-12](#).

**Figure 15-12. TILER Memory Footprint With PAT and Shared Physical Address Translation LUT**

Although each of the four modes has its own separate virtual 128-MB object container, these containers are all mapped to the same piecewise 128-MB physical address space, and are then not physically separated. Consequently, a memory-related system constraint is that no more than 128-MB of objects can be available simultaneously in a TILER view.

---

**NOTE:** Software must ensure that any object allocated in a mode does not physically overlap with any other object, even in another mode.

---

#### 15.2.3.6.1.4 Page Definition

A TILER page defines the granularity of object allocation in virtual TILER containers.

Because the subpage structure is mode-specific, the page is the smallest granularity common to all modes, making it the granularity to consider in the TILER resource manager for object allocation.

15.2.3.6.1.4.1 Container Geometry With 4-KB Pages

Because the size of the page is 4 KB, any 128-MB object container is a set of 32,768 pages, organized in an array of 256 columns and 128 rows, as shown in Figure 15-13.

Figure 15-13. Object Container Geometry With 4-KB Pages

This array of pages is mapped to the system address space, as shown in Figure 15-14.

Figure 15-14. TILER Page Mapping When Using 4-KB Pages

In any 128-MB object container, the 4-KB page  $P_{x,y}$  at column  $x$  (where  $0 \leq x < 256$ ) and row  $y$  (where  $0 \leq y < 128$ ), is found at an offset of  $4096 \cdot (x + 256 \cdot y)$  bytes from the base address of the related object container.

Similarly, the page  $P_{x,y}$  at column  $x$  (where  $0 \leq x < 256$ ) and row  $y$  (where  $0 \leq y < 128$ ), is translated by the LUT entry  $E_{x+256 \cdot y}$  found at the index  $x + 256 \cdot y$ .

15.2.3.6.1.4.2 Container Geometry and Page Mapping Summary

The TILER has a page size of 4096 bytes. The page  $P_{x,y}$ :

- Has  $\max_x = 256$  and  $\max_y = 128$
- Is found at an offset of  $4096 \cdot (x + \max_x \cdot y)$  bytes from the base address of the related object container

- Is translated by the entry at the index  $(x + \max_x, y)$  of the LUT

### 15.2.3.6.1.5 Orientation

This section describes the eight on-the-fly orientation-related isometric transforms, which correspond to all available changes of orthonormal basis in the bidimensional space of the TILER container.

Figure 15-15 shows isometric transforms in the TILER container

**Figure 15-15. Isometric Transforms in the TILER Container**

sdram-010

Mathematically speaking, all these transforms correspond to the composition of a 0-, 90-, 180-, or 270-degree rotation with an optional reflection. The nature of this orientation is based on the three following binary parameters:

- X to change the direction of the  $x$  axis of the TILER container
- Y to change the direction of the  $y$  axis of the TILER container
- S to swap the modified  $x$  and  $y$  axis

Hereafter in this document the term orientation refers to any composition of a "quadrant" rotation with an optional horizontal (flip-flop) or vertical mirroring.

### 15.2.3.6.1.6 Tile Definition

A tile is a subdivision of a page that is aimed at:

- Representing a 2D block to better balance accesses in both directions
- Ensuring that any tiled access that fits within a tile is made atomic in the SDRG and fits in a single SDRAM memory page
- Minimizing the number of SDRAM page openings per 2D block transfer

The tile is defined as a 1-KB 2D block, and a 4-KB page as an array of two lines of two tiles each.

When the considered page is in an interleaved DMM section, it is necessary that:

- The DMM memory interleaving size of tiled accesses is set to 1 KB (a tile size) so that any tiled request that fits within a tile, fits in a single SDRAM memory page.
- Any request that spans two or four tiles is distributed on a maximum number of SDRGs.

**15.2.3.6.1.7 TILER Virtual Addressing**

The TILER can be virtually accessed in four different modes: 8-, 16-, 32-bit, and page modes. Each mode defines the element granularity to apply isometric transforms, as summarized in [Table 15-11](#).

**Table 15-11. Coding and Description of TILER Modes**

Mode	Name	Granularity (Element Size)
0	8-bit tiled mode	8 bits
1	16-bit tiled mode	16 bits
2	32-bit tiled mode	32 bits
3	Page mode	4096 bytes

For instance, making a vertical mirror of a 16-byte horizontal line that contains the word 000102030405060708090A0B0C0D0E0Fh, leads to:

- 0F0E0D0C0B0A09080706050403020100h in 8-bit tiled mode
- 0E0F0C0D0A0B08090607040502030001h in 16-bit tiled mode
- 0C0D0E0F08090A0B0405060700010203h in 32-bit tiled mode
- 000102030405060708090A0B0C0D0E0Fh in page mode – unchanged because the element granularity is 4KB

Besides, because each of the eight orientations is available for any of the four modes, the TILER has 32 addressing possibilities (see [Table 15-12](#)).

**Table 15-12. Coding and Description of TILER Orientations**

S	Y	X	Description	Alternate description
0	0	0	0-degree view	Natural view
0	0	1	0-degree view with vertical mirror	180-degree view with horizontal mirror
0	1	0	0-degree view with horizontal mirror	180-degree view with vertical mirror
0	1	1	180-degree view	
1	0	0	90-degree view with vertical mirror	270-degree view with horizontal mirror
1	0	1	270-degree view	
1	1	0	90-degree view	
1	1	1	90-degree view with horizontal mirror	270-degree view with vertical mirror

**15.2.3.6.1.7.1 Page Mode Virtual Addressing and Characteristics**

When used in page mode, the 128-MB TILER space is seen as an orientation-specific sequence of 32,768 pages of 4 KB each. The access sequence inside a page is left unchanged.

Therefore, in page mode, the TILER is accessed similarly to any 128-MB memory, with a 27-bit byte-based address.

**NOTE:** From here forward, the address is noted as *a* (see [Figure 15-16](#)).

**Figure 15-16. Page Mode Virtual Addressing**

sdr-am-027

**15.2.3.6.1.7.2 Tiled Mode Virtual Addressing and Characteristics**

When used in tiled mode, the 128-MB TILER space is seen as a giant frame-buffer, the container. The addressing and characteristics of this giant frame-buffer depend on:

- The tiled mode, which defines the considered atomic element size
- The orientation, which potentially swaps its x and y axis, and hence the container geometry

Table 15-13 summarizes the container characteristics in tiled mode.

**Table 15-13. Tiled Mode Container Characteristics**

Orientation S	Y	X	Element Size (Bits)	Width (Elements)	Height (Elements)	Stride (Bytes)	
						Progressive	Interlaced
0	x	x	8	16,384	8192	16,384	32,768
			16	16,384	4096	32,768	65,536
			32	8192	4096	32,768	65,536
1	x	x	8	8192	16,384	8192	16,384
			16	4096	16,384	8192	16,384
			32	4096	8192	16,384	32,768

As a result, the coordinate  $(x_0, y_0)$  of a pixel in an oriented view is translated in a virtual address, as shown in Figure 15-17 and Figure 15-18.

**Figure 15-17. Tiled Mode Addressing in 0- or 180-Degree Orientation (S = 0)**

**Figure 15-18. Tiled Mode Addressing in 90- or 270-Degree Orientation (S = 1)**

### 15.2.3.6.1.7.3 Element Ordering in the TILER Container

This section describes how elements (8-, 16-, or 32-bit data or a 4-KB page) are ordered in the container. In other words, this section describes how the path of incrementing virtual addresses is mapped in the container.

Regardless of the mode, and hence the element size, the sequence for ordering the elements in their related container is strictly similar and depends only on the related orientation. In other words:

- Mode is concerned with element granularity.
- Orientation is concerned with change of orthonormal basis for ordering the elements in the mode-specific container.

A corollary to the previous statements is that in a given mode the internal structure of an element is unchanged regardless of the orientation. In page mode for instance, the offset of a word inside a page is invariant by orientation; the content of a page is always accessed in the same manner.

In the following sections, the natural container orthonormal basis is referenced as:

$$(\vec{x}_N, \vec{y}_N)$$

sdram-030

and the oriented orthonormal basis is referenced as:

$$(\vec{x}_O, \vec{y}_O)$$

sdram-031

**15.2.3.6.1.7.3.1 Natural View or 0-Degree View (Orientation 0)**

This orientation defined by  $S = 0$ ,  $\bar{Y} = 0$ , and  $\bar{X} = 0$  means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = \vec{x}_N \\ \vec{y}_O = \vec{y}_N \end{cases}$$

sdram-032

In any TILER mode, the elements are ordered from left to right and then from top to bottom in their container, as shown in Figure 15-19 and Figure 15-20.

**Figure 15-19. Tiled Mode Ordering of Elements in Natural View**

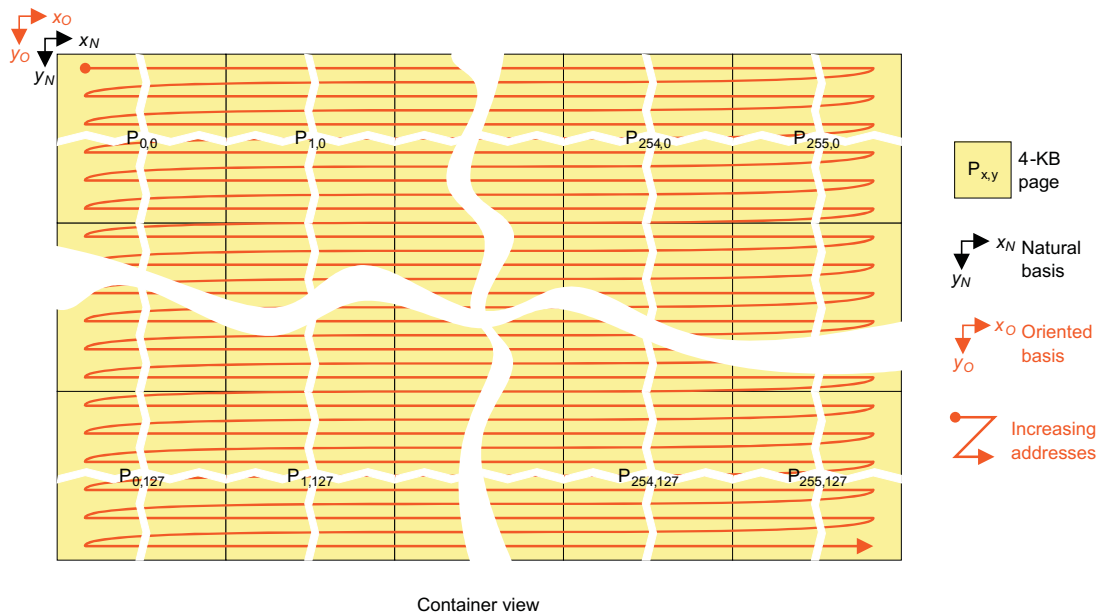

Figure 15-20. Page Mode Ordering of Elements in Natural View

15.2.3.6.1.7.3.2 0-Degree View With Vertical Mirror or 180-Degree View With Horizontal Mirror (Orientation 1)

This orientation defined by  $S = 0$ ,  $\bar{Y} = 0$ , and  $\bar{X} = 1$  and means that the operated change of basis is:

$$\begin{cases} \bar{x}_O = -\bar{x}_N \\ \bar{y}_O = \bar{y}_N \end{cases}$$

sdram-035

In any TILER mode, the elements are then ordered from right to left and then from top to bottom in their container, as shown in Figure 15-21 and Figure 15-22.

Figure 15-21. Tiled Mode Ordering of Elements in 0-Degree View With Vertical Mirror

Figure 15-22. Page Mode Ordering of Elements in 0-Degree View With Vertical Mirror

15.2.3.6.1.7.3.3 0-Degree View With Horizontal Mirror or 180-Degree View With Vertical Mirror (Orientation 2)

This orientation defined by  $S = 0$ ,  $\bar{Y} = 1$ , and  $\bar{X} = 0$  and means that the operated change of basis is:

$$\begin{cases} \bar{x}_O = \bar{x}_N \\ \bar{y}_O = -\bar{y}_N \end{cases}$$

sdram-038

In any TILER mode, the elements are ordered from left to right and then from bottom to top in their container, as shown in Figure 15-23 and Figure 15-24.

Figure 15-23. Tiled Mode Ordering of Elements in 0-Degree View With Horizontal Mirror

**Figure 15-24. Page Mode Ordering of Elements in 0-Degree View With Horizontal Mirror**

**15.2.3.6.1.7.3.4 180-Degree View (Orientation 3)**

This orientation defined by  $S = 0$ ,  $\bar{Y} = 1$ , and  $\bar{X} = 1$  and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = -\vec{x}_N \\ \vec{y}_O = -\vec{y}_N \end{cases}$$

sdram-041

In any TILER mode, the elements are ordered from right to left and then from bottom to top in their container, as shown in [Figure 15-25](#) and [Figure 15-26](#).

**Figure 15-25. Tiled Mode Ordering of Elements in 180-Degree View**

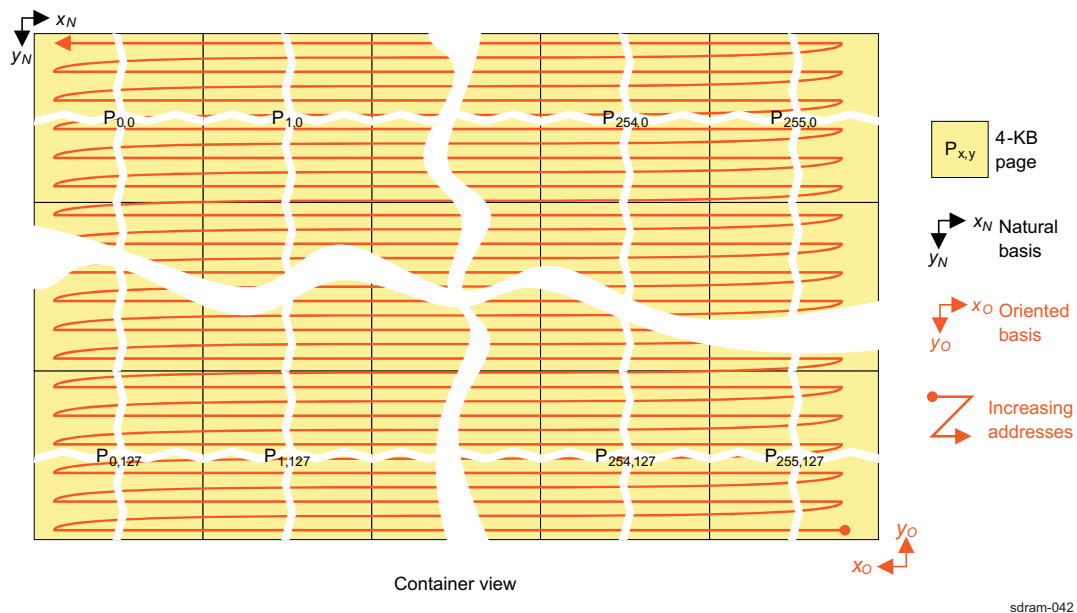

Figure 15-26. Page Mode Ordering of Elements in 180-Degree View

15.2.3.6.1.7.3.5 90-Degree View With Vertical Mirror or 270-Degree View With Horizontal Mirror (Orientation 4)

This orientation defined by  $S = 1$ ,  $\bar{Y} = 0$ , and  $\bar{X} = 0$  and means that the operated change of basis is:

$$\begin{cases} \bar{x}_O = \bar{y}_N \\ \bar{y}_O = \bar{x}_N \end{cases}$$

sdram-044

In any TILER mode, the elements are ordered from top to bottom and then from left to right in their container, as shown in Figure 15-27 and Figure 15-28.

Figure 15-27. Tiled Mode Ordering of Elements in 90-Degree View With Vertical Mirror

**Figure 15-28. Page Mode Ordering of Elements in 90-Degree View With Vertical Mirror**

**15.2.3.6.1.7.3.6 270-Degree View (Orientation 5)**

This orientation defined by  $S = 1$ ,  $\bar{Y} = 0$ , and  $\bar{X} = 1$  and means that the operated change of basis is:

$$\begin{cases} \bar{x}_O = \bar{y}_N \\ \bar{y}_O = -\bar{x}_N \end{cases}$$

sdram-047

In any TILER mode, the elements are ordered from top to bottom and then from right to left in their container, as shown in [Figure 15-29](#) and [Figure 15-30](#).

**Figure 15-29. Tiled Mode Ordering of Elements in 270-Degree View**

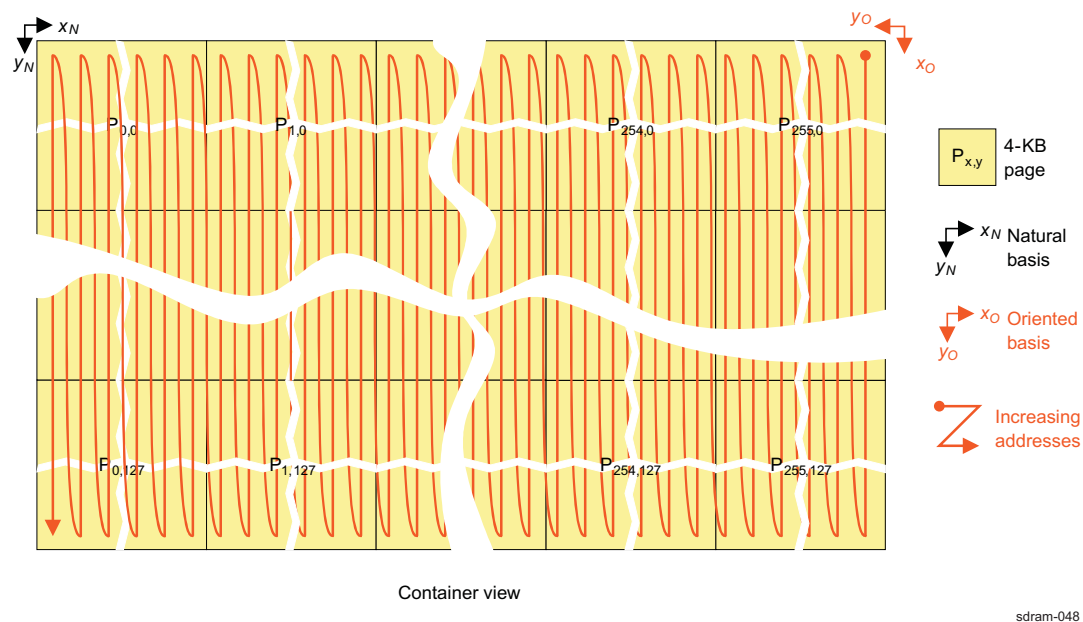

Figure 15-30. Page Mode Ordering of Elements in 270-Degree View

15.2.3.6.1.7.3.7 90-Degree View (Orientation 6)

This orientation defined by  $S = 1$ ,  $\bar{Y} = 1$ , and  $\bar{X} = 0$  and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = -\vec{y}_N \\ \vec{y}_O = \vec{x}_N \end{cases}$$

s dram-050

In any TILER mode, the elements are ordered from bottom to top and then from left to right in their container, as shown in Figure 15-31 and Figure 15-32.

Figure 15-31. Tiled Mode Ordering of Elements in 90-Degree View

**Figure 15-32. Page Mode Ordering of Elements in 90-Degree View**

sdram-052

**15.2.3.6.1.7.3.8 90-Degree View With Horizontal Mirror or 270-Degree View With Vertical Mirror (Orientation 7)**

This orientation defined by  $S = 1$ ,  $\bar{Y} = 1$ , and  $\bar{X} = 1$  and means that the operated change of basis is:

$$\begin{cases} \bar{x}_O = -\bar{y}_N \\ \bar{y}_O = -\bar{x}_N \end{cases}$$

sdram-053

In any TILER mode, the elements are ordered from bottom to top and then from right to left in their container, as shown in [Figure 15-33](#) and [Figure 15-34](#).

**Figure 15-33. Tiled Mode Ordering of Elements in 90-Degree View With Horizontal Mirror**

sdram-054

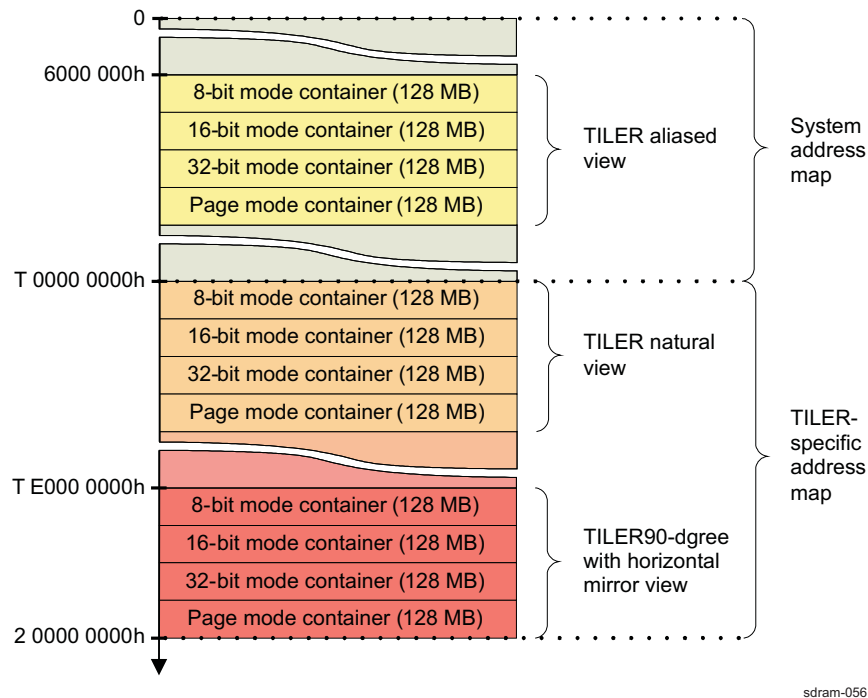

Figure 15-34. Page Mode Ordering of Elements in 90-Degree View With Horizontal Mirror

### 15.2.3.6.2 TILER Macro-Architecture

The TILER requires a 4-GB addressing space to map its 128-MB physical container in four modes and eight orientations. Because its addressing space alone fills the 4-GB global system address map, the TILER addressing space cannot enter as-is into the system address map. Besides, putting in place a register-based mechanism per initiator to specify the orientation of the following accesses and then reducing the TILER addressing space to a single 512-MB view is not an option; this is because most of the bandwidth-hungry initiators require simultaneous accesses to the TILER container in different views.

As a result, 32 bits are not enough to address all these requests, because the TILER port must convey not only virtually addressed requests to the "oriented" TILER containers but also physically addressed requests to the attached SDRs. A thirty-third address bit is necessary to distinguish the two separated address maps, as shown in [Figure 15-35](#).

**Figure 15-35. TILER Port Address Map**

Still, having separated systems and TILER-specific address maps is not sufficient. In a system many existing and external IP blocks still rely on a 32-bit address and would then be limited to one or the other 4-GB addressing space. To overcome this limitation, one 512-MB view is aliased in the system address map as (see [Table 15-14](#) and [Figure 15-36](#)).

**Table 15-14. TILER Aliased View in the L3 Interconnect Mapping**

Start Address (hex)	End Address (hex)	Size
0x6000_0000	0x7FFF_FFFF	512 MB

From all incoming requests, TILER requests are filtered as having an address that fits one of the following:

- The address format in the TILER-specific address map given in [Table 15-15](#), or
- The address format of the aliased view in the system address map given in [Table 15-16](#); other requests are forwarded directly to the SDRC in TILER bypass mode.

**Table 15-15. Address Format in the TILER-Specific Address Map**

32	31	30	29	28	27	26 ... 4	3 ... 0
T	Orientation			Mode		Virtual address	
1	S	Y	X	M1	M0	A26 ... A4	0

**Table 15-16. Address Format of the TILER Aliased View in the System Address Map**

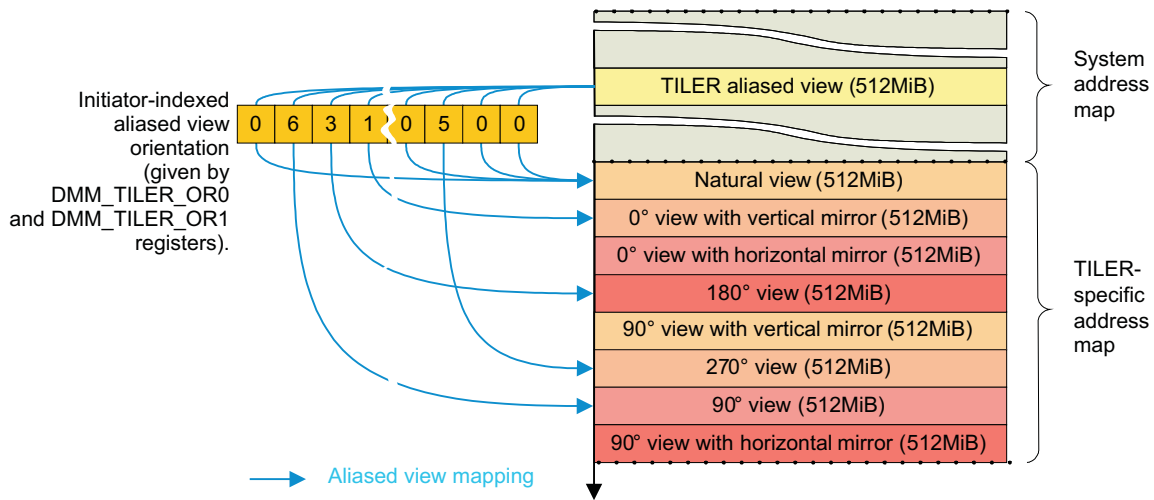

32	31	30	29	28	27	26 ... 4	3 ... 0
T	TILER aliasing			Mode		Virtual address	
0	0	1	1	M1	M0	A26 ... A4	0

In these address formats:

- The thirty-third bit, noted T, is aimed at distinguishing the standard 4-GiB system address map from the 4-GiB TILER-specific address map.
- The orientation bits, noted S,  $\bar{Y}$ , and  $\bar{X}$ , define the request orientation, as specified in Table 15-12.
- The mode bits, noted M1 and M0, define the request mode, as specified in Table 15-11.
- The remaining 27 bits, noted A0 to A26, define the mode and orientation specific virtual address, as defined in Figure 15-16, Figure 15-17, and Figure 15-18.

The orientation of the aliased TILER view is extracted from an initiator-indexed LUT, as shown in Figure 15-36.

Figure 15-36. TILER Aliased View Orientation

As shown in Figure 15-36, an internal initiator-indexed LUT stores the current orientation of the aliased view for each initiator.

When an interconnect request hits the TILER aliased view in the system address map, the request initiator orientation is extracted from the LUT and the request address is translated according to this orientation: the T bit is set and bits [31:29] are replaced with the orientation.

Regarding the dimensioning of this LUT, given that initiators simultaneously accessing multiple views use the TILER-specific address map, and many initiators do not need to access any view or can be restricted to accessing only the natural view, only a limited number of initiators are likely to dynamically modify the orientation of its aliased TILER view.

The orientation LUT is limited to 16 entries. These 16 orientation entries are mapped on the two 32-bit `DMM_TILER_OR0` and `DMM_TILER_OR1` registers.

The first eight entries of the LUT are mapped in the `DMM_TILER_OR0` register, and the last eight entries are mapped in the `DMM_TILER_OR1` register. Therefore, given an index x, the orientation related to this index is given in the ORx field.

Each of these registers is split into eight 4-bit fields, each field mapping an entry of the LUT with:

- An S,  $\bar{Y}$ ,  $\bar{X}$  orientation code on the 3 LSBs
- An  $\bar{W}$  field-specific active-low local write-enable bit, always read as 0, on the MSB.

The registers fields that correspond to initiators that do not need any dynamic configuration of their aliased view orientation must be specified as reserved fields, and only written with zeros.

The  $\bar{W}$  bit allows the modification of a single entry without requiring a read-modify-write sequence. This approach is then more accommodating:

- In a system where multiple initiators can modify their own fields in the registers
- With initiators unable to make the read-modify-write sequence, such as DMA

Still, the  $\overline{W}$  bit is active-low to keep the compatibility with the usual read-modify-write sequence. When reading an aliased view orientation register, because all its  $\overline{W}$  bits are read as 0, if these bits are untouched by the modification—as they should be—writing back the modified register updates all orientation fields of the register.

### 15.2.3.6.3 TILER Guidelines for Initiators

#### 15.2.3.6.3.1 Buffered Raster-Based Initiators

##### 15.2.3.6.3.1.1 Buffer Size

The necessary minimum buffer size depends on the SDRAM prefetch size and on initiator support in terms of the following:

- Element size
- Orientation
- Maximum number of elements per line in all supported element sizes and orientations

Let  $N$  be the maximum number of elements per line for a given mode (element size) and orientation,  $P$  be the SDRAM memory prefetch size in bytes, and  $max$  be the function returning the maximum of the two parameters. The minimum necessary line buffer size to handle all resolutions in a given mode and orientation is listed in [Table 15-17](#).

**Table 15-17. Minimum Buffer Size to Efficiently Handle Lines of up to N Elements**

	0- or 180- Degree Orientation ( $S = 0$ )	90- or 270-Degree Orientation ( $S = 1$ )
8-bit mode	4 x N bytes	$max(4, P/4) \times N$ bytes
16-bit mode	None	$max(8, P/2) \times N$ bytes
32-bit mode	None	$max(8, P/2) \times N$ bytes

This minimal buffer size can be reached only with an advanced FIFO management scheme. The standard ping-pong buffer requires twice this buffer size.

**NOTE:** Given their nature, field accesses to an interlaced frame-buffer require buffers twice as small as in the standard progressive case.

For instance, an initiator that must handle only a single progressive frame-buffer in any orientation of:

- Up to 1920 × 1080 in YUV4:2:0
- Up to 1600 × 1200 in 16-bit RGB565
- Up to 800 × 600 in 32-bit ARGB

requires a line buffer of at least 15,360 bytes because:

- $4 \times 1920 + 4 \times 2960 = 15,360$  bytes required for a 3-plane YUV4:2:0 frame of 1920 × 1080
- $4 \times 1920 + 8 \times 960 = 15,360$  bytes required for a 2-plane YUV4:2:0 frame of 1920 × 1080
- $8 \times 1600 = 12,800$  bytes required for a 16-bit RGB565 frame of 1600 × 1200
- $8 \times 800 = 6400$  bytes required for a 32-bit ARGB frame of 800 × 600

and a line buffer of at least 30,720 bytes when using a simple ping-pong buffer scheme.

##### 15.2.3.6.3.1.2 Performance

[Table 15-18](#) gives the ratio of effective data to transferred data at the external memory interface for buffered raster-based initiators in each mode and orientation, when using an up-to-32-bit DDR, lpDDR, or lpDDR2 SDRAM, or an up-to-16-bit DDR2 memory.

**Table 15-18. Memory Data Payload for Buffered Raster-Based Initiators on Up-to-32-Bit DDR, lpDDR, or lpDDR2**

	0- or 180-Degree Orientation (S = 0)		90- or 270-Degree Orientation (S = 1)	
	Progressive	Interlaced	Progressive	Interlaced
8-bit mode	100%	100%	100%	50%
16-bit mode	100%	100%	100%	50%
32-bit mode	100%	100%	100%	50%
Page mode	100%	N/A	100%	100%

When using 32-bit DDR, lpDDR, or lpDDR2 SDRAMs, or 16-bit DDR, DDR2, lpDDR, or lpDDR2 memories, whenever all previous guidelines are fulfilled, there is no penalty for these initiators to access a tiled object in any orientation, except for accesses to an interlaced frame in 90- or 270-degree orientation where the memory bandwidth is twice the requested bandwidth.

When using up-to-32-bit DDR, lpDDR, lpDDR2, or up-to-16-bit DDR2 SDRAMs, all accesses, except interlaced accesses in a 90- or 270-degree orientation, are equally efficient and offer the full possible memory bandwidth.

Because of its progressive nature, page mode does not introduce any performance hit.

[Table 15-19](#) lists the ratio of effective data-to-transferred data at the external memory interface for the buffered raster-based initiators in each mode and orientation when using a 32-bit DDR2 or DDR3 memory.

**Table 15-19. Memory Data Payload for Buffered Raster-Based Initiators on 32-Bit DDR2 or DDR3**

	0- or 180-Degree Orientation (S = 0)		90- or 270-Degree Orientation (S = 1)	
	Progressive	Interlaced	Progressive	Interlaced
8-bit mode	100%	50%	100%	50%
16-bit mode	100%	50%	100%	50%
32-bit mode	100%	50%	100%	50%
Page mode	100%	N/A	100%	100%

When using 32-bit DDR2 or DDR3 SDRAMs, whenever all previous guidelines are fulfilled, there is no penalty for these initiators to access a tiled object in any orientation, except for accesses to an interlaced frame in any orientation where the memory bandwidth is twice the requested bandwidth.

When using DDR2 or DDR3 SDRAMs, all accesses, except interlaced accesses, are equally efficient and offer the full possible memory bandwidth.

Similarly, page mode does not introduce any performance hit.

## 15.2.4 DMM Use Cases and Tips

### 15.2.4.1 PAT Use Cases

Five ways to use PAT are:

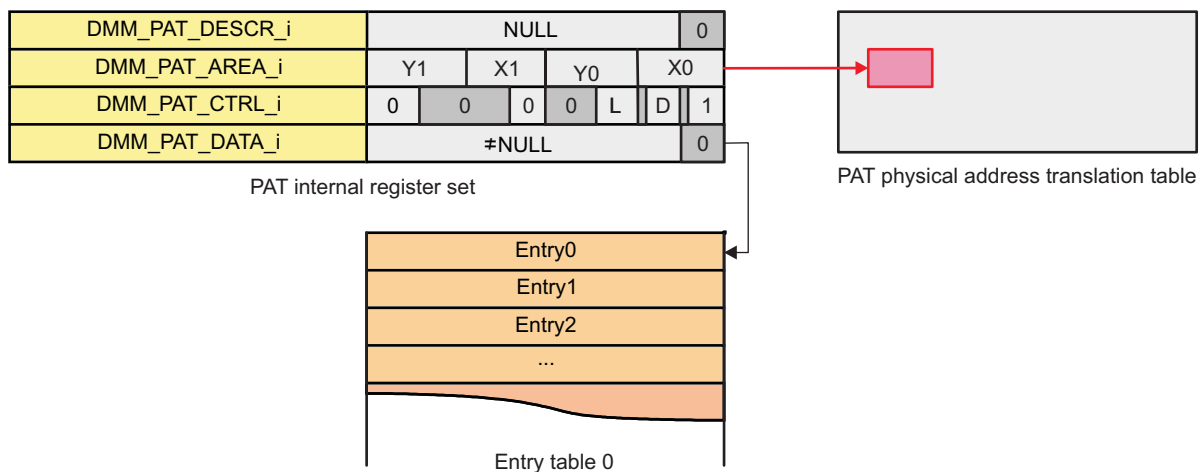

- Simple manual area refill
- Single auto-configured area refill
- Chained auto-configured area refill
- Synchronized auto-configured area refill
- Cyclic synchronized auto-configured area refill

#### 15.2.4.1.1 Simple Manual Area Refill

The following must be performed to create a 16-byte aligned memory-mapped entry table containing all entries of the defined area (see [Figure 15-37](#)):

1. Write the `DMM_PAT_AREA_i` register with the relevant (x0, y0) (x1, y1) area definition.
2. Write the `DMM_PAT_DATA_i` register with the physical address of the created entry table.
3. Write the `DMM_PAT_CTRL_i` register with the requested refill direction and assert the `DMM_PAT_CTRL_i[0]` START bit with the requested refill direction D and with the LUT ID L if multiple LUTs are present in the system.
4. The refill is done when the `DMM_PAT_STATUS_i[3]` DONE bit is set.
5. A new refill can be initiated when the `DMM_PAT_STATUS_i[0]` READY bit is set.

**Figure 15-37. Simple Manual Area Refill Scheme**

sdram-067

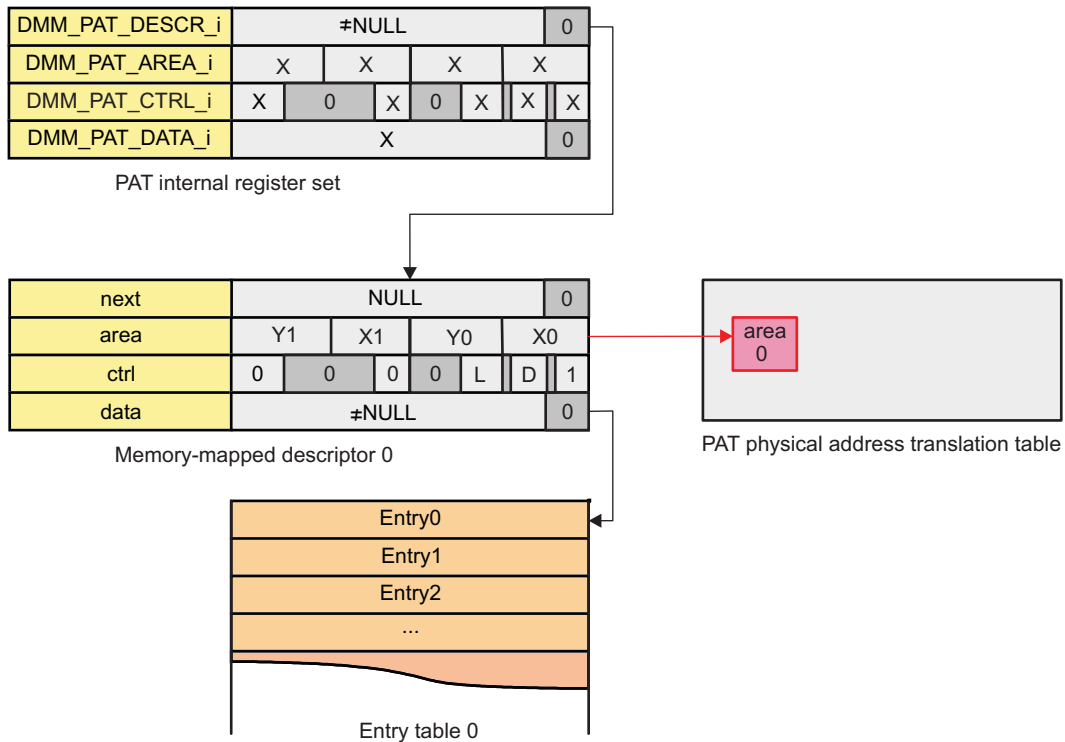

#### 15.2.4.1.2 Single Auto-Configured Area Refill

The following must be performed to create a 16-byte aligned memory-mapped entry table containing all entries of the defined area (see [Figure 15-38](#)):

1. Create a 16-byte aligned memory-mapped descriptor structure where:
  - The next field is set to NULL.
  - The area field is set with the relevant (x0, y0) (x1, y1) area definition.
  - The ctrl field is set with the requested direction D, with the requested LUT ID L if multiple LUTs are present in the system, and the START bit is asserted to start refilling as soon as this descriptor enters the PAT refill engine.
  - The data field is set to the physical address of the created entry table.
2. Write the `DMM_PAT_DESCR_i` register with the physical address of the created descriptor.
3. The refill is done when the `DMM_PAT_STATUS_i[3]` DONE bit is set.

4. A new refill can be initiated when the `DMM_PAT_STATUS_i[0]` READY bit is set.

**Figure 15-38. Single Auto-Configured Area Refill Scheme**

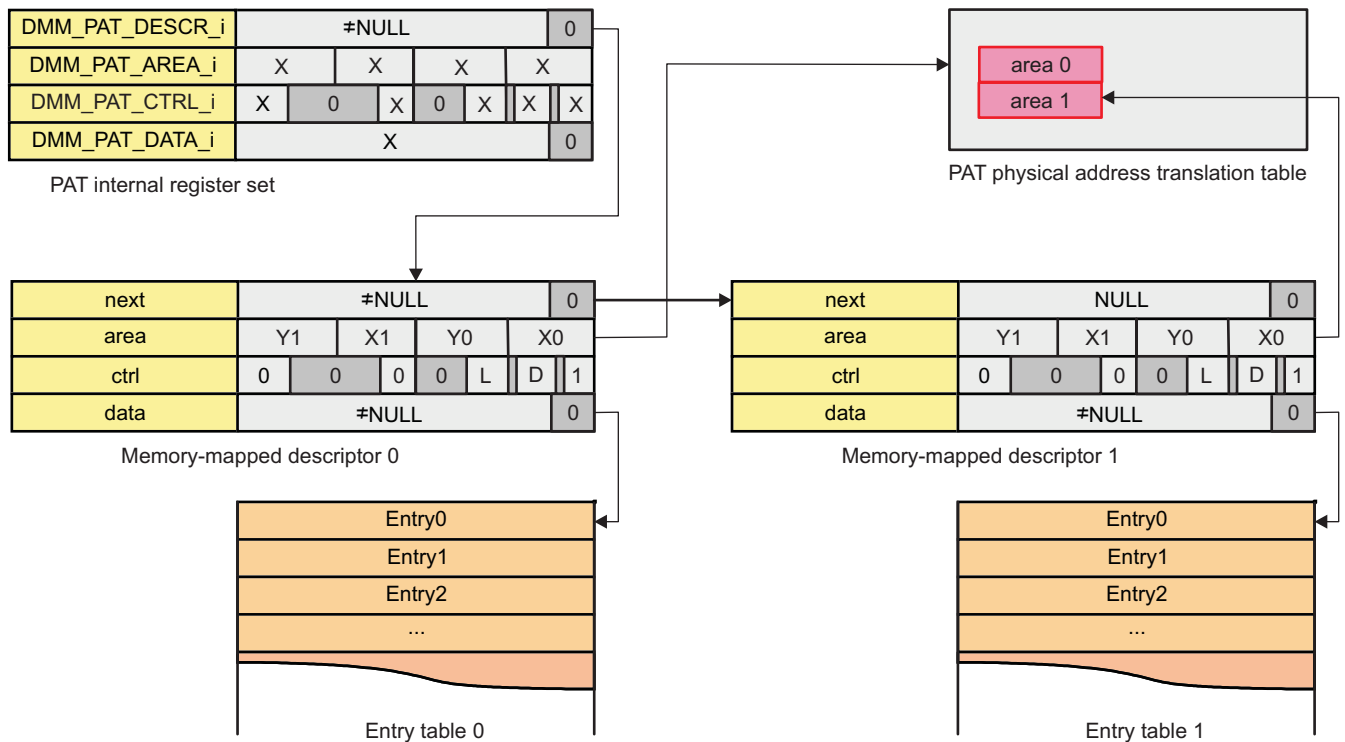

sdram-068

### 15.2.4.1.3 Chained Auto-Configured Area Refill

The following must be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area (see Figure 15-39):

1. Create one 16-byte aligned memory-mapped descriptor structure per area where:
  - The next field is set to the physical address of the next descriptor or NULL for the last one.
  - The area field is set with the relevant (x0, y0) (x1, y1) area definition.
  - The ctrl field is set with the requested direction D, with the requested LUT ID L if multiple LUTs are present in the system, and the START bit is asserted to start refilling as soon as the previous area refill is done.
  - The data field is set to the physical address of the corresponding entry table.
2. Write the `DMM_PAT_DESCR_i` register with the physical address of the first created descriptor.
3. Each area refill is done when the `DMM_PAT_STATUS_i[3]` DONE bit is set.
4. All area refills are done when the `DMM_PAT_STATUS_i[0]` READY bit is set.
5. A new refill can be initiated when the `DMM_PAT_STATUS_i[0]` READY bit is set.

**Figure 15-39. Chained Auto-Configured Area Refill Scheme**

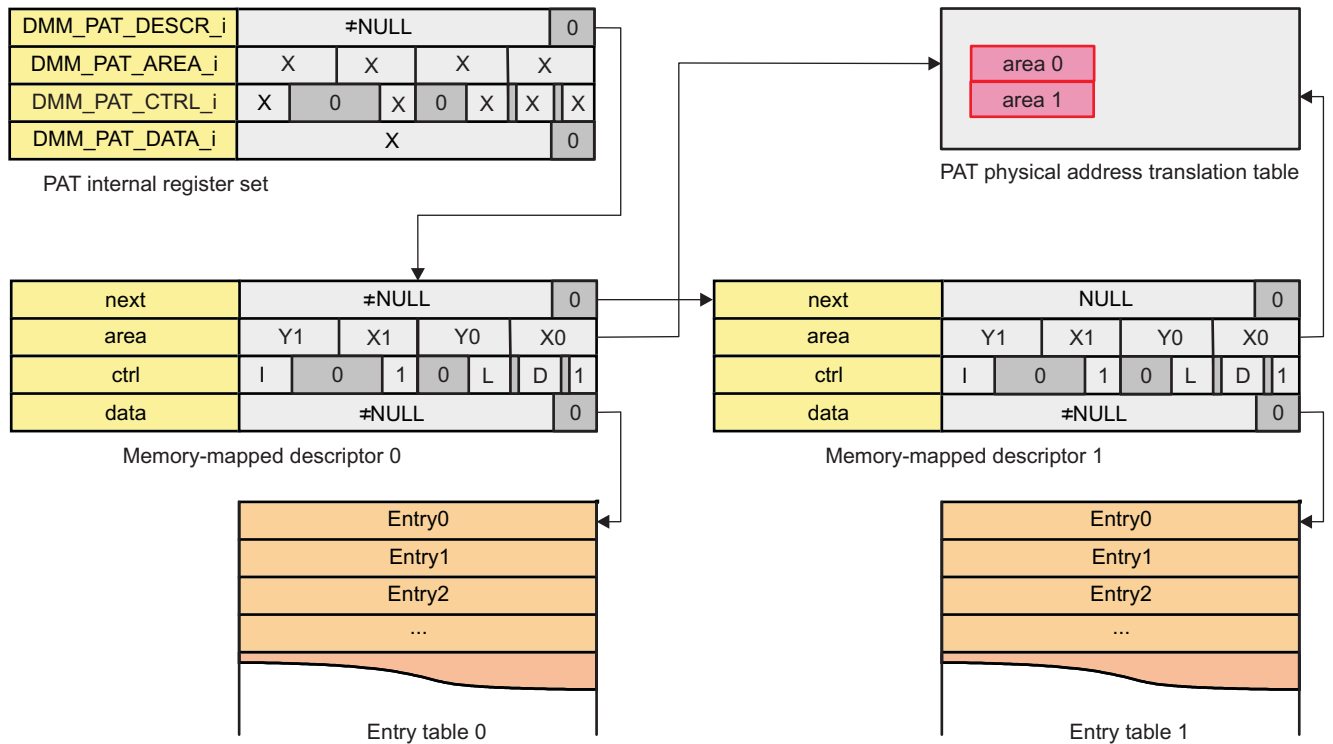

sdram-069

#### 15.2.4.1.4 Synchronized Auto-Configured Area Refill

The following must be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area (see Figure 15-40):

1. Create one 16-byte aligned memory-mapped descriptor structure per area where:
  - The next field is set to the physical address of the next descriptor or NULL for the last one.
  - The area field is set with the relevant (x0, y0) (x1, y1) area definition.
  - The ctrl field is set with the synchronizing initiator identifier I, the SYNC bit is asserted, the requested direction D and the requested LUT ID L if multiple LUTs are present in the system, and the START bit is asserted to start refilling as soon as the previous area refill is done and initiator I has made one access in the previous area.
  - The data field is set to the physical address of the corresponding entry table.
2. Write the `DMM_PAT_DESCR_i` register with the physical address of the first created descriptor.
3. Each area refill is done when the `DMM_PAT_STATUS_i[3]` DONE bit is set.
4. All area refills are done when the `DMM_PAT_STATUS_i[0]` READY bit is set.
5. A new refill can be initiated when the `DMM_PAT_STATUS_i[0]` READY bit is set.

Figure 15-40. Synchronized Auto-Configured Area Refill Scheme

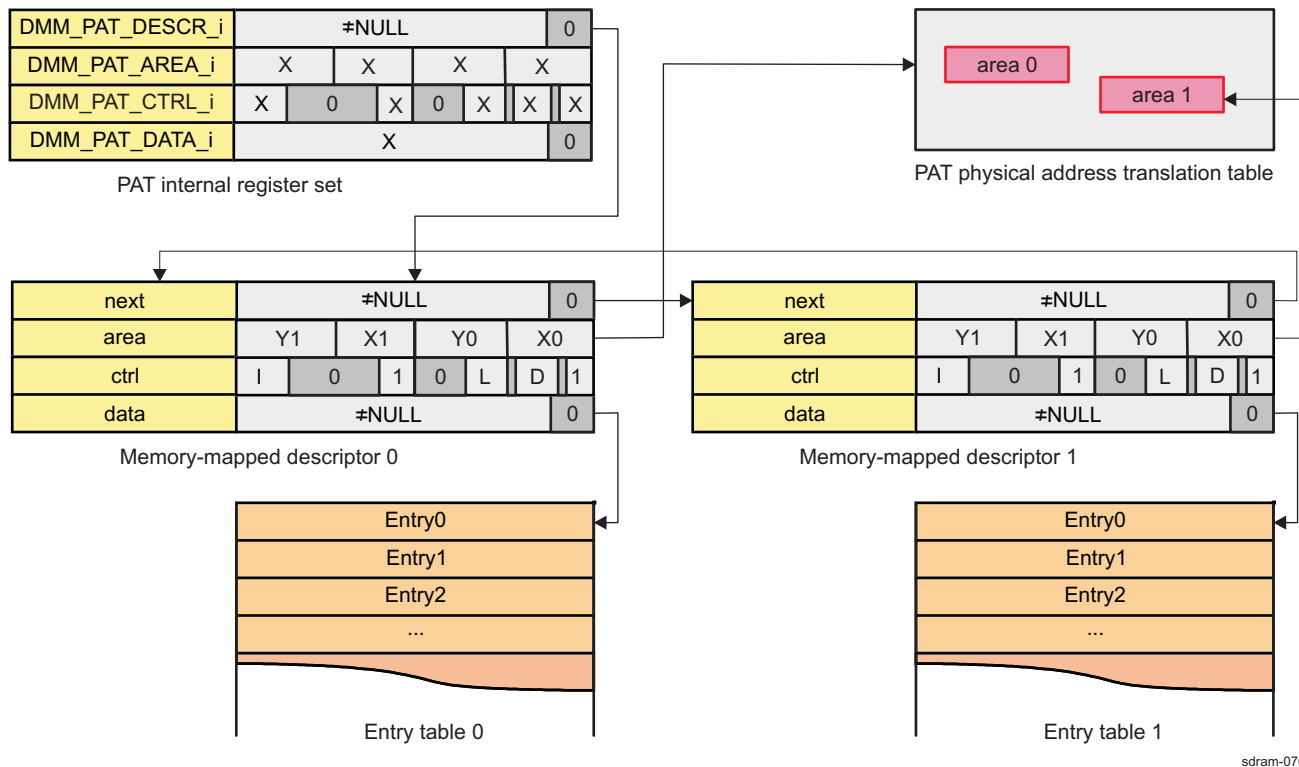

s dram-071

### 15.2.4.1.5 Cyclic Synchronized Auto-Configured Area Refill

The following must be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area (see Figure 15-41):

1. Create one 16-byte aligned memory-mapped descriptor structure per area where:
  - The next field is set to the physical address of the next descriptor in the circular list.
  - The area field is set with the relevant (x0, y0) (x1, y1) area definition.
  - The control field is set with the synchronizing initiator identifier I, the SYNC bit asserted, the requested direction D and requested LUT ID L if multiple LUTs are present in the system, and the START bit is asserted to start refilling as soon as the previous area refill is done and initiator I has made one access in the previous area.
  - The data field is set to the physical address of the corresponding entry table.
2. Write the DMM\_PAT\_DESCR\_i register with the physical address of the initial descriptor.
3. Each area refill is done when the DMM\_PAT\_STATUS\_i[3] DONE bit is set.
4. A new refill can be initiated by writing any value to the DMM\_PAT\_DESCR\_i register to abort the current one.

**Figure 15-41. Cyclic Synchronized Auto-Configured Area Refill Scheme**

**NOTE:** Never use circular lists of descriptors where all descriptors have the `DMM_PAT_CTRL_i[0]` START bit set and there is no synchronization. This leads to an endless continuous refill.

## 15.2.4.2 Addressing Management with LISA

### 15.2.4.2.1 Case 1: Use of One Memory Controller

In this example, assume there is 1 GB of external memory evenly spread onto two address spaces. The address range for address space 0 must start at offset `0x2000_0000` (see [Table 15-20](#)).

**Table 15-20. Address Definition**

Address Range	Memory Controller	Memory Controller Address Space <sup>(1)</sup>	Memory Controller Address Range
0x8000_0000 to 0x9FFF_FFFF	EMIF1	0x1	0x0000_0000 to 0x1FFF_FFFF
0xA000_0000 to 0xBFFF_FFFF	EMIF1	0x0	0x2000_0000 to 0x3FFF_FFFF

<sup>(1)</sup> For memory controller address spaces, see [Section 15.3.4.1.1, L3 Interface](#).

This configuration requires two nonoverlapping sections to be set. They can be defined in any order because there is no concern with priority in this case (see [Table 15-21](#)):

**Table 15-21. Configuration**

Bit Field	Section 0 (DMM_LISA_MAP_0)	Section 1 (DMM_LISA_MAP_1)
[31:24] SYS_ADDR	0x80	0xA0
[22:20] SYS_SIZE	0x5	0x5
[19:18] SDRC_INTL	0x0 (not applicable)	0x0 (not applicable)

**Table 15-21. Configuration (continued)**

Bit Field	Section 0 (DMM_LISA_MAP_0)	Section 1 (DMM_LISA_MAP_1)
[17:16] SDRG_ADDRSPC	0x1	0x0
[8] SDRG_MAP	0x1 (only one controller)	0x1 (only one controller)
[7:0] SDRG_ADDR	0x00	0x20

To check whether an address hits a section, use the 8 upper address bits of the address and mask them with the hit mask:  $2^8 - 2^{\text{SYS\_SIZE}}$ . If the result is equal to SYS\_ADDR, the section is hit.

To define the physical address to be issued to the memory controller, use the 8 upper address bits of the system address, mask them with the address mask:  $2^{\text{SYS\_SIZE}} - 1$ , and OR them with SDRG\_ADDR. This gives the resulting 8 upper physical address bits. All lower address bits are forwarded unchanged.

Request to address 0x99AE\_37F0:

- Upper address bits: 0x99
- Hit mask:  $2^8 - 2^5 = 0xE0$
- Masked upper address bits: 0x80, that is, hits section 0
- Address mask:  $2^5 - 1 = 0x1F$
- Masked upper address bits: 0x19
- OR with SDRG\_ADDR: 0x19
- Physical address: 0x19AE\_37F0

This request is forwarded to address 0x19AE\_37F0, address space 1 of the memory controller.

Request to address 0xB7FF\_0340:

- Upper address bits: 0xB7
- Hit mask:  $2^8 - 2^5 = 0xE0$
- Masked upper address bits: 0xA0, that is, hits section 1
- Address mask:  $2^5 - 1 = 0x1F$
- Masked upper address bits: 0x17
- OR with SDRG\_ADDR: 0x57
- Physical address: 0x57FF\_0340

This request is forwarded to address 0x57FF\_0340, address space 0 of the memory controller.

#### 15.2.4.2.2 Case 2: Use of Two Memory Controllers

In the case of 512 MB interleaved at 128-byte boundaries and 256 MB noninterleaved on the second memory controller, one address space per memory controller, the following results are achieved (see [Table 15-22](#)):

**Table 15-22. Address Definition**

Address Range	Memory Controller	Memory Controller Address Space <sup>(1)</sup>	Memory Controller Address Range
0x8000_0000 to 0x9FFF_FFFF	EMIF1 and EMIF2, interleaved at 128-byte boundaries	0x0 on both controllers	0x0000_0000 to 0x0FFF_FFFF on both controllers
0xA000_0000 to 0xAFFF_FFFF	EMIF2 only	0x0	0x1000_0000 to 0x1FFF_FFFF

<sup>(1)</sup> For memory controller address spaces, see [Section 15.3.4.1.1, L3 Interface](#).

Two sections are used to map such a configuration, see [Table 15-23](#):

**Table 15-23. Configuration**

Bit Field	Section 0 (DMM_LISA_MAP_0)	Section 1 (DMM_LISA_MAP_1)
[31:24] SYS_ADDR	0x80	0xA0
[22:20] SYS_SIZE	0x5	0x4
[19:18] SDRG_INTL	0x1	0x0 (not applicable)
[17:16] SDRG_ADDRSPC	0x0	0x0
[8] SDRG_MAP	0x3	0x2
[7:0] SDRG_ADDR	0x00	0x10

Detecting a section hit is the same for the interleaved case as for the single controller case: to check whether an address hits a section, use the 8 upper address bits of the address and mask them with the hit mask:  $28-2^{\text{SYS\_SIZE}}$ . If the result is equal to SYS\_ADDR, the section is hit.

The physical address generation is modified for the interleaved case. In case of 256-byte interleaving, the first chunk of 256 bytes is mapped to the first controller, the second chunk to the second controller, and so on. This results in system address bit 8 to be decoded as the controller indicator, 0 for the first controller, and 1 for the second controller (system address bit 7 is used for interleaving at the 128-byte boundary, and bit 9 for 512 bytes). This bit is not included in the computed physical address, meaning the upper system address bits [31:9] are shifted to bits [30:8] when generating the physical address.

The rest of the address generation is handled the same as for the single controller case: to define the physical address to be issued to the memory controller, use the 8 upper address bits of the system address, mask them with the address mask:  $2^{\text{SYS\_SIZE}}-1$ , and OR them with SDRG\_ADDR. This gives the resulting 8 upper physical address bits. All lower address bits are forwarded unchanged.

Request to address 0x99AE\_37F0:

- Upper address bits: 0x99
- Hit mask:  $2^8-2^5 = 0xE0$
- Masked upper address bits: 0x80, that is, hits section 0
- Address mask:  $2^5-1 = 0x1F$
- Masked upper address bits: 0x19
- Full masked address: 0x19AE\_37F0
- Bit 7 is 1, that is, targets the second memory controller
- Full masked shifted address (suppressing bit 7): 0x0CD7\_1BF0 (see [Section 15.2.4.2.2.1](#))
- OR upper physical address bits with SDRG\_ADDR: 0x0CD7\_1BF0
- Physical address: 0x0CD7\_1BF0

This request is forwarded to address 0x0CD7\_1BF0, address space 0, of the second memory controller.

**15.2.4.2.2.1 Address Upper Bits Shifting**

Table 15-24 describes shifting the address upper bits.

**Table 15-24. Address Upper Bits Shifting**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<b>Address After Interleaving</b>																																
0	0	0	0	1	1	0	0	1	1	0	1	0	1	1	1	0	0	0	1	1	0	1	1	1	1	1	1	1	0	0	0	0

## 15.2.5 DMM Basic Programming Model

The programming model section:

- Describes how objects can be addressed in all TILER modes and orientations
- Explains how the physical containers and PAT LUT can be shared between different modes
- Does not give an exhaustive description of the TILER and DMM registers, because these are described in [Section 15.2.3.5, DMM](#), and [Section 15.2.3.6, TILER](#).

### 15.2.5.1 Global Initialization

This section identifies the requirements for initializing the surrounding modules when the DMM is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DMM (see [Table 15-25](#)).

**Table 15-25. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	The module interface and functional clocks must be enabled. See <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Dual Cortex - M3 microprocessor unit (MPU)	Cortex-M3 interrupt controller (INTC) configuration must be done to enable the interrupts from the DMM. See <a href="#">Chapter 17, Interrupt Controllers</a> .
Dual Cortex - A9 MPU	Cortex-A9 INTC configuration must be done to enable interrupts from the DMM. See <a href="#">Chapter 17, Interrupt Controllers</a> .
L3 interconnect	Data interface

### 15.2.5.2 DMM Module Global Initialization

This procedure in [Table 15-26](#) initializes the DMM after a power-on reset (POR).

**Table 15-26. DMM Global Initialization**

Step	Register/Bit Field/Programming Model	Value
Configure the DMM for smart-idle power management mode.	<code>DMM_SYSCONFIG[3:2] IDLE_MODE</code>	0x2

### 15.2.5.3 DMM Operational Modes Configuration

#### 15.2.5.3.1 Different Operational Modes

The TILER can be virtually accessed in four different modes: 8-, 16-, 32-bit, and page modes. Each mode defines the element granularity to apply isometric transforms (see [Table 15-27](#)).

**Table 15-27. Coding and Description of TILER Modes**

Mode	Name	Granularity (Element Size)
0	8-bit tiled mode	8 bits
1	16-bit tiled mode	16 bits
2	32-bit tiled mode	32 bits
3	Page mode	4096 bytes

#### 15.2.5.3.2 Configuration Settings and LUT Refill

The procedure in [Table 15-28](#) provides the configuration settings and LUT refill.

**Table 15-28. Configuration Settings and LUT Refill**

Step	Register/Bit Field/Programming Model	Value
PAT configuration refill Engine 0	DMM_PAT_CONFIG[0] MODE0	xxx
PAT configuration refill Engine 1	DMM_PAT_CONFIG[1] MODE1	xxx
Set DMM PAT view register value for each initiator.	DMM_PAT_VIEW0 Vx DMM_PAT_VIEW1 Vx	xxx
Set DMM PAT write enable for the initiators.	DMM_PAT_VIEW0 Wx DMM_PAT_VIEW1 Wx	xxx
Choosing container type and access method	DMM_PAT_VIEW_MAP_i	xxx
Define the base address of all view mappings.	DMM_PAT_VIEW_MAP_BASE[31] BASE_ADDR	xxx
Set area definition for DMM physical address translator.	DMM_PAT_AREA_i	xxx
Set physical address of the current table refill entry data or entry data when in manual mode.	DMM_PAT_DATA_i[31:4] ADDR	xxx
Define the direction of this PAT table refill (S Y X), different from 0x011.	DMM_PAT_CTRL_i[6:4] DIRECTION	xxx
Start a PAT table refill.	DMM_PAT_CTRL_i[0] START	0x1

### 15.2.5.3.3 Interleaving Settings

The procedure in [Table 15-29](#) provides the interleaving settings.

**Table 15-29. Interleaving Settings**

Step	Register/Bit Field/Programming Model	Value
Set DMM system section address MSB.	DMM_LISA_MAP_i[31:24] SYS_ADDR	xxx
Set DMM system section size.	DMM_LISA_MAP_i[22:20] SYS_SIZE	xxx
Set SDRC interleaving mode.	DMM_LISA_MAP_i[19:18] SDRC_INTL	xxx
Set SDRC address space.	DMM_LISA_MAP_i[17:16] SDRC_ADDRSPC	xxx
Set SDRC mapping.	DMM_LISA_MAP_i[9:8] SDRC_MAP	xxx
Set SDRC address MSB.	DMM_LISA_MAP_i[7:0] SDRC_ADDR	xxx
Enable/disable DMM memory mapping lock.	DMM_LISA_LOCK[0] LOCK	xxx

### 15.2.5.3.4 Aliased Tiled View Orientation Settings and LUT Refill

The procedure in [Table 15-30](#) provides the settings for aliased tiled view and LUT refill.

**Table 15-30. Aliased Tiled View Orientation Settings and LUT Refill**

Step	Register/Bit Field/Programming Model	Value
Set DMM TILER orientation for each initiator.	DMM_TILER_OR0 ORx DMM_TILER_OR1 ORx	xxx
Set DMM TILER write enable for the initiators.	DMM_TILER_OR0 Wx DMM_TILER_OR1 Wx	xxx
Define the base address of all view mappings.	DMM_PAT_VIEW_MAP_BASE[31] BASE_ADDR	xxx
DMM PAT initiator for synchronization	DMM_PAT_CTRL_i[31:28] INITIATOR	xxx
Set DMM PAT table reload synchronization.	DMM_PAT_CTRL_i[16] SYNC	xxx
Set DMM PAT LUT index.	DMM_PAT_CTRL_i[9:8] LUT_ID	xxx
Define the direction of this PAT table refill (S Y X).	DMM_PAT_CTRL_i[6:4] DIRECTION	xxx
Start a PAT table refill.	DMM_PAT_CTRL_i[0] START	0x1

### 15.2.5.3.5 Priority Settings

The procedure in [Table 15-31](#) provides the sequence to set priorities.

**Table 15-31. Priority Settings**

Step	Register/Bit Field/Programming Model	Value
Set priority for each initiator.	<a href="#">DMM_PEG_PRIO_k Px</a>	xxx
Set write enable for P_PAT field.	<a href="#">DMM_PEG_PRIO_PAT[4] W_PAT</a>	xxx
Set priority for PAT engine.	<a href="#">DMM_PEG_PRIO_PAT[2:0] P_PAT</a>	xxx

### 15.2.5.3.6 Error Handling

The procedure in [Table 15-32](#) provides the sequence for error handling.

**Table 15-32. Error Handling**

Step	Register/Bit Field/Programming Model	Value
Enable interrupt for selected type of error.	<a href="#">DMM_PAT_IRQENABLE_SET[15:9]</a> <a href="#">DMM_PAT_IRQENABLE_SET[7:0]</a>	xxx
When interrupt occurs		
Disable type of error to handle.	<a href="#">DMM_PAT_IRQENABLE_CLR[15:9]</a> <a href="#">DMM_PAT_IRQENABLE_CLR[7:0]</a>	xxx
Check error status.	<a href="#">DMM_PAT_IRQSTATUS[15:9]</a> <a href="#">DMM_PAT_IRQSTATUS[7:0]</a>	xxx

### 15.2.5.3.7 PAT Programming Model

The PAT maps the tiled data anywhere in the 4-GB physical address range, with a PAGE granularity. (The TILER page is the granularity of physical memory allocation in the TILER container. Each page is 4kiB).

A PAT view defines the kind of PAT to perform for each page, 8-, 16-, and 32-bit mode access. Each mode in each PAT view can be programmed in two different modes: direct translation and indirect translation.

#### 15.2.5.3.7.1 PAT in Direct Translation Mode

In this mode, the PAT performs a translation of the 128-MB virtual container as a whole in the physical address space (that is, in the SDRAM). This mode is used only for debug or in case of a DMM without a PAT.

#### 15.2.5.3.7.2 PAT in Indirect Translation Mode

This is the most commonly used mode. In this mode, the PAT performs a translation of each 4-KB page individually. In this way the 128-MB virtual address space can be scattered in the whole 2GB of the physical address space. This is achieved by using a 32,768-word LUT that converts each page index (32,768 possible values) into 19 address bits that represent this page address in the physical memory. The main characteristic of this mode is there is no constraint on the use of the physical memory except that it uses a multiple of 4-KB areas located at 4-KB boundaries in the physical memory. In this mode, the translation vector is in the internal 32-k entry PAT vector table at the index given by bits [26:12] of the input virtual address, and `CONT_x = 0`.

Programming sequence:

1. Set the [DMM\\_PAT\\_VIEW0](#) register (or [DMM\\_PAT\\_VIEW1](#), depending on the L3 CONN\_ID of the initiator that is to perform the tiled accesses) with the appropriate value. For example, if the L3 CONN\_ID equals 0, then the [DMM\\_PAT\\_VIEW0](#) register must be programmed with the value 0x0000\_0001 (PAT view 1 selected for initiator 0).
2. Set [DMM\\_PAT\\_VIEW\\_MAP\\_BASE\[31\] = 0x8000\\_0000](#) (must always be programmed at 1 to select the upper 2GB of the physical address space that corresponds to the external memory).

- Set all 16-bit tiled accesses in indirect translation mode by setting at least the field ACCESS\_16 to 1 (DMM\_PAT\_VIEW\_MAP\_1 = 0x0000\_8000), program DMM\_PAT\_VIEW\_MAP\_1 at 0x8080\_8080.

### 15.2.5.4 Addressing an Object in Tiled Mode

This section describes how a frame-buffer with a top-left pixel at (x0,y0) in the natural view container and a bottom right pixel at (x1,y1) in the natural view container is addressed in any tiled mode and orientation.

#### 15.2.5.4.1 Frame-Buffer Addressing

**NOTE:** In this section, the (x,y) coordinates are given in pixel units.

Given an (S,  $\bar{Y}$ ,  $\bar{X}$ ) orientation, the (x,y) coordinates of the first pixel of the frame in the oriented view (where W = the width and H = the height in pixels of the container in the considered frame mode) is:

(x,y) = (x<sub>or</sub>, y<sub>or</sub>) when S, (y<sub>or</sub>, x<sub>or</sub>) otherwise  
with:

x<sub>or</sub> = x<sub>0</sub> when  $\bar{X}$ , W-1-x<sub>1</sub> otherwise  
y<sub>or</sub> = y<sub>0</sub> when  $\bar{Y}$ , H-1-y<sub>1</sub> otherwise

Given a (M<sub>1</sub>, M<sub>0</sub>) TILER mode where M<sub>1</sub> ≠ 0 or M<sub>0</sub> ≠ 0, the size in bytes of a pixel is 2<sup>2M<sub>1</sub>+M<sub>0</sub></sup>.

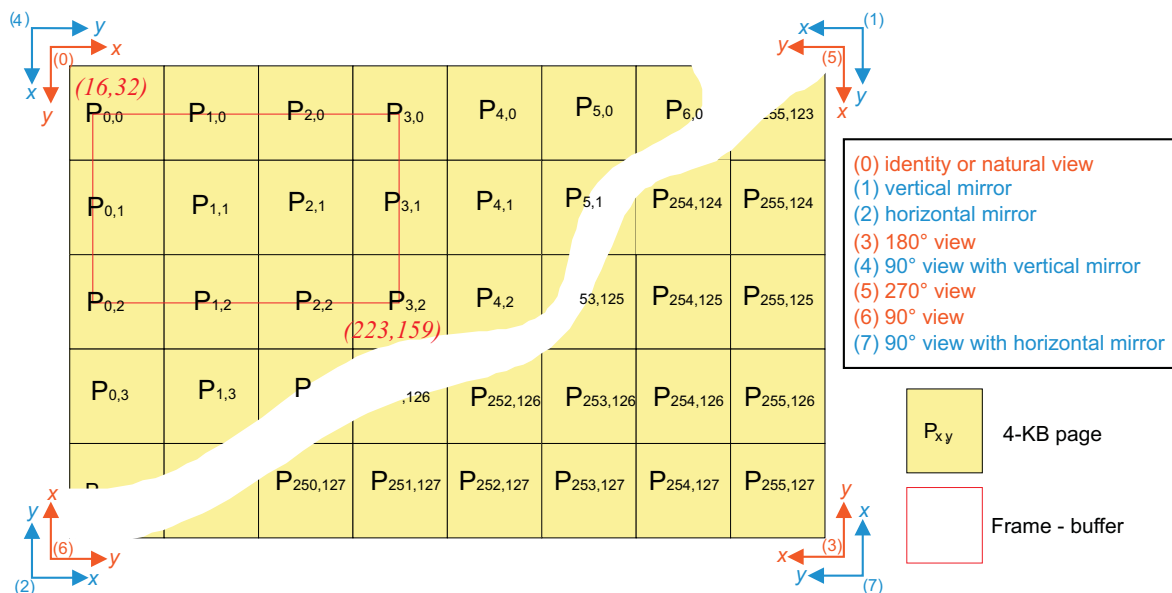

Therefore, given an (S,  $\bar{Y}$ ,  $\bar{X}$ ) orientation and a n(M<sub>1</sub>, M<sub>0</sub>) TILER mode where M<sub>1</sub> ≠ 0 or M<sub>0</sub> ≠ 0, the byte offset of the base address of the considered oriented frame in its container is:

base\_address((x<sub>0</sub>, y<sub>0</sub>), (x<sub>1</sub>, y<sub>1</sub>), (S,  $\bar{Y}$ ,  $\bar{X}$ ), (M<sub>1</sub>, M<sub>0</sub>)) = (y<sub>or</sub>W + x<sub>or</sub>) P<sub>5</sub> when S, (x<sub>or</sub>H + y<sub>or</sub>) P<sub>5</sub> otherwise  
with:

x<sub>or</sub> = x<sub>0</sub> when  $\bar{X}$ , W-1-x<sub>1</sub> otherwise  
y<sub>or</sub> = y<sub>0</sub> when  $\bar{Y}$ , H-1-y<sub>1</sub> otherwise  
P<sub>5</sub> = 2<sup>2M<sub>1</sub>+M<sub>0</sub></sup>

In its natural orientation, the TILER container consists of 8192 lines of 16,384 pixels of 8 bits, or 4096 lines of 16,384 pixels of 16 bits, or 4096 lines of 8192 pixels of 32 bits.

Figure 15-42. Example of 8-Bit Frame-Buffer Addressing in any Orientation

sdram-075

This frame-buffer address generation is independent from the page size. For instance, the 8-bit frame-buffer shown in Figure 15-42 that ranges from the top-left pixel at (16, 32) to the bottom-right pixel at (223, 159) in the natural orientation view, corresponds to the 29-bit view address offsets and full 33-bit TILER addresses given in Table 15-33.

**Table 15-33. 29-Bit View Address Offset and 33-Bit Full TILER Address for an 8-Bit Frame-Buffer**

S	$\bar{Y}$	$\bar{X}$	$x_{or}$	$y_{or}$	29-Bit Address Offset in View	Full 33-Bit TILER Address
0	0	0	16	32	00080010h	100080010h
0	0	1	16,160	32	00083F20h	120083F20h
0	1	0	16	8032	07D80010h	147D80010h
0	1	1	16,160	8032	07D83F20h	167D83F20h
1	0	0	16	32	00020020h	180020020h
1	0	1	16,160	32	07E40020h	1A7E40020h
1	1	0	16	8032	00021F60h	1C0021F60h
1	1	1	16,160	8032	07E41F60h	1E7E41F60h

In this example the TILER is addressed in 8-bit mode, which translates to addresses with all mode bits (bits 27 and 28) cleared in the 29-bit address offset in view and in the full 33-bit TILER address.

#### 15.2.5.4.2 TILER Page Mapping

Let:

- $c$  ( $c = 0, 1, \text{ or } 2$ ) be the TILER page configuration (0 for 4-KB pages, 1 for 16-KB pages, and 2 for 64-KB pages)
- $(x_0, y_0)$  be the top-left pixel and  $(x_1, y_1)$  be the bottom-right pixel of a frame in its natural orientation
- $W$  be the width and  $H$  the height in pixels of the container in the considered frame mode

The top-left page coordinates  $(P_{x0}, P_{y0})$  and bottom-right page coordinates  $(P_{x1}, P_{y1})$  that correspond to the frame are given by:  $P_{x0} = (64 \cdot x_0 \cdot 2^{2-c}) / W$ ,  $P_{y0} = (32 \cdot y_0 \cdot 2^{2-c}) / H$ ,  $P_{x1} = (64 \cdot x_1 \cdot 2^{2-c}) / W$  and  $P_{y1} = (32 \cdot y_1 \cdot 2^{2-c}) / H$ .

In its natural orientation, the TILER container consists of 8192 lines of 16,384 pixels of 8 bits, or 4096 lines of 16,384 pixels of 16 bits, or 4096 lines of 8192 pixels of 32 bits.

**NOTE:** The page area type has the same structure as the [DMM\\_PAT\\_AREA\\_i](#) registers. For instance, the 8-bit frame-buffer described in [Figure 15-42](#) and ranging from the top-left pixel at (16, 32) to the bottom-right pixel at (223, 159) in the natural orientation view, is mapped from the top-left page at P0,0 to the bottom-right page P3,2.

#### 15.2.5.5 Addressing an Object in Page Mode

In page mode, the orientation modifies only the sequence of accessed pages, not their content. In this respect the orientation must be seen as a way to optimize the one-dimensional (1D) object allocation in a TILER container by allowing a 1D object spanning multiple pages to map a set of adjacent pages in any direction. For instance, a 1.25-MB object, mapped on 320 pages of 4-KB can be allocated in a TILER container in any of the eight orientations (see [Section 15.2.3.6.1.7.3, Element Ordering in the TILER Container](#)).

The initial page can be chosen freely among all pages. In this respect, the address offset of a page in a TILER container is expressed as:

Let:

- $c$  ( $c = 0, 1 \text{ or } 2$ ) be the TILER page configuration (0 for 4-KB pages, 1 for 16-KB pages, and 2 for 64-KB pages)
- $(S, \bar{Y}, \bar{X})$  be the orientation of the considered 1D object in page mode
- $(P_x, P_y)$  be the coordinate of the initial page in the natural orientation view

The byte offset of the base address of the considered initial page in its oriented container is:

$\text{base\_address}((P_x, P_y), (S, \bar{Y}, \bar{X})) = 4096 \cdot (64 \cdot y_{or} \cdot 2^{2-c} + x_{or}) \cdot 2^{2-c}$  when  $S$ ,  $4096 \cdot (32 \cdot x_{or} \cdot 2^{2-c} + y_{or}) \cdot 2^{2-c}$  otherwise with:

$x_{or} = P_x$  when  $\bar{X}$ ,  $64 \cdot 2^{2-c} - 1 - P_x$  otherwise

$y_{or} = P_y$  when  $\bar{Y}$ ,  $32 \cdot 2^{2-c} - 1 - P_y$  otherwise

For instance, a 1D object starting from the page P32,63 in the natural orientation view on a DMM using 4-KB pages, corresponds to the 29-bit view address offsets and full 33-bit TILER addresses given in [Table 15-34](#).

**Table 15-34. 29-Bit View Address Offset and 33-Bit Full TILER Address for a 1D Object**

S	Y	X	x <sub>or</sub>	y <sub>or</sub>	29-Bit Address Offset in View	Full 33-Bit TILER Address
0	0	0	32	63	1BF20000h	11BF20000h
0	0	1	223	63	1BFDF000h	13BFDF000h
0	1	0	32	64	1C020000h	15C020000h
0	1	1	223	64	1C0DF000h	17C0DF000h
1	0	0	32	63	1903F000h	19903F000h
1	0	1	223	63	1EFBF000h	1BEFBF000h
1	1	0	32	64	19040000h	1D9040000h
1	1	1	223	64	1EFC0000h	1FEFC0000h

In this example the TILER is addressed in page mode, which translates to addresses with mode bits (bits 27 and 28) set in the 29-bit address offset in view and full 33-bit TILER address.

### 15.2.5.6 Sharing Containers Between Different Modes

When allocating objects in TILER containers, take care to ensure that no two objects physically overlap.

In this respect, and to ease the object allocation and deallocation, it is strongly advised to share a TILER page only for different objects that do both of the following:

- Belong to the same mode
- Have the same lifetime (that is, are allocated and deallocated simultaneously)

Two objects of different modes can physically overlap if:

- One physical page is mapped twice in two different locations of the DMM LUT.
- The two objects share the DMM LUT and the intersection of their two page set is not empty.

These two issues can be easily avoided by allocating a physical page only once in the DMM LUT.

The second issue is a bit more difficult, especially if the allocation of objects in the various TILER containers must be dynamic. Managing the fragmentation within a flat memory model in a space-constrained system is not straightforward, and is the main reason for the existence of MMUs in most current processors, which adds yet another constraint to the problem (the y dimension, which makes it even more difficult).

Returning to the CPU-analogy, the memory fragmentation issue has been mostly solved by using a virtual memory space larger than the actual physical memory space and a virtual-to-physical translation system. This allows contiguous virtual memory allocation when sufficient physical memory is available and the larger contiguous physical buffer is smaller than the requested memory allocation.

Similarly, the DMM answer to this object allocation in the TILER containers is two-fold:

- The DMM must have sufficient virtual address space in all modes to permit a static allocation of a pool of virtual buffers in all TILER modes for all TILER-aware initiators.
- Each TILER-aware initiator must dynamically manage its own pool of virtual buffers.

## 15.2.6 DMM Register Manual

This section provides information about the DMM registers. [Table 15-35](#) describes the DMM instance.

### 15.2.6.1 DMM Instance Summary

**Table 15-35. DMM Instance Summary**

Module Name	Base Address	Size
DMM	0x4E00 0000	32MB

### 15.2.6.2 DMM Registers

#### 15.2.6.2.1 DMM Register Summary

[Table 15-36](#) provides a summary of the DMM registers.

## 15.3 EMIF Controller

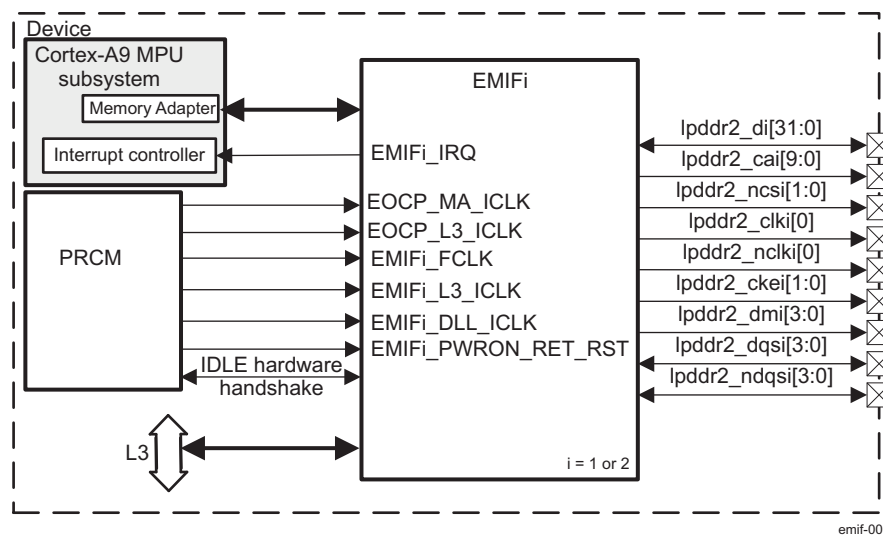

This section describes the features and functions of the external memory interface (EMIF) module of the device.

### 15.3.1 EMIF Module Overview

The EMIF module provides connectivity between the device and the LPDDR2-type memories and manages data bus read/write accesses between external memories, the microprocessor unit (MPU), and the direct memory access (DMA) controller.

The device includes two EMIF controllers. [Figure 15-43](#) is an overview of the EMIF module.

**Figure 15-43. EMIF Module Overview**

#### 15.3.1.1 EMIF Module Main Features

The EMIF module supports the following features:

- JEDEC standard-compliant LPDDR2-SDRAM (S2 and S4) devices
- 2-GB SDRAM address ranges over two chip-selects (CSs) (1GB per CS) (configurable with the dynamic memory manager (DMM) module; see [Section 15.2, Dynamic Memory Manager](#), for more information)
- Two independent CSs with their corresponding register sets and independent page tracking
- Both CSs must have the same memory type and size.
- Flexible address muxing scheme, which permits the choosing of different bank mapping allocation by configuring the decoding order of the bank, column, and row address
- 16- or 32-bit data path to external SDRAM
- LPDDR2 devices with one, two, four, or eight internal banks
- Data bus widths:
  - 128-bit L3 interconnect data bus width
  - 16- and 32-bit SDRAM data bus widths
- CAS latencies: 3, 4, 5, 6, 7, and 8
- 256-, 512-, 1024-, and 2048-word page sizes
- Burst lengths: 8
- Sequential burst type
- SDRAM auto initialization from reset or configuration change
- Bank interleaving across both CSs if the same memory type

- Self-refresh and precharge power-down modes for low power (per CS, manual entry/exit self-refresh and deep power-down modes)
- Deep power-down mode for low power
- Partial array self-refresh and temperature-controlled self-refresh modes for low power. Temperature-controlled self-refresh is supported only for mobile SDRAM having on-chip temperature sensor.
- Prioritized refresh
- Programmable SDRAM refresh rate and backlog counter
- Output impedance (ZQ) calibration
- Active power-down
- Temperature monitoring

### 15.3.1.2 Not Supported Features

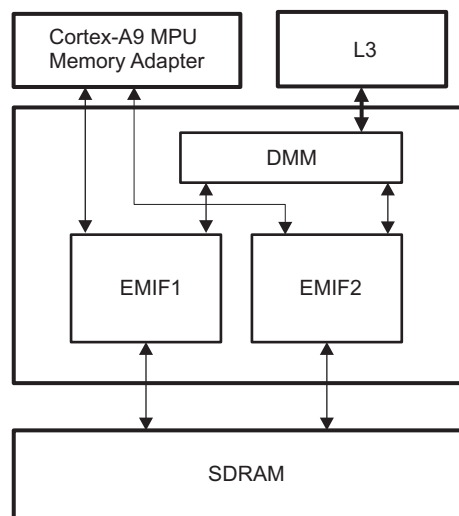

The EMIF module does not support:

- Interleave burst type
- Auto precharge
- Per-bank refreshes for LPDDR2-SDRAM

### 15.3.1.3 EMIF Overall Architecture

Figure 15-44 shows the EMIF connection with the surrounding modules.

**Figure 15-44. EMIF Overall Architecture**

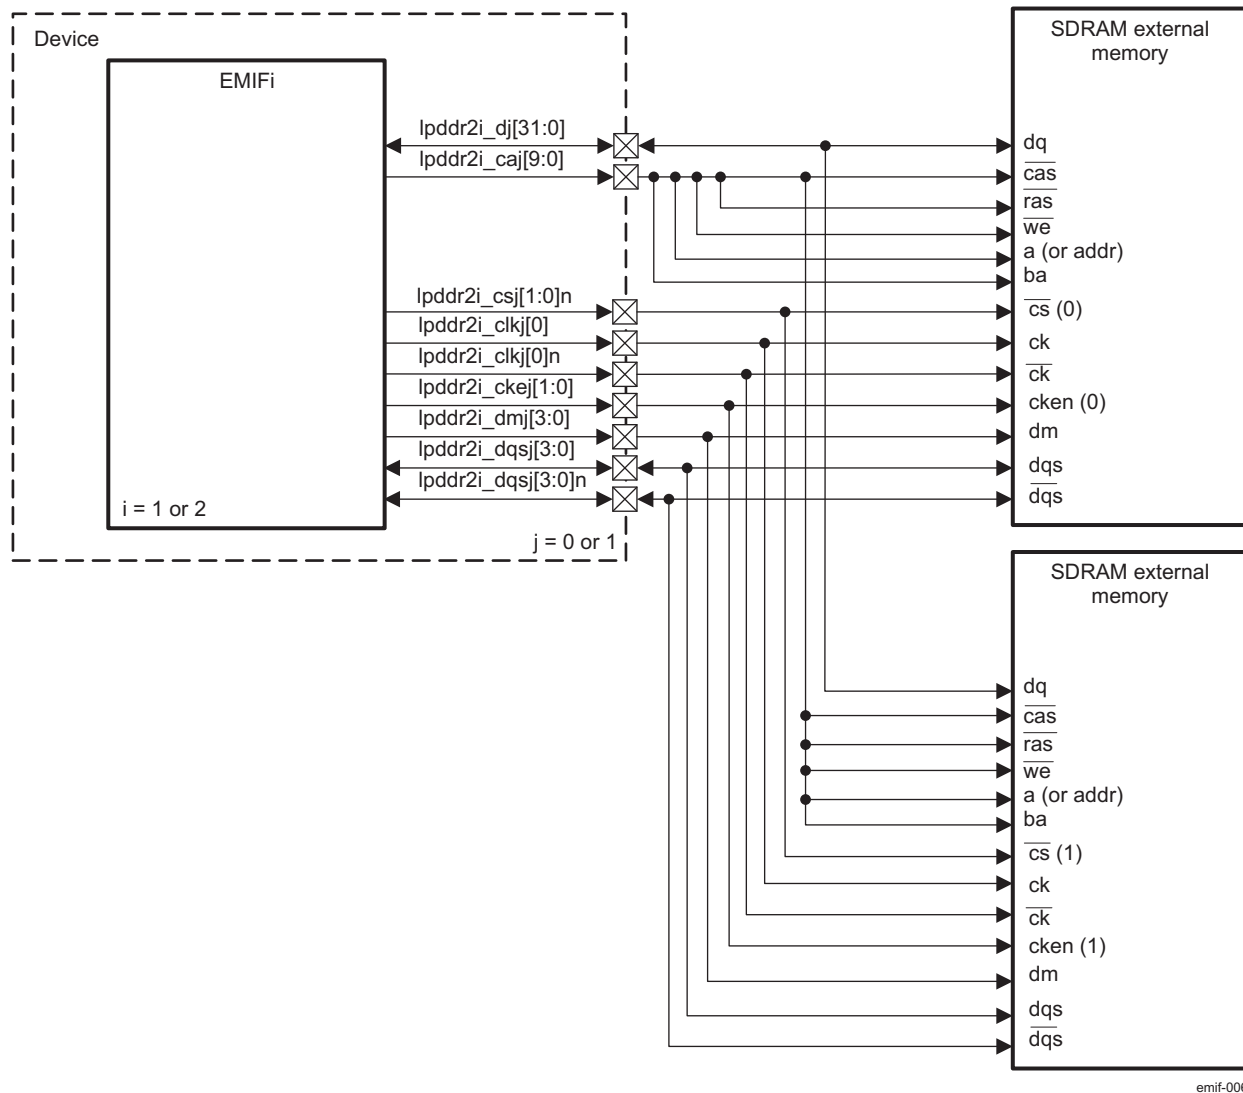

emif-007

## 15.3.2 EMIF Environment

This section describes the EMIF application fields from an environment point of view (external connections).

Figure 15-45 shows the EMIF generic configuration.

Figure 15-45. EMIF Generic Configuration

emif-006

### 15.3.2.1 EMIF Signals

Table 15-93 describes the module signals and specifies their links to functions.

Table 15-93. I/O Signals

Signal	I/O <sup>(1)</sup>	Description
<b>EMIF1</b>		
$lpddr21\_dq[31:0]$	I/O	Data bus
$lpddr21\_ca[9:0]$	O	Double-data rate (DDR) command/address
$lpddr21\_ncs[1:0]$	O	Chip selects 1–0 (active low)
$lpddr21\_clk$	O	Clock
$lpddr21\_nclk$	O	Clock invert
$lpddr21\_cke[1:0]$	O	Clock enables 1–0
$lpddr21\_dm[3:0]$	I/O	Data mask
$lpddr21\_dqs[3:0]$	I/O	Data strobe
$lpddr21\_ndqs[3:0]$	I/O	Data strobe invert

<sup>(1)</sup> I = Input; O = Output

**Table 15-93. I/O Signals (continued)**

Signal	I/O <sup>(1)</sup>	Description
<b>EMIF2</b>		
lpddr22_dq[31:0]	I/O	Data bus
lpddr22_ca[9:0]	O	DDR command/address
lpddr22_ncs[1:0]	O	Chip selects 1–0 (active low)
lpddr22_clk	O	Clock
lpddr22_nclk	O	Clock invert
lpddr22_cke[1:0]	O	Clock enables 1–0
lpddr22_dm[3:0]	I/O	Data mask
lpddr22_dqs[3:0]	I/O	Data strobe
lpddr22_ndqs[3:0]	I/O	Data strobe invert

The CKE memory pin is dynamically driven by the SDRAM controller (SDRC) according to the memory interface activity. Each CS has its own CKE pin so that each CS can be controlled independently in terms of power-down, deep power-down, and self-refresh modes.

Each LPDDR2 channel (that is, each EMIF controller) can be connected to two external LPDDR2 memories. For more information, see [Section 15.2, Dynamic Memory Manager](#).

### 15.3.3 EMIF Integration

This section describes the integration of the module in the device, and includes information about clocks, resets, and hardware requests.

Figure 15-46 shows the integration of the EMIF1 module in the device.

**Figure 15-46. EMIF1 Integration**

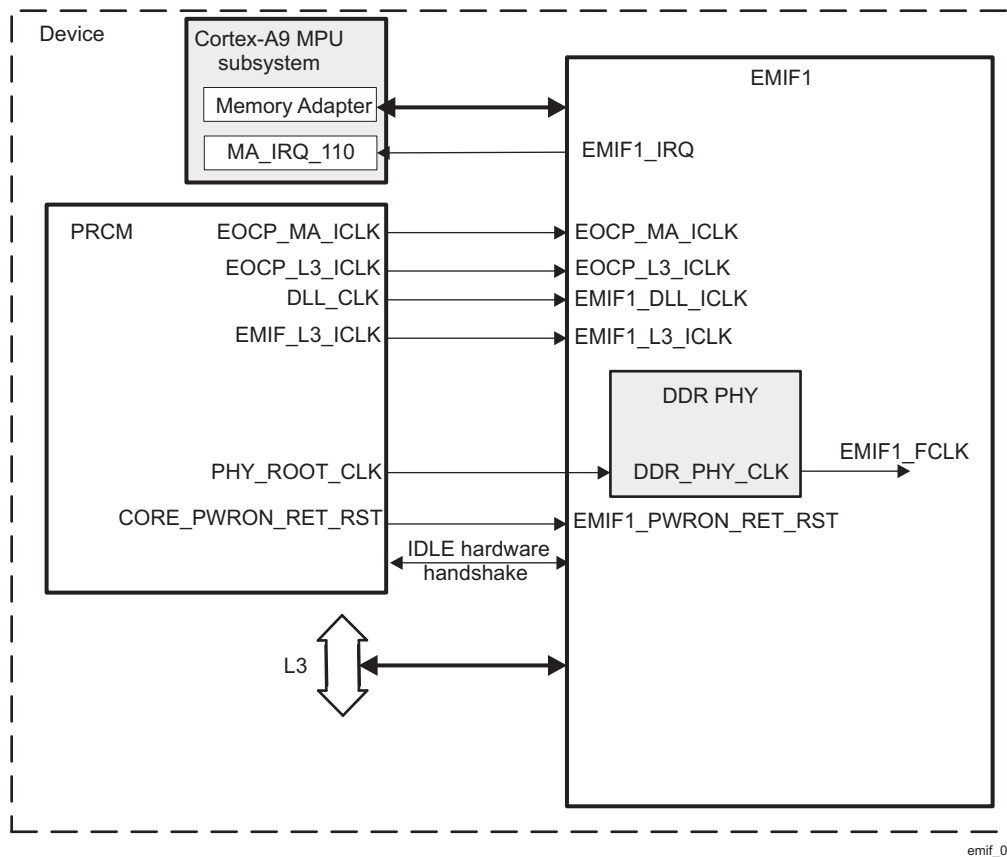

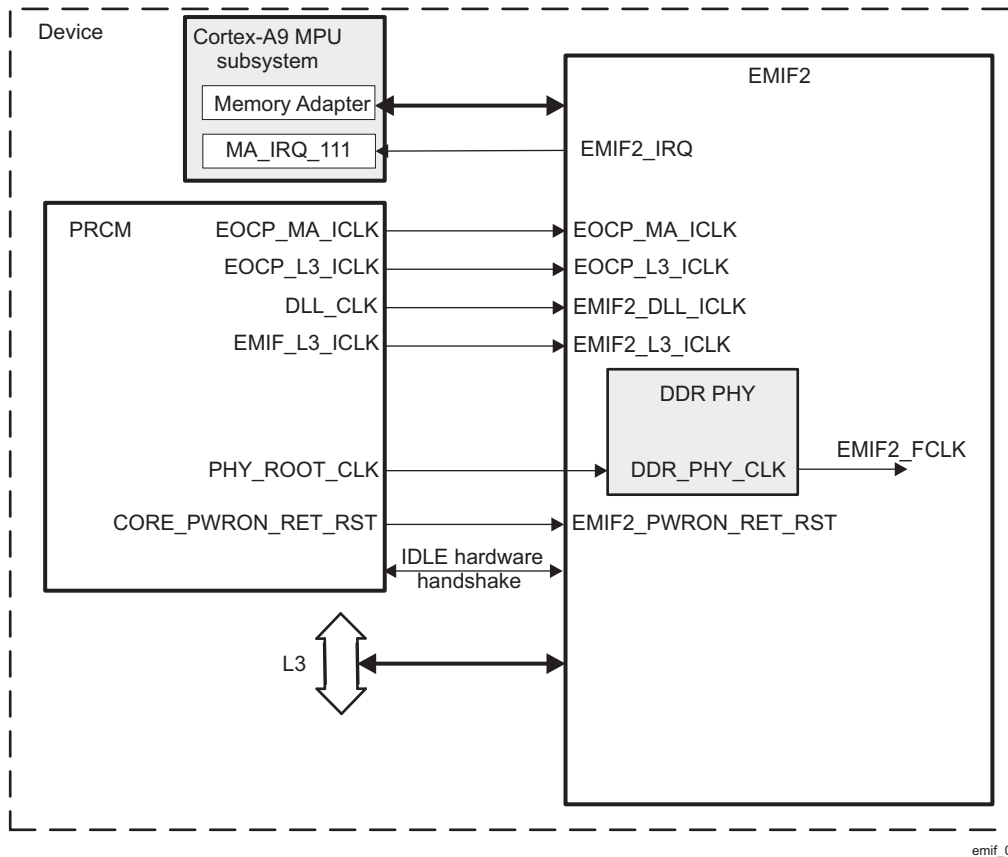

Figure 15-47 shows the integration of the EMIF2 module in the device.

Figure 15-47. EMIF2 Integration

**NOTE:** DDR\_PHY\_CLK is equal to PHY\_ROOT\_CLK divided by 2. EMIFi\_FCLK is equal to DDR\_PHY\_CLK divided by 2.

For more information about the EMIF clocking scheme, see [Chapter 3, Power, Reset, and Clock Management](#).

**NOTE:** For more information about the IDLE hardware handshake, see [Chapter 3, Power, Reset, and Clock Management](#).

Table 15-94 through Table 15-96 summarize the integration of the module in the device.

Table 15-94. Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
EMIF1	PD_CORE	No	L3
EMIF2	PD_CORE	No	L3

Table 15-95. Clocks and Resets

Module Instance	Destination Signal Name	Source Signal Name	Clocks	
			Source	Description
EMIF1	EMIF1_FCLK	EMIF_FCLK	PRCM	EMIF1 core functional clock
	EMIF1_L3_ICLK	EMIF_L3_ICLK	PRCM	Interface clock

**Table 15-95. Clocks and Resets (continued)**

	EOCP_MA_ICLK	EOCP_MA_ICLK	PRCM	Interface clock

	EMIF2_L3_ICLK	EMIF_L3_ICLK	PRCM	Interface clock
	EOCP_MA_ICLK	EOCP_MA_ICLK	PRCM	Interface clock
	EOCP_L3_ICLK	EOCP_L3_ICLK	PRCM	Interface clock
	EMIF2_DLL_ICLK	DLL_CLK	PRCM	Interface clock
<b>Resets</b>				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
EMIF1	EMIF1_PWRON_RET_RST	CORE_PWRON_RET_RST	PRCM	Retention reset
EMIF2	EMIF2_PWRON_RET_RST	CORE_PWRON_RET_RST	PRCM	Retention reset

**NOTE:** The two clocks EOCP\_MA\_ICLK and EOCP\_L3\_ICLK are exclusive. EMIF modules are clocked by EOCP\_MA\_ICLK when MPU is active, otherwise EOCP\_L3\_ICLK clock is used.

**Table 15-96. Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
EMIF1	EMIF1_IRQ	MA_IRQ_110	Cortex™-A9 interrupt controller (INTC)	Interrupt to the MPU subsystem
EMIF2	EMIF2_IRQ	MA_IRQ_111	Cortex™-A9 INTC	Interrupt to the MPU subsystem
No DMA Requests				

**NOTE:** For the description of the interrupt source, see [Section 15.3.4.5, Interrupt Requests](#).

### 15.3.4 EMIF Functional Description

#### 15.3.4.1 Block Diagram

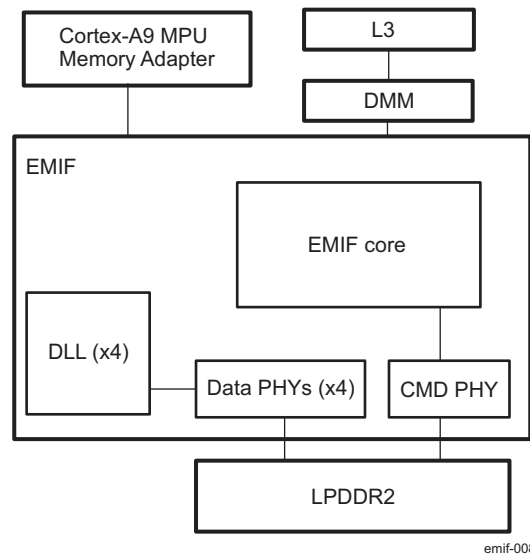

The EMIF is an L3 bus peripheral that provides an interface to the LPDDR2 memories.

Figure 15-48 shows the interconnection between the EMIF module and the other modules.

Digital locked loops (DLLs) are used to delay the input DQS signals during reads so that these strobe signals can be used to latch incoming data on the DQ pins, as required by the LPDDR2 standard.

Physical layers (PHYS) are hard macros that convert single-data rate (SDR) signals to DDR signals.

Figure 15-48. EMIF Block Diagram

##### 15.3.4.1.1 L3 Interface

The EMIF supports three local interfaces: one connects to the system interconnect, one to a low-latency master, and one comes from the MPU half of the EMIF-to-MPU connection. These interfaces are used to request all external memory device accesses, to access the EMIF registers, and to transfer all data to and from the EMIF controller. Table 15-97 shows the MAddrSpace mapping to different chip-selects. A third interface arranges the connection between the EMIF and the MPU. It is separated to the MPU half of the EMIF-to-MPU L3 Interface and the EMIF half of the EMIF-to-MPU L3 Interface.

Table 15-97. MAddrSpace Mapping to Chip-Selects

MAddrSpace <sup>(1)</sup>	Chip-Select	Description	Exclusions
0x0	ICS[1:0]	SDRAM(s)	
0x1	CS1	Reserved for LPDDR2-NVM	
0x2	N/A	Reserved	Not visible to the MA port
0x3	N/A	Internal registers	Not visible to the MA port

<sup>(1)</sup> See DMM\_LISA\_MAP\_i [17:16] SDRC\_ADDRSPC register in Section 15.2, Dynamic Memory Manager.

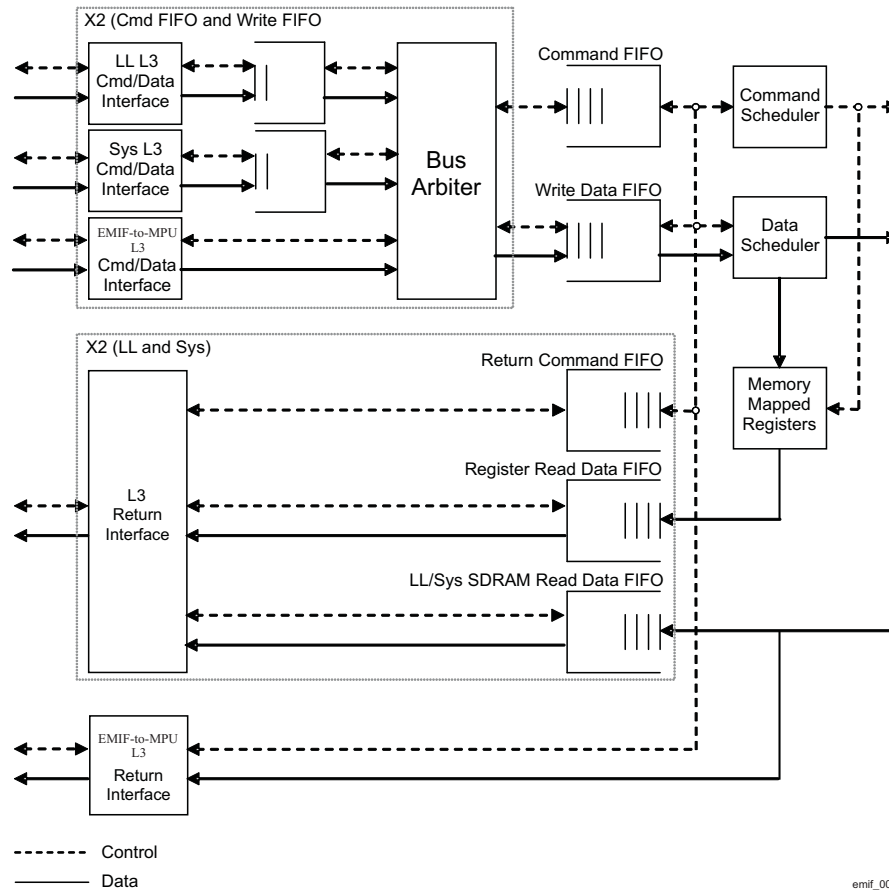

##### 15.3.4.1.2 FIFO Description

The EMIF module contains the following FIFOs:

- Command FIFO
- Write data FIFO
- Return command FIFO
- Two read data FIFOs

Figure 15-49 shows the overall architecture of the EMIF module.

**Figure 15-49. FIFO Block Diagram**

Because the system (128-bit) L3 interface is the main interface, it has a higher allocation of FIFO slots than the low-latency (64-bit) L3 interface. Table 15-98 lists the allocation of the entries.

**Table 15-98. FIFO Allocation**

Parameter	System L3 Interface Entries	Low-Latency L3 Interface Entries	MPU Half of the EMIF-to-MPU L3 Interface Entries
Pre Command FIFO	5	5	3
Command FIFO	Programmable <sup>(1)</sup>	Programmable <sup>(1)</sup>	Programmable <sup>(1)</sup>
Pre Write FIFO	8	8	8
Write Data FIFO	Up to 19+8	Up to 19 + 8	Up to 19 + 8
Return Command FIFO	22	17	13
SDRAM Read Data FIFO	22	17	20
Register Read Data FIFO	2	2	0

<sup>(1)</sup> The total number of entries in the command FIFO is 10.

The command FIFO is shared between the three L3 interfaces, whereas there are three different FIFOs for every other type, one dedicated to each L3 interface.

The command FIFO stores all the commands coming in on the L3 command interface. The allocation of entries in the command FIFO is programmable per L3 interface using the [EMIF\\_L3\\_CONFIG\[27:24\]](#) REG\_SYS\_THRESH\_MAX, [EMIF\\_L3\\_CONFIG\[19:16\]](#) REG\_LL\_THRESH\_MAX, and [EMIF\\_L3\\_CONFIG\[23:20\]](#) REG\_MPU\_TRESH\_MAX bit fields.

If the addition of the [EMIF\\_L3\\_CONFIG\[27:24\] REG\\_SYS\\_THRESH\\_MAX](#) and [EMIF\\_L3\\_CONFIG\[19:16\] REG\\_LL\\_THRESH\\_MAX](#) bit fields is greater than the number of entries in the command FIFO, the allocation depends on the traffic on the interfaces. For example, if both fields are programmed to 7, then either of the interfaces can use seven entries in the command FIFO if the other interface is idle. If both interfaces have traffic, then the EMIF starts to gradually allocate entries to both interfaces until it settles down to seven entries for the low-latency interface and three entries for the system interface, because the low-latency interface has higher priority. If the low-latency interface has no traffic, the system interface can use seven entries.

The allocation also depends on the traffic on the interfaces, if the [EMIF\\_L3\\_CONFIG\[27:24\] REG\\_SYS\\_THRESH\\_MAX](#) and [EMIF\\_L3\\_CONFIG\[19:16\] REG\\_LL\\_THRESH\\_MAX](#) bit fields are programmed to be equal to or greater than the number of entries in the command FIFO. For example, if both fields are programmed to 10, then the low-latency port can use all the entries if there is no traffic on the system interface. However, if there is no traffic on the low-latency interface, the system interface can use all but one entry. This is because the low-latency interface has higher priority than the system interface. The only way for the system interface to use all command FIFO entries is to set the [EMIF\\_L3\\_CONFIG\[19:16\] REG\\_LL\\_THRESH\\_MAX](#) bit field to 0. Writing 0 reserves no space for the associated interface. If the value is set to 0 and a request is seen for that interface, the command FIFO assumes a value of 1 for that interface.

The write data FIFO stores the write data for all the write transactions coming in on the L3 write data interface. The write FIFO is shared for all the ports. A similar token mechanism is used to allocate the write FIFO with the following exceptions. All ports are given a minimum of four tokens, which ensures that each has ensured access to three write FIFO locations. Any one port can only use up to 19 of the 25 write FIFO locations. Because there is an 8-word pre-FIFO, each port can have up to 27 backlogged writes.

The return command FIFO stores all the return transactions that are to be issued to the L3 return interface. These include the write status return and the read data return commands.

Two read data FIFOs store the read data to be sent to the L3 return interface. One read data FIFO stores read data from the memory mapped registers. The other read data FIFO stores read data from external memory.

A write command is executed only when four L3 words of the corresponding data is received in the write data FIFO, or when it is the last data, and if there is space in the return command FIFO. The EMIF schedules a read-only if the results can fit into the return command FIFO and the corresponding read data FIFOs.

#### **15.3.4.1.3 MPU Port Restrictions**

The EMIF MPU port is defined only to process memory requests. All register accesses are processed through the system or LL ports of the EMIF. The EMIF MPU port does not support 2D or register requests required or provided by the system and LL interfaces. The port priority is as follows:

1. LL port (highest priority)
2. System or MPU, depending on the MPriority field of the MReqInfo bus

The EMIF considers an address that matches and requires coherency if the arriving address rounded down to the nearest 1-K block matches any address in the FIFO rounded down to the nearest 1-K block plus or minus 1-K block. This ensures that any address within a burst will be coherent with any address within any other burst. This ensures that any address within 1024 bytes will be coherent. It is possible to be coherent up to 2048 bytes apart depending on the address. To maintain coherency two rules must be followed:

- Rule A: Any command arriving on any interface (MPU, system, or LL) that matches an address in the cFIFO is executed after the command in the cFIFO.
- Rule B: Any command arriving within a 10-cycle window of another, from the different interfaces that do not match any address in the cFIFO but may match command addresses arriving on a different interface, can be executed in any order.

#### 15.3.4.1.4 Arbitration

The EMIF looks at all the commands stored in the command FIFO to schedule commands to the external memory. All commands with the same MConnID on a particular L3 interface complete in order. The EMIF does not ensure ordering between commands with different MConnIDs or between commands from two L3 interfaces. For more information about L3 interconnect terms (MConnID, MCMD, MADDR, etc.) see [Section 13.2, L3 Interconnect](#).

However, the EMIF does maintain data coherency. Therefore, the EMIF blocks a command, regardless of priority or the L3 interface, if that command is to the same block address (2048 bytes) as an older command that is not complete. Thus, the EMIF may have one pending read or write for each MConnID. Among all pending reads, the EMIF selects all reads that have their corresponding SDRAM banks already open. Similarly, among all pending writes, the EMIF selects all writes that have their corresponding SDRAM banks already open. Accesses to memory mapped registers are treated as accesses that have open banks.

As a result of this reordering, the EMIF may now have several pending reads and writes that have their corresponding banks open. The EMIF then selects the highest priority read from pending reads, and the highest priority write from pending writes. Commands from the low-latency L3 interface have a higher priority over the commands from the system L3 interface. If two or more commands have the highest priority, the EMIF selects the oldest command. As a result, the EMIF may now have the next read and a write command. If the return command FIFO and the read data FIFO have space and the external bus conflict is resolved, the EMIF performs the final read command before the final write command. If the return command FIFO has space but the read data FIFO is full, the EMIF performs the final write command before the final read command. Resolution of external bus conflict means all the SDRAM command-to-command counters are satisfied and the read-to-write or write-to-read turnaround time is met.

The EMIF does not support tag interleaving. In other words, for an L3 interface, the EMIF completes executing an L3 command before it switches to another command. The EMIF can, however, interleave execution between commands from two L3 interfaces.

The data coherency inside the EMIF is ensured only in a single level of L3 infrastructure. For example, if a write from a secondary L3 bus segment is blocked by a bridge element, the read from a tertiary bus can still beat the write to the EMIF. In such a case, to confirm that a write from master A has landed before a read from master B is performed, master A must wait for the write status from the EMIF before indicating to master B that the data is ready to be read. If master A does not use the L3 wait status, it must do the following:

1. Perform the required write.
2. Perform a dummy write to the [EMIF\\_MOD\\_ID\\_REV](#) register.
3. Perform a dummy read to the [EMIF\\_MOD\\_ID\\_REV](#) register.
4. Indicate to master B that the data is ready to be read after completion of read in Step 3. The completion of read in Step 3 ensures that the previous writes were done.

Apart from reads and writes, the EMIF must also open and close SDRAM banks and maintain the refresh counts for an SDRAM. The priority of SDRAM commands with respect to refresh levels are:

1. SDRAM refresh request when refresh-must level is reached (highest priority)
2. L3 request for a read without a higher priority write
3. SDRAM refresh request when refresh-need level is reached
4. L3 request for a write
5. SDRAM activate commands
6. SDRAM deactivate commands
7. SDRAM deep power-down request
8. SDRAM refresh request when refresh-may level is reached
9. SDRAM self-refresh or SDRAM power-down request (lowest priority)

While performing the previous scheduling algorithm, the EMIF may encounter two conditions:

- A continuous stream of high-priority commands can block lower priority commands.
- A continuous stream of SDRAM commands to a row in an open bank can block commands to another

row in the same bank.

In addition to this scheduling, the highest priority condition is a reset command. If this condition occurs, the EMIF abandons what it is doing and begins its start-up sequence. In this case, commands and data stored in the FIFOs are lost. The EMIF also starts its start-up sequence whenever the [EMIF\\_SDRAM\\_CONFIG](#) register is written and the [EMIF\\_SDRAM\\_REF\\_CTRL](#)[31] REG\_INITREF\_DIS bit is set to 0. In this case, commands and data stored in the FIFOs are not lost. The EMIF ensures that in-flight read or write transactions to the SDRAM are complete before starting the initialization sequence.

All the accesses to an SDRAM are pipelined to maximize use of the external bus. All of these are done while fulfilling the access timing requirements of an SDRAM.

### 15.3.4.2 Clock Management

The EMIF can gate EMIF\_FCLK. There is an internal mechanism that can stop EMIF\_FCLK automatically.

EMIF\_FCLK can be stopped only after the SDRAM is put into self-refresh mode and the power-idle protocol on the L3 bus completes.

The EMIF waits for the DLL lock before performing any memory access.

The EMIF\_FCLK frequency can be changed only after putting the external SDRAM in self-refresh mode.

EMIFi\_FCLK frequency is equal to half of the DDR\_PHY\_CLK frequency. DDR\_PHY\_CLK is equal to half of the PHY\_ROOT\_CLK frequency.

### 15.3.4.3 Software Reset

The EMIF does not support a software reset.

The EMIF supports global warm reset mode, during which the EMIF keeps the SDRAM content. Upon a request from the PRCM module indicating a need to enter global warm reset mode, the EMIF does the following:

1. Completes the ongoing access and then puts the SDRAM in self-refresh mode
2. Clears all its FIFO contents and deasserts the sys\_SCmdAccept and sys\_SDataAccept ports

When the global warm reset must terminate:

1. The PRCM block deasserts its request signal to the EMIF.
2. The EMIF exits self-refresh mode when it receives host accesses from the MPU to the external memory.

### 15.3.4.4 System Power Management

#### 15.3.4.4.1 Read Idle Window

The [EMIF\\_READ\\_IDLE\\_CTRL](#) register can force idle time between consecutive reads to allow the DDR PHY to recalibrate the DLL delays during gradual voltage and frequency change.

The [EMIF\\_READ\\_IDLE\\_CTRL](#)[8:0] REG\_READ\_IDLE\_INTERVAL bit field determines the maximum interval  $((\text{REG\_READ\_IDLE\_INTERVAL} + 1) * 64 \text{ EMIF\_FCLK clock cycles})$  between read idle detections or force read idle time. A value of 0 disables the read idle function.

The [EMIF\\_READ\\_IDLE\\_CTRL](#)[19:16] REG\_READ\_IDLE\_LEN bit field determines the minimum size of idle window for the read idle detection and the force read idle time. The EMIF introduces idle time only if it does not see at least  $(\text{REG\_READ\_IDLE\_LEN} + 1) * 2$  number of idle EMIF\_FCLK cycles in REG\_READ\_IDLE\_INTERVAL. Any command other than a read command is considered idle for this purpose. Force read idle occurs when the data bus is busy transferring read data and the read idle interval expires without seeing a read idle length pause in the reads.

#### 15.3.4.4.2 LPDDR2-SDRAM Power-Down Mode

The EMIF supports power-down mode for low power. The EMIF automatically puts the SDRAM into power-down mode after it is idle for [EMIF\\_PWR\\_MGMT\\_CTRL\[15:12\] REG\\_PD\\_TIM](#) number of EMIF\_FCLK cycles and the [EMIF\\_PWR\\_MGMT\\_CTRL\[10:8\] REG\\_LP\\_MODE](#) bit field is set to 0x4. In power-down mode, the EMIF does not stop the clocks to the SDRAM. The EMIF maintains [lpddr2i\\_cke\[j\]1:0](#)] (where i = 1 or 2 and j = 0 or 1) low to maintain the power-down mode.

When the SDRAM is in power-down mode, the EMIF services register accesses normally.

If the LPDDR2-SDRAM is in power-down mode and one of the following occurs, the EMIF brings SDRAM out of power-down mode:

1. [EMIF\\_PWR\\_MGMT\\_CTRL\[10:8\] REG\\_LP\\_MODE](#) bit field is changed from 0x4 to some other value.
2. An SDRAM access is requested.
3. The refresh-must level is reached.

For LPDDR2-SDRAM, the EMIF module:

1. Drives [lpddr2i\\_cke\[j\]1:0](#)] (where i = 1 or 2 and j = 0 or 1) high
2. Waits for [EMIF\\_SDRAM\\_TIM\\_2\[30:28\] REG\\_T\\_XP + 1](#) cycles
3. Enters its idle mode and can issue any commands

#### 15.3.4.4.3 LPDDR2-SDRAM Deep Power-Down Mode

For ultimate power savings, the EMIF supports deep power-down mode for LPDDR2-SDRAM.

The SDRAM can be forced into deep power-down mode through software by setting the [EMIF\\_PWR\\_MGMT\\_CTRL\[11\] REG\\_DPD\\_EN](#) bit to 0x1. In this case the EMIF continues normal operation until all SDRAM access requests are serviced. At this point the EMIF issues a deep power-down command. The EMIF then maintains [lpddr2i\\_cke\[j\]1:0](#)] (where i = 1 or 2 and j = 0 or 1) low to maintain deep power-down mode. In deep power-down mode, the EMIF automatically stops the clocks to the SDRAM.

Setting the [EMIF\\_PWR\\_MGMT\\_CTRL\[11\] REG\\_DPD\\_EN](#) bit to 1 overrides the setting of the [EMIF\\_PWR\\_MGMT\\_CTRL\[10:8\] REG\\_LP\\_MODE](#) bit field. Therefore, if the SDRAM is in self-refresh or power-down mode, and the [EMIF\\_PWR\\_MGMT\\_CTRL\[11\] REG\\_DPD\\_EN](#) bit is set to 1, the EMIF exits those modes and goes into deep power-down mode.

When the SDRAM is in deep power-down mode, the EMIF services register accesses normally.

If the [EMIF\\_PWR\\_MGMT\\_CTRL\[11\] REG\\_DPD\\_EN](#) bit is set to 0x0, the EMIF brings the SDRAM out of deep power-down mode.

For LPDDR2-SDRAM, the EMIF controller:

1. Drives [lpddr2i\\_cke\[j\]1:0](#)] (where i = 1 or 2 and j = 0 or 1) high
2. Issues a RESET command to LPDDR2 (MRW)
3. Enters its idle mode and can issue any commands
4. Software must perform initialization, as specified in [Section 15.3.4.12, LPDDR2-SDRAM Initialization](#).

#### 15.3.4.4.4 LPDDR2-SDRAM Self-Refresh Mode

The EMIF supports self-refresh mode for low power. The EMIF automatically puts the SDRAM into self-refresh mode after the EMIF is idle for [EMIF\\_PWR\\_MGMT\\_CTRL\[3:0\] REG\\_CS\\_TIM](#) number of EMIF\_FCLK cycles and the [EMIF\\_PWR\\_MGMT\\_CTRL\[10:8\] REG\\_LP\\_MODE](#) bit field is set to 0x2. In self-refresh mode, the EMIF automatically stops the clocks to the SDRAM. The EMIF maintains [lpddr2i\\_cke\[j\]1:0](#)] (where i = 1 or 2 and j = 0 or 1) low to maintain self-refresh mode.

When the SDRAM is in self-refresh mode, the EMIF services register accesses normally.

If the LPDDR2-SDRAM is in self-refresh mode and one of the following occurs, the EMIF brings SDRAM out of self-refresh mode:

1. The [EMIF\\_PWR\\_MGMT\\_CTRL\[10:8\] REG\\_LP\\_MODE](#) bit field is changed from 0x2 to some other value.

2. An SDRAM access is requested.
3. [EMIF\\_SDRAM\\_TIM\\_2\[2:0\]](#) REG\_T\_CKE + 1 cycles have elapsed since the SELF-REFRESH command was issued.

For LPDDR2-SDRAM, the EMIF:

1. Enables clocks
2. Drives `lpddr2i_cke[j][1:0]` ( $i = 1$  or  $2$  and  $j = 0$  or  $1$ ) high
3. Waits for [EMIF\\_SDRAM\\_TIM\\_2\[24:16\]](#) REG\_T\_XSNR + 1 cycles
4. Starts an auto-refresh cycle in the next cycle
5. Enters its idle mode and can issue any commands

#### 15.3.4.4.5 Save and Restore

The EMIF supports the save-and-restore mechanism to switch off power to the EMIF.

For more information about the off-mode sequence and restoration of power to the EMIF sequence, see [Chapter 3, Power, Reset, and Clock Management](#).

#### 15.3.4.4.6 Retention Mode

EMIF supports full-retention mode.

#### 15.3.4.5 Interrupt Requests

The EMIF sources two interrupts: one for the system L3 interface and the other for the low-latency L3 interface. The pulse and level interrupt signals for a particular interface are sourced from the same raw interrupt internal to the module.

The EMIF sets the [EMIF\\_IRQSTATUS\\_RAW\\_SYS\[0\]](#) REG\_RAW\_SYS/EMIF\_IRQSTATUS\_RAW\_LL[0] REG\_RAW\_LL bit (depending on which interface sent the command having an error) to 1, if an access request to an unsupported MAddrSpace is received. If such an error occurs, it is due to bad programming of the DMM. For more information about addressing, see [Section 15.2, Dynamic Memory Manager](#).

The interrupts can be cleared by writing 1 to the corresponding bits in the [EMIF\\_IRQSTATUS\\_RAW\\_SYS/EMIF\\_IRQSTATUS\\_RAW\\_LL](#) or the [EMIF\\_IRQSTATUS\\_SYS/EMIF\\_IRQSTATUS\\_LL](#) registers.

[Table 15-99](#) lists the event flags and their mask that can cause module interrupts.

**Table 15-99. Events**

Event Flag	Event Mask	Description
<a href="#">EMIF_IRQSTATUS_RAW_SYS[1]</a> REG_TA_SYS / <a href="#">EMIF_IRQSTATUS_SYS[1]</a> REG_TA_SYS	<a href="#">EMIF_IRQENABLE_SET_SYS[1]</a> REG_EN_TA_SYS / <a href="#">EMIF_IRQENABLE_CLR_SYS[1]</a> REG_EN_TA_SYS	System L3 interrupt for SDRAM temperature alert
<a href="#">EMIF_IRQSTATUS_RAW_LL[1]</a> REG_TA_LL / <a href="#">EMIF_IRQSTATUS_LL[1]</a> REG_TA_LL	<a href="#">EMIF_IRQENABLE_SET_LL[1]</a> REG_EN_TA_LL / <a href="#">EMIF_IRQENABLE_CLR_LL[1]</a> REG_EN_TA_LL	Low-latency L3 interrupt for SDRAM temperature alert
<a href="#">EMIF_IRQSTATUS_RAW_SYS[0]</a> REG_ERR_SYS / <a href="#">EMIF_IRQSTATUS_SYS[0]</a> REG_ERR_SYS	<a href="#">EMIF_IRQENABLE_SET_SYS[0]</a> REG_EN_ERR_SYS / <a href="#">EMIF_IRQENABLE_CLR_SYS[0]</a> REG_EN_ERR_SYS	System L3 interrupt for command or address error
<a href="#">EMIF_IRQSTATUS_RAW_LL[0]</a> REG_ERR_LL / <a href="#">EMIF_IRQSTATUS_LL[0]</a> REG_ERR_LL	<a href="#">EMIF_IRQENABLE_SET_LL[0]</a> REG_EN_ERR_LL / <a href="#">EMIF_IRQENABLE_CLR_LL[0]</a> REG_EN_ERR_LL	Low-latency L3 interrupt for command or address error

### 15.3.4.6 SDRAM Output Impedance Calibration

The EMIF supports automatic output impedance calibration. The ZQ calibration can be enabled per CS by setting the [EMIF\\_ZQ\\_CONFIG\[31\]](#) REG\_ZQ\_CS1EN and [EMIF\\_ZQ\\_CONFIG\[30\]](#) REG\_ZQ\_CS0EN bits. The EMIF supports three types of ZQ calibration commands:

- ZQINIT: ZQ calibration command during initialization
- ZQCS: ZQ calibration short command
- ZQCL: ZQ calibration long command

The EMIF issues a ZQCS command each time the [EMIF\\_ZQ\\_CONFIG\[15:0\]](#) REG\_ZQ\_REFINTERVAL bit field expires. In other words, the REG\_ZQ\_REFINTERVAL defines the interval between ZQCS commands. When a ZQCS command is issued, the EMIF waits and blocks any other command for ([EMIF\\_SDRAM\\_TIM\\_3\[20:15\]](#) REG\_ZQ\_ZQCS + 1) number of DDR clock cycles.

If the [EMIF\\_ZQ\\_CONFIG\[28\]](#) REG\_ZQ\_SFEXITEN bit field is set to 1, the EMIF issues a ZQCL command every time it exits self-refresh, active power-down, and precharge power-down modes. When a ZQCL command is issued, the EMIF waits and blocks any other command for ([EMIF\\_ZQ\\_CONFIG\[17:16\]](#) REG\_ZQ\_ZQCL\_MULT + 1) × ([EMIF\\_SDRAM\\_TIM\\_3\[20:15\]](#) REG\_ZQ\_ZQCS + 1) number of DDR clock cycles.

If a separate calibration resistor is used per device, the ZQ calibration can be performed simultaneously over both CSs. To enable ZQ calibration to be performed simultaneously over both CSs, the [EMIF\\_ZQ\\_CONFIG\[27\]](#) REG\_ZQ\_DUALCALEN bit must be set to 1. If REG\_ZQ\_DUALCALEN is set to 0, the EMIF performs ZQ calibration per CS serially.

### 15.3.4.7 SDRAM Temperature Monitoring

The EMIF supports automatic temperature monitoring to facilitate the software update of the refresh rate according to the temperature changes of the LPDDR2. Temperature monitoring can be enabled per CS by setting the [EMIF\\_TEMP\\_ALERT\\_CONFIG\[31\]](#) REG\_TA\_CS1EN and [EMIF\\_TEMP\\_ALERT\\_CONFIG\[30\]](#) REG\_TA\_CS0EN bits.

The EMIF polls the temperature of the LPDDR2 (issues an MRR command to Mode Register 4) every time the [EMIF\\_TEMP\\_ALERT\\_CONFIG\[21:0\]](#) REG\_TA\_REFINTERVAL bit field expires. In other words, REG\_TA\_REFINTERVAL defines the interval between temperature alert polls. If the EMIF sees a 1 on bit 7 of the read data value from the MRR, which indicates the temperature has changed, the [EMIF\\_IRQSTATUS\\_SYS\[1\]](#) REG\_TA\_SYS bit (for L3 interconnect) or [EMIF\\_IRQSTATUS\\_LL\[1\]](#) REG\_TA\_LL bit (for low-latency L3) is set and the module sends an interrupt on the system and low-latency interrupt lines, respectively. When the interrupt is received, software updates the [EMIF\\_SDRAM\\_REF\\_CTRL\[15:0\]](#) REG\_REFRESH\_RATE bit field to the required value as per the temperature change.

If the [EMIF\\_TEMP\\_ALERT\\_CONFIG\[28\]](#) REG\_TA\_SFEXITEN bit is set to 1, the EMIF polls for temperature change every time it exits self-refresh, active power-down, and precharge power-down modes.

Because the EMIF is performing an MRR, it needs information about how the LPDDR2 is connected. The [EMIF\\_TEMP\\_ALERT\\_CONFIG\[27:26\]](#) REG\_TA\_DEVWDT and [EMIF\\_TEMP\\_ALERT\\_CONFIG\[25:24\]](#) REG\_TA\_DEVCNT bit fields provide the necessary information to the EMIF for MRR data compare. For example, if REG\_TA\_DEVWDT is set to 0, which indicates 8-bit devices are used, and if REG\_TA\_DEVCNT is set to 2, which indicates four devices are used to form a 32-bit bus, the mask used for checking is 4'b1111; that is, the EMIF expects data on each byte lane on a 32-bit bus.

### 15.3.4.8 SDRAM Refresh Scheduling

The EMIF uses two counters to schedule AUTO REFRESH commands: a 13-bit decrementing refresh interval counter and a 4-bit refresh backlog counter. The interval counter is used to define the rate at which connected SDRAM devices are refreshed. It is loaded with the value of the [EMIF\\_SDRAM\\_REF\\_CTRL\[15:0\] REG\\_REFRESH\\_RATE](#) bit field at reset (only the 13 LSBs are taken). The interval counter decrements by 1 each cycle until it reaches 0, at which point it reloads from the [EMIF\\_SDRAM\\_REF\\_CTRL\[15:0\] REG\\_REFRESH\\_RATE](#) bit field and restarts decrementing. The counter also reloads and restarts decrementing whenever the [EMIF\\_SDRAM\\_REF\\_CTRL\[15:0\] REG\\_REFRESH\\_RATE](#) bit field is updated.

The refresh backlog counter records the number of outstanding AUTO REFRESH commands the EMIF has. The backlog counter increments by 1 each time the interval counter reloads (unless it has reached its maximum value of 15). The backlog counter decrements by 1 each time the EMIF issues an AUTO REFRESH command (unless it is already 0). For the range of values that the backlog counter can take, there are four levels of urgency with which the EMIF must perform an auto refresh cycle (in which it issues AUTO REFRESH commands):

1. Refresh-may level is reached when the backlog count is greater than 0, which indicates there is a refresh backlog; therefore, if the EMIF is not busy and none of the SDRAM banks are open, the EMIF must perform an auto refresh cycle.
2. Refresh-release level is reached when the backlog count is greater than 4, which indicates the refresh backlog is getting bigger; therefore, if the EMIF is not busy it must perform an auto refresh cycle even if any of the banks are open.
3. Refresh-need level is reached when the backlog count is greater than 5, which indicates the refresh backlog is getting bigger and the EMIF must raise the priority of performing an auto refresh cycle above that of servicing new memory write requests. The EMIF starts servicing new memory accesses after the refresh-release level is cleared.
4. Refresh-must level is reached when the backlog count is greater than 7, which indicates the refresh backlog is becoming excessive and the EMIF must perform an auto refresh cycle before servicing any new memory access requests. The EMIF starts servicing new memory accesses after the refresh-release level is cleared.

The refresh counters do not operate when SDRAM is in self-refresh mode.

The EMIF issues AUTO REFRESH commands within auto refresh cycles. An auto refresh cycle consists of issuing an AUTO REFRESH command and waiting  $T_{RFC}$  (see [EMIF\\_SDRAM\\_TIM\\_3](#)) cycles before rechecking the refresh levels. If the refresh-release level is not reached, the EMIF starts another auto refresh cycle; otherwise, it returns to idle mode where it can issue any command. The EMIF ensures that no more than eight AUTO REFRESH commands are issued in any rolling  $tREFBW (= 4 * 8 * tRFC)$  window.

#### 15.3.4.8.1 Performance Counters Description

The [EMIF\\_PERF\\_CNT\\_1](#) and [EMIF\\_PERF\\_CNT\\_2](#) registers can be used to monitor or calculate the EMIF bandwidth and efficiency. These counters can count events such as total SDRAM accesses, SDRAM activates, reads, writes, etc. Each counter counts events independent of the other counters. In addition to the ability to count events, the counters can also filter the events from a particular master or address space. The events to be counted and the filter enabling can be configured using the [EMIF\\_PERF\\_CNT\\_CFG](#) register. The filter value to be used can be configured using the [EMIF\\_PERF\\_CNT\\_SEL](#) register. Each counter can be configured independently.

[Table 15-100](#) lists all the events that can be counted and whether a filter can be applied to a particular event. A filter can be applied to an event if the following bits for Performance Counter 1 and Performance Counter 2 can be set equal to 0x1 for that event:

- Performance Counter 1: [EMIF\\_PERF\\_CNT\\_CFG\[15\] REG\\_CNTR1\\_MCONNID\\_EN](#) and [EMIF\\_PERF\\_CNT\\_CFG\[14\] REG\\_CNTR1\\_REGION\\_EN](#)
- Performance Counter 2: [EMIF\\_PERF\\_CNT\\_CFG\[31\] REG\\_CNTR2\\_MCONNID\\_EN](#) and [EMIF\\_PERF\\_CNT\\_CFG\[30\] REG\\_CNTR2\\_REGION\\_EN](#)

Table 15-100 shows the possible filter configurations for the two performance counters. These filter configurations can be used in conjunction with a L3 master ID and/or external chip-select to obtain performance statistics for a particular L3 master and/or external chip-select.

**Table 15-100. Performance Counter Filter Configuration**

CNTRn_CFG <sup>(1)</sup>	CNTRn_REGION_EN <sup>(1)</sup>	CNTRn_MCONNID_EN <sup>(1)</sup>	Description
0x0 <sup>(2)</sup>	0x0	0x0 or 0x1	Count total SDRAM accesses
0x1 <sup>(2)</sup>	0x0	0x0 or 0x1	Count total SDRAM activates
0x2 <sup>(2)</sup>	0x0 or 0x1	0x0 or 0x1	Count total L3 reads. CPU cache based operations are 32 bytes. DMA burst is 128 bytes.
0x3 <sup>(2)</sup>	0x0 or 0x1	0x0 or 0x1	Count total L3 writes. CPU cache based operations are 32 bytes. DMA burst is 128 bytes.
0x4	0x0	0x0	Count number of EMIF FCLK clock cycles L3 Command FIFO is full
0x5	0x0	0x0	Count number of EMIF FCLK clock cycles L3 Write Data FIFO is full
0x6	0x0	0x0	Count number of EMIF FCLK clock cycles L3 Read Data FIFO is full
0x7	0x0	0x0	Count number of EMIF FCLK clock cycles L3 Return Command FIFO is full
0x8	0x0 or 0x1	0x0 or 0x1	Count number of priority elevations
0x9	0x0	0x0	Count number of EMIF FCLK clock cycles that a command was pending
0xA <sup>(2)</sup>	0x0	0x0	Count number of EMIF FCLK clock cycles for which the memory data bus was transferring data.
0xA <sup>(2)</sup>	0x0	0x1	Count number of L3 commands for which the memory data bus was transferring data.
0xB to 0xF	0x0	0x0	Reserved for future use.

<sup>(1)</sup> n = 1 or 2

<sup>(2)</sup> When MReqDebug is set to a 1 for a particular L3 command, the performance counters will not be incremented for that command.

When CNTRn\_CFG = 0xA and CNTRn\_MCONNID\_EN=0x1, the following guidelines must apply:

- Count of 1 implies OCP command up to 32 bytes for all the initiators except for Cortex-A9 MPU
- Count of 1 implies OCP command up to 16 bytes for Cortex-A9 MPU when all the other initiators are not generating traffic on SDRAM.
- When ConnID is set to a value other than 0x00, the performance counter reflects the traffic generated by the initiator that is associated with that ConnID. In case of ConnID=0x00 (MPU), the performance counter reflects combined traffic by all active initiators. Therefore, if there are multiple initiators generating traffic, the traffic generated by the MPU must be calculated using this formula:

$$\text{Actual MPU Count} = \text{Count value} - \sum_{i=0}^{\text{all\_initiators-MPU}} \text{Count}_i$$

where i is different initiators and Count<sub>i</sub> is the Count value for each of those initiators. Then:

- Actual MPU count of 1 implies OCP command up to 16 bytes for Cortex-A9 MPU
- Bandwidth for all other initiators except MPU is Count × 32 bytes
- Bandwidth calculation for MPU is MPU Count × 16 bytes

### 15.3.4.8.2 Performance Counters General Examples

#### 15.3.4.8.2.1 PERF\_CNT\_1 General Example for Counting Write Accesses

The Performance Counter 1 register must count all write accesses from the dual Cortex-M3 MPU subsystem:

- To enable counting writes, the [EMIF\\_PERF\\_CNT\\_CFG\[3:0\]](#) REG\_CNTR1\_CFG bit field must be set to 0x3.
- The [EMIF\\_PERF\\_CNT\\_SEL\[15:8\]](#) REG\_MCONNID1 bit field must be set to 0x44. The values programmed into the REG\_MCONNIDx bit fields are those in [Table 28-20](#), in [Chapter 28, On-Chip Debug Support](#), left-shifted by 2 bits.
- To enable filtering, the [EMIF\\_PERF\\_CNT\\_CFG\[15\]](#) REG\_CNTR1\_MCONNID\_EN bit must be set to 0x1.

With this configuration, Counter 1 counts every write made to the EMIF from master 0x44 to any address space. This does not include accesses from other masters and does not include commands other than writes.

#### 15.3.4.8.2.2 PERF\_CNT\_2 General Example for Counting Total Access

The Performance Counter 2 register must count total accesses to SDRAM regardless of the masters or address space.

- To enable counting all SDRAM accesses, the [EMIF\\_PERF\\_CNT\\_CFG\[19:16\]](#) REG\_CNTR2\_CFG bit field must be set to 0x0.
- To disable filtering, the [EMIF\\_PERF\\_CNT\\_CFG\[31\]](#) REG\_CNTR2\_MCONNID\_EN and the [EMIF\\_PERF\\_CNT\\_CFG\[30\]](#) REG\_CNTR2\_REGION\_EN bits must be set to 0x0.

With this configuration, Counter 2 counts every access made to the EMIF. This includes all accesses from all masters and to any address space.

#### 15.3.4.8.2.3 PERF\_CNT\_3 General Example for Counting all Read Accesses

The Performance Counter 1 register must count all read accesses from the dual Cortex-M3 MPU subsystem to address space 0x0.

- To enable counting reads, the [EMIF\\_PERF\\_CNT\\_CFG\[3:0\]](#) REG\_CNTR1\_CFG bit field must be set to 0x2.
- The [EMIF\\_PERF\\_CNT\\_SEL\[15:8\]](#) REG\_MCONNID1 and [EMIF\\_PERF\\_CNT\\_SEL\[1:0\]](#) REG\_REGION\_SEL1 bit fields must be set to 0x44 and 0x0, respectively.
- To enable filtering, the [EMIF\\_PERF\\_CNT\\_CFG\[15\]](#) REG\_CNTR1\_MCONNID\_EN and [EMIF\\_PERF\\_CNT\\_CFG\[14\]](#) REG\_CNTR1\_REGION\_EN bits must be set to 0x1.

With this configuration, Counter 1 counts every read made to the EMIF from master 0x44 to address space 0x0. This does not include accesses from other masters or accesses to other address space and does not include commands other than reads.

### 15.3.4.9 EMIF Access Cycles

By default, the EMIF keeps the SDRAM CSs active. To direct a command to one of the SDRAMs, the EMIF deasserts the CS to the other SDRAMs for the duration of the command. If the [EMIF\\_SDRAM\\_CONFIG\[3\]](#) REG\_EBANK bit in the SDRAM configuration register is set to 0, CS1 is always driven high except during initialization and for REFRESH, POWER DOWN, SELF-REFRESH, and DEEP POWER-DOWN commands.

The EMIF always performs burst accesses to the SDRAM. Multiple SDRAM bursts may be needed to service a single L3 burst request. [Table 15-101](#) through [Table 15-105](#) show a few examples of how EMIF accesses SDRAM for a linear incrementing transaction type. T0, T1, etc. are clock cycles. R0 is read starting at column 0, R8 is read starting at column 8, and R16 is read starting at column 16. D0-1 is the data from column 0 and 1, D2-3 is the data from column 2 and 3, and so on.

**Table 15-101. 64-Byte Linear Read Starting at Address 0x0**

T0	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11

R4		R8					R16						
		D4-5	D6-7	D8-9	D10-11	D12-13	D14-15	D16-17	D18-19	Unused	Unused		

**Table 15-105. 64-Byte Linear Read Starting at Address 0x18**

T0	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11	T12	T13
R6		R8				R16							
		D6-7	Unused	D8-9	D10-11	D12-13	D14-15	D16-17	D18-19	D20-21	Unused		

The EMIF uses the unused data phases in the preceding figures by issuing successive read commands if there are reads to open banks pending in the command FIFO.

The write data conversion from SDR to DDR is done outside the EMIF.

#### 15.3.4.9.1 SDRAM Read

A read access to an SDRAM is initiated with a READ command. The EMIF provides the internal bank address and the column address on pad\_ca\_o with the READ command. The EMIF registers the first read data from lpddr2i\_dj (where i = 1 or 2 and j = 0 or 1) after (read\_latency + 3) DDR clock cycles. Read latency is programmed in the [EMIF\\_DDR\\_PHY\\_CTRL\\_1](#) register.

#### 15.3.4.9.2 SDRAM Write

A write access to an SDRAM is initiated with a WRITE command. The EMIF provides the internal bank address and the column address on pad\_ca\_o with the WRITE command.

The EMIF delays the write data by the appropriate write latency minus 1. Subsequent data words are provided on lpddr2i\_dj (where i = 1 or 2 and j = 0 or 1) along with the appropriate data mask on lpddr2i\_dmj (where i = 1 or 2 and j = 0 or 1) on each successive clock cycle. The DDR PHY then adds one more clock cycle delay to the write data to appropriately center the write data to the outgoing DQS.

### 15.3.4.10 Turnaround Time

Table 15-106 lists the turnaround time the EMIF introduces on the data bus for various back-to-back accesses. The EMIF takes advantage of the CAS latencies and packs the commands as close as possible on the control bus to introduce the following turnaround time on the data bus.

**Table 15-106. Turnaround Time**

Previous Access	Next Access	Turnaround Time (Number of DDR Clock Cycles)
SDRAM read	SDRAM read to the same CS	0
SDRAM read	SDRAM read to a different CS	2
SDRAM read	SDRAM write	2
SDRAM write	SDRAM write	0
SDRAM write	SDRAM read	2

### 15.3.4.11 SDRAM Address Mapping

The EMIF interleaves the internal banks for SDRAM connected to both CSs (see Table 15-107 for the SDRAM addressing space), according to the DMM (for more information, see Section 15.2, *Dynamic Memory Manager*). From the system point of view, the external SDRAM is seen as one block of SDRAM. If two external 64-MB devices are used, a 128-MB memory block is observed. If two external 32-MB devices are used, a 64-MB block is observed.

**Table 15-107. SDRAM Addressing Space**

Module Name	Base Address	Size
EMIF1   EMIF2-CS0-SDRAM <sup>(1)</sup>	0x8000 0000	0 to 1GB, programmable in DMM (see Section 15.2, <i>Dynamic Memory Manager</i> )
EMIF1   EMIF2-CS1-SDRAM <sup>(2)</sup>	0xC000 0000	0 to 1GB, programmable in DMM (see Section 15.2, <i>Dynamic Memory Manager</i> )

<sup>(1)</sup> The addressing space is interleaved on two LPDDR memory controllers (EMIF1, EMIF2), each activating their CS0 line. These CSs can address 64, 128, 256, 512, 1024, or 2048MBs. Interleaving occurs at 128-byte granularity. EMIF1-CS0 base address is always 0x8000 0000 at reset, and occupies a 1-GB address space at reset (interleaving disabled at reset).

<sup>(2)</sup> The addressing space is interleaved on two LPDDR memory controllers (EMIF1, EMIF2), each activating its CS1 line. These CSs are programmable to 64, 128, 256, 512, or 1024MBs. Interleaving occurs at 128-byte granularity. EMIF1-CS1 and EMIF2-CS1 are disabled at reset. Their base address is programmable to achieve a continuous address space with the respective CS0, regardless of the programmed address range. EMIF1-CS1 is disabled if the EMIF1-CS0 memory density is set to 2048MB (2GB) when interleaving is disabled, or if the EMIF1-CS0 + EMIF2-CS0 memory density is set to 1024MB (1GB) when interleaving is enabled.

When addressing SDRAM, if the `EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS` bit field is set to 0, the EMIF uses the following three bit fields to determine the mapping from the source address to the SDRAM row, column, bank, and CS:

- `EMIF_SDRAM_CONFIG[6:4] REG_IBANK`
- `EMIF_SDRAM_CONFIG[3] REG_EBANK`
- `EMIF_SDRAM_CONFIG[2:0] REG_PAGESIZE`

If the `EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS` bit field is set to 1, 2, or 3, the EMIF uses the following four bit fields to determine the mapping from the source address to the SDRAM row, column, bank, and CS:

- `EMIF_SDRAM_CONFIG[6:4] REG_IBANK`
- `EMIF_SDRAM_CONFIG[3] REG_EBANK`
- `EMIF_SDRAM_CONFIG[2:0] REG_PAGESIZE`
- `EMIF_SDRAM_CONFIG[9:7] REG_ROWSIZE`

In all cases the EMIF considers its SDRAM address space to be a single logical block, regardless of the number of physical devices or whether the devices are mapped across one or two EMIF CSs.

For [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) REG\_IBANK\_POS = 0, [Table 15-108](#) and [Table 15-109](#) list which source address bits (MAddr) map to the SDRAM row, column, bank, and CS bits for all combinations of REG\_IBANK, REG\_EBANK, and REG\_PAGESIZE.

For [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) REG\_IBANK\_POS != 0, [Table 15-111](#) and [Table 15-112](#) show which source address bits (MAddr) map to the SDRAM row, column, bank, and CS bits for all combinations of REG\_IBANK, REG\_EBANK, REG\_PAGESIZE, and REG\_ROW\_SIZE.

The tables also list the maximum size of the resulting SDRAM space.

For [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) `REG_IBANK_POS = 0`, the effect of the address-mapping scheme is that as the source address increments across SDRAM page boundaries, the EMIF moves onto the same page in the next bank in the current device (`lpddr2i_cs1[0]n`, where  $i = 1$  or  $2$ ). This movement along the banks of the current device continues until the page is accessed in all banks in the current device. The EMIF then proceeds to the same page in the next device (if [EMIF\\_SDRAM\\_CONFIG\[3\]](#) `REG_EBANK = 1`, `lpddr2i_cs1[1]n`, where  $i = 1$  or  $2$ ) and proceeds through the same page in all its banks before moving to the next page in the first device (`lpddr2i_cs1[0]n`, where  $i = 1$  or  $2$ ). The EMIF exploits this movement across internal banks and CSs while remaining on the same page to maximize the number of open SDRAM banks within the overall SDRAM space.

Thus, the EMIF can keep a maximum of 16 banks (eight internal banks across two CSs) open at a time, and can interleave among all of them.

[Table 15-110](#) through [Table 15-112](#) list the L3 address to SDRAM address mapping. In each case, there are  $x$  bits for bank, followed by  $y$  bits for row, followed by  $z$  bits for CS, followed by  $s$  bits for bank, and  $t$  bits for col in `MAddr[31:N]` ( $x$ ,  $y$ ,  $z$ ,  $s$ , and  $t$  are given depending on the value of the [EMIF\\_SDRAM\\_CONFIG](#) bit field).

**Table 15-110. L3 Address to SDRAM Address Mapping for [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) `REG_IBANK_POS = 1` and [EMIF\\_SDRAM\\_CONFIG\\_2\[27\]](#) `REG_EBANK_POS = 0`**

<code>MAddr[31:N]</code>				
Bank Address	Row Address	Chip-Select	Bank Address	Column Address
Number of bits defined by <a href="#">EMIF_SDRAM_CONFIG</a> <code>[6] REG_IBANK</code>	Number of bits defined by <a href="#">EMIF_SDRAM_CONFIG</a> <code>[9:7] REG_ROWSIZE</code>	Number of bits defined by <a href="#">EMIF_SDRAM_CONFIG</a> <code>[3] REG_EBANK</code>	Number of bits defined by <a href="#">EMIF_SDRAM_CONFIG</a> <code>[5:3] REG_IBANK</code>	Number of bits defined by <a href="#">EMIF_SDRAM_CONFIG</a> <code>[2:0] REG_PAGESIZE</code>
= 0: 0 bit	= 0: 9 bits	= 0: 0 bit	= 0: 0 bit	= 0: 8 bits
= 1: 0 bit	= 1: 10 bits	= 1: 1 bit	= 1: 1 bit	= 1: 9 bits
	= 2: 11 bits		= 2: 2 bits	= 2: 10 bits
	= 3: 12 bits		= 3: 2 bits	= 3: 11 bits
	= 4: 13 bits			
	= 5: 14 bits			
	= 6: 15 bits			
	= 7: 16 bits			

**NOTE:** N = 1 for 16-bit SDRAM, and N = 2 for 32-bit SDRAM.

The REG\_IBANK bit field is listed twice because it gives the number of bank bits depending on their place in the MAddr.

For EMIF\_SDRAM\_CONFIG[28:27] REG\_IBANK\_POS = 1, the EMIF interleaves banks the same as for EMIF\_SDRAM\_CONFIG[28:27] REG\_IBANK\_POS = 0, but the interleaving of banks within a device (per CS) is limited to four banks. Thus, the EMIF can keep a maximum of 16 banks (eight internal banks across two CSs) open at a time, but can interleave among only 8 of them.

**Table 15-111. L3 Address to SDRAM Address Mapping for EMIF\_SDRAM\_CONFIG[28:27] REG\_IBANK\_POS = 2 and EMIF\_SDRAM\_CONFIG\_2[27] REG\_EBANK\_POS = 0**

= 3: 3 bits	= 3: 12 bits		= 3: 11 bits
	= 4: 13 bits		
	= 5: 14 bits		
	= 6: 15 bits		
	= 7: 16 bits		

---

**NOTE:** N = 1 for 16-bit SDRAM, and N = 2 for 32-bit SDRAM.

---

For [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) REG\_IBANK\_POS = 3, the EMIF cannot interleave banks within a device (per CS). However, it can interleave banks between the two CSs. Thus, the EMIF can keep a maximum of 16 banks (eight internal banks across two CSs) open at a time, but can interleave among only 2 of them.

Because the EMIF interleave among a fewer number of banks when [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) REG\_IBANK\_POS != 0, these cases are lower in performance than the [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) REG\_IBANK\_POS = 0 case. Thus, these cases are recommended to be used only with partial array self-refresh where performance can be traded off for power savings.

**Table 15-113. L3 Address to SDRAM Address Mapping for [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) REG\_IBANK\_POS = 1 and [EMIF\\_SDRAM\\_CONFIG\\_2\[27\]](#) REG\_EBANK\_POS = 1**

The interleaving of banks within a device (per chip-select) is limited to two banks. The EMIF cannot interleave banks between the two chip-selects. Thus, the EMIF can keep a maximum of 16 banks (8 internal banks across two chip-selects) open at a time, but can interleave among only 2 of them.

**Table 15-115. L3 Address to SDRAM Address Mapping for EMIF\_SDRAM\_CONFIG[28:27]  
REG\_IBANK\_POS = 3 and EMIF\_SDRAM\_CONFIG\_2[27] REG\_EBANK\_POS = 1**

MAddr[31:N]			
Chip-Select	Bank Address	Row Address	Column Address
Number of bits defined by EMIF_SDRAM_CONFIG[3] REG_EBANK	Number of bits defined by EMIF_SDRAM_CONFIG[6:4] REG_IBANK	Number of bits defined by EMIF_SDRAM_CONFIG[9:7] REG_ROWSIZE	Number of bits defined by EMIF_SDRAM_CONFIG[2:0] REG_PAGESIZE
= 0: 0 bit	= 0: 0 bit	= 0: 9 bits	= 0: 8 bits
= 1: 1 bit	= 1: 1 bit	= 1: 10 bits	= 1: 9 bits
	= 2: 2 bits	= 2: 11 bits	= 2: 10 bits
	= 3: 3 bits	= 3: 12 bits	= 3: 11 bits
		= 4: 13 bits	
		= 5: 14 bits	
		= 6: 15 bits	
		= 7: 16 bits	

---

**NOTE:** N = 1 for 16-bit SDRAM, and N = 2 for 32-bit SDRAM.

---

The EMIF cannot interleave banks within a device (per chip-select) or between the two chip-selects. Thus, the EMIF can keep a maximum of 16 banks (8 internal banks across two chip-selects) open at a time, but cannot interleave among them.

Because the EMIF interleaves among fewer banks when REG\_IBANK\_POS != 0 or REG\_EBANK\_POS = 1, these cases are lower in performance than the REG\_IBANK\_POS = 0 case. Thus, these cases are recommended to be used only along with partial array self-refresh, where performance can be traded for power savings.

### 15.3.4.12 LPDDR2 SDRAM Initialization

When coming out of reset if the [EMIF\\_SDRAM\\_CONFIG](#)[31:29] REG\_SDRAM\_TYPE bit field is equal to 4 or 5, the EMIF performs an LPDDR2 initialization sequence as follows:

1. Drives `lpddr2i_cke[j][1:0]` (where  $i = 1$  or  $2$  and  $j = 0$  or  $1$ ) high and starts to issue NOP commands continuously.
2. After 16 SDRAM refresh rate intervals, issues a PRECHARGE-ALL command. The SDRAM refresh rate is defined in the [EMIF\\_SDRAM\\_REF\\_CTRL](#)[15:0] REG\_REFRESH\_RATE bit field.
3. Issues a RESET command.
4. Software initializes LPDDR2 using the [EMIF\\_LPDDR2\\_MODE\\_REG\\_CFG](#) and [EMIF\\_LPDDR2\\_MODE\\_REG\\_DATA](#) registers. Software must enable refreshes by writing 1 in the [EMIF\\_LPDDR2\\_MODE\\_REG\\_CFG](#)[30] REG\_REFRESH\_EN bit during the last MRW command.

The EMIF also performs the initialization sequence whenever the [EMIF\\_SDRAM\\_CONFIG](#) register is written and the LPDDR2 initialization was not performed previously because the [SDRAM\\_REF\\_CTRL](#)[31] REG\_INITREF\_DIS bit was set to 0. Once the EMIF performs initialization, rewriting the SDRAM configuration register does not cause reinitialization.

---

**NOTE:** The values of the different bit fields in the [EMIF\\_SDRAM\\_CONFIG](#) and [EMIF\\_SDRAM\\_CONFIG\\_2](#) registers are set by the control module at reset. These values must be modified by the configuration header feature in the ROM code or by the initial boot image running from an external XIP booting memory or internal RAM (see [Section 27.4.8, Image Format](#)). They must not be modified during run time, because they reflect the used hardware LPDDR2 SDRAM configurations.

---

The EMIF does not perform any transactions until the LPDDR2 initialization sequence completes.

When the EMIF comes out of reset, the delay time in Step 2 resulting from the 16 refresh rate intervals + 8 cycles is approximately  $16 \times \text{EMIF\_SDRAM\_REF\_CTRL}[15:0] \text{ REG\_REFRESH\_RATE} / \text{input frequency}$ .

## 15.3.5 EMIF Programming Guide

### 15.3.5.1 EMIF Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the EMIF module.

The following programming sequences are double, because there are two EMIF modules (EMIF1 and EMIF2) with the same register mapping but different register addresses.

#### 15.3.5.1.1 Global Initialization

**Table 15-116. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	The module interface and functional clocks must be enabled. See <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Interrupt submodule of the MPU	The interrupt requests from the EMIF must be enabled (unmasked). See <a href="#">Chapter 17, Interrupt Controllers</a> .
DMM	The EMIF is a slave to the DMM. The DMM must be enabled and configured for communication with LPDDR2 memories. See <a href="#">Section 15.2, Dynamic Memory Manager</a> .

#### 15.3.5.1.1.1 EMIF Module Global Initialization

This procedure initializes the EMIF after a power-on reset (POR). The unused bits in all registers must be written with zeros. The values of the shadow registers are loaded in their corresponding registers when a frequency update sequence is performed.

**NOTE:** The values of the different bit fields in the [EMIF\\_SDRAM\\_CONFIG](#) and [EMIF\\_SDRAM\\_CONFIG\\_2](#) registers are set by the control module at reset. These values must be modified by the configuration header feature in the ROM code or by the initial boot image running from an external XIP booting memory or internal RAM (see [Section 27.4.8, Image Format](#)). They must not be modified during run time, because they reflect the used hardware LPDDR2 SDRAM configurations.

**Table 15-117. EMIF Global Initialization**

Step	Register/ Bit Field / Programming Model	Value
Assign the external bank address bits from lower or higher OCP address as shown in <a href="#">Table 15-110</a> , <a href="#">Table 15-111</a> , <a href="#">Table 15-112</a> , <a href="#">Table 15-113</a> , <a href="#">Table 15-114</a> , and <a href="#">Table 15-115</a> .	<a href="#">EMIF_SDRAM_CONFIG_2</a> [27] REG_EBANK_POS	0x-
Select the SDRAM type (S2 or S4)	<a href="#">EMIF_SDRAM_CONFIG</a> [31:29] REG_SDRAM_TYPE	0x-
Assign internal bank address bits from L3 address as shown in <a href="#">Table 15-108</a> , <a href="#">Table 15-109</a> , <a href="#">Table 15-110</a> , <a href="#">Table 15-111</a> , <a href="#">Table 15-112</a> , <a href="#">Table 15-113</a> , <a href="#">Table 15-114</a> , and <a href="#">Table 15-115</a> .	<a href="#">EMIF_SDRAM_CONFIG</a> [28:27] REG_IBANK_POS	0x-
Enable/disable DLL.	<a href="#">EMIF_SDRAM_CONFIG</a> [20] REG_DDR_DISABLE_DLL	0x-
Choose between 32-bit or 16-bit wide SDRAM data bus.	<a href="#">EMIF_SDRAM_CONFIG</a> [15:14] REG_NARROW_MODE	0x-
Define CAS latency when accessing connected SDRAM devices.	<a href="#">EMIF_SDRAM_CONFIG</a> [13:10] REG_CL	0x-
Define the number of row address bits of connected SDRAM device.	<a href="#">EMIF_SDRAM_CONFIG</a> [9:7] REG_ROWSIZE	0x-
Define the number of banks inside connected SDRAM device.	<a href="#">EMIF_SDRAM_CONFIG</a> [6:4] REG_IBANK	0x-

**Table 15-117. EMIF Global Initialization (continued)**

Step	Register/ Bit Field / Programming Model	Value
Define whether SDRAM accesses use 1 or 2 chip-select lines.	EMIF_SDRAM_CONFIG[3] REG_EBANK	0x-
Define the internal page size of connected SDRAM device.	EMIF_SDRAM_CONFIG[2:0] REG_PAGESIZE	0x-
Configure the DDR PHY physical layer to the SDRAM (Read Latency for the read data from SDRAM in number of DDR clock cycles)	EMIF_DDR_PHY_CTRL_1 <sup>(1)</sup>	0x-----
Write the Shadow register of the EMIF_DDR_PHY_CTRL_1 with the same value.	EMIF_DDR_PHY_CTRL_1_SHDW <sup>(1)</sup>	EMIF_DDR_PHY_CTRL_1
Initialize MR LPDDR2 registers.	External LPDDR2 initialization, see <a href="#">Table 15-120</a>	
Configure the DDR PHY physical layer to the SDRAM parameters.	EMIF_DDR_PHY_CTRL_2	0x-----
Define timings and clock parameters	EMIF Timing Initialization, see <a href="#">Table 15-119</a>	
Configure the SDRAM Output Impedance Calibration parameters	EMIF Output Impedance Calibration Mode, see <a href="#">Table 15-121</a>	
Configure the Temperature Alert parameters	EMIF Temperature Monitoring Mode, see <a href="#">Table 15-130</a>	
(Optional) Configure the performance counter configuration Register	EMIF_PERF_CNT_CFG	0x-00--00-
(Optional) Configure the performance counter master region select register	EMIF_PERF_CNT_SEL	0x-0---0-
(Optional) Configure the System, Low-Latency L3 and MPU Interface threshold maxima.	EMIF_L3_CONFIG	0x0-0-00--
Clear all eventual previous indications of treated interrupts.	EMIF_IRQSTATUS_SYS, EMIF_IRQSTATUS_LL	0x-
(Optional) Enable system L3 interrupt for command or address error.	EMIF_IRQENABLE_SET_SYS[0] REG_EN_ERR_SYS	0x1
(Optional) Enable low-latency L3 interrupt for command or address error.	EMIF_IRQENABLE_SET_LL[0] REG_EN_ERR_LL	0x1

<sup>(1)</sup> Values loaded in these registers depend on OPP.

**Table 15-118. Subprocess Call Summary for Main Sequence – EMIF Global Initialization**

Subprocess Name	Cross-Reference
EMIF Timing Initialization	<a href="#">Table 15-119</a> <i>EMIF Timing Initialization</i>
EMIF Output Impedance Calibration Mode	<a href="#">Table 15-121</a> <i>EMIF Output Impedance Calibration Mode</i>
EMIF Temperature Monitoring Mode	<a href="#">Table 15-130</a> <i>EMIF Temperature Monitoring Mode</i>
External LPDDR2 initialization	<a href="#">Table 15-120</a> <i>External LPDDR2 initialization</i>

### 15.3.5.1.1.2 Subsequence – EMIF Timing Initialization

**Table 15-119. Subsequence – EMIF Timing Initialization**

Step	Register/ Bit Field / Programming Model	Value
Determine the minimum required size of the Read Idle window to be detected or generated.	EMIF_READ_IDLE_CTRL[19:16] REG_READ_IDLE_LEN	0x-
Determine the maximum interval between successive read idle events.	EMIF_READ_IDLE_CTRL[8:0] REG_READ_IDLE_INTERVAL	0x---
Write the Shadow register of the EMIF_READ_IDLE_CTRL with the same value.	EMIF_READ_IDLE_CTRL_SHDW	EMIF_READ_IDLE_CTRL
Define the minimum number of DDR clock cycles from Precharge to Activate or Refresh, minus one.	EMIF_SDRAM_TIM_1[28:25]REG_T_RP	0x-
Define minimum number of DDR clock cycles from Activate to Read or Write, minus one.	EMIF_SDRAM_TIM_1[24:21] REG_T_RCD	0x-

**Table 15-119. Subsequence – EMIF Timing Initialization (continued)**

Step	Register/ Bit Field / Programming Model	Value
Define minimum number of DDR clock cycles from last Write transfer to Precharge, minus one.	EMIF_SDRAM_TIM_1[20:17] REG_T_WR	0x-
Define minimum number of DDR clock cycles from Activate to Precharge, minus one.	EMIF_SDRAM_TIM_1[16:12] REG_T_RAS	0x--
Define Minimum number of DDR clock cycles from Activate to Activate, minus one.	EMIF_SDRAM_TIM_1[11:6]REG_T_RC	0x--
Define Minimum number of DDR clock cycles from Activate to Activate for a different bank, minus one.	EMIF_SDRAM_TIM_1[5:3]REG_T_RRD	0x-
Define Minimum number of DDR clock cycles from last Write to Read, minus one.	EMIF_SDRAM_TIM_1[2:0] REG_T_WTR	0x-
Write the Shadow register of the EMIF_SDRAM_TIM_1 <sup>(1)</sup> .	EMIF_SDRAM_TIM_1_SHDW <sup>(1)</sup>	0x-----
Define minimum number of DDR clock cycles from Powerdown exit to any command other than a Read, minus one.	EMIF_SDRAM_TIM_2[30:28] REG_T_XP	0x-
Define minimum number of DDR clock cycles from Self-Refresh exit to any command other than a Read command, minus one.	EMIF_SDRAM_TIM_2[24:16] REG_T_XSNR	0x---
Define minimum number of DDR clock cycles from Self-Refresh exit to a Read command, minus one.	EMIF_SDRAM_TIM_2[15:6] REG_T_XSRD	0x---
Define minimum number of DDR clock cycles for the last read command to a Precharge command, minus one.	EMIF_SDRAM_TIM_2[5:3] REG_T_RTP	0x-
Write the Shadow register of the EMIF_SDRAM_TIM_2 <sup>(2)</sup> .	EMIF_SDRAM_TIM_2_SHDW <sup>(2)</sup>	0x-----
Define minimum number of DDR clock cycles for which LPDDR2 must remain in Self Refresh, minus one.	EMIF_SDRAM_TIM_3[23:21] REG_T_CKESR	0x-
Define number of DDR clock cycles for a ZQCS command duration, minus one.	EMIF_SDRAM_TIM_3[20:15] REG_ZQ_ZQCS	0x--
Define number of DDR clock cycles related to the tDQSCKmax timing parameter. For a 400MHz DDR clock and tDQSCKMAX=5.5 ns, the recommended setting is 0x2.	EMIF_SDRAM_TIM_3[14:13] REG_T_TDQSCKMAX	0x2
Define minimum number of DDR clock cycles from Refresh or Load Mode to Refresh or Activate, minus one.	EMIF_SDRAM_TIM_3[12:4] REG_T_RFC	0x---
Define maximum number of EMIF_SDRAM_REF_CTRL[15:0] REG_REFRESH_RATE intervals from Activate to Precharge command.	EMIF_SDRAM_TIM_3[3:0] REG_T_RAS_MAX	0x-
Write the Shadow register of the EMIF_SDRAM_TIM_3 <sup>(2)</sup> .	EMIF_SDRAM_TIM_3_SHDW <sup>(2)</sup>	0x-----
Define the rate at which the connected SDRAM devices are refreshed.	EMIF_SDRAM_REF_CTRL[15:0] REG_REFRESH_RATE	0x----
Write the Shadow register of the EMIF_SDRAM_REF_CTRL with the same value.	EMIF_SDRAM_REF_CTRL_SHDW	EMIF_SDRAM_REF_CTRL

<sup>(1)</sup> Values loaded in these registers depend on OPP.

<sup>(2)</sup> Values loaded in these registers depend on OPP.

### 15.3.5.1.1.3 Subsequence - External LPDDR2 Initialization

**Table 15-120. Subsequence - External LPDDR2 Initialization**

Step	LPDDR2 mode registers (MR)	Value
Wait until MR0[0]=0 (MR0[0] = 0 indicates that memory auto – initialization is completed).	MR0[0]	=0
Issue ZQINIT calibration command.	MR10	0xFF
Configure BT, BL, WC.	MR1	0x--
Configure the memory latency settings (RL and WL).	MR2 <sup>(1)</sup>	0x--
Unmask memory banks.	MR16	0x--
Unmask memory segments.	MR17	0x--

<sup>(1)</sup> Memory latency settings (RL and WL) depend on OPP.

### 15.3.5.1.2 Operational Modes Configuration

#### 15.3.5.1.2.1 EMIF Output Impedance Calibration Mode

**Table 15-121. EMIF Output Impedance Calibration Mode**

Step	Register/Bit Field/Programming Model	Value
IF : Calibration per CS		
Determine on which chip select CS1 or CS0 the calibration is enabled.	EMIF_ZQ_CONFIG[31:30] REG_ZQ_CS1/0EN	0x-
ELSE : (Calibration on both the CS0 and CS1)		
Enable automatic output impedance calibration for both the chip selects simultaneously.	EMIF_ZQ_CONFIG[29] REG_ZQ_DUALCALEN	0x1
ENDIF		
Define the interval (number of refresh periods) between ZQCS commands.	EMIF_ZQ_CONFIG[15:0] REG_ZQ_REFINTERVAL	0x----
Define the number of ZQCL durations that build the ZQINIT duration.	EMIF_ZQ_CONFIG[19:18] REG_ZQ_ZQINIT_MULT	0x-
Define the number of ZQCS intervals that build the ZQCL duration.	EMIF_ZQ_CONFIG[17:16] REG_ZQ_ZQCL_MULT	0x-
Enable the issuing of ZQ-Long command on self-refresh, active power-down, and precharge power-down exit.	EMIF_ZQ_CONFIG[28] REG_ZQ_SFEXITEN	0x1

#### 15.3.5.1.2.2 EMIF MR Read

**Table 15-122. EMIF MR Read**

Step	Register/Bit Field/Programming Model	Value
Choose CS0 or CS1 to issue the mode register read command.	EMIF_LPDDR2_MODE_REG_CFG[31] REG_CS	0x-
Write the mode register (MR) address.	EMIF_LPDDR2_MODE_REG_CFG[7:0] REG_ADDRESS	0x--
Initiate read command by reading the register.	EMIF_LPDDR2_MODE_REG_DATA[7:0]	

#### 15.3.5.1.2.3 EMIF MR Write

**Table 15-123. EMIF MR Write**

Step	Register/Bit Field/Programming Model	Value
Choose CS0 or CS1 to issue mode register write command.	EMIF_LPDDR2_MODE_REG_CFG[31] REG_CS	0x-

**Table 15-123. EMIF MR Write (continued)**

Step	Register/Bit Field/Programming Model	Value
Write the mode register (MR) address.	<a href="#">EMIF_LPDDR2_MODE_REG_CFG</a> [7:0] REG_ADDRESS	0x----
Supply the data byte to be written and initiate write command by writing the register.	<a href="#">EMIF_LPDDR2_MODE_REG_DATA</a> [7:0] REG_VALUE_0	0x-

#### 15.3.5.1.2.4 EMIF SDRAM Self-Refresh

**Table 15-124. EMIF SDRAM Self-Refresh Entering**

Step	Register/Bit Field/Programming Model	Value
Define the number of DDR clock cycles after which the EMIF puts the external SDRAM in Self Refresh mode, when EMIF is idle.	<a href="#">EMIF_PWR_MGMT_CTRL</a> [7:4] REG_SR_TIM	0x-
Enable self-refresh mode.	<a href="#">EMIF_PWR_MGMT_CTRL</a> [10:8] REG_LP_MODE	0x2
Write the shadow register of <a href="#">EMIF_PWR_MGMT_CTRL</a> .	<a href="#">EMIF_PWR_MGMT_CTRL_SHDW</a>	0x-

**Table 15-125. EMIF SDRAM Self-Refresh Exiting**

Step	Register/ Bit Field / Programming Model	Value
Change REG_LP_MODE bitfield from 0x2 to any value.	<a href="#">EMIF_PWR_MGMT_CTRL</a> [10:8] REG_LP_MODE	0x-
Write the shadow register of <a href="#">EMIF_PWR_MGMT_CTRL</a> .	<a href="#">EMIF_PWR_MGMT_CTRL_SHDW</a>	0x-----

#### 15.3.5.1.2.5 EMIF LPDDR2 SDRAM Power-Down Mode

**Table 15-126. EMIF SDRAM Power-Down Mode**

Step	Register/Bit Field/Programming Model	Value
Define the number of DDR clock cycles after which the EMIF puts the external SDRAM in Power Down mode, when EMIF is idle.	<a href="#">EMIF_PWR_MGMT_CTRL</a> [15:12] REG_PD_TIM	0x-
Enable (enter) power-down mode.	<a href="#">EMIF_PWR_MGMT_CTRL</a> [10:8] REG_LP_MODE	0x4
Write the shadow register of <a href="#">EMIF_PWR_MGMT_CTRL</a> .	<a href="#">EMIF_PWR_MGMT_CTRL_SHDW</a>	0x-----

**Table 15-127. EMIF SDRAM Power-Down Mode Exiting**

Step	Register/ Bit Field / Programming Model	Value
Change REG_LP_MODE bitfield from 0x4 to any value.	<a href="#">EMIF_PWR_MGMT_CTRL</a> [10:8] REG_LP_MODE	0x-
Write the shadow register of <a href="#">EMIF_PWR_MGMT_CTRL</a> .	<a href="#">EMIF_PWR_MGMT_CTRL_SHDW</a>	0x-----

#### 15.3.5.1.2.6 EMIF LPDDR2-SDRAM Deep Power-Down Mode

**Table 15-128. EMIF LPDDR2-SDRAM Deep Power-Down Mode Entering**

Step	Register/Bit Field/Programming Model	Value
Define the number of DDR clock cycles after which the EMIF puts the external SDRAM in Power saving mode, when EMIF is idle.	<a href="#">EMIF_PWR_MGMT_CTRL</a> [3:0] REG_CS_TIM	0x-

**Table 15-128. EMIF LPDDR2-SDRAM Deep Power-Down Mode Entering (continued)**

Step	Register/Bit Field/Programming Model	Value
Enable (enter) deep power-down mode.	EMIF_PWR_MGMT_CTRL[11] REG_DPD_EN	0x1
Write the shadow register of EMIF_PWR_MGMT_CTRL.	EMIF_PWR_MGMT_CTRL_SHDW	0x-----

**Table 15-129. EMIF LPDDR2-SDRAM Deep Power-Down Mode Exiting**

Step	Register/ Bit Field / Programming Model	Value
Clear REG_DPD_EN bit.	EMIF_PWR_MGMT_CTRL[11] REG_DPD_EN	0
Write the shadow register of EMIF_PWR_MGMT_CTRL.	EMIF_PWR_MGMT_CTRL_SHDW	0x-----

**NOTE:** After Deep Power-Down exit Software must perform initialization, as specified in [Table 15-120](#).

### 15.3.5.1.2.7 EMIF Temperature Monitoring Mode

**Table 15-130. EMIF Temperature Monitoring Mode**

Step	Register/Bit Field/Programming Model	Value
Determine whether CS1 or CS0 is used for temperature alert polling.	EMIF_TEMP_ALERT_CONFIG[31:30] REG_TA_CS1/0EN	0x-
Define the interval (number of refresh periods) between temperature alert polls.	EMIF_TEMP_ALERT_CONFIG[21:0] REG_TA_REFINTERVAL	0x-----
Define how wide the physical memory device is.	EMIF_TEMP_ALERT_CONFIG[27:26] REG_TA_DEVWDT	0x-
Define which external byte lanes contain a device for temperature monitoring (which devices to be polled).	EMIF_TEMP_ALERT_CONFIG[25:24] REG_TA_DEVCNT	0x-
(Optional) Enable the issuing of a temperature alert poll on self-refresh exit (poll for temperature change every time EMIF exits self-refresh, active power-down, and precharge power-down modes).	EMIF_TEMP_ALERT_CONFIG[28] REG_TA_SFEXITEN	0x1
Enable system L3 interrupt for SDRAM temperature alert.	EMIF_IRQENABLE_SET_SYS[1] REG_EN_TA_SYS	0x1
Enable low-latency L3 interrupt for SDRAM temperature alert.	EMIF_IRQENABLE_SET_LL[1] REG_EN_TA_LL	0x1

### 15.3.5.1.3 EMIF Events Servicing

#### 15.3.5.1.3.1 Interrupt Servicing

This section describes event servicing (interrupt treatment) of the EMIF module.

The following Interrupt mechanism is double, because there are two EMIF modules with different register addresses and two Interrupt lines, EMIF1\_IRQ and EMIF2\_IRQ.

**Table 15-131. EMIF Event Servicing**

Step	Register/ Bit Field / Programming Model	Value
Read the status registers:	EMIF_IRQSTATUS_SYS, EMIF_IRQSTATUS_LL	
IF:	EMIF_IRQSTATUS_SYS[0]	=1
Read the Error Log register and determine the Addressing mode, Command type and the Connection ID of the first errored transaction.	EMIF_L3_ERR_LOG	

**Table 15-131. EMIF Event Servicing (continued)**

Step	Register/ Bit Field / Programming Model	Value
Clear corresponding status flag	EMIF_IRQSTATUS_SYS[0] REG_ERR_SYS	0x1
ELSE IF :	EMIF_IRQSTATUS_SYS[1]	=1
Update the REFRESH_RATE to the required value as per the temperature change.	EMIF_SDRAM_REF_CTRL[15:0] REG_REFRESH_RATE	0x----
Clear corresponding status flag	EMIF_IRQSTATUS_SYS[1] REG_TA_SYS	0x1
ELSE IF:	EMIF_IRQSTATUS_LL[0]	=1
Read the error log register and determine the addressing mode, command type, and connection ID of the first errored transaction.	EMIF_L3_ERR_LOG	
Clear corresponding status flag	EMIF_IRQSTATUS_LL[0] REG_ERR_LL	0x1
ELSE IF:	EMIF_IRQSTATUS_LL[1]	=1
Update the REFRESH_RATE to the required value as per the temperature change.	EMIF_SDRAM_REF_CTRL[15:0] REG_REFRESH_RATE	0x----
Clear corresponding status flag	EMIF_IRQSTATUS_LL[1] REG_TA_LL	0x1
ENDIF		
Disable interrupts if needed	EMIF_IRQENABLE_CLR_SYS[0] REG_EN_ERR_SYS or EMIF_IRQENABLE_CLR_LL[0] REG_EN_ERR_LL	0x1

### 15.3.6 EMIF Register Manual

Table 15-132 lists the EMIF instance.

#### 15.3.6.1 EMIF Instance Summary

**Table 15-132. EMIF Instance Summary**

Module Name	Base Address	Size
EMIF1	0x4C00 0000	16MB
EMIF2	0x4D00 0000	16MB

#### 15.3.6.2 EMIF Registers

Table 15-133 summarizes the EMIF register mapping.

##### 15.3.6.2.1 EMIF Register Summary

**Table 15-133. EMIF Registers Mapping Summary**

Register Name	Type	Register Width (Bits)	Address Offset	EMIF1 L3 Physical Address	EMIF2 L3 Physical Address
EMIF_MOD_ID_RE V	R	32	0x0000 0000	0x4C00 0000	0x4D00 0000

**NOTE:** The values of the different bit fields in the [EMIF\\_SDRAM\\_CONFIG](#) and [EMIF\\_SDRAM\\_CONFIG2](#) registers are set by the control module at reset. These values must be modified by the configuration header feature in the ROM code or by the initial boot image running from an external XIP booting memory or internal RAM (see [Section 27.4.8, Image Format](#)). They must not be modified during run time, because they reflect the used hardware LPDDR2 SDRAM configurations.

**15.3.6.2.2 EMIF Register Description**

[Table 15-134](#) through describe the individual EMIF registers.

Bits	Field Name	Description	Type	Reset
31:29	REG_SDRAM_TYPE	SDRAM Type selection. Set to 4 for LPDDR2-S4, Set to 5 for LPDDR2-S2 All other value are reserved.	RW	0x- <sup>(1)</sup>
28:27	REG_IBANK_POS	Internal bank position. Set to 0 to assign internal bank address bits from L3 address as shown in <a href="#">Table 15-108</a> and <a href="#">Table 15-109</a> . Set to 1, 2, or 3 to assign internal bank address bits from L3 address as shown in <a href="#">Table 15-110</a> , <a href="#">Table 15-111</a> , and <a href="#">Table 15-112</a> .	RW	0x- <sup>(1)</sup>
26:24	RESERVED	RESERVED	RW	0x0
23	REG_DDR2_DDQS	DDR2 differential DQS enable. Set to 0 for single-ended DQS. Set to 1 for differential DQS. This bit is only for DDR2 mode, because the device supports LPDDR2; this bit is don't care.	RW	0x- <sup>(1)</sup>
22:21	RESERVED	RESERVED	RW	0x- <sup>(1)</sup>
20	REG_DDR_DISABLE_DLL	Disable DLL select. Set to 1 to disable DLL inside SDRAM.	RW	0x- <sup>(1)</sup>
19:16	RESERVED	RESERVED	RW	0x0
15:14	REG_NARROW_MODE	SDRAM data bus width. Set to 0 for 32-bit and set to 1 for 16-bit. All other values are reserved.	RW	0x- <sup>(1)</sup>
13:10	REG_CL	CAS Latency (referred to as read latency (RL) in some SDRAM specs). The value of this field defines the CAS latency to be used when accessing connected SDRAM devices. Value of 3, 4, 5, 6, 7, and 8 (CAS latency of 3, 4, 5, 6, 7, and 8) are supported for LPDDR2-SDRAM. All other values are reserved. Also program the <a href="#">EMIF_DDR_PHY_CTRL_1[3:0]</a> REG_READ_LATENCY	RW	0x- <sup>(1)</sup>

<sup>(1)</sup> Value loaded by the control module at reset (see [Section 18.6.4, SYSCTRL\\_GENERAL\\_WKUP Register Summary](#)).

Bits	Field Name	Description	Type	Reset
9:7	REG_ROWSIZE	Row Size. Defines the number of row address bits of connected SDRAM devices. Set to 0 for 9 row bits, Set to 1 for 10 row bits, Set to 2 for 11 row bits, Set to 3 for 12 row bits, Set to 4 for 13 row bits, Set to 5 for 14 row bits, Set to 6 for 15 row bits, Set to 7 for 16 row bits. This field is only used when <a href="#">EMIF_SDRAM_CONFIG[28:27]</a> REG_IBANK_POS field is set to 1, 2, or 3 or REG_EBANK_POS field in <a href="#">EMIF_SDRAM_CONFIG_2</a> register is set to 1.	RW	0x- <sup>(2)</sup>
6:4	REG_IBANK	Internal Bank setup. Defines number of banks inside connected SDRAM devices. Set to 0 for 1 bank, Set to 1 for 2 banks, Set to 2 for 4 banks, Set to 3 for 8 banks. All other values are reserved.	RW	0x- <sup>(2)</sup>
3	REG_EBANK	External chip select setup. Defines whether SDRAM accesses will use 1 or 2 chip select lines. Set to 0 to use pad_cs_o_n[0] only. Set to 1 to use pad_cs_o_n[1:0]. This bit will automatically be set to 0 if <a href="#">EMIF_SDRAM_CONFIG_2[30]</a> REG_CS1NVMEN field is set to 1.	RW	0x- <sup>(2)</sup>
2:0	REG_PAGESIZE	Page Size. Defines the internal page size of connected SDRAM devices. Set to 0 for 256-word page (8 column bits), Set to 1 for 512-word page (9 column bits), Set to 2 for 1024-word page (10 column bits), Set to 3 for 2048-word page (11 column bits). All other values are reserved.	RW	0x- <sup>(2)</sup>

<sup>(2)</sup> Value loaded by the control module at reset (see [Section 18.6.4, SYSCTRL\\_GENERAL\\_WKUP Register Summary](#)).

<b>Physical Address</b>	<a href="#">0x4C00 0028</a> <a href="#">0x4D00 0028</a>		
<b>Description</b>	SDRAM Timing 3 Register. If this register is byte written, care must be taken that all the fields are written before performing any accesses to the SDRAM.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								REG_T_CKESR	REG_ZQ_ZQCS								REG_T_TDQSCKMAX	REG_T_RFC								REG_T_RAS_MAX					

Bits	Field Name	Description	Type	Reset
31:24	RESERVED	Reserved	R	0x0
23:21	REG_T_CKESR	Minimum number of DDR clock cycles for which LPDDR2 must remain in Self Refresh, minus one.	RW	0x2
20:15	REG_ZQ_ZQCS	Number of DDR clock cycles for a ZQCS command, minus one.	RW	0x08
14:13	REG_T_TDQSCKMAX	Number of DDR clock cycles related to the tDQSCKmax timing parameter. For a 400MHz DDR clock and tDQSCKMAX=5.5 ns, the recommended setting is 0x2.	RW	0x1
12:4	REG_T_RFC	Minimum number of DDR clock cycles from Refresh or Load Mode to Refresh or Activate, minus one.	RW	0x115
3:0	REG_T_RAS_MAX	Maximum number of reg_refresh_rate intervals from Activate to Precharge command. This field must be equal to ((tRASmax / tREFI)-1) rounded down to the next lower integer. Value for REG_T_RAS_MAX can be calculated as follows: If tRASmax = 120 us and tREFI = 15.7 us, then REG_T_RAS_MAX = ((120/15.7)-1) = 6.64. Round down to the next lower integer. Therefore, the programmed value must be 6.	RW	0x1

<b>Address Offset</b>	0x0000 00CC	<b>Instance</b>	EMIF1 EMIF2
<b>Physical Address</b>	<a href="#">0x4C00 00CC</a> <a href="#">0x4D00 00CC</a>		
<b>Description</b>	Temperature Alert Config Register		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REG_TA_CS1EN	REG_TA_CS0EN	RESERVED	REG_TA_SFEXITEN	REG_TA_DEVWDT	REG_TA_DEVCNT	RESERVED		REG_TA_REFINTERVAL																							

Bits	Field Name	Description	Type	Reset
31	REG_TA_CS1EN	Writing a 1 enables temperature alert polling for CS1.	RW	0x0
30	REG_TA_CS0EN	Writing a 1 enables temperature alert polling for CS0.	RW	0x0
29	RESERVED	Reserved	R	0x0
28	REG_TA_SFEXITEN	Temperature Alert Poll on Self-Refresh, Active Power-Down, and Precharge Power-Down exit enable. Writing a 1 enables the issuing of a temperature alert poll on Self-Refresh exit.	RW	0x0
27:26	REG_TA_DEVWDT	This field indicates how wide a physical device is. It is used in conjunction with the reg_ta_devcnt register to determine which byte lanes contain the temperature alert info. A value of 0 = eight bit wide, 1 = sixteen bit wide, 2 = thirty two bit wide. All others are reserved. If this field is set to 1 and the reg_ta_devcnt field is set to one the byte mask for checking will be 4'b0101.	RW	0x0
25:24	REG_TA_DEVCNT	This field indicates which external byte lanes contain a device for temperature monitoring. A value of 0 = one device, 1 = two devices, 2 = four devices. All other reserved.	RW	0x0
23:22	RESERVED	Reserved	R	0x0
21:0	REG_TA_REFINTERVAL	Number of refresh periods between temperature alert polls. This field supports between one refresh period to 10 seconds between temperature alert polls. Refresh period is defined by reg_refresh_rate in SDRAM Refresh Control register.	RW	0x000000

<b>Address Offset</b>	0x0000 00E4	<b>Instance</b>	EMIF1 EMIF2
<b>Physical Address</b>	0x4C00 00E4 0x4D00 00E4		
<b>Description</b>	DDR PHY Control 1 Register. This register is used to control the DDR PHY. The bit field definitions are DDR PHY specific.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DLL_MASTER_SENSITIVITY				REG_PHY_FREEZE_DELAY_CODE_POSTAMBLE				REG_PHY_FREEZE_DELAY_CODE_PREAMBLE				REG_DLL_MASTER_SW_CODE_CTRL								REG_DLL_SLAVE_DLY_CTRL								REG_READ_LATENCY			

Bits	Field Name	Description	Type	Reset
31:30	DLL_MASTER_SENSITIVITY	This field defines the level of sensitivity of the DLL master: the lower the value, the more sensitive the DLL is to PVT variation. The recommended setting is 0x2.	RW	0x0
29:26	REG_PHY_FREEZE_DELAY_CODE_POSTAMBLE	Postamble time respected by the DATA PHY freezing the DLL slave code after reads. Use the TI-validated value of 0x1.	RW	0x0
25:22	REG_PHY_FREEZE_DELAY_CODE_PREAMBLE	Preamble time respected by the DATA PHY before freezing the DLL slave code during reads. Use the TI-validated value of 0x2.	RW	0x0
21:12	REG_DLL_MASTER_SW_CODE_CTRL	DLL delay code when in software override mode, typically at OPP_BOOT. Keep at maximum delay (0x1FF) for this case. Override mode is controlled through DLL_OVERRIDE register fields in PRCM.	RW	0x1FF
11:4	REG_DLL_SLAVE_DLY_CTRL	DLL slave delay ratio control.  For the typical SDRAM frequency of 400 MHz and DLL reference clock frequency of 100 MHz, this number must be set to 0x40 (1/4-th of 0xFF). 0x40: DLL ratio of 4 0x80: DLL ratio of 2 0xFF: DLL ratio of 1	RW	0xFF
3:0	REG_READ_LATENCY	This field defines the read latency for the read data from SDRAM in number of DDR clock cycles. For a 400 MHz DDR clock, tDQSKMAX=5.5ns, and RL = 6, the recommended setting for REG_READ_LATENCY is 0x9. The write latency (WL) is tied to the RL. See the LPDDR2 SDRAM standard.	RW	0x0

## 15.4 General-Purpose Memory Controller

### 15.4.1 GPMC Overview

The general-purpose memory controller (GPMC) is a unified memory controller dedicated to interfacing external memory devices:

- Asynchronous SRAM-like memories and application-specific integrated circuit (ASIC) devices
- Asynchronous, synchronous, and page mode (only available in non-muxed mode) burst NOR flash devices
- NAND Flash
- Pseudo-SRAM devices

### 15.4.2 GPMC Environment

This section describes the GPMC application fields from an environment point of view (external connections). It describes GPMC connectivity options, and gives three possible interfaces.

#### 15.4.2.1 GPMC Modes

This section shows three GPMC external connections options:

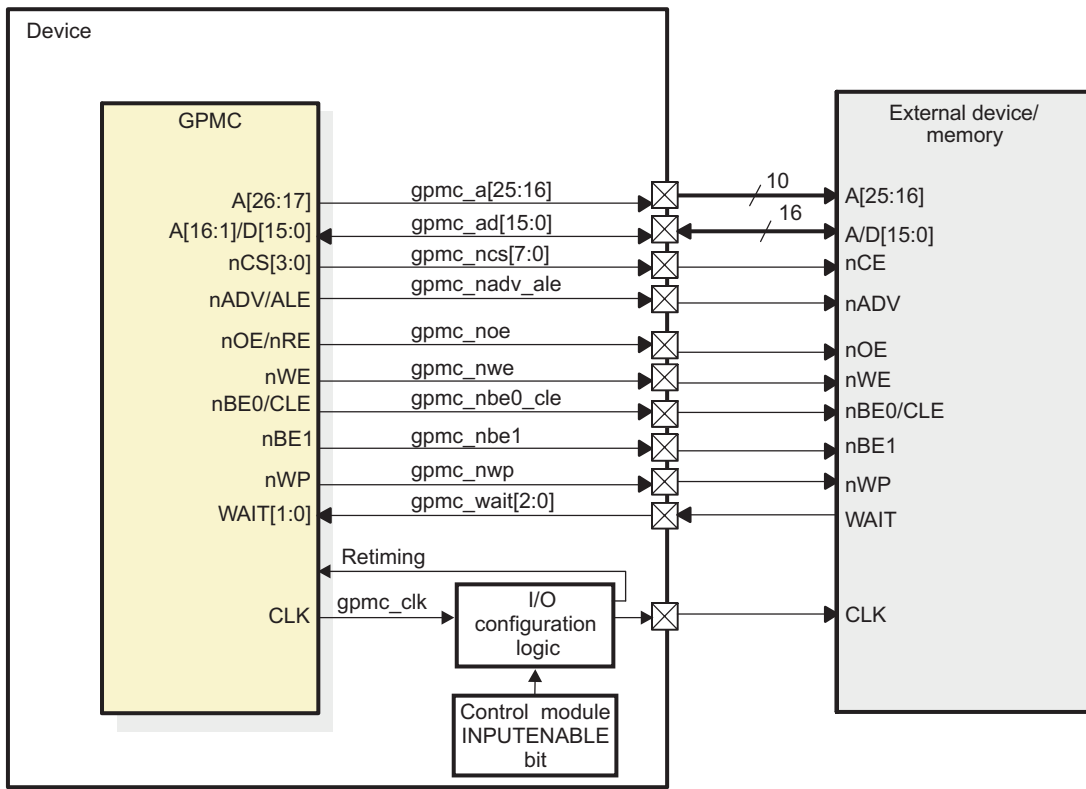

- [Figure 15-50](#) shows a connection between the GPMC and a 16-bit synchronous address/data-multiplexed (or AAD-multiplexed, but this protocol use less address pins) external memory device ([Figure 15-50](#)).
- [Figure 15-50](#) shows a connection between the GPMC and a 16-bit synchronous nonmultiplexed external memory device ([Figure 15-51](#)).
- [Figure 15-52](#) shows a connection between the GPMC and a 16-bit NAND device ([Figure 15-52](#)).

---

**NOTE:** The device does not provide the A0 byte address line required for random-byte addressable 8-bit wide device interfacing (for multiplexed and nonmultiplexed protocol). Hence, an 8-bit device must be connected to the D[7:0] / gpmc\_ad[7:0] data bus (rather than D[15:8] / gpmc\_ad[15:8]) of the GPMC controller. This limits the use of 8-bit wide device interfacing to byte-alias access.

### 15.4.2.2 GPMC Signals

Table 15-216 lists the GPMC subsystem I/O pins.

Table 15-216. GPMC I/O Description

Pin Name	I/O	Description
gpmc_a[25:16]	O	Address
gpmc_ad[15:0]	I/O	Data
gpmc_ncs[7:0]	O	Chip-selects (active low)
gpmc_clk	O <sup>(1)</sup>	Clock generated for the external memory or device
gpmc_nadv_ale	O	Address valid (active low). Also used as address latch enable (active high) for NAND protocol memories.
gpmc_noe_nre	O	Output enable (active low). Also used as read enable (active low) for NAND protocol memories.
gpmc_nwe	O	Write enable (active low)
gpmc_nbe0_cle	O	Lower-byte enable (active low). Also used as command latch enable for NAND protocol memories.
gpmc_nbe1	O	Upper-byte enable (active low).
gpmc_nwp	O	Write protect (active low)
gpmc_wait[2:0]	I	External wait signal for NOR and NAND protocol memories. The wait signals can be mapped on any of the chip-select.
gpmc_io_dir	O	gpmc_ad[15:0] signal direction control: Low during transmit (for write access: data OUT from GPMC to memory), High during receive (for read access: data IN from memory to GPMC)

<sup>(1)</sup> This output signal is also used as retiming input (the INPUTENABLE bit in the corresponding pad configuration register must be set to 1).

Table 15-217 shows the use of address and data GPMC controller pins based on the type of external device.

**Table 15-217. GPMC Pin Multiplexing Options**

GPMC Pin	Multiplexed Address Data 16-Bit Device	Nonmultiplexed Address Data 16-Bit Device With LIMITED- ADDRESS Bit Enabled	16-Bit NAND Device	8-Bit NAND Device
gpmc_a[25]	A26	A10	Not used	Not used
gpmc_a[24]	A25	A9	Not used	Not used
gpmc_a[23]	A24	A8	Not used	Not used
gpmc_a[22]	A23	A7	Not used	Not used
gpmc_a[21]	A22	A6	Not used	Not used
gpmc_a[20]	A21	A5	Not used	Not used
gpmc_a[19]	A20	A4	Not used	Not used
gpmc_a[18]	A19	A3	Not used	Not used
gpmc_a[17]	A18	A2	Not used	Not used
gpmc_a[16]	A17	A1	Not used	Not used
gpmc_ad[15]	A16/D15	D15	D15	Not used
gpmc_ad[14]	A15/D14	D14	D14	Not used
gpmc_ad[13]	A14/D13	D13	D13	Not used
gpmc_ad[12]	A13/D12	D12	D12	Not used
gpmc_ad[11]	A12/D11	D11	D11	Not used
gpmc_ad[10]	A11/D10	D10	D10	Not used
gpmc_ad[9]	A10/D9	D9	D9	Not used
gpmc_ad[8]	A9/D8	D8	D8	Not used
gpmc_ad[7]	A8/D7	D7	D7	D7
gpmc_ad[6]	A7/D6	D6	D6	D6
gpmc_ad[5]	A6/D5	D5	D5	D5
gpmc_ad[4]	A5/D4	D4	D4	D4
gpmc_ad[3]	A4/D3	D3	D3	D3
gpmc_ad[2]	A3/D2	D2	D2	D2
gpmc_ad[1]	A2/D1	D1	D1	D1
gpmc_ad[0]	A1/D0	D0	D0	D0

When using non-multiplexed memories, it is recommended to enable [GPMC\\_CONFIG\[1\] LIMITEDADDRESS](#). This bit forces A[26:11] to 1 on the GPMC I/O side. Thus, only 2Kbytes of memory address space is accessible regardless of the memory size.

With all device types, the GPMC does not drive unnecessary address lines. They stay at their reset value of 0x00.

Address mapping supports address/data-multiplexed 16-bit wide devices:

- The NOR flash memory controller still supports non-multiplexed address and data memory devices.
- Multiplexing mode can be selected through the [GPMC\\_CONFIG1\\_i\[9:8\] MUXADDDATA](#) bit field (i = 0 to 7).
- Asynchronous page mode is not supported for multiplexed address and data devices.

**NOTE:** The numbering for A (address) is starting from 1 instead of 0 such as D (data) because the A0 signal is handled within the GPMC but is not driven to any pad. The signal is only relevant to 8-bit accesses and this configuration is not recommended. If such a memory or device is connected, only every second word in the memory is accessible, that is, each 16-bit aligned 8-bit word is mapped but not the non-16-bit aligned ones. Any access to a non-aligned one will actually result in accessing the associated aligned one, at address A1 instead of address A.

---

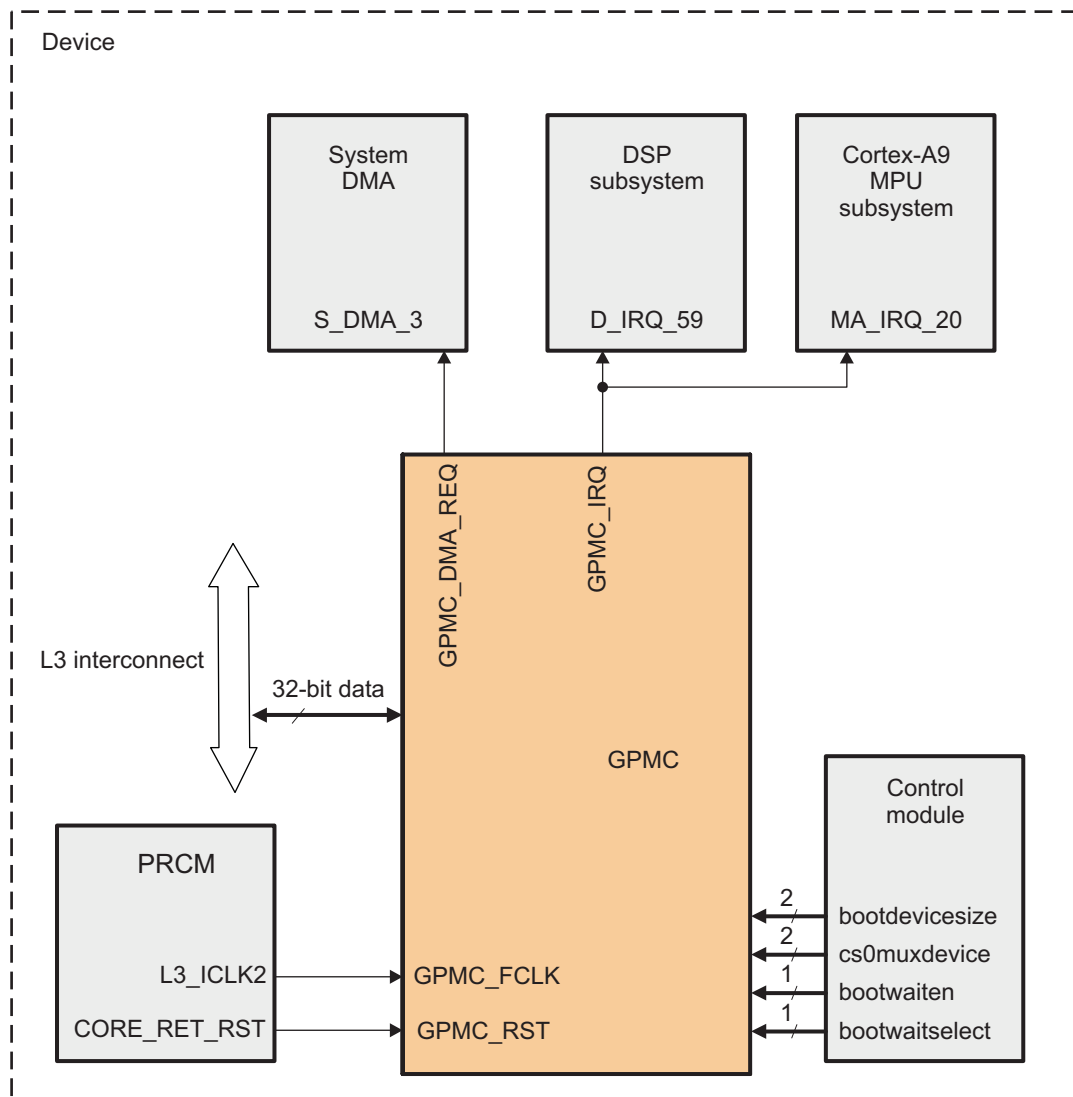

### 15.4.3 GPMC Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

- No STANDBY hardware handshake
- No wake-up request
- One system direct memory access (sDMA) request
- One interrupt request to the Cortex-A9 MPU Interrupt Controller (MA\_IRQ) and to DSP subsystem (D\_IRQ)
- One clock for functional and interface domains

Figure 15-53 shows GPMC integration.

Figure 15-53. GPMC Integration

gpmc-004

Table 15-218, Table 15-219 and Table 15-220 summarize the integration of the module in the device.

**Table 15-218. GPMC Integration Attributes**

Module Instance	Attributes		
	Power Domain	Wake-up Capability	Interconnect
GPMC	PD_CORE	No	L3

**NOTE:**

- For information about operation performance point (OPP) configuration description, see [Section 3.1.1.1.2, Module Level Clock Management](#) in [Chapter 3, Power, Reset, and Clock Management](#).

**Table 15-219. GPMC Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
GPMC	GPMC_FCLK	L3_ICLK2	PRCM	Functional clock
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
GPMC	GPMC_RST	CORE_RET_RST	PRCM	GPMC reset

**NOTE:** For clock description, see [Section 15.4.4.2, GPMC Clock Configuration](#).

**Table 15-220. GPMC Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
GPMC	GPMC_IRQ	D_IRQ_59	DSP	GPMC interrupt to DSP subsystem
	GPMC_IRQ	MA_IRQ_20	Cortex-A9	GPMC interrupt to Cortex-A9 MPU subsystem
DMA Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
GPMC	GPMC_DMA_REQ	S_DMA_3	sDMA	GPMC request from Prefetch Engine to sDMA

**NOTE:**

- For interrupt source description, see [Section 15.4.4.5, GPMC Interrupt Requests](#).
- For DMA source description, see [Section 15.4.4.6, GPMC DMA Requests](#).

### 15.4.4 GPMC Functional Description

The GPMC basic programming model offers maximum flexibility to support various access protocols for each of the eight configurable chip-selects. Use optimal chip-select settings, based on the characteristics of the external device:

- Different protocols can be selected to support generic asynchronous or synchronous random-access devices (NOR flash, SRAM) or to support specific NAND devices.
- The address and the data bus can be multiplexed on the same external bus.
- Read and write access can be independently defined as asynchronous or synchronous.
- System requests (byte, 16-bit word, burst) are performed through single or multiple accesses. External access profiles (single, multiple with optimized burst length, native- or emulated-wrap) are based on external device characteristics (supported protocol, bus width, data buffer size, native-wrap support).
- System burst read or write requests are synchronous-burst (multiple-read or multiple-write). When neither burst nor page mode is supported by external memory or ASIC devices, system burst read or write requests are translated to successive single synchronous or asynchronous accesses (single reads or single writes). 8-bit wide devices are supported only in single synchronous or single asynchronous read or write mode.
- To simulate a programmable internal-wait state, an external wait pin can be monitored to dynamically control external access at the beginning (initial access time) of and during a burst access.

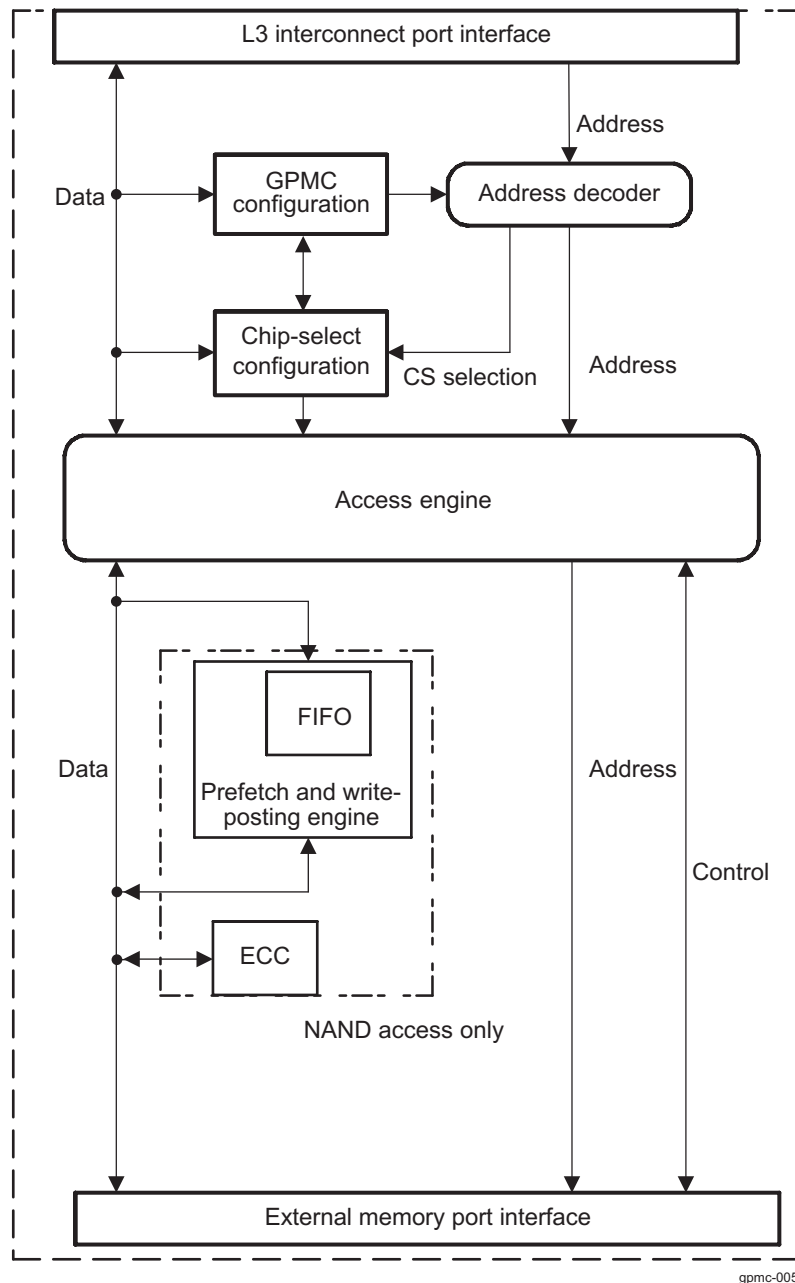

Each control signal is controlled independently for each chip-select. The internal functional clock of the GPMC (GPMC\_FCLK) is used as a time reference to specify the following:

- Read- and write-access duration
- Most GPMC external interface control-signal assertion and deassertion times
- Data-capture time during read access
- External wait-pin monitoring time
- Duration of idle time between accesses, when required

#### 15.4.4.1 GPMC Block Diagram

Figure 15-54 shows the GPMC functional block diagram. The GPMC consists of six blocks:

- L3 interconnect port interface
- Address decoder, GPMC configuration, and chip-select configuration register file
- Access engine
- Prefetch and write-posting engine
- Error correction code engine (ECC)
- External device/memory port interface

**Figure 15-54. GPMC Block Diagram**

gpmc-005

The GPMC can access various external devices through the L3 Interconnect. The flexible programming model allows a wide range of attached device types and access schemes.

Based on the programmed configuration bit fields stored in the GPMC registers, the GPMC is able to generate all control signals timing depending on the attached device and access type.

Given the chip-select decoding and its associated configuration registers, the GPMC selects the appropriate device type control signals timing.

#### 15.4.4.2 GPMC Clock Configuration

Table 15-221 describes the GPMC clocks.

**Table 15-221. GPMC Clocks**

Signal	I/O <sup>(1)</sup>	Description
GPMC_FCLK	I	Functional and interface clock
gpmc_clk	O	External clock provided to synchronous external memory devices.

<sup>(1)</sup> I = Input; O = Output

The gpmc\_clk is generated by the GPMC from the internal GPMC\_FCLK clock. The source of the GPMC\_FCLK is described in [Table 15-219](#). The gpmc\_clk is configured via the [GPMC\\_CONFIG1\\_i\[1:0\]](#) GPMCFCLKDIVIDER field (for i = 0 to 7) as shown in [Table 15-222](#).

**Table 15-222. gpmc\_clk Configuration**

Source Clock	<a href="#">GPMC_CONFIG1_i[1:0]</a> GPMCFCLKDIVIDER	gpmc_clk Generated Clock Provided to External Memory Device
GPMC_FCLK	00	GPMC_FCLK
	01	GPMC_FCLK/2
	10	GPMC_FCLK/3
	11	GPMC_FCLK/4

#### 15.4.4.3 GPMC Software Reset

The GPMC can be reset by software through the [GPMC\\_SYSCONFIG\[1\]](#) SOFTRESET bit. Setting the bit to 1 enables an active software reset that is functionally equivalent to a hardware reset. Hardware and software resets initialize all GPMC registers and the finite state-machine (FSM) immediately and unconditionally. The [GPMC\\_SYSSTATUS\[0\]](#) RESETDONE bit indicates that the software reset is complete when its value is 1. The software must ensure that the software reset completes before doing GPMC operations.

#### 15.4.4.4 GPMC Power Management

GPMC power is supplied by the CORE power domain, and GPMC power management complies with system power-management guidelines.

[Table 15-223](#) describes power-management features available for the GPMC module.

**NOTE:**

- For information about source clock gating and sleep/wake-up transitions description, see [Section 3.1.1.1, Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).
- For descriptions of EnaWakeUp, IdleMode, ClockActivity, and StandbyMode features, see [Section 3.6, Clock Management Functional Description](#), in [Chapter 3, Power, Reset, and Clock Management](#).

**Table 15-223. GPMC Local Power Management Features**

Feature	Registers	Description
Clock Auto Gating	<a href="#">GPMC_SYSCONFIG[0]</a> AUTOIDLE bit	This bit allows a local power optimization inside the module, by gating the GPMC_FCLK clock upon the internal activity.
Slave Idle Modes	<a href="#">GPMC_SYSCONFIG[4:3]</a> SIDLEMODE bit field	Force-idle, No-idle and Smart-idle wakeup modes are available
Clock Activity	N/A	Feature not available
Master Standby Modes	N/A	Feature not available
Global Wake-up Enable	N/A	Feature not available
Wake-up Sources Enable	N/A	Feature not available

### 15.4.4.5 GPMC Interrupt Requests

The GPMC generates one interrupt event as shown in [Figure 15-53](#) :

- The interrupt request goes from GPMC (GPMC\_IRQ) to the Cortex-A9 MPU subsystem : MA\_IRQ\_20 and to the DSP subsystem : D\_IRQ\_59.

[Table 15-224](#) lists the event flags, and their mask, that can cause module interrupts.

**Table 15-224. GPMC Interrupt Events**

Event Flag	Event Mask	Sensitivity	Map to	Description
<a href="#">GPMC_IRQSTATUS</a> [10] WAIT2EDGE DETECTIONSTATUS	<a href="#">GPMC_IRQENABLE</a> [10] WAIT2EDGE DETECTIONENABLE	Edge	D_IRQ_59 and MA_IRQ_20	Wait2 edge detection interrupt: Triggered if a rising or falling edge is detected on the gpmc_wait2 signal. The rising or falling edge detection of Wait2 is selected through <a href="#">GPMC_CONFIG</a> [10] WAIT2PINPOLARITY
<a href="#">GPMC_IRQSTATUS</a> [9] WAIT1EDGE DETECTIONSTATUS	<a href="#">GPMC_IRQENABLE</a> [9] WAIT1EDGE DETECTIONENABLE	Edge	D_IRQ_59 and MA_IRQ_20	Wait1 edge detection interrupt: Triggered if a rising or falling edge is detected on the gpmc_wait1 signal. The rising or falling edge detection of Wait1 is selected through <a href="#">GPMC_CONFIG</a> [9] WAIT1PINPOLARITY
<a href="#">GPMC_IRQSTATUS</a> [8] WAIT0EDGE DETECTIONSTATUS	<a href="#">GPMC_IRQENABLE</a> [8] WAIT0EDGE DETECTIONENABLE	Edge	D_IRQ_59 and MA_IRQ_20	Wait0 edge detection interrupt: Triggered if a rising or falling edge is detected on the gpmc_wait0 signal. The rising or falling edge detection of Wait0 is selected through <a href="#">GPMC_CONFIG</a> [8] WAIT0PINPOLARITY
<a href="#">GPMC_IRQSTATUS</a> [1] TERMINAL COUNTSTATUS	<a href="#">GPMC_IRQENABLE</a> [1] TERMINAL COUNTENABLE	Level	D_IRQ_59 and MA_IRQ_20	Terminal count event: Triggered on prefetch process completion, that is when the number of currently remaining data to be requested reaches zero
<a href="#">GPMC_IRQSTATUS</a> [0] FIFOEVENTSTATUS	<a href="#">GPMC_IRQENABLE</a> [0] FIFOEVENTENABLE	Level	D_IRQ_59 and MA_IRQ_20	FIFO event interrupt: Indicates FIFO levels availability for in Write-Posting mode and prefetch mode. <a href="#">GPMC_PREFETCH_CONFIG1</a> [2] DMAMODE shall be set to 0.

### 15.4.4.6 GPMC DMA Requests

The GPMC generates one DMA event as shown in [Figure 15-53](#) :

- From GPMC (GPMC\_DMA\_REQ) to the system DMA (sDMA) : S\_DMA\_3.

### 15.4.4.7 L3 Interconnect Interface

The GPMC L3 interconnect interface is a pipelined interface including an 16 x 32-bit word write buffer.

Any system host can issue external access requests through the GPMC.

The device system can issue the following requests through this interface:

- One 8-bit / 16-bit / 32-bit interconnect access (read/write)
- Two incrementing 32-bit interconnect accesses (read/write)
- Two wrapped 32-bit interconnect accesses (read/write)
- Four incrementing 32-bit interconnect accesses (read/write)
- Four wrapped 32-bit interconnect accesses (read/write)
- Eight incrementing 32-bit interconnect accesses (read/write)
- Eight wrapped 32-bit interconnect accesses (read/write)

Only linear burst transactions are supported; interleaved burst transactions are not supported. Only power-of-two-length precise bursts 2 x 32, 4 x 32, 8 x 32 or 16 x 32 with the burst base address aligned on the total burst size are supported (this limitation applies to incrementing bursts only).

This interface also provides one interrupt and one DMA request line, for specific event control.

It is recommended to program the ATTACHEDDEVICEPAGELENGTH field ([GPMC\\_CONFIG1\\_i\[24:23\]](#)) according to the effective attached device page length and to enable WRAPBURST bit ([GPMC\\_CONFIG1\\_i\[31\]](#)) if the attached device supports wrapping burst.

However, it is possible to emulate wrapping burst on a non-wrapping memory by providing relevant addresses within the page or splitting transactions. Bursts larger than the memory page length are chopped into multiple bursts transactions. Due to the alignment requirements, a page boundary is never crossed.

#### 15.4.4.8 GPMC Address and Data Bus

The current application supports GPMC connection to NAND devices and to address/data-multiplexed memories or devices. Connection to address/data-nonmultiplexed memories or devices is supported with a limited address range of 2 Kbytes.

Depending on the GPMC configuration of each chip-select, address and data bus lines that are not required for a particular access protocol are not updated (changed from current value) and are not sampled when input (input data bus).

- When the [GPMC\\_CONFIG\[1\] LIMITEDADDRESS](#) bit is set to 1, A26-A11 are not modified during an external memory access. This limits the memory address space to 2K-byte regardless of the memory size.
- For address/data-multiplexed and AAD-multiplexed NOR devices, the address is multiplexed on the data bus.
- 8-bit wide NOR devices do not use GPMC I/O: `gpmc_ad[15:8]` for data (they are used for address if needed).
- 16-bit wide NAND devices do not use GPMC I/O: `gpmc_a[25:16]`.
- 8-bit wide NAND devices do not use GPMC I/O: `gpmc_a[25:16]` and GPMC I/O: `gpmc_ad[15:8]`.

#### CAUTION

Before accessing a chip-select configured with a nonmultiplexed protocol, set the LIMITEDADDRESS bit control.

##### 15.4.4.8.1 GPMC I/O Configuration Setting

---

**NOTE:** In this section and next sections, the *i* in `GPMC_CONFIGx_i` stands for the GPMC chip-select *i* where *i* = 0 to 7.

---

To select a NAND device, program the following register fields:

- [GPMC\\_CONFIG1\\_i\[11:10\]](#) DEVICETYPE field = 0b10
- [GPMC\\_CONFIG1\\_i\[9:8\]](#) MUXADDDATA bit = 0b00

To select an address/data-multiplexed device, program the following register fields:

- [GPMC\\_CONFIG1\\_i\[11:10\]](#) DEVICETYPE field = 0b00
- [GPMC\\_CONFIG1\\_i\[9:8\]](#) MUXADDDATA bit = 0b10

To select an address/address/data-multiplexed device, program the following register fields:

- [GPMC\\_CONFIG1\\_i\[11:10\]](#) DEVICETYPE field = 0b00
- [GPMC\\_CONFIG1\\_i\[9:8\]](#) MUXADDDATA bit = 0b01

To select an address/data-nonmultiplexed device (limited to a 2K-byte address range), program the following register fields:

- [GPMC\\_CONFIG1\\_i\[11:10\]](#) DEVICETYPE field = 0b00
- [GPMC\\_CONFIG1\\_i\[9:8\]](#) MUXADDDATA bit = 0b00
- [GPMC\\_CONFIG\[1\] LIMITEDADDRESS](#) bit = 1

---

**NOTE:** The `GPMC_CONFIG1[1]` LIMITEDADDRESS bit only applies to address/data-nonmultiplexed devices; it has no effect on other device types (NAND, address/data-multiplexed).

---

#### 15.4.4.8.2 GPMC CS0 Default Configuration at IC Reset

To ensure a correct external boot with a GPMC access from IC reset time on CS0, several external pins are sampled:

- The `sys_boot[4:0]` pins (device boundary) define the sequence of interfaces and devices to use for booting.
- The `sys_boot[5]` pin defines which group of booting sequences is preferred: memory booting (`sys_boot[5] = 0`) or peripheral booting (`sys_boot[5] = 1`).
- Additional pins are used to configure reset values in the `GPMC_CONFIG1_i` register (where  $i = 0$ ) as detailed below and in [Table 15-225](#):
  - The `bootdevicesize` input pin (at the GPMC boundary) defines the size of the attached device on chip-select 0 and is used to configure the `GPMC_CONFIG1_i[13:12]` DEVICESIZE bits (where  $i = 0$ ). The `BOOT_DEVICE_TYPE` signal is propagated from the system control module (SCM). Its value is fixed for the device at 0x1 at IC reset, which means that only 16-bit memories are supported for booting.
  - The `cs0muxdevice` input pin (at the GPMC boundary) selects whether the attached device to chip-select 0 is an address/data-multiplexed device or not. The input pin is used to configure the `GPMC_CONFIG1_i[9:8]` MUXADDDATA bit (where  $i = 0$ ). The `CS0_MUX_DEVICE` signal is propagated from the SCM. Its value is fixed for the device at 0x2 at IC reset, which means that only address/data-multiplexed memories are supported for booting (that is, in a standalone way from memories connected to CS0).
  - The `bootwaiten` input pin (at the GPMC boundary) enables the monitoring on chip-select 0 of the WAIT pin at IC reset release time for read accesses. The input pin is used to configure the `GPMC_CONFIG1_i[22]` WAITREADMONITORING bit (where  $i = 0$ ). The `BOOT_WAIT_ENABLE` signal is propagated from the system control module (SCM). When `sys_boot[5:0] = 0b11 1111`, the `BOOT_WAIT_ENABLE` signal is activated, causing the wait pin to be monitored for read accesses.
  - The `bootwaitselect` input pin selects the WAIT signal at IC reset release time between WAIT0 input pin, WAIT1 input pin or WAIT2 input pin. At IC reset release time, these three pins have different polarity.

**Table 15-225. Boot Control Interface Input Signals Description**

Signal Name	Width	Description
<code>bootdevicesize</code>	2	Size of the device attached on CS0 0b00: 8-bit 0b01: 16-bit 0b10: Reserved 0b11: Reserved
<code>cs0muxdevice</code>	2	Multiplexing mode of the device on CS0 0b00: Nonmultiplexed device on CS0 0b01: AAD-multiplexed device on CS0 (address-address-data) 0b10: Address/Data-multiplexed device on CS0 0b11: Reserved
<code>bootwaiten</code>	1	Wait monitoring on CS0 at IC reset release time for read accesses 0: Wait pin is not monitored 1: Wait pin is monitored
<code>bootwaitselect</code>	1	Selection of the wait pin 0: WAIT0 input pin 1: WAIT1 input pin 2: WAIT2 input pin

### CAUTION

Using the internal boot code, the entire CS0 configuration can be modified before the first CS0 access. This modification of internal boot code is necessary for two external devices:

- NAND device attached to CS0
- Nonmultiplexed 2 Kbytes address range device attached to CS0

At reset time, the IC may boot from the internal ROM.

Reset values of the timing control parameters are defined to cope with direct boot on address and data multiplexed NOR Flash device, on non-multiplexed NOR Flash device or on any asynchronous device with large timing margins assuming a low GPMC\_FCLK frequency (for example, 19.2Mhz) at boot time.

For a multiplexed access, the address 16 low-order bits are presented onto gpmc\_ad[15:0] while the high-order bits are presented both onto gpmc\_a[26:16]. If the external chip interface to the memories uses a 16-bit data bus, the high-order address bits are sampled on the address bus.

The reset values of timing parameters used at boot time are:

- CSONTIME = 1
- CSRDOFFTIME = 16
- ADVONTIME = 4
- ADVRDOFFTIME = 5
- OEONTIME = 6
- OEOFFTIME = 16
- RDACCESSTIME = 15
- RDCYCLETIME = 17

For an AAD-multiplexed access, all address bits are passed onto the data bus using two nADV rising edge. The first rising edge latches the address MSB down to bit 17 while the second rising edge latches address bits 16 down to 1. This configuration is only used for 16-bit memories.

The reset values of these timing parameters used at boot time are:

- ADVAADMUXONTIME = 1
- ADVAADMUXRDOFFTIME = 2
- OEAADMUXONTIME = 1
- OEAADMUXRDOFFTIME = 3

#### 15.4.4.9 Address Decoder and Chip-Select Configuration

Addresses are decoded accordingly with the address request of the chip-select and the content of the chip-select base address register file, which includes a set of global GPMC configuration registers and eight sets of chip-select configuration registers.

The GPMC configuration register file is memory-mapped and can be read or written with byte, 16-bit word, or 32-bit word accesses. The register file should be configured as a noncacheable, nonbufferable region to prevent any desynchronization between host execution (write request) and the completion of register configuration (write completed with register updated). [Section 15.4.7, GPMC Register Manual](#) provides the GPMC register locations. For the map of GPMC memory locations, see [Chapter 2, Memory Mapping](#).

After the chip-select is configured, the access engine accesses the external device, drives the external interface control signals, and applies the interface protocol based on user-defined timing parameters and settings.

### 15.4.4.9.1 Chip-Select Base Address and Region Size

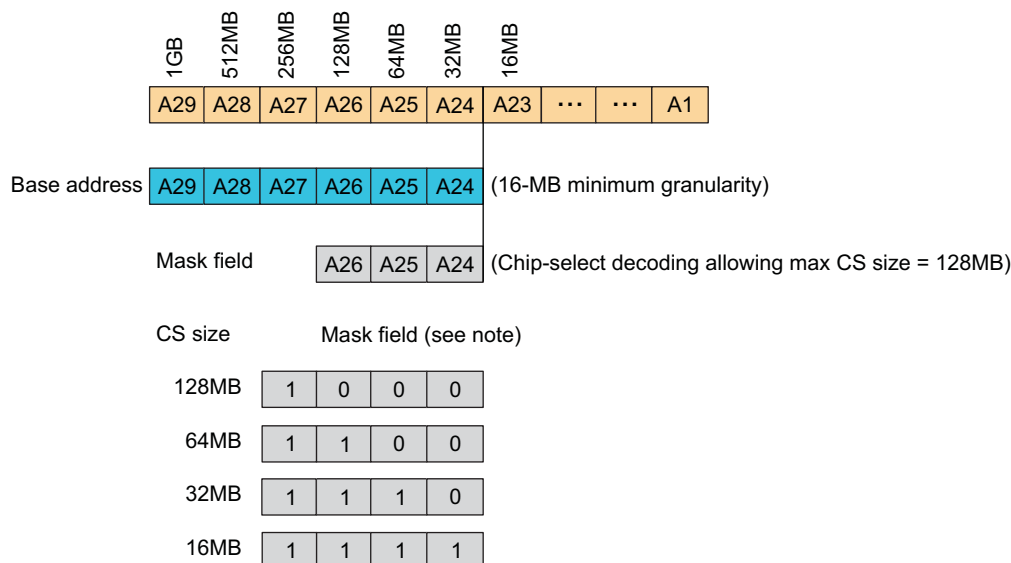

Any external memory or ASIC device attached to the GPMC external interface can be accessed by any device system host within the GPMC 1 Gbyte contiguous address space. For details, see [Chapter 2, Memory Mapping](#).

The GPMC 1G byte address space can be divided into a maximum of eight chip-select regions with programmable base address and programmable CS size. The CS size is programmable from 16M bytes to 128M bytes (must be a power-of-2) and is defined by the mask field. Attached memory smaller than the programmed CS region size is accessed through the entire CS region (aliasing).

Each chip-select has a 6-bit base address encoding and a 4-bit decoding mask, which must be programmed according to the following rules:

- The programmed chip-select region base address must be aligned on the chip-select region size address boundary and is limited to a power-of-2 address value. During access decoding, the register base address value is used for address comparison with the address-bit line mapping as described in [Figure 15-55](#) (with A0 as the device system byte-address line). Base address is programmed through the `GPMC_CONFIG7_i[5:0]` BASEADDRESS bit field
- The register mask is used to exclude some address lines from the decoding. A register mask bit field set to 0 suppresses the associated address line from the address comparison (incoming address bit line is don't care). The register mask value must be limited to the subsequent value, based on the desired chip-select region size. Any other value has an undefined result. When multiple chip-select regions with overlapping addresses are enabled concurrently, access to these chip-select regions is cancelled and a GPMC access error is posted. The mask field is programmed through the `GPMC_CONFIG7_i[11:8]` MASKADDRESS bit field.

**Figure 15-55. Chip-Select Address Mapping and Decoding Mask**

gpmc-006

Chip-select configuration (base and mask address or any protocol and timing settings) must be performed while the associated chip-select is disabled through the `GPMC_CONFIG7_i[6]` CSVALID bit (where *i* stands for the GPMC chip-select value, *i* = 0 to 7). In addition, a chip-select configuration can only be disabled if there is no ongoing access to that chip-select. This requires activity monitoring of the prefetch or write-posting engine if the engine is active on the chip-select. Also, the write buffer state must be monitored to wait for any posted write completion to the chip-select.

Any access attempted to a nonvalid GPMC address region (CSVALID disabled or address decoding outside a valid chip-select region) is not propagated to the external interface and a GPMC access error is posted. In case of chip-selects overlapping, an error is generated and no access will occur on either chip-select.

Chip-select 0 is the only chip-select region enabled after either a power-up or a GPMC reset.

### **CAUTION**

Although the GPMC interface can drive up to 4 chip-selects, the frequency specified for this interface is for a specific load. If this load is exceeded, the maximum frequency cannot be reached. One solution is to implement a board with buffers, to allow the slowest device to maintain the total load on the lines.

#### **15.4.4.9.2 Access Protocol**

##### **15.4.4.9.2.1 Supported Devices**

The access protocol of each chip-select can be independently specified through the [GPMC\\_CONFIG1\\_i\[11:10\]](#) DEVICETYPE parameter (where i = 0 to 7) for:

- Random-access synchronous or asynchronous memory like NOR flash, SRAM
- NAND flash asynchronous devices

---

**NOTE:** For more information about the NAND flash GPMC basic programming model and NAND support, see [Section 15.4.4.13](#), *NAND Device Basic Programming Model*, and [Section 15.4.4.13.1](#), *NAND Memory Device in Byte or Word 16 Stream Mode*.

---

##### **15.4.4.9.2.2 Access Size Adaptation and Device Width**

Each chip-select can be independently configured through the [GPMC\\_CONFIG1\\_i\[13:12\]](#) DEVICESIZE field (i = 0 to 7) to interface with a 16-bit wide device or an 8-bit wide device. System requests with data width greater than the external device data bus width are split into successive accesses according to both the external device data-bus width and little-endian data organization.

---

**NOTE:** The device does not provide the A0 byte address line required for random-byte addressable 8-bit wide device interfacing (for both multiplexed and nonmultiplexed protocol). It limits the use of 8-bit wide device interfacing to byte-alias accesses. This limitation is not applicable to NAND device interfacing (8-bit wide or 16-bit wide devices).

---

##### **15.4.4.9.2.3 Address/Data-Multiplexing Interface**

For random synchronous or asynchronous memory interfacing (DEVICETYPE = 0b00), an address- and data-multiplexing protocol can be selected through the [GPMC\\_CONFIG1\\_i\[9:8\]](#) MUXADDDATA bit field (i = 0 to 7). The nADV signal must be used as the external device address latch control signal. For the associated chip-select configuration, nADV assertion and deassertion time and nOE assertion time must be set to the appropriate value to meet the address latch setup/hold time requirements of the external device. See [Section 15.4.3](#), *GPMC Integration*.

---

**NOTE:** This address/data-multiplexing interface is not applicable to NAND device interfacing. NAND devices require a specific address, command, and data multiplexing protocol. See [Section 15.4.4.13](#), *NAND Device Basic Programming Model*.

---

#### **15.4.4.9.3 External Signals**

##### **15.4.4.9.3.1 WAIT Pin Monitoring Control**

GPMC access time can be dynamically controlled using an external gpmc\_wait pin when the external device access time is not deterministic and cannot be defined and controlled only using the GPMC internal RDACCESSTIME, WRACCESSTIME and PAGEBURSTACCESSTIME wait state generator.

The GPMC features three input wait pins: gpmc\_wait2, gpmc\_wait1 and gpmc\_wait0. These pins allow control of external devices with different wait-pin polarity. They also allow the overlap of wait-pin assertion from different devices without affecting access to devices for which the wait pin is not asserted.

- The [GPMC\\_CONFIG1\\_i\[17:16\]](#) WAITPINSELECT field (i = 0 to 7) selects which input gpmc\_wait pin is used for the device attached to the corresponding chip-select.
- The polarity of the wait pin is defined through the WAITxPINPOLARITY bit of the [GPMC\\_CONFIG](#) register. A wait pin configured to be active low means that low level on the WAIT signal indicates that the data is not ready and that the data bus is invalid. When WAIT is inactive, data is valid.

The GPMC access engine can be configured per CS to monitor the wait pin of the external memory device or not, based on the access type: read or write.

- The [GPMC\\_CONFIG1\\_i\[22\]](#) WAITREADMONITORING bit defines whether the wait pin should be monitored during read accesses or not.
- The [GPMC\\_CONFIG1\\_i\[21\]](#) WAITWRITEMONITORING bit defines whether the wait pin should be monitored during write accesses or not.

The GPMC access engine can be configured to monitor the wait pin of the external memory device asynchronously or synchronously with the GPMC\_CLK clock, depending on the access type: synchronous or asynchronous (the [GPMC\\_CONFIG1\\_i\[29\]](#) READTYPE and [GPMC\\_CONFIG1\\_i\[27\]](#) WRITETYPE bits).

#### 15.4.4.9.3.1.1 Wait Monitoring During an Asynchronous Read Access

When wait-pin monitoring is enabled for read accesses (WAITREADMONITORING), the effective access time is a logical AND combination of the RDACCESSTIME timing completion and the wait-deasserted state.

During asynchronous read accesses with wait-pin monitoring enabled, the wait pin must be at a valid level (asserted or deasserted) for at least two GPMC clock cycles before RDACCESSTIME completes, to ensure correct dynamic access-time control through wait-pin monitoring. The advance pipelining of the two GPMC clock cycles is the result of the internal synchronization requirements for the WAIT signal.

In this context, RDACCESSTIME is used as a WAIT invalid timing window and is set to such a value that the wait pin is at a valid state two GPMC clock cycles before RDACCESSTIME completes.

Similarly, during a multiple-access cycle (for example, asynchronous read page mode), the effective access time is a logical AND combination of PAGEBURSTACCESSTIME timing completion and the wait-deasserted state. Wait-monitoring pipelining is also applicable to multiple accesses (access within a page).

- WAIT monitored as active freezes the CYCLETIME counter. For an access within a page, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as asserted extends the current access time in the page. Control signals are kept in their current state. The data bus is considered invalid, and no data are captured during this clock cycle.
- WAIT monitored as inactive unfreezes the CYCLETIME counter. For an access within a page, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as inactive completes the current access time and starts the next access phase in the page. The data bus is considered valid, and data are captured during this clock cycle. In case of a single access or if this was the last access in a multiple-access cycle, all signals are controlled according to their related control timing value and according to the CYCLETIME counter status.

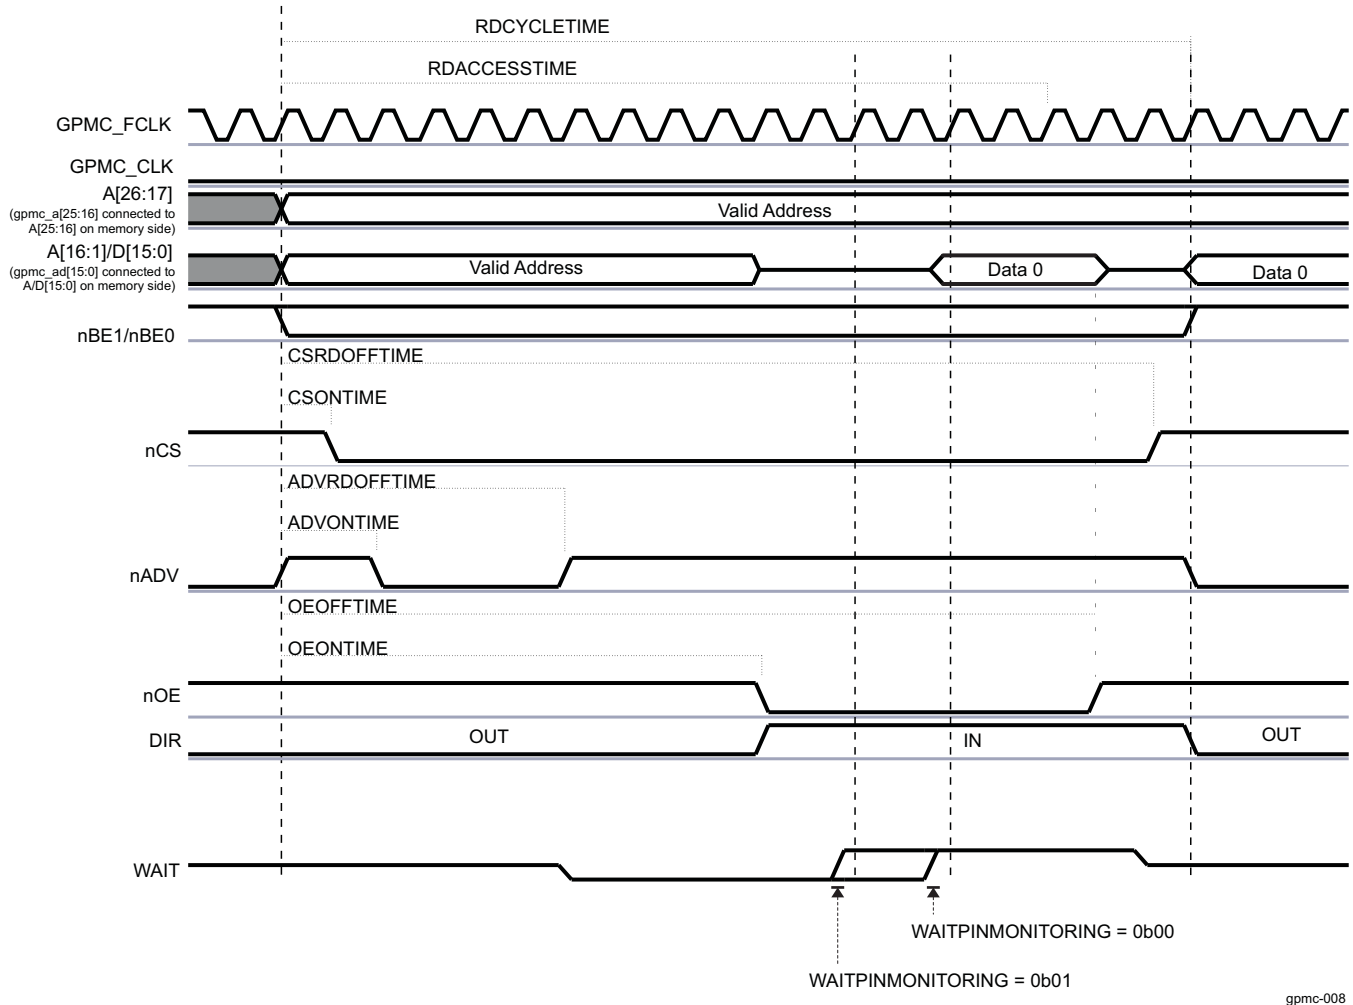

When a delay larger than two GPMC clocks must be observed between wait-pin deactivation time and data valid time (including the required GPMC and the device data setup time), an extra delay can be added between wait-pin deassertion time detection and effective data-capture time and the effective unlock of the CYCLETIME counter. This extra delay can be programmed in the [GPMC\\_CONFIG1\\_i\[19:18\]](#) WAITMONITORINGTIME field (i = 0 to 7).

**NOTE:**

- The WAITMONITORINGTIME parameter does not delay the wait-pin active or inactive detection, nor does it modify the two GPMC clocks pipelined detection delay.
- This extra delay is expressed as a number of GPMC\_CLK clock cycles, even though the access is defined as asynchronous, and no GPMC\_CLK clock is provided to the external device. Still, GPMCFCLKDIVIDER is used as a divider for the GPMC clock, so it must be programmed to define the correct WAITMONITORINGTIME delay.

Figure 15-56 shows wait behavior during an asynchronous single read access.

**Figure 15-56. Wait Behavior During an Asynchronous Single Read Access (GPMCFCLKDivider = 1)**

**NOTE:** The WAIT signal is active low. `GPMC_CONFIG1_i[19:18] WAITMONITORINGTIME = 0b00`, or `0b01`.

**15.4.4.9.3.1.2 Wait Monitoring During an Asynchronous Write Access**

When wait-pin monitoring is enabled for write accesses (`GPMC_CONFIG1_i[21] WAITWRITEMONITORING` bit = `0x1`), the WAIT-invalid timing window is defined by the WRACCESSTIME field. WRACCESSTIME must be set so that the wait pin is at a valid state two GPMC clock cycles before WRACCESSTIME completes. The advance pipelining of the two GPMC clock cycles is the result of the internal synchronization requirements for the WAIT signal.

- WAIT monitored as active freezes the CYCLETIME counter. This informs the GPMC that the data bus

is not captured by the external device. The control signals are kept in their current state. The data bus still drives the data.

- WAIT monitored as inactive unfreezes the CYCLETIME counter. This informs that the data bus is correctly captured by the external device. All signals, including the data bus, are controlled according to their related control timing value and to the CYCLETIME counter status.

When a delay larger than two GPMC clock cycles must be observed between wait-pin deassertion time and the effective data write into the external device (including the required GPMC data setup time and the device data setup time), an extra delay can be added between wait-pin deassertion time detection and effective data write time into the external device and the effective unfreezing of the CYCLETIME counter. This extra delay can be programmed in the [GPMC\\_CONFIG1\\_i\[19:18\]](#) WAITMONITORINGTIME fields (i = 0 to 7).

**NOTE:**

- The WAITMONITORINGTIME parameter does not delay the wait-pin assertion or deassertion detection, nor does it modify the two GPMC clock cycles pipelined detection delay.
- This extra delay is expressed as a number of GPMC\_CLK clock cycles, even though the access is defined as asynchronous, and even though no clock is provided to the external device. Still, [GPMC\\_CONFIG1\\_i\[1:0\]](#) GPMCFCLKDIVIDER is used as a divider for the GPMC clock and so it must be programmed to define the correct WAITMONITORINGTIME delay.

#### 15.4.4.9.3.1.3 Wait Monitoring During a Synchronous Read Access

During synchronous accesses with wait-pin monitoring enabled, the wait pin is captured synchronously with GPMC\_CLK, using the rising edge of this clock.

The WAIT signal can be programmed to apply to the same clock cycle it is captured in. Alternatively, it can be sampled one or two GPMC\_CLK cycles ahead of the clock cycle it applies to. This pipelining is applicable to the entire burst access, and to all data phase in the burst access. This WAIT pipelining depth is programmed in the [GPMC\\_CONFIG1\\_i\[19:18\]](#) WAITMONITORINGTIME field (where i = 0 to 7), and is expressed as a number of GPMC\_CLK clock cycles.

In synchronous mode, when wait-pin monitoring is enabled ([GPMC\\_CONFIG1\\_i\[22\]](#) WAITREADMONITORING bit), the effective access time is a logical AND combination of the RDACCESSTIME timing completion and the WAIT deasserted-state detection.

Depending on the programmed WAITMONITORINGTIME value, the wait pin should be at a valid level, either asserted or deasserted:

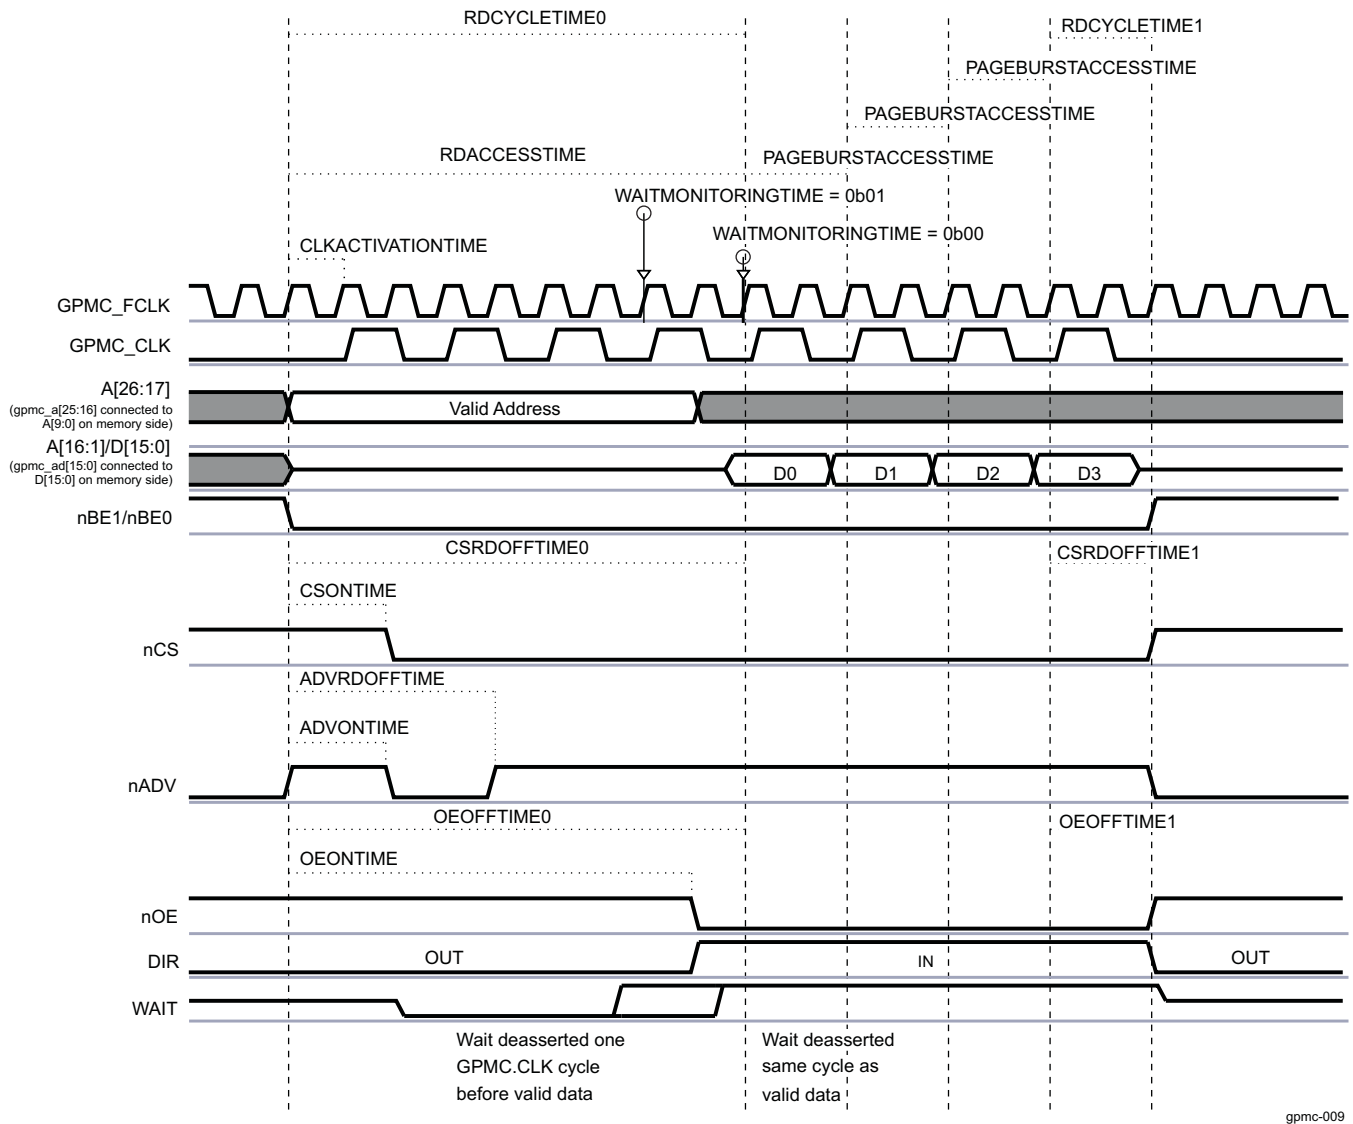

- In the same clock cycle the data is valid if WAITMONITORINGTIME = 0 ( at RDACCESSTIME completion)
- In the WAITMONITORINGTIME x (GPMCFCLKDIVIDER + 1) GPMC\_FCLK clock cycles before RDACCESSTIME completion if WAITMONITORINGTIME not equal to 0

Similarly, during a multiple-access cycle (burst mode), the effective access time is a logical AND combination of PAGEBURSTACCESSTIME timing completion and the wait-inactive state. The Wait pipelining depth programming applies to the whole burst access.

- WAIT monitored as active freezes the CYCLETIME counter. For an access within a burst (when the CYCLETIME counter is by definition in a lock state), WAIT monitored as active extends the current access time in the burst. Control signals are kept in their current state. The data bus is considered invalid, and no data are captured during this clock cycle.
- WAIT monitored as inactive unfreezes the CYCLETIME counter. For an access within a burst (when the CYCLETIME counter is by definition in lock state), WAIT monitored as inactive completes the current access time and starts the next access phase in the burst. The data bus is considered valid, and data are captured during this clock cycle. In a single access or if this was the last access in a multiple-access cycle, all signals are controlled according to their relative control timing value and the CYCLETIME counter status.

[Figure 15-57](#) shows wait behavior during a synchronous read burst access.

Figure 15-57. Wait Behavior During a Synchronous Read Burst Access

gpmc-009

**NOTE:** The WAIT signal is active low. WAITMONITORINGTIME = 00, 01.

#### 15.4.4.9.3.1.4 Wait Monitoring During a Synchronous Write Access

During synchronous accesses with wait-pin monitoring enabled (the WAITWRITEMONITORING bit), the wait pin is captured synchronously with GPMC\_CLK, using the rising edge of this clock.

If enabled, external wait-pin monitoring can be used in combination with WRACCESSTIME to delay the effective memory device GPMC\_CLK capture edge.

Wait-monitoring pipelining depth is similar to synchronous read access:

- At WRACCESSTIME completion if WAITMONITORINGTIME = 0
- In the WAITMONITORINGTIME x (GPMCFCLKDIVIDER + 1) GPMC\_FCLK cycles before WRACCESSTIME completion if WAITMONITORINGTIME not equal to 0.

Wait-monitoring pipelining definition applies to whole burst accesses:

- WAIT monitored as active freezes the CYCLETIME counter. For accesses within a burst, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as active indicates that the data

bus is not being captured by the external device. Control signals are kept in their current state. The data bus is kept in its current state.

- WAIT monitored as inactive unfreezes the CYCLETIME counter. For accesses within a burst, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as inactive indicates the effective data capture of the bus by the external device and starts the next access of the burst. In case of a single access or if this was the last access in a multiple access cycle, all signals, including the data bus, are controlled according to their related control timing value and the CYCLETIME counter status.

---

**NOTE:** Wait monitoring is supported for all configurations except for `GPMC_CONFIG1_i[19:18]` `WAITMONITORINGTIME = 0x0` (where `i = 0 to 7`) for write bursts with a clock divider of 1 or 2 (`GPMC_CONFIG1_i[1:0]` `GPMCFCLKDIVIDER` field equal to `0x0` or `0x1` respectively).

---

#### 15.4.4.9.3.1.5 WAIT with NAND Device

For details about the use of the wait pin for communication with a NAND flash external device, see [Section 15.4.4.13.2, NAND Device-Ready Pin](#).

#### 15.4.4.9.3.1.6 Idle Cycle Control Between Successive Accesses

##### 15.4.4.9.3.1.6.1 Bus Turnaround (BUSTURNAROUND)

To prevent data-bus contention, an access that follows a read access to a slow memory/device must be delayed (in other words, control the nCS/nOE de-assertion to data bus in high-impedance delay).

The bus turnaround is a time-out counter starting after nCS or nOE de-assertion time, whichever occurs first, and delays the next access start-cycle time. The counter is programmed through the `GPMC_CONFIG6_i[3:0]` `BUSTURNAROUND` bit field (where `i = 0 to 7`).

After a read access to a chip-select with a non zero `BUSTURNAROUND`, the next access is delayed until the `BUSTURNAROUND` delay completes, if the next access is one of the following:

- A write access to any chip-select (same or different from the chip-select data was read from)
- A read access to a different chip-select from the chip-select data was read access from
- A read or write access to a chip-select associated with an address/data-multiplexed device

---

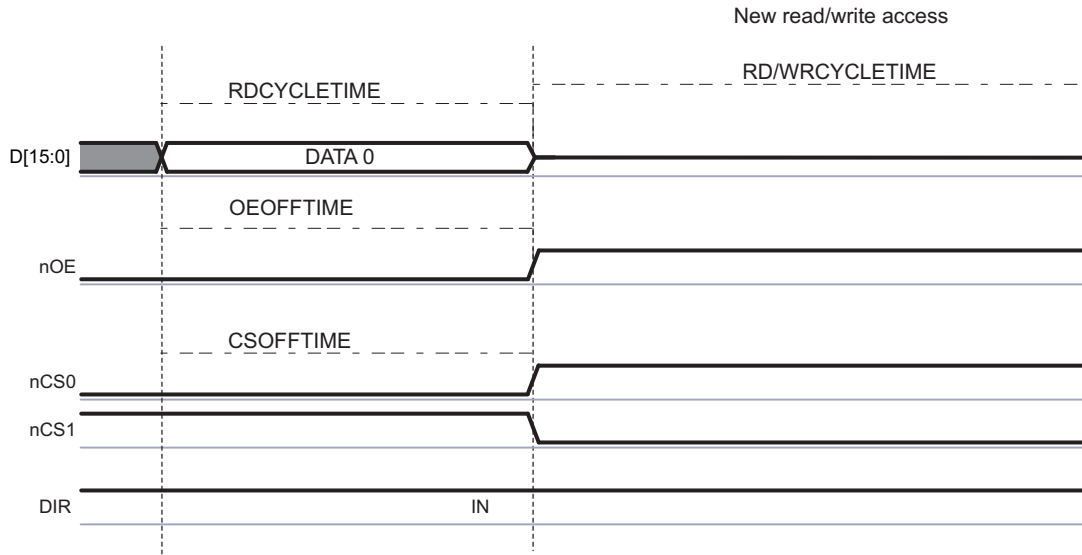

**NOTE:** Bus keeping starts after bus turnaround completion so that DIR changes from IN to OUT after bus turnaround. The bus will not have enough time to go into high-impedance even though it could be driven with the same value before bus turnaround timing.

---

`BUSTURNAROUND` delay runs in parallel with `GPMC_CONFIG6_i[3:0]` `CYCLE2CYCLEDELAY` delays. It should be noted that `BUSTURNAROUND` is a timing parameter for the ending chip-select access while `CYCLE2CYCLEDELAY` is a timing parameter for the following chip-select access. The effective minimum delay between successive accesses is driven by these delay timing parameters and by the access type of the following access. See [Figure 15-58](#) to [Figure 15-60](#).

Another way to prevent bus contention is to define an earlier nCS or nOE deassertion time for slow devices or to extend the value of `RDCYCLETIME`. Doing this prevents bus contention, but affects all accesses of this specific chip-select.

**Figure 15-58. Read to Read for an Address-Data Multiplexed Device, on Different CS, without Bus Turnaround (nCS0 attached to a fast device)**

gpmc-049

**Figure 15-60. Read to Read / Write for a Address-Data or AAD-multiplexed device, on the Same CS, with Bus Turnaround**

gpmc-051

#### 15.4.4.9.3.1.6.2 Idle Cycles Between Accesses to Same Chip-Select (CYCLE2CYCLESAMECSEN, CYCLE2CYCLEDELAY)

Some devices require a minimum chip-select signal inactive time between accesses. The [GPMC\\_CONFIG6\\_i\[7\]](#) CYCLE2CYCLESAMECSEN bit ( $i = 0$  to 7) enables insertion of a minimum number of GPMC\_FCLK cycles, defined by the [GPMC\\_CONFIG6\\_i\[11:8\]](#) CYCLE2CYCLEDELAY field, between successive accesses of any type (read or write) to the same chip-select.

If CYCLE2CYCLESAMECSEN is enabled, any subsequent access to the same chip-select is delayed until its CYCLE2CYCLEDELAY completes. The CYCLE2CYCLEDELAY counter starts when CSRDOFFTIME/CSWROFFTIME completes.

The same applies to successive accesses occurring during 32-bit word or burst accesses split into successive single accesses when the single-access mode is used ([GPMC\\_CONFIG1\\_i\[30\]](#) READMULTIPLE = 0 or [GPMC\\_CONFIG1\\_i\[28\]](#) WRITEMULTIPLE = 0).

All control signals (CS, ADV#/ALE, BE0#/CLE, WE#, and GPMC.CLK) are kept inactive (ADV#/ALE, BE0#/CLE, and GPMC.CLK at low level; and CS, OE#/RE, and WE at high level) during the idle GPMC.FCLK cycles. This prevents back-to-back accesses to the same chip-select without idle cycles between accesses.

#### 15.4.4.9.3.1.6.3 Idle Cycles Between Accesses to Different Chip-Select (CYCLE2CYCLEDIFFCSEN, CYCLE2CYCLEDELAY)

Because of the pipelined behavior of the system, successive accesses to different chip-selects can occur back-to-back with no idle cycles between accesses. Depending on the control signals (nCS, nADV/ALE, nBE0/CLE, nOE/RE, nWE) assertion and de-assertion timing parameters and on the IC timing parameters, some control signals assertion times may overlap between the successive accesses to different CS. Similarly, some control signals (WE, OE/RE) may not respect required transition times.

To work around the overlapping and to observe the required control-signal transitions, a minimum of CYCLE2CYCLEDELAY inactive cycles is inserted between the access being initiated to this chip-select and the previous access ending for a different chip-select. This applies to any type of access (read or write).

If [GPMC\\_CONFIG6\\_i](#)[6] CYCLE2CYCLEDIFFCSEN is enabled, the chip-select access is delayed until CYCLE2CYCLEDELAY cycles have expired since the end of a previous access to a different chip-select. CYCLE2CYCLEDELAY count starts at CSRDOFFTIME/CSWROFFTIME completion. All control signals are kept inactive during the idle GPMC\_FCLK cycles.

**NOTE:** CYCLE2CYCLESAMECSEN and CYCLE2CYCLEDIFFCSEN should be set in [GPMC\\_CONFIG6\\_i](#) registers to respectively get idle cycles inserted between accesses on this chip-select and after accesses to a different chip-select.

The CYCLE2CYCLEDELAY delay runs in parallel with the BUSTURNAROUND delay. It should be noted that BUSTURNAROUND is a timing parameter defined for the ending chip-select access, whereas CYCLE2CYCLEDELAY is a timing parameter defined for the starting chip-select access. The effective minimum delay between successive accesses is based on the larger delay timing parameter and on access type combination, since bus turnaround does not apply to all access types. See [Section 15.4.4.9.3.1.6.1, Bus Turnaround \(BUSTURNAROUND\)](#) for more details on bus turnaround.

[Table 15-226](#) describes the configuration required for idle cycle insertion.

**Table 15-226. Idle Cycle Insertion Configuration**

1st Access Type	BUSTURN AROUND Timing Parameter	Second Access Type	Chip-Select	Add/Data Multiplexed	CYCLE2 CYCLE SAMECSEN Parameter	CYCLE2 CYCLE DIFFCSEN Parameter	Idle Cycle Insertion Between the Two Accesses
R/W	= 0	R/W	Any	Any	0	x	No idle cycles are inserted if the two accesses are well pipelined.
R	> 0	R	Same	Nonmuxed	x	0	No idle cycles are inserted if the two accesses are well pipelined.
R	> 0	R	Different	Nonmuxed	0	0	BUSTURNAROUND cycles are inserted.
R	> 0	R/W	Any	Muxed	0	0	BUSTURNAROUND cycles are inserted.
R	> 0	W	Any	Any	0	0	BUSTURNAROUND cycles are inserted.
W	> 0	R/W	Any	Any	0	0	No idle cycles are inserted if the two accesses are well pipelined.
R/W	= 0	R/W	Same	Any	1	x	CYCLE2CYCLEDELAY cycles are inserted.
R/W	= 0	R/W	Different	Any	x	1	CYCLE2CYCLEDELAY cycles are inserted.
R/W	> 0	R/W	Same	Any	1	x	CYCLE2CYCLEDELAY cycles are inserted. If BTA idle cycles already apply on these two back-to-back accesses, the effective delay is max (BUSTURNAROUND, CYCLE2CYCLEDELAY).
R/W	> 0	R/W	Different	Any	x	1	CYCLE2CYCLEDELAY cycles are inserted. If BTA idle cycles already apply on these two back-to-back accesses, the effective delay is maximum (BUSTURNAROUND, CYCLE2CYCLEDELAY).

#### 15.4.4.9.3.1.7 Slow Device Support (TIMEPARAGRANULARITY Parameter)

All access-timing parameters can be multiplied by 2 by setting the [GPMC\\_CONFIG1\\_i](#)[4] TIMEPARAGRANULARITY bit (where i stands for the GPMC chip-select value, i = 0 to 7). Increasing all access timing parameters allows support of slow devices.

### 15.4.4.9.3.2 *gpmc\_io\_dir* Pin

The *gpmc\_io\_dir* pin is used to control I/O direction on the GPMC data bus *gpmc\_ad*[15:0]. Depending on top-level pad multiplexing, this signal can be output and used externally to the device, if required.

The *gpmc\_io\_dir* pin is low during transmit (OUT) and high during receive (IN).

For write accesses, the *gpmc\_io\_dir* pin stays OUT from start-cycle time to end-cycle time.

For read accesses, the *gpmc\_io\_dir* pin goes from OUT to IN at *nOE* assertion time and stays IN until:

- BUSTURNAROUND is enabled:
  - The *gpmc\_io\_dir* pin goes from IN to OUT at end-cycle time plus programmable bus turnaround time.
- BUSTURNAROUND is disabled:
  - After an asynchronous read access, the *gpmc\_io\_dir* pin goes from IN to OUT at *RDACCESSTIME* + 1 *GPMC\_FCLK* cycle or when *RDCYCLETIME* completes, whichever occurs last.
  - After a synchronous read access, the *gpmc\_io\_dir* pin goes from IN to OUT at *RDACCESSTIME* + 2 *GPMC\_FCLK* cycles or when *RDCYCLETIME* completes, whichever occurs last.

Because of the bus-keeping feature of the GPMC, after a read or write access and with no other accesses pending, the default value of the *gpmc\_io\_dir* pin is OUT (see [Section 15.4.4.10.10, Bus Keeping Support](#)).

In nonmultiplexed devices, the *gpmc\_io\_dir* pin stays IN between two successive read accesses to prevent unnecessary toggling (nonmultiplexed 16-bit wide devices support is limited to 2 Kbytes).

### 15.4.4.9.3.3 *Reset*

No reset signal is sent to the external memory device by the GPMC. For more information about external-device reset, see [Chapter 3, Power, Reset, and Clock Management](#).

The PRCM module provides an input pin, *global\_rst\_n*, to the GPMC:

- The *global\_rst\_n* pin is activated during device warm reset and cold reset.
- The *global\_rst\_n* pin initializes the internal state-machine and the internal configuration registers.

### 15.4.4.9.3.4 *Write Protect Signal (nWP)*

When connected to the attached memory device, the write protect signal can enable or disable the lockdown function of the attached memory.

The *gpmc\_nwp* output pin value is controlled through the [GPMC\\_CONFIG\[4\]](#) WRITEPROTECT bit, which is common to all CS.

### 15.4.4.9.3.5 *Byte Enable (nBE1/nBE0)*

Byte enable signals (*nBE1/nBE0*) are:

- Valid (asserted or nonasserted according to the incoming system request) from access start to access completion for asynchronous and synchronous single accesses
- Asserted low from access start to access completion for asynchronous and synchronous multiple read accesses
- Valid (asserted or nonasserted, according to the incoming system request) synchronously to each written data for synchronous multiple write accesses

### 15.4.4.9.4 *Error Handling*

When an error occurs in the GPMC, the error information is stored in the [GPMC\\_ERR\\_TYPE](#) register and the address of the illegal access is stored in the [GPMC\\_ERR\\_ADDRESS](#) register. The GPMC only keeps the first error abort information until the [GPMC\\_ERR\\_TYPE](#) register is reset. Subsequent accesses that cause errors are not logged until the error is cleared by hardware with the [GPMC\\_ERR\\_TYPE\[0\]](#) ERRORVALID bit.

- **ERRORNOTSUPPADD** occurs when an incoming system request address decoding does not match any valid chip-select region, or if two chip-select regions are defined as overlapped, or if a register file access is tried outside the valid address range of 1 Kbyte.
- **ERRORNOTSUPPMCMD** occurs when an unsupported command request is decoded at the L3 interconnect interface.
- **ERRORTIMEOUT**: A time-out mechanism prevents the system from hanging. The start value of the 9-bit time-out counter is defined in the [GPMC\\_TIMEOUT\\_CONTROL](#) register and enabled with the [GPMC\\_TIMEOUT\\_CONTROL\[0\] TIMEOUTENABLE](#) bit. When enabled, the counter starts at start-cycle time until it reaches 0 and data is not responded to from memory, then a time-out error occurs. When data are sent from memory, this counter is reset to its start value. With multiple accesses (asynchronous page mode or synchronous burst mode), the counter is reset to its start value for each data access within the burst.

The GPMC does not generate interrupts on these errors. True abort to the MPU or interrupt generation is handled at interconnect level.

#### 15.4.4.10 Timing Setting

The GPMC offers the maximum flexibility to support various access protocols. Most of the timing parameters of the protocol access used by the GPMC to communicate with attached memories or devices are programmable on a chip-select basis. Assertion and deassertion times of control signals are defined to match the attached memory or device timing specifications and to get maximum performance during accesses. For more information on GPMC\_CLK and GPMC\_FCLK see [Section 15.4.4.10.6](#), [GPMC\\_CLK](#).

---

**NOTE:** In the following sections, the start access time refer to the time at which the access begins.

---

##### 15.4.4.10.1 Read Cycle Time and Write Cycle Time (RDCYCLETIME / WRCYCLETIME)

The [GPMC\\_CONFIG5\\_i\[4:0\] RDCYCLETIME](#) and [GPMC\\_CONFIG5\\_i\[12:8\] WRCYCLETIME](#) fields (i = 0 to 7) define the address bus and byte enables valid times for read and write accesses. To ensure a correct duty cycle of GPMC\_CLK between accesses, RDCYCLETIME and WRCYCLETIME are expressed in GPMC\_FCLK cycles and must be multiples of the GPMC\_CLK cycle. RDCYCLETIME and WRCYCLETIME bit fields can be set with a granularity of 1 or 2 through [GPMC\\_CONFIG1\\_i\[4\] TIMEPARAGRANULARITY](#).

When either RDCYCLETIME or WRCYCLETIME completes, if they are not already deasserted, all control signals (nCS, nADV/ALE, nOE/RE, nWE, and BE0/CLE) are deasserted to their reset values, regardless of their deassertion time parameters.

An exception to this forced deassertion occurs when a pipelined request to the same chip-select or to a different chip-select is pending. In such a case, it is not necessary to deassert a control signal with deassertion time parameters equal to the cycle-time parameter. This exception to forced deassertion prevents any unnecessary glitches. This requirement also applies to BE signals, thus avoiding an unnecessary BE glitch transition when pipelining requests.

---

**NOTE:** All control signals (CS, ADV#/ALE, BE0#/CLE, WE#, and GPMC.CLK) are kept inactive (ADV#/ALE, BE0#/CLE, and GPMC.CLK at low level; and CS, OE#/RE, and WE at high level) during the idle GPMC.FCLK cycles.

---

If no inactive cycles are required between successive accesses to the same or to a different chip-select ([GPMC\\_CONFIG6\\_i\[7\] CYCLE2CYCLESAMECSEN = 0](#) or [GPMC\\_CONFIG6\\_i\[6\] CYCLE2CYCLEDIFFCSEN = 0](#), where i = 0 to 7), and if assertion-time parameters associated with the pipelined access are equal to 0, asserted control signals (nCS, nADV/ALE, nBE0/CLE, nWE, and nOE/RE) are kept asserted. This applies to any read/write to read/write access combination.

If inactive cycles are inserted between successive accesses, that is, [CYCLE2CYCLESAMECSEN = 1](#) or [CYCLE2CYCLEDIFFCSEN = 1](#), the control signals are forced to their respective default reset values for the number of GPMC\_FCLK cycles defined in [CYCLE2CYCLEDELAY](#).

#### 15.4.4.10.2 nCS: Chip-Select Signal Control Assertion/Deassertion Time (CSONTIME / CSRDOFFTIME / CSWROFFTIME / CSEXTRADELAY)

The [GPMC\\_CONFIG2\\_i\[3:0\]](#) CSONTIME field (where  $i = 0$  to 7) defines the nCS signal-assertion time relative to the start access time. It is common for read and write accesses.

[GPMC\\_CONFIG2\\_i\[12:8\]](#) CSRDOFFTIME (read access) and [GPMC\\_CONFIG2\\_i\[20:16\]](#) CSWROFFTIME (write access) bit fields define the nCS signal deassertion time relative to start access time.

CSONTIME, CSRDOFFTIME and CSWROFFTIME parameters are applicable to synchronous and asynchronous modes. CSONTIME can be used to control an address and byte enable setup time before chip-select assertion. CSRDOFFTIME and CSWROFFTIME can be used to control an address and byte enable hold time after chip-select deassertion.

nCS signal transitions as controlled through CSONTIME, CSRDOFFTIME, and CSWROFFTIME can be delayed by half a GPMC\_FCLK period by enabling the [GPMC\\_CONFIG2\\_i\[7\]](#) CSEXTRADELAY bit. This half of a GPMC\_FCLK period provides more granularity on the nCS assertion and deassertion time to guarantee proper setup and hold time relative to GPMC\_CLK. CSEXTRADELAY is especially useful in configurations where GPMC\_CLK and GPMC\_FCLK have the same frequency, but can be used for all GPMC configurations. If enabled, CSEXTRADELAY applies to all parameters controlling nCS transitions.

The CSEXTRADELAY bit must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the RDCYCLETIME and WRCYCLETIME bit fields to be greater than the nCS signal-deassertion time, including the extra half-GPMC\_FCLK-period delay.

#### 15.4.4.10.3 nADV/ALE: Address Valid/Address Latch Enable Signal Control Assertion/Deassertion Time (ADVONTIME / ADVRDOFFTIME / ADVWROFFTIME / ADVEXTRADELAY/ADVAADMUXONTIME/ADVAADMUXRDOFFTIME/ADVAADMUXWROFFTIME)

The [GPMC\\_CONFIG3\\_i\[3:0\]](#) ADVONTIME field (where  $i = 0$  to 7) defines the nADV/ALE signal-assertion time relative to start access time. It is common to read and write accesses.

[GPMC\\_CONFIG3\\_i\[12:8\]](#) ADVRDOFFTIME (read access) and [GPMC\\_CONFIG3\\_i\[20:16\]](#) ADVWROFFTIME (write access) bit fields define the nADV/ALE signal-deassertion time relative to start access time.

ADVONTIME can be used to control an address and byte enable valid setup time control before nADV/ALE assertion. ADVRDOFFTIME and ADVWROFFTIME can be used to control an address and byte enable valid hold time control after nADV/ALE de-assertion. ADVRDOFFTIME and ADVWROFFTIME are applicable to both synchronous and asynchronous modes.

nADV/ALE signal transitions as controlled through ADVONTIME, ADVRDOFFTIME, and ADVWROFFTIME can be delayed by half a GPMC\_FCLK period by enabling the [GPMC\\_CONFIG3\\_i\[7\]](#) ADVEXTRADELAY bit. This half of a GPMC\_FCLK period provides more granularity on nADV/ALE assertion and deassertion time to guarantee proper setup and hold time relative to GPMC\_CLK. The ADVEXTRADELAY configuration parameter is especially useful in configurations where GPMC\_CLK and GPMC\_FCLK have the same frequency, but can be used for all GPMC configurations. If enabled, ADVEXTRADELAY applies to all parameters controlling nADV/ALE transitions.

ADVEXTRADELAY must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the RDCYCLETIME and WRCYCLETIME bit fields to be greater than nADV/ALE signal-deassertion time, including the extra half-GPMC\_FCLK-period delay.

[GPMC\\_CONFIG3\\_i\[6:4\]](#) ADVAADMUXONTIME, [GPMC\\_CONFIG3\\_i\[26:24\]](#) ADVAADMUXRDOFFTIME, and [GPMC\\_CONFIG3\\_i\[30:28\]](#) ADVAADMUXWROFFTIME parameters have the same functions as ADVONTIME, ADVRDOFFTIME, and ADVWROFFTIME, but apply to the first address phase in the AAD-multiplexed protocol. It is the user responsibility to make sure ADVAADMUXxxOFFTIME is programmed to a value lower than or equal to ADVxxOFFTIME. Functionality in AAD-mux mode is undefined if the settings do not comply with this requirement. ADVAADMUXxxOFFTIME can be programmed to the same value as ADVONTIME if no high nADV pulse is needed between the two AAD-mux address phases, which is the typical case in synchronous mode. In this configuration, nADV is kept low until it reaches the correct ADVxxOFFTIME.

See [Section 15.4.4.13, NAND Access Description](#) for more details on ADVONTIME, ADVRD OFFTIME, ADVWROFFTIME, and ADVAADMUXRD OFFTIME, ADVAADMUXWROFFTIME usage for CLE and ALE (Command / Address Latch Enable) usage for a NAND Flash interface.

#### **15.4.4.10.4 nOE/nRE: Output Enable / Read Enable Signal Control Assertion / Deassertion Time (OEONTIME / OEOFFTIME / OEEXTRADELAY / OEAADMUXONTIME / OEAADMUXOFFTIME)**

The [GPMC\\_CONFIG4\\_i\[3:0\]](#) OEONTIME field (where i = 0 to 7) defines the nOE/nRE signal assertion time relative to start access time. It is applicable only to read accesses.

The [GPMC\\_CONFIG4\\_i\[12:8\]](#) OEOFFTIME field defines the nOE/nRE signal deassertion time relative to start access time. It is applicable only to read accesses. nOE/nRE is not asserted during a write cycle.

OEONTIME, OEOFFTIME, OEAADMUXONTIME and OEAADMUXOFFTIME parameters are applicable to synchronous and asynchronous modes. OEONTIME can be used to control an address and byte enable valid setup time control before nOE/nRE assertion. OEOFFTIME can be used to control an address and byte enable valid hold time control after nOE/nRE assertion.

OEAADMUXONTIME and OEAADMUXOFFTIME parameters have the same functions as OEONTIME and OEOFFTIME, but apply to the first OE assertion in the AAD-multiplexed protocol for a read phase, or to the only OE assertion for a write phase. It is the user responsibility to make sure OEAADMUXOFFTIME is programmed to a value lower than OEONTIME. Functionality in AAD-mux mode is undefined if the settings do not comply with this requirement. OEAADMUXOFFTIME shall never be equal to OEONTIME because the AAD-mux protocol requires a second address phase with the nOE signal deasserted before nOE can be asserted again to define a read command.

The nOE/RE signal transitions as controlled through OEONTIME, OEOFFTIME, OEAADMUXONTIME and OEAADMUXOFFTIME can be delayed by half a GPMC\_FCLK period by enabling the [GPMC\\_CONFIG4\\_i\[7\]](#) OEEXTRADELAY bit. This half of a GPMC\_FCLK period provides more granularity on nOE/RE assertion and deassertion time to guaranty proper setup and hold time relative to GPMC\_CLK. If enabled, OEEXTRADELAY applies to all parameters controlling nOE/nRE transitions.

OEEXTRADELAY must be used carefully, to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program RDCYCLETIME and WRCYCLETIME to be greater than nOE/RE signal-deassertion time, including the extra half-GPMC\_FCLK-period delay.

---

**NOTE:** When the GPMC generates a read access to an address-/data-multiplexed device, it drives the address bus until nOE assertion time.

---

#### **15.4.4.10.5 nWE: Write Enable Signal Control Assertion / Deassertion Time (WEONTIME / WEOFFTIME / WEEXTRADELAY)**

The [GPMC\\_CONFIG4\\_i\[19:16\]](#) WEONTIME field (where i = 0 to 7) defines the nWE signal-assertion time relative to start access time. The [GPMC\\_CONFIG4\\_i\[28:24\]](#) WEOFFTIME field defines the nWE signal-deassertion time relative to start access time. These bit fields only apply to write accesses. nWE is not asserted during a read cycle.

WEONTIME can be used to control an address and byte enable valid setup time control before nWE assertion. WEOFFTIME can be used to control an address and byte enable valid hold time control after nWE assertion.

nWE signal transitions as controlled through WEONTIME, and WEOFFTIME can be delayed by half a GPMC\_FCLK period by enabling the [GPMC\\_CONFIG4\\_i\[23\]](#) WEEXTRADELAY bit. This half of a GPMC\_FCLK period provides more granularity on nWE assertion and deassertion time to guaranty proper setup and hold time relative to GPMC\_CLK. If enabled, WEEXTRADELAY applies to all parameters controlling nWE transitions.

The WEEXTRADELAY bit must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the WRCYCLETIME bit field to be greater than the nWE signal-deassertion time, including the extra half-GPMC\_FCLK-period delay.

#### 15.4.4.10.6 GPMC\_CLK

GPMC\_CLK is the external clock provided to the attached synchronous memory or device.

- The GPMC\_CLK clock frequency is the GPMC\_FCLK functional clock frequency divided by 1, 2, 3, or 4, depending on the [GPMC\\_CONFIG1\\_i\[1:0\]](#) GPMCFCLKDIVIDER bit field (where  $i = 0$  to 7), with a guaranteed 50-percent duty cycle.
- The GPMC\_CLK clock is only activated when the access in progress is defined as synchronous (read or write access).
- The [GPMC\\_CONFIG1\\_i\[26:25\]](#) CLKACTIVATIONTIME field ( $i = 0$  to 7) defines the number of GPMC\_FCLK cycles from start access time to GPMC\_CLK activation.
- The GPMC\_CLK clock is stopped when cycle time completes and is asserted low between accesses.
- The GPMC\_CLK clock is kept low when access is defined as asynchronous.

#### CAUTION

When cycle time completes, the GPMC\_CLK may be high because of the GPMCFCLKDIVIDER bit field. To ensure correct stoppage of the GPMC\_CLK clock within the 50-percent required duty cycle, it is the user's responsibility to extend the RDCYCLETIME or WRCYCLETIME value.

**NOTE:** To ensure a correct external clock cycle, the following rules must be applied:

- $(RDCYCLETIME \text{ CLKACTIVATIONTIME})$  must be a multiple of  $(GPMCFCLKDIVIDER + 1)$ .
- The PAGEBURSTACCESSTIME value must be a multiple of  $(GPMCFCLKDIVIDER + 1)$ .

#### 15.4.4.10.7 GPMC\_CLK and Control Signals Setup and Hold

Control-signal transition (assertion and deassertion) setup and hold values with respect to the GPMC\_CLK edge can be controlled in the following ways:

- For the GPMC\_CLK signal, the [GPMC\\_CONFIG1\\_i\[26:25\]](#) CLKACTIVATIONTIME field ( $i = 0$  to 7) allows setup and hold control of control-signal assertion time.
- The use of a divided GPMC\_CLK allows setup and hold control of control-signal assertion and deassertion times.
- When GPMC\_CLK runs at the GPMC\_FCLK frequency so that GPMC\_CLK edge and control-signal transitions refer to the same GPMC\_FCLK edge, the control-signal transitions can be delayed by half of a GPMC\_FCLK period to provide minimum setup and hold times. This half-GPMC\_FCLK delay is enabled with the CSEXTRADELAY, ADVEXTRADELAY, OEEXTRADELAY, or WEEXTRADELAY parameter. This delay must be used carefully to prevent control-signal overlap between successive accesses to different chip-selects. This implies that the RDCYCLETIME and WRCYCLETIME are greater than the last control-signal deassertion time, including the extra half-GPMC\_FCLK cycle.

#### 15.4.4.10.8 Access Time (RDACCESSTIME / WRACCESSTIME)

The read access time and write access time durations can be programmed independently through [GPMC\\_CONFIG5\\_i\[20:16\]](#) RDACCESSTIME and [GPMC\\_CONFIG6\\_i\[28:24\]](#) WRACCESSTIME ( $i = 0$  to 7). This allows nOE and GPMC data capture timing parameters to be independent of nWE and memory device data capture timing parameters. RDACCESSTIME and WRACCESSTIME bit fields can be set with a granularity of 1 or 2 through [GPMC\\_CONFIG1\\_i\[4\]](#) TIMEPARAGRANULARITY.

##### 15.4.4.10.8.1 Access Time on Read Access

In asynchronous read mode, for single and paged accesses, [GPMC\\_CONFIG5\\_i\[20:16\]](#) RDACCESSTIME field ( $i = 0$  to 7) defines the number of GPMC\_FCLK cycles from start access time to the GPMC\_FCLK rising edge used for the first data capture. RDACCESSTIME must be programmed to the rounded greater value (in GPMC\_FCLK cycles) of the read access time of the attached memory device.

In synchronous read mode, for single or burst accesses, RDACCESSTIME defines the number of GPMC\_FCLK cycles from start access time to the GPMC\_FCLK rising edge corresponding to the GPMC\_CLK rising edge used for the first data capture.

GPMC\_CLK which is sent to the memory device for synchronization with the GPMC controller, is internally retimed to correctly latch the returned data. [GPMC\\_CONFIG5\\_i\[4:0\]](#) RDCYCLETIME must be greater than RDACCESSTIME in order to let the GPMC latch the last return data using the internally retimed GPMC\_CLK.

The external WAIT signal can be used in conjunction with RDACCESSTIME to control the effective GPMC data-capture GPMC\_FCLK edge on read access in both asynchronous mode and synchronous mode. For details about wait monitoring, see [Section 15.4.4.9.3.1, Chip-Select Base Address and Region Size](#).

#### **15.4.4.10.8.2 Access Time on Write Access**

In asynchronous write mode, the [GPMC\\_CONFIG6\\_i\[28:24\]](#) WRACCESSTIME timing parameter is not used to define the effective write access time. Instead, it is used as a WAIT invalid timing window, and must be set to a correct value so that the gpmc\_wait pin is at a valid state two GPMC\_CLK cycles before WRACCESSTIME completes. For details about wait monitoring, see [Section 15.4.4.9.3.1, Chip-Select Base Address and Region Size](#).

In synchronous write mode, for single or burst accesses, WRACCESSTIME defines the number of GPMC\_FCLK cycles from start access time to the GPMC\_CLK rising edge used by the memory device for the first data capture.

The external WAIT signal can be used in conjunction with WRACCESSTIME to control the effective memory device data capture GPMC\_CLK edge for a synchronous write access. For details about wait monitoring, see [Section 15.4.4.9.3.1, Chip-Select Base Address and Region Size](#).

#### **15.4.4.10.9 Page Burst Access Time (PAGEBURSTACCESSTIME)**

[GPMC\\_CONFIG5\\_i\[27:24\]](#) PAGEBURSTACCESSTIME bit field (i = 0 to 7) can be set with a granularity of 1 or 2 through [GPMC\\_CONFIG1\\_i\[4\]](#) TIMEPARAGRANULARITY.

##### **15.4.4.10.9.1 Page Burst Access Time on Read Access**

In asynchronous page read mode, the delay between successive word captures in a page is controlled through the PAGEBURSTACCESSTIME bit field. The PAGEBURSTACCESSTIME parameter must be programmed to the rounded greater value (in GPMC\_FCLK cycles) of the read access time of the attached device.

In synchronous burst read mode, the delay between successive word captures in a burst is controlled through the PAGEBURSTACCESSTIME field.

The external WAIT signal can be used in conjunction with PAGEBURSTACCESSTIME to control the effective GPMC data capture GPMC\_FCLK edge on read access. For details about wait monitoring, see [Section 15.4.4.9.3.1, Chip-Select Base Address and Region Size](#).

##### **15.4.4.10.9.2 Page Burst Access Time on Write Access**

Asynchronous page write mode is not supported. PAGEBURSTACCESSTIME is irrelevant in this case.

In synchronous burst write mode, PAGEBURSTACCESSTIME controls the delay between successive memory device word captures in a burst.

The external WAIT signal can be used in conjunction with PAGEBURSTACCESSTIME to control the effective memory-device data capture GPMC\_CLK edge in synchronous write mode. For details about wait monitoring, see [Section 15.4.4.9.3.1, Chip-Select Base Address and Region Size](#).

#### **15.4.4.10.10 Bus Keeping Support**

At the end-cycle time of a read access, if no other access is pending, the GPMC drives the bus with the last data read after RDCYCLETIME completion time to prevent bus floating and reduce power consumption.

After a write access, if no other access is pending, the GPMC keeps driving the data bus after WRCYCLETIME completes with the same data to prevent bus floating and power consumption.

#### 15.4.4.11 NOR Access Description

For each chip-select configuration, the read access can be specified as either asynchronous or synchronous access through the `GPMC_CONFIG1_i[29]` READTYPE bit ( $i = 0$  to 7). For each chip-select configuration, the write access can be specified as either synchronous or asynchronous access through the `GPMC_CONFIG1_i[27]` WRITETYPE bit ( $i = 0$  to 7).

Asynchronous and synchronous read and write access time and related control signals are controlled through timing parameters that refer to `GPMC_FCLK`. The primary difference of synchronous mode is the availability of a configurable clock interface (`GPMC_CLK`) to control the external device. Synchronous mode also affects data-capture and wait-pin monitoring schemes in read access.

For details about asynchronous and synchronous access, see the descriptions of `GPMC_CLK`, `RdAccessTime`, `WrAccessTime`, and wait-pin monitoring.

For more information about timing-parameter settings, see the sample timing diagrams in this chapter.

---

**NOTE:** The address bus and `nBE[1:0]` are fixed for the duration of a synchronous burst read access, but they are updated for each beat of an asynchronous page-read access.

---

##### 15.4.4.11.1 Asynchronous Access Description

This section describes:

- Asynchronous single-read operation on an address/data multiplexed device
- Asynchronous single write operation on an address/data-multiplexed device
- Asynchronous single read operation on an AAD-multiplexed device
- Asynchronous single write operation on an AAD-multiplexed device
- Asynchronous multiple (page) read operation on a non-multiplexed device

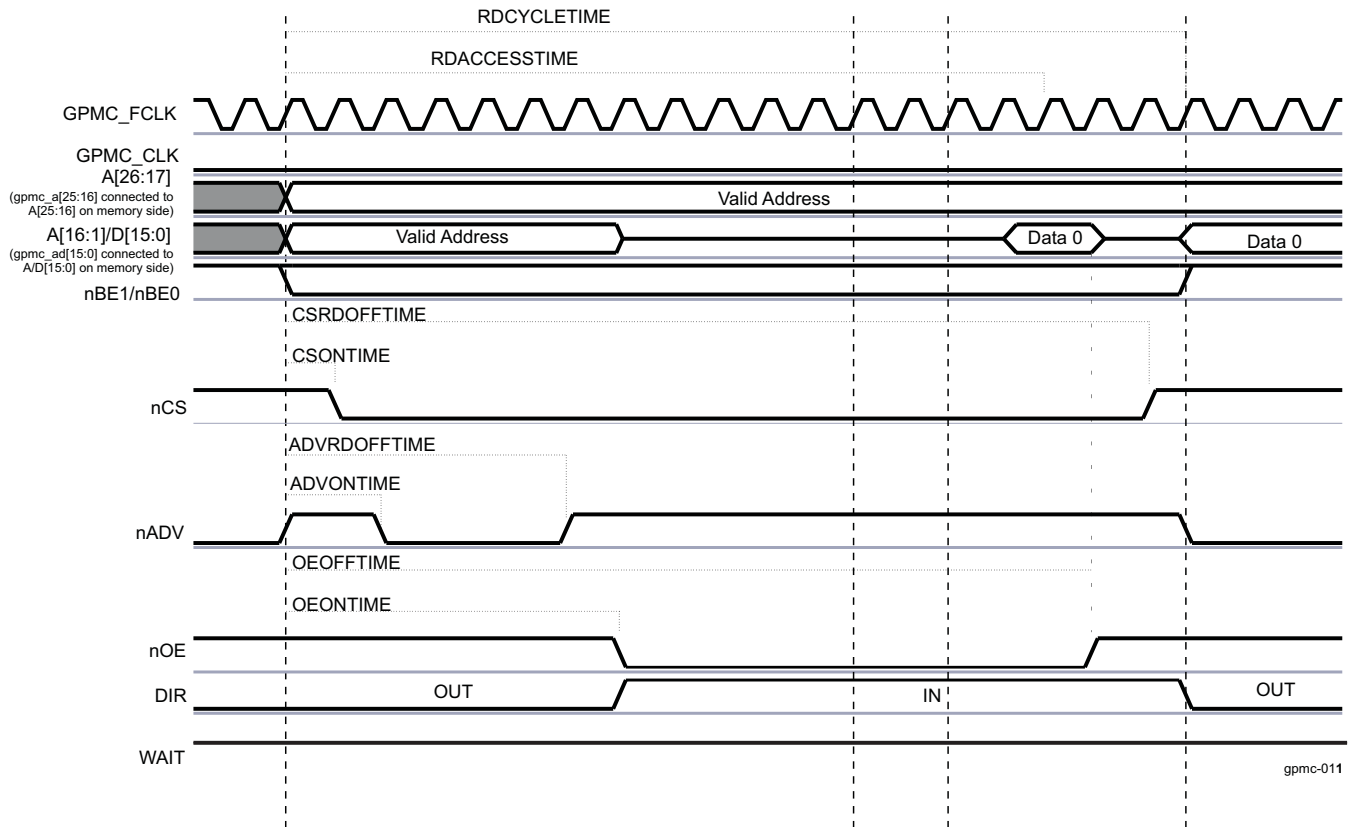

In asynchronous operations `GPMC_CLK` is not provided outside the GPMC and is kept low.

15.4.4.11.1.1 Access on Address/Data Multiplexed Devices

15.4.4.11.1.1.1 Asynchronous Single-Read Operation on an Address/Data Multiplexed Device

Figure 15-61 shows an asynchronous single read operation on an address/data-multiplexed device.

Figure 15-61. Asynchronous Single Read on an Address/Data-Multiplexed Device

See Section 15.4.5.6.1, *GPMC Timing Parameters Formulas* for formulas to calculate timing parameters.

Table 15-258 lists the timing bit fields to set up in order to configure the GPMC in asynchronous single read mode.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until nOE assertion time. For details, see Section 15.4.4.9.2.3, *Address/Data-Multiplexing Interface*.

Address bits (A[16:1] from a GPMC perspective, A[15:0] from an external device perspective) are placed on the address/data bus, and the remaining address bits gpmc\_a[25:16] are placed on the address bus. The address phase ends at nOE assertion, when the DIR signal goes from OUT to IN.

- Chip-select signal nCS:
  - nCS assertion time is controlled by the GPMC\_CONFIG2\_i[3:0] CS ONTIME field. It controls the address setup time to nCS assertion.
  - nCS deassertion time is controlled by the GPMC\_CONFIG2\_i[12:8] CSRD OFFTIME field. It controls the address hold time from nCS deassertion.
- Address valid signal nADV:
  - nADV assertion time is controlled by the GPMC\_CONFIG3\_i[3:0] ADV ONTIME field.
  - nADV deassertion time is controlled by the GPMC\_CONFIG3\_i[12:8] ADV RD OFFTIME field.
- Output enable signal nOE:
  - nOE assertion indicates a read cycle.
  - nOE assertion time is controlled by the GPMC\_CONFIG4\_i[3:0] OE ONTIME field.

- nOE deassertion time is controlled by the `GPMC_CONFIG4_i[12:8]` OEOFFTIME field.
- Read data is latched when RDACCESSTIME completes. Access time is defined in the `GPMC_CONFIG5_i[20:16]` RDACCESSTIME field.
- Direction signal DIR: DIR goes from OUT to IN at the same time that nOE is asserted.
- The end of the access is defined by the `GPMC_CONFIG5_i[4:0]` RDCYCLETIME parameter.

In the GPMC, when a 16-bit wide device is attached to the controller, a 32-bit word write access is split into two 16-bit word write accesses. For more information about GPMC access size and type adaptation, see [Section 15.4.4.11.5, System Burst Versus External Device Burst Support](#).

Between two successive accesses, if an nCS pulse is needed:

- The `GPMC_CONFIG6_i[11:8]` CYCLE2CYCLEDELAY field can be programmed with `GPMC_CONFIG6_i[7]` CYCLE2CYCLESAMECSEN enabled.
- The CSWROFFTIME and CSONTIME parameters also allow a chip-select pulse, but this affects all other types of access.

**Figure 15-62. Two Asynchronous Single Read Accesses on an Address/Data Multiplexed Device (32-bit read split into 2 x 16-bit read)**

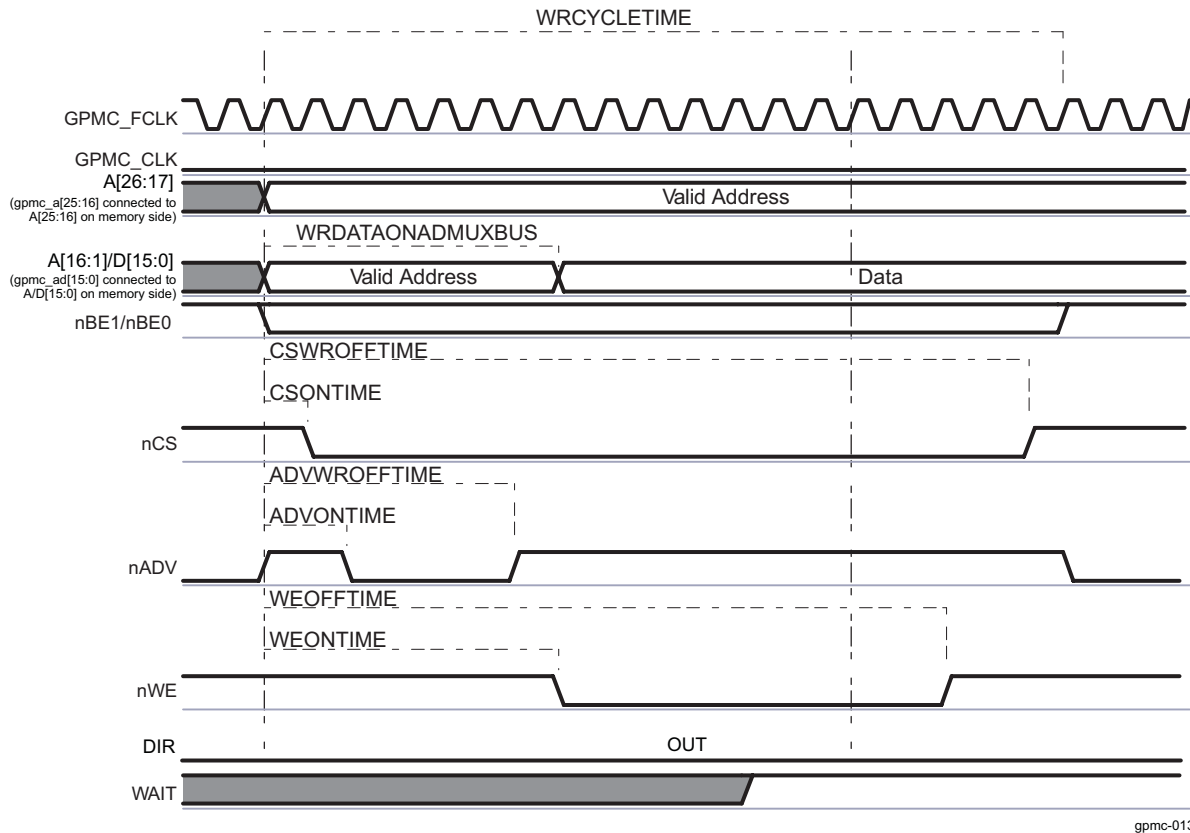

gpmc-044

#### 15.4.4.11.1.2 Asynchronous Single Write Operation on an Address/Data-Multiplexed Device

Figure 15-63 shows an asynchronous single write operation on an address/data-multiplexed device.

**Figure 15-63. Asynchronous Single Write on an Address/Data-Multiplexed Device**

gpmc-013

See [Section 15.4.5.6.1, GPMC Timing Parameters Formulas](#) for formulas to calculate timing parameters.

[Table 15-258](#) lists the timing bit fields to set up in order to configure the GPMC in asynchronous single write mode.

When the GPMC generates a write access to an address/data-multiplexed device, it drives the address bus until nWE assertion time. For more information, see [Section 15.4.4.9.2.3, Address/Data-Multiplexing Interface](#).

The nCS, and nADV signals are controlled in the same way as for asynchronous single read operation on an address/data-multiplexed device.

- Write enable signal nWE:
  - nWE assertion indicates a write cycle.
  - nWE assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[19:16\] WEONTIME](#) field.
  - nWE deassertion time is controlled by the [GPMC\\_CONFIG4\\_i\[28:24\] WEOFFTIME](#) field.
- Direction signal DIR: DIR signal is OUT during the entire access.
- The end of the access is defined by the [GPMC\\_CONFIG5\\_i\[12:8\] WRCYCLETIME](#) parameter.

Address bits A[16:1] (GPMC point of view) are placed on the address/data bus at the start of cycle time, and the remaining address bits A[26:17] are placed on the address bus.

Data is driven on the address/data bus at a [GPMC\\_CONFIG6\\_i\[19:16\] WRDATAONADMUXBUS](#) time.

---

**NOTE:** Write multiple access in asynchronous mode is not supported. If WRITEMULTIPLE is enabled with WRITETYPE as asynchronous, the GPMC processes single asynchronous accesses.

---

After a write operation, if no other access (read or write) is pending, the data bus keeps its previous value. See [Section 15.4.4.10.10](#), *Bus Keeping Support*.

#### **15.4.4.11.1.1.3 Asynchronous Multiple (Page) Write Operation on an Address/Data-Multiplexed Device**

Write multiple (page) access in asynchronous mode is not supported for address/data-multiplexed devices.

If `GPMC_CONFIG1_i[28]` `WRITEMULTIPLE` is enabled (0x1) with `GPMC_CONFIG1_i[27]` `WRITETYPE` as asynchronous (0x0), the GPMC processes single asynchronous accesses.

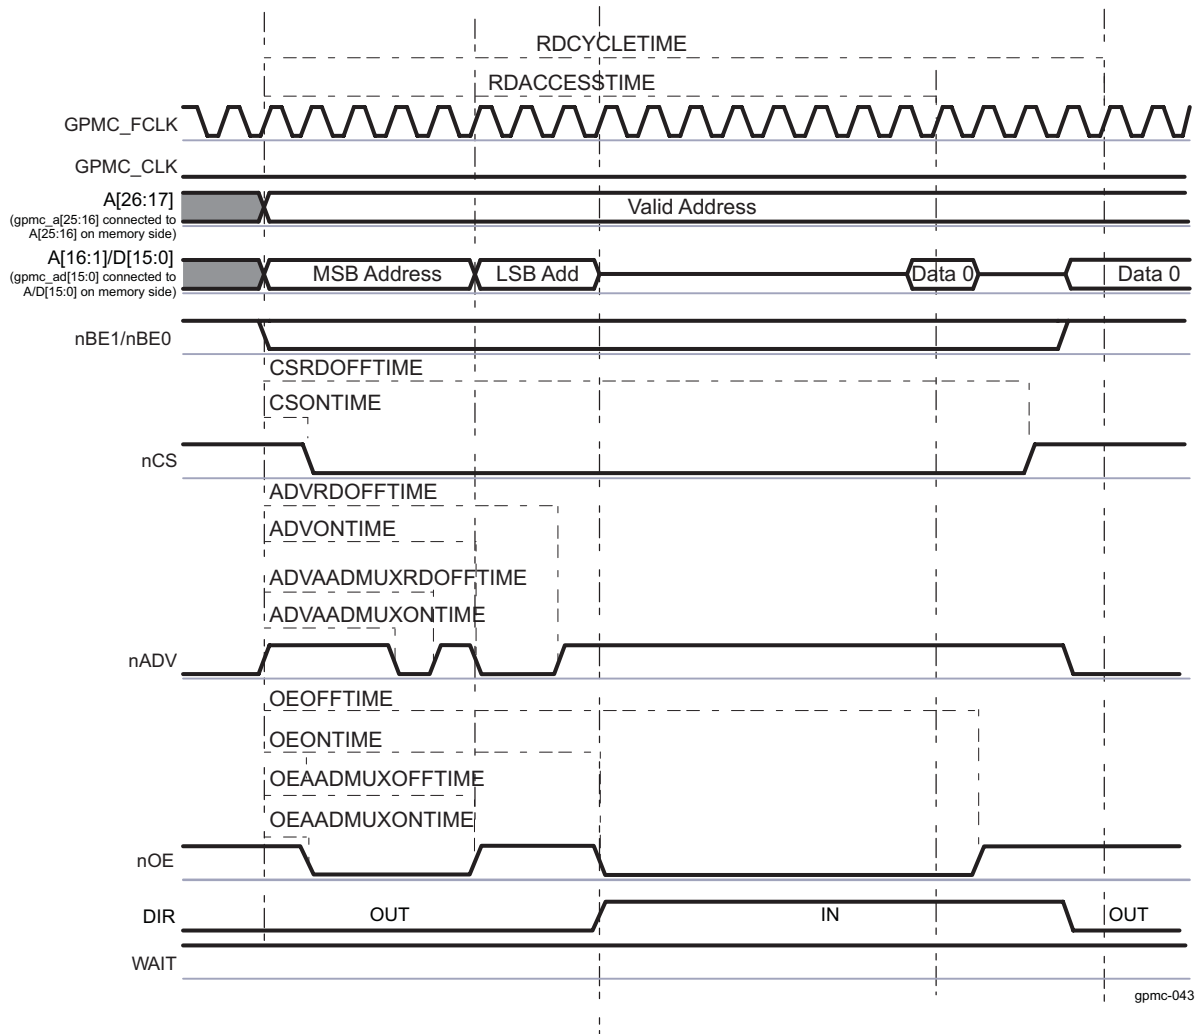

For accesses on non-multiplexed devices refer to [Section 15.4.4.11.3](#), *Asynchronous and Synchronous Accesses in Nonmultiplexed Mode*.

15.4.4.11.1.2 Access on Address/Address/Data Multiplexed Devices

15.4.4.11.1.2.1 Asynchronous Single Read Operation on an AAD-Multiplexed Device

Figure 15-64 shows an asynchronous single read operation on an AAD-multiplexed device.

Figure 15-64. Asynchronous Single Read on an AAD-Multiplexed Device

See Section 15.4.5.6.1, GPMC Timing Parameters Formulas for formulas to calculate timing parameters.

Table 15-258 lists the timing bit fields to set up in order to configure the GPMC in asynchronous single write mode.

When the GPMC generates a read access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The first address phase ends at the first nOE deassertion time. The second phase for LSB address is qualified with nOE driven high. The second address phase ends at the second nOE assertion time, when the DIR signal goes from OUT to IN.

The nCS, and DIR signals are controlled in the same way as for asynchronous single read operation on an address/data-multiplexed device.

- Address valid signal nADV. nADV is asserted and deasserted twice during a read transaction:
  - nADV first assertion time is controlled by the GPMC\_CONFIG3\_i[6:4] ADVAADMUXONTIME field.
  - nADV first deassertion time is controlled by the GPMC\_CONFIG3\_i[26:24] ADVAADMUXRDOFFTIME field.

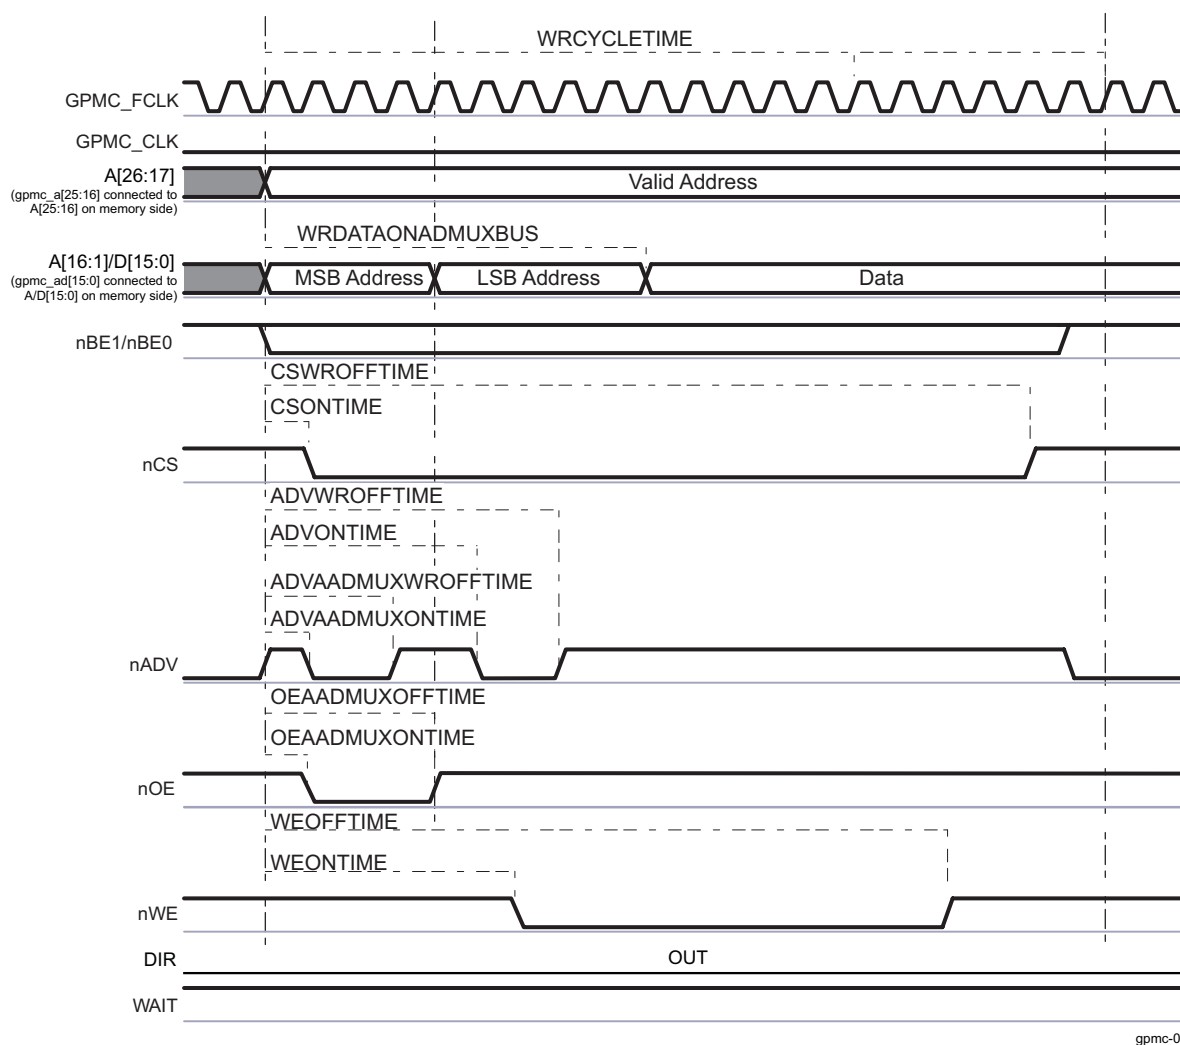

- nADV second assertion time is controlled by the [GPMC\\_CONFIG3\\_i\[3:0\]](#) ADVONTIME field.
- nADV second deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[12:8\]](#) ADVRDOFFTIME field.
- Output Enable signal nOE. nOE is asserted and deasserted twice during a read transaction (nOE second assertion indicates a read cycle):
  - nOE first assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[6:4\]](#) OEAADMUXONTIME field.
  - nOE first deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[15:13\]](#) OEAADMUXOFFTIME field.
  - nOE second assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[3:0\]](#) OEONTIME field.
  - nOE second deassertion time is controlled by the [GPMC\\_CONFIG4\\_i\[12:8\]](#) OEOFFTIME field.

#### 15.4.4.11.1.2.2 Asynchronous Single Write Operation on an AAD-Multiplexed Device

Figure 15-65 shows an asynchronous single write operation on an AAD-multiplexed device.

**Figure 15-65. Asynchronous Single Write on an AAD-Multiplexed Device**

See [Section 15.4.5.6.1, GPMC Timing Parameters Formulas](#) for formulas to calculate timing parameters.

[Table 15-258](#) lists the timing bit fields to set up in order to configure the GPMC in asynchronous single write mode.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The second phase for LSB address is qualified with nOE driven high. The address phase ends at nWE assertion time.

The nCS, nWE, and DIR signals are controlled in the same way as for asynchronous single write operation on an address/data-multiplexed device. See [Table 15-249](#).

- Address valid signal nADV is asserted and deasserted twice during a write transaction:
  - nADV first assertion time is controlled by the [GPMC\\_CONFIG3\\_i\[6:4\]](#) ADVAADMUXONTIME field.
  - nADV first deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[30:28\]](#) ADVAADMUXWROFFTIME field.
  - nADV second assertion time is controlled by the [GPMC\\_CONFIG3\\_i\[3:0\]](#) ADVONTIME field.
  - nADV second deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[20:16\]](#) ADVWROFFTIME field.
- Output Enable signal nOE is asserted during the address phase of a write transaction:
  - nOE assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[6:4\]](#) OEAADMUXONTIME field.
  - nOE deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[15:13\]](#) OEAADMUXOFFTIME field.

The address bits for the first address phase are driven onto the data bus until nOE deassertion. Data is driven onto the address/data bus at the clock edge defined by the [GPMC\\_CONFIG6\\_i\[19:16\]](#) WRDATAONADMUXBUS parameter.

#### **15.4.4.11.1.2.3 Asynchronous Multiple (Page) Read Operation on an AAD-Multiplexed Device**

Write multiple (page) access in asynchronous mode is not supported for AAD-multiplexed devices.

If [GPMC\\_CONFIG1\\_i\[28\]](#) WRITEMULTIPLE is enabled (0x1) with [GPMC\\_CONFIG1\\_i\[27\]](#) WRITETYPE as asynchronous (0x0), the GPMC processes single asynchronous accesses.

For accesses on non-multiplexed devices refer to [Section 15.4.4.11.3](#), *Asynchronous and Synchronous Accessed in Nonmultiplexed Mode*.

#### **15.4.4.11.2 Synchronous Access Description**

This section details read and write synchronous accesses on address/data multiplexed. All information in this section can be applied to any type of memory - non-multiplexed, address and data multiplexed or AAD-multiplexed - with a difference limited to the address phase. For accesses on non-multiplexed devices refer to [Section 15.4.4.11.3](#), *Asynchronous and Synchronous Accessed in Nonmultiplexed Mode*.

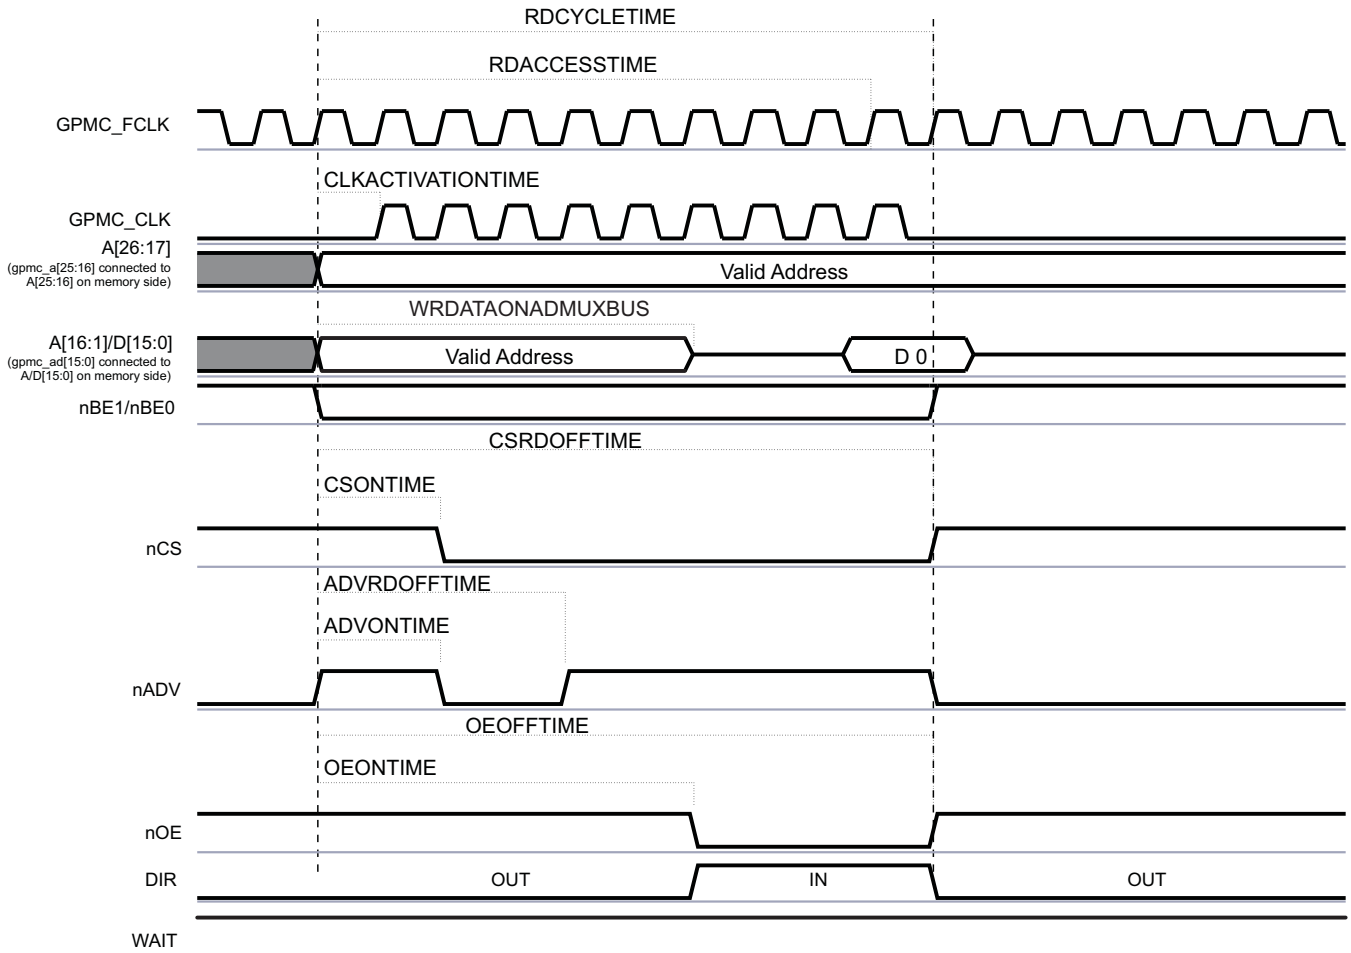

In synchronous operations:

- The GPMC\_CLK clock is provided outside the GPMC when accessing the memory device.
- The GPMC\_CLK clock is derived from the GPMC\_FCLK clock using the [GPMC\\_CONFIG1\\_i\[1:0\]](#) GPMCFCLKDIVIDER field. In the following section i stands for the chip-select number, i = 0 to 7.
- The [GPMC\\_CONFIG1\\_i\[26:25\]](#) CLKACTIVATIONTIME field specifies that the GPMC\_CLK is provided outside the GPMC 0, 1, or 2 GPMC\_FCLK cycles after start access time until RDCYCLETIME or WRCYCLETIME completion.

##### **15.4.4.11.2.1 Synchronous Single Read**

[Figure 15-66](#) and [Figure 15-67](#) show a synchronous single-read operation with GPMCFCLKDIVIDER equal to 0 and 1, respectively.

**Figure 15-66. Synchronous Single Read (GPMCFCLKDIVIDER = 0)**

gpmc-015

Figure 15-67. Synchronous Single Read (GPMCFCLKDIVIDER = 1)

gpmc-016

See Section 15.4.5.6.1, *GPMC Timing Parameters Formulas* for formulas to calculate timing parameters.

Table 15-258 lists the timing bit fields to set up in order to configure the GPMC in asynchronous single read mode.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until nOE assertion time. For details, see Section 15.4.4.9.2.3, *Address/Data-Multiplexing Interface*.

- Chip-select signal nCS:
  - nCS assertion time is controlled by the `GPMC_CONFIG2_i[3:0]` CSONTIME field and ensures address setup time to nCS assertion.
  - nCS deassertion time is controlled by the `GPMC_CONFIG2_i[12:8]` CSRDOFFTIME field and ensures address hold time to nCS deassertion.
- Address valid signal nADV:
  - nADV assertion time is controlled by the `GPMC_CONFIG3_i[3:0]` ADVONTIME field.
  - nADV deassertion time is controlled by the `GPMC_CONFIG3_i[12:8]` ADVRDOFFTIME field.
- Output enable signal nOE:
  - nOE assertion indicates a read cycle.
  - nOE assertion time is controlled by the `GPMC_CONFIG4_i[3:0]` OEONTIME field.
  - nOE deassertion time is controlled by the `GPMC_CONFIG4_i[12:8]` OEOFFTIME field.
- Initial latency for the first read data is controlled by `GPMC_CONFIG5_i[20:16]` RDACCESSTIME or by monitoring the WAIT signal.
- Total access time (`GPMC_CONFIG5_i[4:0]` RDCYCLETIME) corresponds to RDACCESSTIME plus the address hold time from nCS deassertion, plus time from RDACCESSTIME to CSRDOFFTIME.
- Direction signal DIR: DIR goes from OUT to IN at the same time as nOE assertion.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The second phase for LSB address is qualified with nOE driven high. The address phase ends at nWE assertion time.

The nCS, and DIR signals are controlled in the same way as for synchronous single read operation on an address/data-multiplexed device.

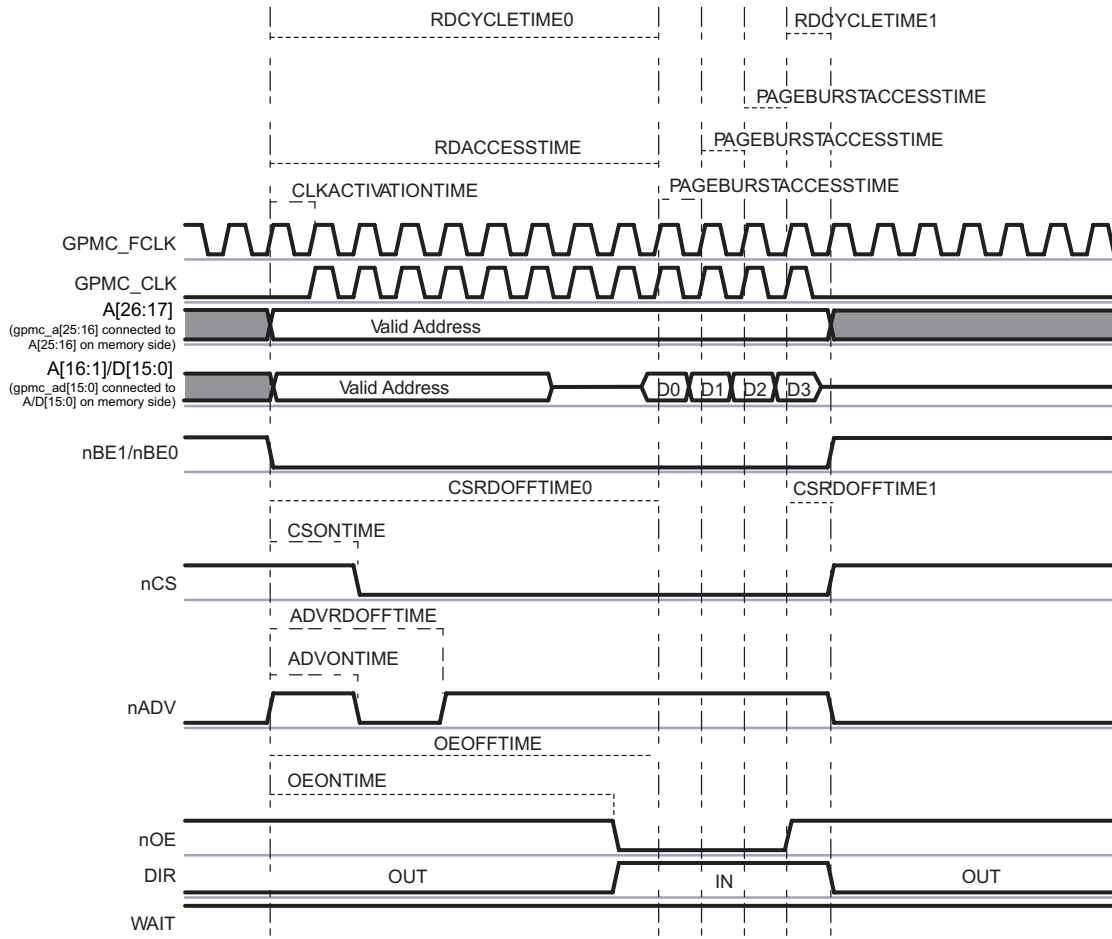

- Address valid signal nADV is asserted and deasserted twice during a read transaction:
  - nADV first assertion time is controlled by the [GPMC\\_CONFIG3\\_i\[6:4\]](#) ADVAADMUXONTIME field.
  - nADV first deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[26:24\]](#) ADVAADMUXRDOFFTIME field.
  - nADV second assertion time is controlled by the [GPMC\\_CONFIG3\\_i\[3:0\]](#) ADVONTIME field.
  - nADV second deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[12:8\]](#) ADVRDOFFTIME field.
- Output Enable signal nOE is asserted and deasserted twice during a read transaction (nOE second assertion indicates a read cycle):
  - nOE first assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[6:4\]](#) OEAADMUXONTIME field.
  - nOE first deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[15:13\]](#) OEAADMUXOFFTIME field.
  - nOE second assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[3:0\]](#) OEONTIME field.
  - nOE second deassertion time is controlled by the [GPMC\\_CONFIG4\\_i\[12:8\]](#) OEOFFTIME field.

After a read operation, if no other access (read or write) is pending, the data bus is driven with the previous read value. See [Section 15.4.4.10.10](#), *Bus Keeping Support*.

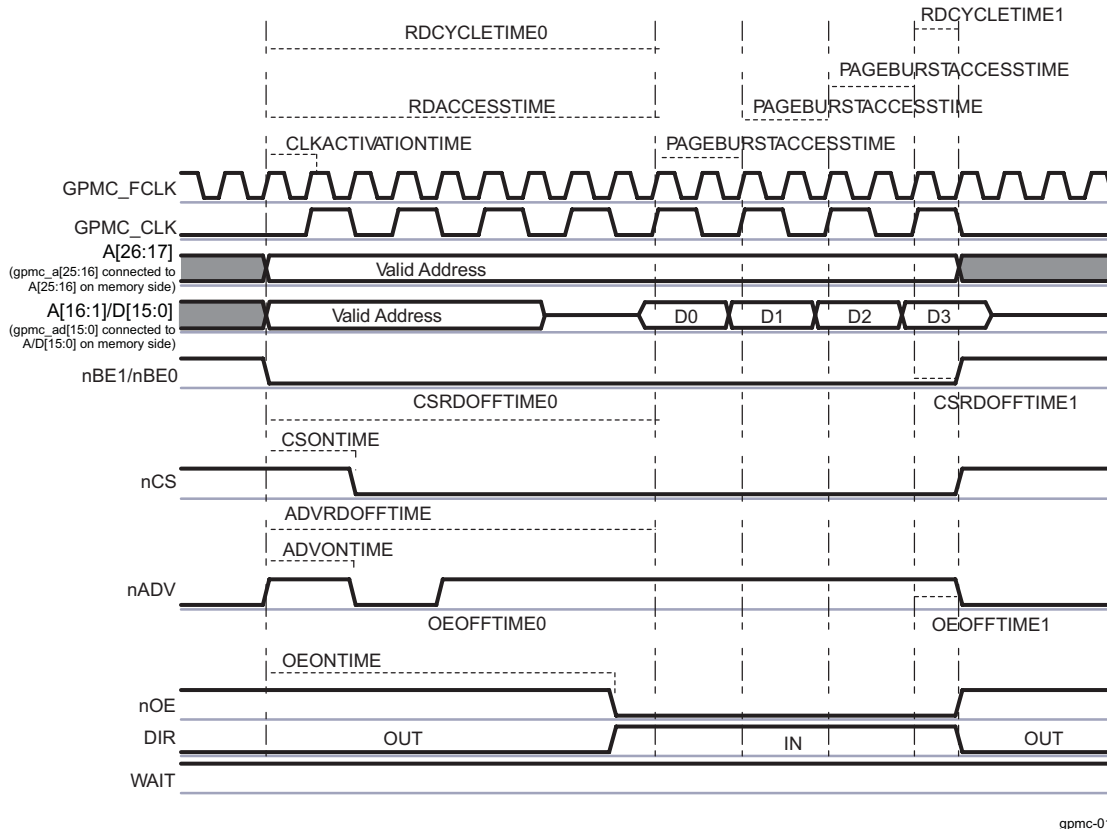

#### 15.4.4.11.2.2 Synchronous Multiple (Burst) Read (4-, 8-, 16-Word16 Burst With Wraparound Capability)

[Figure 15-68](#) and [Figure 15-69](#) show a synchronous multiple read operation with GPMCFCLKDivider equal to 0 and 1, respectively.

Figure 15-68. Synchronous Multiple (Burst) Read (GPMCFCLKDIVIDER = 0)

gpmc-018

**Figure 15-69. Synchronous Multiple (Burst) Read (GPMCFCLKDIVIDER = 1)**

When `GPMC_CONFIG5_i[20:16]` `RDACCESSTIME` completes, control-signal timings are frozen during the multiple data transactions, corresponding to `GPMC_CONFIG5_i[27:24]` `PAGEBURSTACCESSTIME` multiplied by the number of remaining data transactions.

The `nCS`, `nADV`, `nOE` and `DIR` signals are controlled in the same way as for synchronous single read operation. See [Table 15-244](#).

Initial latency for the first read data is controlled by `RDACCESSTIME` or by monitoring the `WAIT` signal. Successive read data are provided by the memory device each one or two `GPMC_CLK` cycles. The `PAGEBURSTACCESSTIME` parameter must be set accordingly with `GPMC_CONFIG1_i[1:0]` `GPMCFCLKDIVIDER` and the memory-device internal configuration. Depending on the device page length, the GPMC checks device page crossing during a new burst request and purposely insert initial latency (of `RDACCESSTIME`) when required.

Total access time `GPMC_CONFIG5_i[4:0]` `RDCYCLETIME` corresponds to `RDACCESSTIME` plus the address hold time from `nCS` deassertion. In [Figure 15-69](#), `RDCYCLETIME` programmed value equals to `RDCYCLETIME0` + `RDCYCLETIME1`.

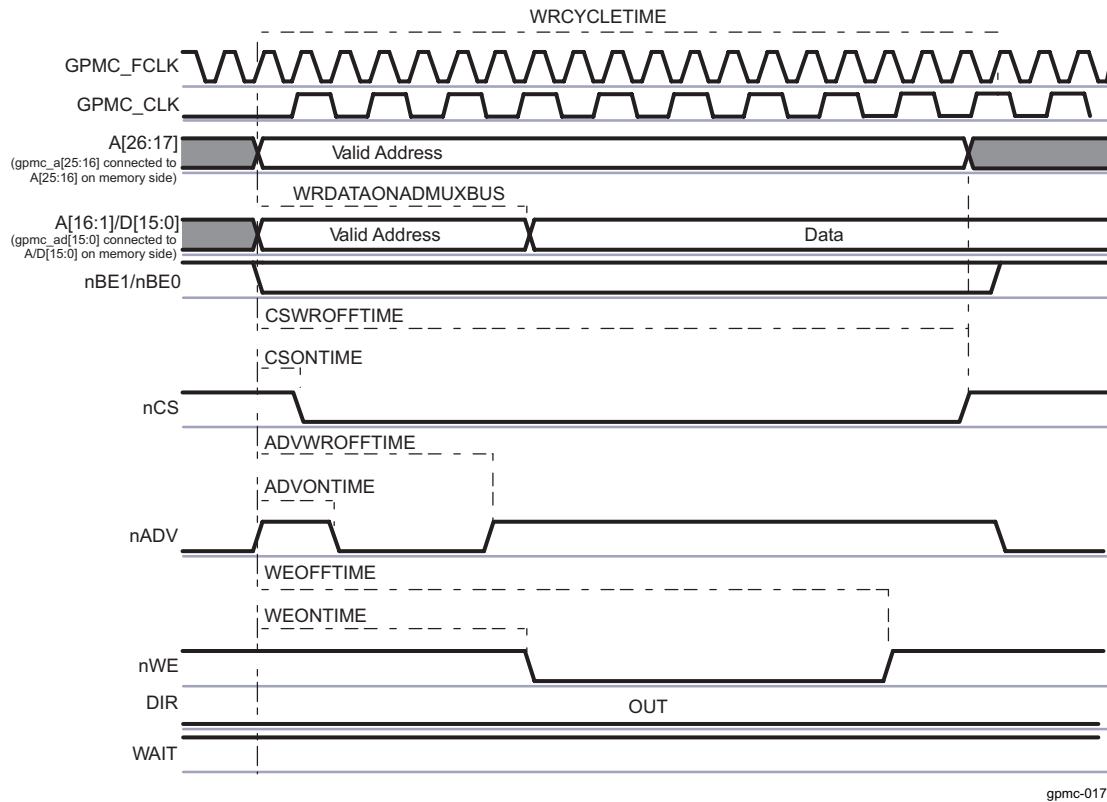

After a read operation, if no other access (read or write) is pending, the data bus is driven with the previous read value. See [Section 15.4.4.10.10, Bus Keeping Support](#).

Burst wraparound is enabled through the `GPMC_CONFIG1_i[31]` `WRAPBURST` bit and allows a 4-, 8-, or 16-Word16 linear burst access to wrap within its burst-length boundary through `GPMC_CONFIG1_i[24:23]` `ATTACHEDDEVICEPAGELENGTH`.

### 15.4.4.11.2.3 Synchronous Single Write

Burst write mode is used for synchronous single or burst accesses.

**Figure 15-70. Synchronous Single Write on an Address/Data-Multiplexed Device**

When the GPMC generates a write access to an address/data-multiplexed device, it drives the data bus (with address bits A[16:1]) until **GPMC\_CONFIG6\_i[19:16]** WRDATAONADMUXBUS time. First data of the burst is driven on the address/data bus at WRDATAONADMUXBUS time.

#### 15.4.4.11.2.4 Synchronous Multiple (Burst) Write

Synchronous burst write mode provides synchronous single or consecutive accesses.

[Figure 15-71](#) shows a synchronous burst write access when the chip-select is configured in address/data-multiplexed mode.

**Figure 15-71. Synchronous Multiple Write (Burst Write) in Address/Data-Multiplexed Mode**

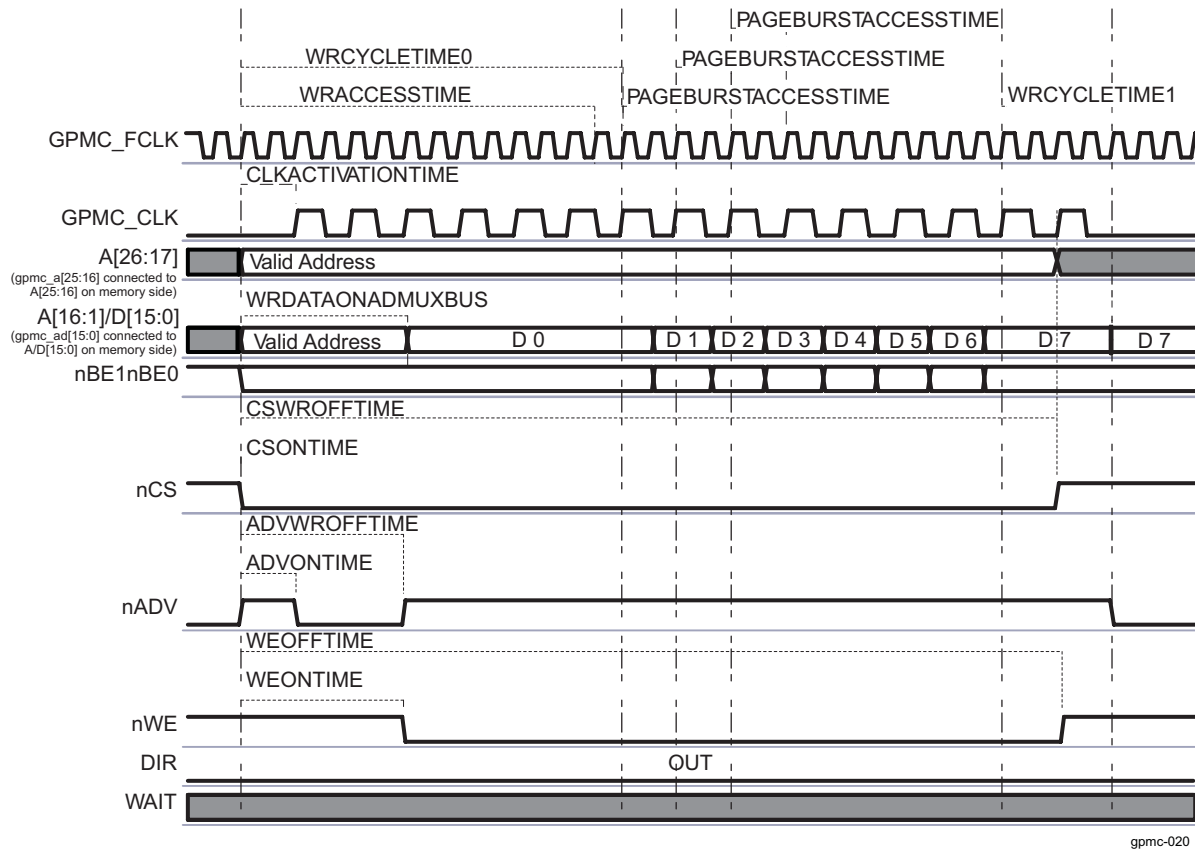

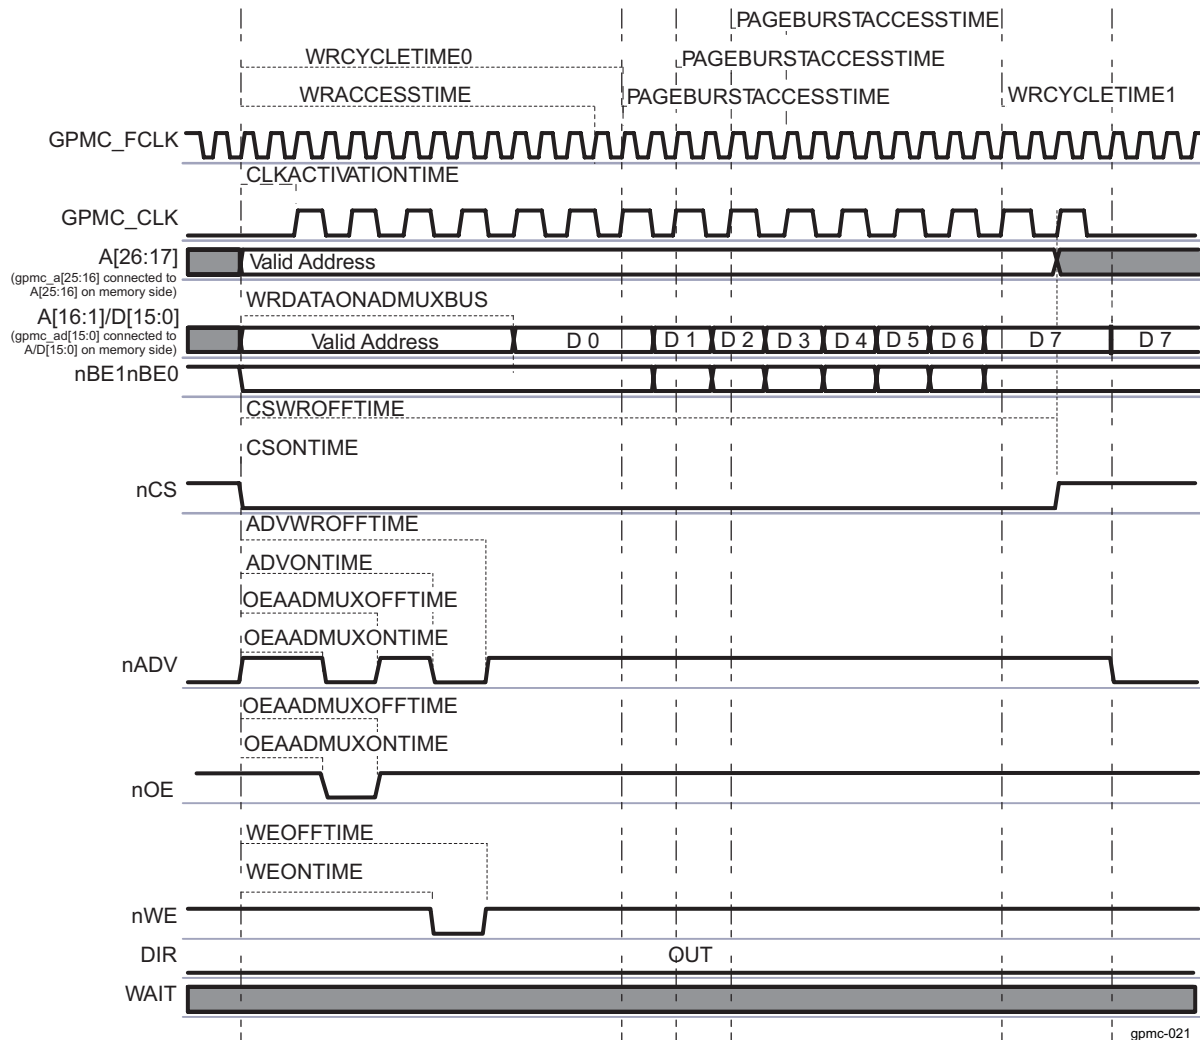

Figure 15-72 shows the same synchronous burst write access when the chip-select is configured in address/address/data-multiplexed (AAD-multiplexed) mode.

**Figure 15-72. Synchronous Multiple Write (Burst Write) in Address/Address/Data-Multiplexed Mode**

The first data of the burst is driven on the A/D bus at [GPMC\\_CONFIG6\\_i\[19:16\]](#) WRDATAONADMUXBUS.

When WRACCESTIME completes, control-signal timings are frozen during the multiple data transactions, corresponding to the [GPMC\\_CONFIG5\\_i\[27:24\]](#) PAGEBURSTACCESTIME multiplied by the number of remaining data transactions.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until nOE assertion time. For details, see [Section 15.4.4.9.2.3, Address/Data-Multiplexing Interface](#).

- Chip-select signal nCS:
  - nCS assertion time is controlled by the [GPMC\\_CONFIG2\\_i\[3:0\]](#) CSONTIME field (i = 0 to 7) and ensures address setup time to nCS assertion.
  - nCS deassertion time controlled by the [GPMC\\_CONFIG2\\_i\[20:16\]](#) CSWROFFTIME field and ensures address hold time to nCS deassertion.
- Address valid signal nADV:
  - nADV assertion time is controlled by the [GPMC\\_CONFIG3\\_i\[3:0\]](#) ADVONTIME field.
  - nADV deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[20:16\]](#) ADVWROFFTIME field.
- Write enable signal nWE:
  - nWE assertion indicates a read cycle.
  - nWE assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[19:16\]](#) WEONTIME field.

- nWE deassertion time is controlled by the [GPMC\\_CONFIG4\\_i\[28:24\]](#) WEOFFTIME field.

---

**NOTE:** The nWE falling edge must not be used to control the time when the burst first data is driven in the address/data bus because some new devices require the nWE signal at low during the address phase.

---

- Direction signal DIR is OUT during the entire access.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The second phase for LSB address is qualified with nOE driven high. The address phase ends at nWE assertion time.

The nCS, and DIR signals are controlled as detailed above.

- Address valid signal nADV is asserted and deasserted twice during a read transaction:
  - nADV first assertion time is controlled by the [GPMC\\_CONFIG3\\_i\[6:4\]](#) ADVAADMUXONTIME field.
  - nADV first deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[26:24\]](#) ADVAADMUXRDOFFTIME field.
  - nADV second assertion time is controlled by the [GPMC\\_CONFIG3\\_i\[3:0\]](#) ADVONTIME field.
  - nADV second deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[12:8\]](#) ADVRDOFFTIME field.
- Output Enable signal nOE is asserted and deasserted twice during a read transaction (nOE second assertion indicates a read cycle):
  - nOE first assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[6:4\]](#) OEAADMUXONTIME field.
  - nOE first deassertion time is controlled by the [GPMC\\_CONFIG4\\_i\[15:13\]](#) OEAADMUXOFFTIME field.
  - nOE second assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[3:0\]](#) OEONTIME field.
  - nOE second deassertion time is controlled by the [GPMC\\_CONFIG4\\_i\[12:8\]](#) OEOFFTIME field.

First write data is driven by the GPMC at [GPMC\\_CONFIG6\\_i\[19:16\]](#) WRDATAONADMUXBUS, when in address/data mux configuration. The next write data of the burst is driven on the bus at WRACCESSTIME + 1 during [GPMC\\_CONFIG5\\_i\[27:24\]](#) PAGEBURSTACCESSTIME GPMC\_FCLK cycles. The last data of the synchronous burst write is driven until [GPMC\\_CONFIG5\\_i\[12:8\]](#) WRCYCLETIME completes.

- WRACCESSTIME is defined in the [GPMC\\_CONFIG6\\_i\[28:24\]](#) register.
- The PAGEBURSTACCESSTIME parameter must be set accordingly with GPMCFCLKDIVIDER and the memory-device internal configuration.

Total access time [GPMC\\_CONFIG5\\_i\[12:8\]](#) WRCYCLETIME corresponds to WRACCESSTIME plus the address hold time from nCS deassertion. In [Figure 15-71](#), the WRCYCLETIME programmed value equals WRCYCLETIME0 + WRCYCLETIME1. WRCYCLETIME0 and WRCYCLETIME1 delays are not actual parameters and are only a graphical representation of the full WRCYCLETIME value.

After a write operation, if no other access (read or write) is pending, the data bus keeps the previous value. See [Section 15.4.4.10.10, Bus Keeping Support](#).

### 15.4.4.11.3 Asynchronous and Synchronous Accesses in Nonmultiplexed Mode

Page mode is only available in non-muxed mode. The non-muxed mode is described in this section even though its use is very limited (address space limited to 2 KBytes).

- Asynchronous single read operation on a nonmultiplexed device
- Asynchronous single write operation on a nonmultiplexed device
- Asynchronous multiple (page mode) read operation on a nonmultiplexed device
- Synchronous operations on a nonmultiplexed device

#### 15.4.4.11.3.1 Asynchronous Single Read Operation on a Nonmultiplexed Device

[Figure 15-73](#) shows an asynchronous single read operation on a nonmultiplexed device.

**Figure 15-73. Asynchronous Single Read on an Address/Data-Nonmultiplexed Device**

The 10-bit address is driven onto the address bus A[10:1] and the 16-bit data is driven onto the data bus D[15:0].

Read data is latched at [GPMC\\_CONFIG1\\_5\[20:16\]](#) RDACCESSTIME completion time. The end of the access is defined by the [GPMC\\_CONFIG1\\_5\[4:0\]](#) RDCYCLETIME parameter.

Set [GPMC\\_CONFIG\[1\] LIMITEDADDRESS](#) to 0x1 (A26-A11 are not modified during an external memory access).

nCS, nADV, nOE and DIR signals are controlled in the same way as address/data multiplexed accesses, see [Table 15-249](#).

gpmc-010

#### 15.4.4.11.3.2 Asynchronous Single Write Operation on a Nonmultiplexed Device

[Figure 15-74](#) shows an asynchronous single write operation on a nonmultiplexed device.

**Figure 15-74. Asynchronous Single Write on an Address/Data-Nonmultiplexed Device**

gpmc-012

The 10-bit address is driven onto the address bus A[10:1] and the 16-bit data is driven onto the data bus D[15:0].

Set `GPMC_CONFIG[1] LIMITEDADDRESS` to 0x1 (A26-A11 are not modified during an external memory access).

nCS, nADV, nWE and DIR signals are controlled in the same way as address/data multiplexed accesses, see [Table 15-249](#).

#### 15.4.4.11.3.3 Asynchronous Multiple (Page Mode) Read Operation on a Nonmultiplexed Device

[Figure 15-75](#) shows an asynchronous multiple read operation on a Nonmultiplexed Device, in which two word32 host read accesses to the GPMC are split into one multiple (page mode of 4 word16) read access to the attached device.

Figure 15-75. Asynchronous Multiple (Page Mode) Read

gpmc-014

**NOTE:** The WAIT signal is active low.

nCS, nADV, nOE and DIR signals are controlled in the same way as address/data multiplexed accesses, see [Table 15-249](#).

When RDACCESSTIME completes, control-signal timings are frozen during the multiple data transactions, corresponding to PAGEBURSTACCESSTIME multiplied by the number of remaining data transactions.

Read data is latched at [GPMC\\_CONFIG5\\_i\[20:16\]](#) RDACCESSTIME completion time (i = 0 to 7). The end of the access is defined by the [GPMC\\_CONFIG5\\_i\[4:0\]](#) RDCYCLETIME parameter.

Set [GPMC\\_CONFIG\[1\]](#) LIMITEDADDRESS to 0x1 (A26-A11 are not modified during an external memory access).

During consecutive accesses, the GPMC increments the address after each data read completes.

Delay between successive read data in the page is controlled by the [GPMC\\_CONFIG5\\_i\[27:24\]](#) PAGEBURSTACCESSTIME parameter. Depending on the device page length, the GPMC can control device page crossing during a burst request and insert initial RDACCESSTIME latency. Note that page crossing is only possible with a new burst access, meaning a new initial access phase is initiated.

Total access time RDCYCLETIME corresponds to RDACCESSTIME plus the address hold time starting from the nCS deassertion.

- The read cycle time is defined in the [GPMC\\_CONFIG5\\_i\[4:0\]](#) RDCYCLETIME field.
- In [Figure 15-75](#), the RDCYCLETIME programmed value equals RDCYCLETIME0 (before paged accesses) + RDCYCLETIME1 (after paged accesses).

#### 15.4.4.11.3.4 Synchronous Operations on a Nonmultiplexed Device

All information for this section is equivalent to similar operations for address/data- or AAD-multiplexed accesses. The only difference resides in the address phase. See [Section 15.4.5.3, GPMC Configuration in NOR Mode](#).

#### 15.4.4.11.4 Page and Burst Support

Each chip-select can be configured to process system single or burst requests into successive single accesses or asynchronous page/synchronous burst accesses, with appropriate access size adaptation.

Depending on the external device page or burst capability, read and write accesses can be independently configured through the GPMC. The [GPMC\\_CONFIG1\\_i\[30\]](#) READMULTIPLE and [GPMC\\_CONFIG1\\_i\[28\]](#) WRITMULTIPLE bits ( $i = 0$  to 7) are associated with the READTYPE and WRITETYPE parameters.

---

#### NOTE:

- Asynchronous write page mode is not supported.
  - 8-bit wide device support is limited to nonburstable devices (READMULTIPLE and WRITEMULTIPLE are ignored).
  - Not applicable to NAND device interfacing.
- 

#### 15.4.4.11.5 System Burst Versus External Device Burst Support

The device system can issue the following requests to the GPMC:

- Byte, 16-bit word, 32-bit word requests (byte enable controlled). This is always a single request from the interconnect point of view.
- Incrementing fixed-length bursts of two words, four words, and eight words
- Wrapped (critical word access first) fixed-length burst of two, four, or eight words

To process a system request with the optimal protocol, the READMULTIPLE (and READTYPE) and WRITEMULTIPLE (and WRITETYPE) parameters must be set according to the burstable capability (synchronous or asynchronous) of the attached device.

The GPMC access engine issues only fixed-length burst. The maximum length that can be issued is defined per CS by the [GPMC\\_CONFIG1\\_i\[24:23\]](#) ATTACHEDDEVICEPAGELENGTH field ( $i = 0$  to 7). When the ATTACHEDDEVICEPAGELENGTH value is less than the system burst request length (including the appropriate access size adaptation according to the device width), the GPMC splits the system burst request into multiple bursts. Within the specified 4-, 8-, or 16-word value, the ATTACHEDDEVICEPAGELENGTH field value must correspond to the maximum-length burst supported by the memory device configured in fixed-length burst mode (as opposed to continuous burst mode).

To get optimal performance from memory devices that natively support 16 Word16-length-wrapping burst capability (critical word access first), the ATTACHEDDEVICEPAGELENGTH parameter must be set to 16 words and the [GPMC\\_CONFIG1\\_i\[31\]](#) WRAPBURST bit ( $i = 0$  to 7) must be set to 1. Similarly DEVICESPAGELENGTH is set to 4 and 8 for memories supporting respectively 4 and 8 Word16-length-wrapping burst.

When the memory device does not offer (or is not configured to offer) native 16 Word16-length-wrapping burst, the WRAPBURST parameter must be cleared, and the GPMC access engine emulates the wrapping burst by issuing the appropriate burst sequences according to the ATTACHEDDEVICEPAGELENGTH value.

When the memory device does not support native-wrapping burst, there is usually no difference in behavior between a fixed burst length mode and a continuous burst mode configuration (except for a potential power increase from a memory-speculative data prefetch in a continuous burst read). However, even though continuous burst mode is compatible with GPMC behavior, because the GPMC access engine issues only fixed-length burst and does not benefit from continuous burst mode, it is best to configure the memory device in fixed-length burst mode.

The memory device maximum-length burst (configured in fixed-length burst wrap or nonwrap mode) usually corresponds to the memory device data buffer size. Memory devices with a minimum of 16 half-word buffers are the most appropriate (especially with wrap support), but memory devices with smaller buffer size (4 or 8) are also supported, assuming that the `GPMC_CONFIG1_i[24:23]` `ATTACHEDDEVICEPAGELENGTH` field is set accordingly to 4 or 8 words.

The device system issues only requests with addresses or starting addresses for nonwrapping burst requests; that is, the request size boundary is aligned. In case of an eight-word-wrapping burst, the wrapping address always occurs on the eight-words boundary. As a consequence, all words requested must be available from the memory data buffer when the buffer size is equal to or greater than the `ATTACHEDDEVICEPAGELENGTH` value. This usually means that data can be read from or written to the buffer at a constant rate (number of cycles between data) without wait states between data accesses. If the memory does not behave this way (nonzero wait state burstable memory), wait-pin monitoring must be enabled to dynamically control data-access completion within the burst.

---

**NOTE:** When the system burst request length is less than the `ATTACHEDDEVICEPAGELENGTH` value, the GPMC proceeds with the required accesses.

---

#### 15.4.4.12 pSRAM Access Specificities

pSRAM devices are SRAM-pin-compatible low-power memories that contain a self-refreshed DRAM memory array. The `GPMC_CONFIG1_i[11:10]` `DEVICETYPE` field ( $i = 0$  to 7) must be set to 0b00.

The pSRAM devices uses the NOR protocol. It support the following operations:

- Asynchronous single read
- Asynchronous page read
- Asynchronous single write
- Synchronous single read and write
- Synchronous burst read
- Synchronous burst write (not supported by NOR Flash memory)

pSRAM devices must be powered up and initialized in a predefined manner according to the specifications of the attached device.

pSRAM devices can be programmed to use either mode: fixed or variable latency. pSRAM devices can either automatically schedule autorefresh operations, which force the GPMC to use its `WAIT` signal capability when read or write operations occur during an internal self-refresh operation, or pSRAM devices automatically include the autorefresh operation in the access time. These devices do not require additional `WAIT` signal capability or a minimum `nCS` high pulse width between consecutive accesses to ensure that the correct internal refresh operation is scheduled.

#### 15.4.4.13 NAND Access Description

NAND (8-bit and 16-bit) memory devices using a standard NAND asynchronous address/data-multiplexing scheme can be supported on any chip-select with the appropriate asynchronous configuration settings.

As for any other type of memory compatible with the GPMC interface, accesses to a chip-select allocated to a NAND device can be interleaved with accesses to chip-selects allocated to other external devices. This interleaved capability limits the system to *chip enable don't care* NAND devices since the chip-select allocated to the NAND device has to be deasserted if accesses to other chip-selects are requested.

##### 15.4.4.13.1 NAND Memory Device in Byte or 16-bit Word Stream Mode

NAND devices require correct command and address programming before data array read or write accesses. The GPMC does not include specific hardware to translate a random address system request into a NAND-specific multiphase access. In that sense, GPMC NAND support, as opposed to random memory-map device support, is data-stream-oriented (byte or 16-bit word).

The GPMC NAND programming model relies on a software driver for address and command formatting with the correct data address pointer value according to the block and page structure. Because of NAND structure and protocol interface diversity, the GPMC does not support automatic command and address phase programming, and software drivers must access the NAND device ID to ensure that correct command and address formatting are used for the identified device.

NAND device data read and write accesses are achieved through an asynchronous read or write access. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

Any chip-select region can be qualified as a NAND region to constrain the nADV/ALE signal as Address Latch Enable (ALE active high, default state value at low) during address program access, and the nBE0/CLE signal as Command Latch Enable (CLE active high, default state value at low) during command program access. GPMC address lines are not used (the previous value is not changed) during NAND access.

#### 15.4.4.13.1.1 Chip-Select Configuration for NAND Interfacing in Byte or Word Stream Mode

The [GPMC\\_CONFIG7\\_i](#) register (where  $i = 0$  to 7) associated with a NAND device region interfaced in byte or word stream mode can be initialized with a minimum size of 16 Mbytes, because any address location in the chip-select memory region can be used to access a NAND data array. The NAND Flash protocol specifies an address sequence where address bits are passed through the data bus in a series of write accesses with the ALE pin asserted. After this address phase, all operations are streamed and the system requests address is irrelevant.

#### CAUTION

To allow correct command, address, and data-access controls, the [GPMC\\_CONFIG1\\_i](#) register associated with a NAND device region must be initialized in asynchronous read and write modes with the parameters shown in [Table 15-227](#). Failure to comply with these settings corrupts the NAND interface protocol.

**Table 15-227. Chip-Select Configuration for NAND Interfacing**

Bit Field	Register	Value	Comments
WRAPBURST	<a href="#">GPMC_CONFIG1_i</a> [31] <sup>(1)</sup>	0	No wrap
READMULTIPLE	<a href="#">GPMC_CONFIG1_i</a> [30]	0	Single access
READTYPE	<a href="#">GPMC_CONFIG1_i</a> [29]	0	Asynchronous mode
WRITEMULTIPLE	<a href="#">GPMC_CONFIG1_i</a> [28]	0	Single access
WRITETYPE	<a href="#">GPMC_CONFIG1_i</a> [27]	0	Asynchronous mode
CLKACTIVATIONTIME	<a href="#">GPMC_CONFIG1_i</a> [26:25]	0b00	
ATTACHEDDEVICEPAGELENGTH	<a href="#">GPMC_CONFIG1_i</a> [24:23]	Don't care	Single-access mode

<sup>(1)</sup>  $i = 0$  to 7

**Table 15-227. Chip-Select Configuration for NAND Interfacing (continued)**

Bit Field	Register	Value	Comments
TIMEPARAGRANULARITY	<a href="#">GPMC_CONFIG1_i[4]</a>	0	Timing achieved with best GPMC clock granularity
GPMCFCLKDIVIDER	<a href="#">GPMC_CONFIG1_i[1:0]</a>	Don't care	Asynchronous mode

The [GPMC\\_CONFIG1\\_i](#) to [GPMC\\_CONFIG4\\_i](#) register (where  $i = 0$  to  $7$ ) associated with a NAND device region must be initialized with the correct control-signal timing value according to the NAND device timing parameters.

#### 15.4.4.13.1.2 NAND Device Command and Address Phase Control

NAND devices require multiple address programming phases. The MPU software driver is responsible for issuing the correct number of command and address program accesses, according to the device command set and the device address-mapping scheme.

NAND device-command and address-phase programming is achieved through write requests to the [GPMC\\_NAND\\_COMMAND\\_i](#) and [GPMC\\_NAND\\_ADDRESS\\_i](#) register locations ( $i = 0$  to  $7$ ) with the correct command and address values. These locations are mapped in the associated chip-select register region. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

Command and address values are not latched during the access and cannot be read back at the register location.

- Only write accesses must be issued to these locations, but the GPMC does not discard any read access. Accessing a NAND device with nOE and CLE or ALE asserted (read access) can produce undefined results.
- Write accesses to the [GPMC\\_NAND\\_COMMAND\\_i](#) register location and to the [GPMC\\_NAND\\_ADDRESS\\_i](#) register location must be posted for faster operations ( $i = 0$  to  $7$ ). The [GPMC\\_CONFIG\[0\]](#) NANDFORCEPOSTEDWRITE bit enables write accesses to these locations as posted, even if they are defined as nonposted.

A write buffer is used to store write transaction information before the external device is accessed:

- Up to eight consecutive posted write accesses can be accepted and stored in the write buffer.
- For nonposted write, the pipeline is one deep.
- An [GPMC\\_STATUS\[0\]](#) EMPTYWRITEBUFFERSTATUS bit stores the empty status of the write buffer.

[GPMC\\_NAND\\_COMMAND\\_i](#) and [GPMC\\_NAND\\_ADDRESS\\_i](#) ( $i = 0$  to  $7$ ) are 32-bit word locations, which means any 32-bit word or 16-bit word access is split into 4- or 2-byte accesses if an 8-bit wide NAND device is attached. For multiple-command phase or multiple-address phase, the software driver can use 32-bit word or 16-bit word access to these registers, but it must account for the splitting and little-endian ordering scheme. When only one byte command or address phase is required, only byte write access to [GPMC\\_NAND\\_COMMAND\\_i](#) and [GPMC\\_NAND\\_ADDRESS\\_i](#) can be used, and any of the four byte locations of the registers are valid.

The same applies to a [GPMC\\_NAND\\_COMMAND\\_i](#) and a [GPMC\\_NAND\\_ADDRESS\\_i](#) ( $i = 0$  to  $7$ ) 32-bit word write access to a 16-bit wide NAND device (split into two 16-bit word accesses). In the case of a 16-bit word write access, the MSByte of the 16-bit word value must be set according to the NAND device requirement (usually 0). Either 16-bit word location or any one of the four byte locations of the registers is valid.

#### 15.4.4.13.1.3 Command Latch Cycle

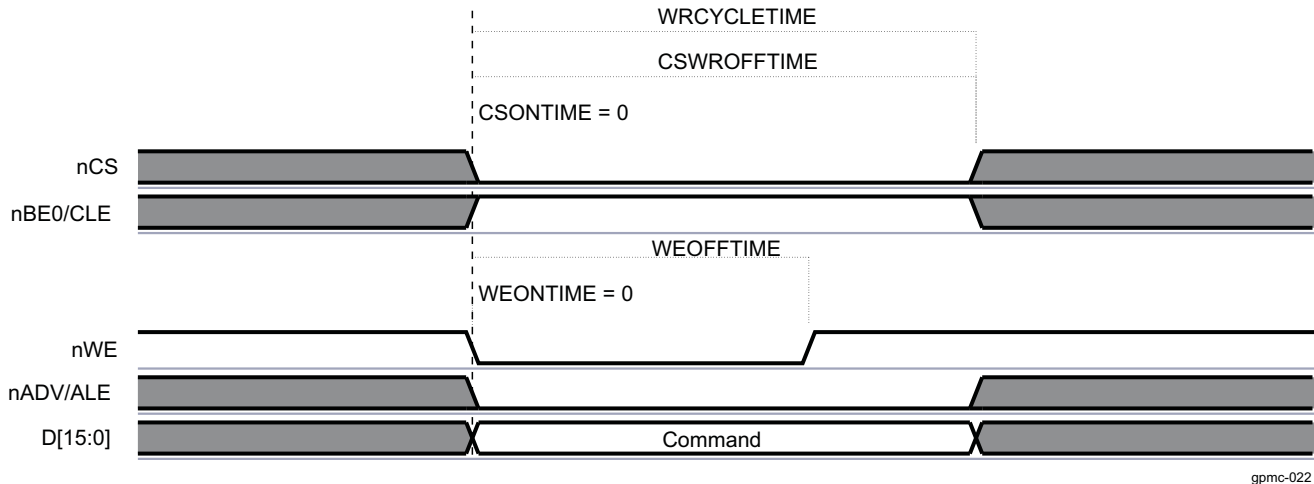

Writing data at the [GPMC\\_NAND\\_COMMAND\\_i](#) location ( $i = 0$  to  $7$ ) places the data as the NAND command value on the bus, using a regular asynchronous write access.

- nCE is controlled by the CSONTIME and CSWROFFTIME timing parameters.
- CLE is controlled by the ADVONTIME and ADVWROFFTIME timing parameters.

- nWE is controlled by the WEONTIME and WEOFFTIME timing parameters.
- ALE and nRE (nOE) are maintained inactive.

Figure 15-76 shows the NAND command latch cycle.

**Figure 15-76. NAND Command Latch Cycle**

gpmc-022

**NOTE:** CLE is shared with the nBE0 output signal and has an inverted polarity from BE0. The NAND qualifier deals with this. During the asynchronous NAND data access cycle, nBE0 (also nBE1) must not toggle, because it is shared with CLE.

NAND Flash memories do not use byte enable signals at all.

#### 15.4.4.13.1.4 Address Latch Cycle

Writing data at the [GPMC\\_NAND\\_ADDRESS\\_i](#) location ( $i = 0$  to 7) places the data as the NAND partial address value on the bus, using a regular asynchronous write access.

- nCS is controlled by the CSONTIME and CSWROFFTIME timing parameters.
- ALE is controlled by the ADVONTIME and ADVWROFFTIME timing parameters.
- nWE is controlled by the WEONTIME and WEOFFTIME timing parameters.
- CLE and nRE (nOE) are maintained inactive.

Figure 15-77 shows the NAND address latch cycle.

Figure 15-77. NAND Address Latch Cycle

**NOTE:** ALE is shared with the nADV output signal and has an inverted polarity from ADV. The NAND qualifier deals with this. During the asynchronous NAND data access cycle, ALE is kept stable.

#### 15.4.4.13.1.5 NAND Device Data Read and Write Phase Control in Stream Mode

NAND device data read and write accesses are achieved through a read or write request to the chip-select-associated memory region at any address location in the region or through a read or write request to the `GPMC_NAND_DATA_i` location ( $i = 0$  to 7) mapped in the chip-select-associated control register region. `GPMC_NAND_DATA_i` is not a true register, but an address location to enable nRE or nWE signal control. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

Reading data from the `GPMC_NAND_DATA_i` location or from any location in the associated chip-select memory region activates an asynchronous read access.

- nCS is controlled by the CSONTIME and CSRDOFFTIME timing parameters.
- nRE is controlled by the OEONTIME and OEOFFTIME timing parameters.
- To take advantage of nRE high-to-data invalid minimum timing value, the RDACCESSTIME can be set so that data are effectively captured after nRE deassertion. This allows optimization of NAND read access cycle time completion. For optimal timing parameter settings, see the NAND device and the device IC timing parameters.

ALE, CLE, and nWE are maintained inactive.

Figure 15-78 shows the NAND data read cycle.

**Figure 15-78. NAND Data Read Cycle**

gpmc-024

Writing data to the [GPMC\\_NAND\\_DATA\\_i](#) location or to any location in the associated chip-select memory region activates an asynchronous write access.

- **nCS** is controlled by the **CS ONTIME** and **CSWROFFTIME** timing parameters.
- **nWE** is controlled by the **WE ONTIME** and **WEOFFTIME** timing parameters.
- **ALE**, **CLE**, and **nRE** (**nOE**) are maintained inactive.

Figure 15-79 shows the NAND data write cycle.

**Figure 15-79. NAND Data Write Cycle**

gpmc-025

#### 15.4.4.13.1.6 NAND Device General Chip-Select Timing Control Requirement

For most NAND devices, read data access time is dominated by **nCS**-to-data-valid timing and has faster **nRE**-to-data-valid timing. Successive accesses with **nCS** deassertions between accesses are affected by this timing constraint. Because accesses to a NAND device can be interleaved with other chip-select accesses, there is no certainty that **nCS** always stays low between two accesses to the same chip-select. Moreover, an **nCS** deassertion time between the same chip-select NAND accesses is likely to be required as follows: the **nCS** deassertion requires programming **CYCLETIME** and **RDACCESSTIME** according to the **nCS**-to-data-valid critical timing.

To get full performance from NAND read and write accesses, the prefetch engine can dynamically reduce RDCYCLETIME, WRCYCLETIME, RDACCESSTIME, WRACCESSTIME, CSRDOFFTIME, CSWROFFTIME, ADVRDOFFTIME, ADVWROFFTIME, OEOFFTIME, and WEOFFTIME on back-to-back NAND accesses (to the same memory) and suppress the minimum nCS high pulse width between accesses. For more information about optimal prefetch engine access, see [Section 15.4.4.13.4, Prefetch and Write-Posting Engine](#).

Some NAND devices require minimum write-to-read idle time, especially for device-status read accesses following status-read command programming (write access). If such write-to-read transactions are used, a minimum nCS high pulse width must be set. For this, CYCLE2CYCLESAMEECSEN and CYCLE2CYCLEDELAY must be set according to the appropriate timing requirement to prevent any timing violation.

NAND devices usually have an important nRE high to data bus in tristate mode. This requires a bus turnaround setting (BUSTURNAROUND = 1), so that the next access to a different chip-select is delayed until the BUSTURNAROUND delay completes. Back-to-back NAND read accesses to the same NAND Flash are not affected by the programmed bus turnaround delay.

### **15.4.4.13.1.7 Read and Write Access Size Adaptation**

#### **15.4.4.13.1.7.1 8-bit wide NAND Device**

Host 16-bit word and 32-bit word read and write access requests to a chip-select associated with an 8-bit wide NAND device are split into successive read and write byte accesses to the NAND memory device. Byte access is ordered according to little-endian organization. A NAND 8-bit wide device must be interfaced on the D0D7 interface bus lane. GPMC data accesses are justified on this bus lane when the chip-select is associated with an 8-bit wide NAND device.

#### **15.4.4.13.1.7.2 16-bit wide NAND Device**

Host 32-bit word read and write access requests to a chip-select associated with a 16-bit wide NAND device are split into successive read and write 16-bit word accesses to the NAND memory device. 16-bit word access is ordered according to little-endian organization.

Host byte read and write access requests to a 16-bit wide NAND device are completed as 16-bit accesses on the device itself, because there is no byte-addressing capability on 16-bit wide NAND devices. This means that the NAND device address pointer is incremented on a 16-bit word basis and not on a byte basis. For a read access, only the requested byte is given back to the host, but the remaining byte is not stored or saved by the GPMC, and the next byte or 16-bit word read access gets the next 16-bit word NAND location. For a write access, the invalid byte part of the 16-bit word is driven to FF, and the next byte or 16-bit word write access programs the next 16-bit word NAND location.

Generally, byte access to a 16-bit wide NAND device should be avoided, especially when ECC calculation is enabled. 8-bit or 16-bit ECC-based computations are corrupted by a byte read to a 16-bit wide NAND device, because the nonrequested byte is considered invalid on a read access (not captured on the external data bus; FF is fed to the ECC engine) and is set to FF on a write access.

Host requests (read/write) issued in the chip-select memory region are translated in successive single or split accesses (read/write) to the attached device. Therefore, incrementing 32-bit burst requests are translated in multiple 32-bit sequential accesses following the access adaptation of the 32-bit to 8- or 16-bit device.

### **15.4.4.13.2 NAND Device-Ready Pin**

The NAND memory device provides a ready pin to indicate data availability after a block/page opening and to indicate that data programming is complete. The ready pin can be connected to one of the WAIT GPMC input pins; data read accesses must not be tried when the ready pin is sampled inactive (device is not ready) even if the associated chip-select WAITREADMONITORING bit field is set. The duration of the NAND device busy state after the block/page opening is so long (up to 50 micro second) that accesses occurring when the ready pin is sampled inactive can stall GPMC access and eventually cause a system time-out.

**NOTE:** If a read access to a NAND flash is done using the wait monitoring mode, the device is blocked during a page opening, and so is the GPMC. If the correct settings are used, other chip-selects can be used while the memory processes the page opening command.

To avoid a time-out caused by a block/page opening delay in NAND flash, disable the wait pin monitoring for read and write accesses (that is, set the [GPMC\\_CONFIG1\\_i\[21\]](#) WAITWRITEMONITORING and [GPMC\\_CONFIG1\\_i\[22\]](#) WAITREADMONITORING bits to 0, where  $i = 0$  to 7), and use one of the following methods instead:

- Use software to poll the WAITnSTATUS bit ( $n = 0$  to 3) of the [GPMC\\_STATUS](#) register.
- Configure an interrupt that is generated on the WAIT signal change (through the [GPMC\\_IRQENABLE](#) register bits[11:8]).

Even if the READWAITMONITORING bit is not set, the external memory nR/B pin status is captured in the programmed WAIT bit in the [GPMC\\_STATUS](#) register.

The READWAITMONITORING bit method must be used for other memories than NAND flash, if they require the use of a WAIT signal.

#### 15.4.4.13.2.1 Ready Pin Monitored by Software Polling

The ready signal state can be monitored through the [GPMC\\_STATUS](#) WAITxSTATUS bit ( $x = 0$  or 1). The software must monitor the ready pin only when the signal is declared valid. Refer to the NAND device timing parameters to set the correct software temporization to monitor ready only after the invalid window is complete from the last read command written to the NAND device.

#### 15.4.4.13.2.2 Ready Pin Monitored by Hardware Interrupt

Each `gpmc_wait` input pin can generate an interrupt when a wait-to-no-wait transition is detected. Depending on whether the [GPMC\\_CONFIG](#) WAITxPINPOLARITY bits ( $x = 0$  or 1) is active low or active high, the wait-to-no-wait transition is a low-to-high external WAIT signal transition or a high-to-low external WAIT signal transition, respectively.

The wait transition pin detector must be cleared before any transition detection. This is done by writing 1 to the WAITxEDGEDETECTIONSTATUS bit ( $x = 0$  or 3) of the [GPMC\\_IRQSTATUS](#) register according to the `gpmc_wait` pin used for the NAND device-ready signal monitoring. To detect a wait-to-no-wait transition, the transition detector requires a wait active time detection of a minimum of two `GPMC_FCLK` cycles. Software must incorporate precautions to clear the wait transition pin detector before wait (busy) time completes.

A wait-to-no-wait transition detection can issue a GPMC interrupt if the WAITxEDGEDETECTIONENABLE bit in the [GPMC\\_IRQENABLE](#) register is set and if the WAITxEDGEDETECTIONSTATUS bit field in the [GPMC\\_IRQSTATUS](#) register is set.

The WAITMONITORINGTIME field does not affect wait-to-no-wait transition time detection.

It is also possible to poll the WAITxEDGEDETECTIONSTATUS bit field in the [GPMC\\_IRQSTATUS](#) register according to the `gpmc_wait` pin used for the NAND device ready signal monitoring.

#### 15.4.4.13.3 ECC Calculator

The General Purpose Memory Controller includes an Error Code Correction (ECC) calculator circuitry that enables on the fly ECC calculation during data read or data program (that is, write) operations. The page size supported by the ECC calculator in one calculation/context is 512 bytes.

The user can choose from two different algorithms with different error correction capabilities through the [GPMC\\_ECC\\_CONFIG\[16\]](#) ECCALGORITHM bit:

1. Hamming code for 1-bit error code correction on 8- or 16-bit NAND Flash organized with page size greater than 512 bytes
2. BCH (Bose-Chaudhuri-Hocquenghem) code for 4- to 16-bit error correction

The GPMC does not directly handle the error code correction itself. During writes, the GPMC computes parity bits. During reads, the GPMC provides enough information for the processor to correct errors without reading the data buffer all over again.

The Hamming code ECC is based on a 2-dimensional (row and column) bit parity accumulation. This parity accumulation is either accomplished on the programmed number of bytes or 16-bit words read from the memory device, or written to the memory device in stream mode.

Because the ECC engine includes only one accumulation context, it can be allocated to only one chip-select at a time through the [GPMC\\_ECC\\_CONFIG\[3:1\]](#) ECCCS bit field. Even if two CS use different ECC algorithms, one the Hamming code and the other a BCH code, they must define separate ECC contexts because some of the ECC registers are common to all types of algorithms.

#### **15.4.4.13.3.1 Hamming Code**

All references to Error Code Correction (ECC) in this subsection refer to the 1-bit error correction Hamming code.

The ECC is based on a two-dimensional (row and column) bit parity accumulation known as Hamming Code. The parity accumulation is done for a programmed number of bytes or 16-bit word read from the memory device or written to the memory device in stream mode.

There is no automatic error detection or correction, and it is the software NAND driver responsibility to read the multiple ECC calculation results, compare them to the expected code value, and take the appropriate corrective actions according to the error handling strategy (ECC storage in spare byte, error correction on read, block invalidation).

The ECC engine includes a single accumulation context. It can be allocated to a single designated chip-select at a time and parallel computations on different chip-selects are not possible. Since it is allocated to a single chip-select, the ECC computation is not affected by interleaved GPMC accesses to other chip-selects and devices. The ECC accumulation is sequentially processed in the order of data read from or written to the memory on the designated chip-select. The ECC engine does not differentiate read accesses from write accesses and does not differentiate data from command or status information. It is the software responsibility to make sure only relevant data are passed to the NAND flash memory while the ECC computation engine is active.

The starting NAND page location must be programmed first, followed by an ECC accumulation context reset with an ECC enabling, if required. The NAND device accesses discussed in the following sections must be limited to data read or write until the specified number of ECC calculations is completed.

##### **15.4.4.13.3.1.1 ECC Result Register and ECC Computation Accumulation Size**

The GPMC includes up to nine ECC result registers ([GPMC\\_ECCj\\_RESULT](#),  $j = 1$  to 9) to store ECC computation results when the specified number of bytes or 16-bit words has been computed.

The ECC result registers are used sequentially; one ECC result is stored in one ECC result register on the list, the next ECC result is stored in the next ECC result register on the list, and so forth, until the last ECC computation. The [GPMC\\_ECCj\\_RESULT](#) register value is valid only when the programmed number of bytes or 16-bit words has been accumulated, which means that the same number of bytes or 16-bit words has been read from or written to the NAND device in sequence.

The [GPMC\\_ECC\\_CONTROL\[3:0\]](#) ECCPOINTER field must be set to the correct value to select the ECC result register to be used first in the list for the incoming ECC computation process. The ECCPointer can be read to determine which ECC register is used in the next ECC result storage for the ongoing ECC computation. The [GPMC\\_ECCj\\_RESULT](#) register value ( $j = 1$  to 9) can be considered valid when ECCPOINTER equals  $j + 1$ . When [GPMC\\_ECCj\\_RESULT](#) (where  $j = 9$ ) is updated, ECCPOINTER is frozen at 10, and ECC computing is stopped (ECCENABLE = 0).

The ECC accumulator must be reset before any ECC computation accumulation process. The [GPMC\\_ECC\\_CONTROL\[8\]](#) ECCCLEAR bit must be set to 1 (nonpersistent bit) to clear the accumulator and all ECC result registers.

For each ECC result (each [GPMC\\_ECCj\\_RESULT](#) register,  $j = 1$  to 9), the number of bytes or 16-bit words used for ECC computing accumulation can be selected from between two programmable values.

The ECCjRESULTSISE bits (j = 1 to 9) in the [GPMC\\_ECC\\_SIZE\\_CONFIG](#) register select which programmable size value (ECCSIZE0 or ECCSIZE1) must be used for this ECC result (stored in [GPMC\\_ECCj\\_RESULT](#)).

The ECCSIZE0 and ECCSIZE1 fields allow selection of the number of bytes or 16-bit words used for ECC computation accumulation. Any even values from 2 to 512 are allowed.

Flexibility in the number of ECCs computed and the number of bytes or 16-bit words used in the successive ECC computations enables different NAND page error-correction strategies. Usually based on 256 or 512 bytes and on 128 or 256 16-bit word, the number of ECC results required is a function of the NAND device page size. Specific ECC accumulation size can be used when computing the ECC on the NAND spare byte.

For example, with a 2 Kbyte data page 8-bit wide NAND device, eight ECCs accumulated on 256 bytes can be computed and added to one extra ECC computed on the 24 spare bytes area where the eight ECC results used for comparison and correction with the computed data page ECC are stored. The GPMC then provides nine [GPMC\\_ECCj\\_RESULT](#) registers (j= 1 to 9) to store the results. In this case, ECCSIZE0 is set to 256, and ECCSIZE1 is set to 24; the ECC[1:8]RESULTSISE bits are set to 0, and the ECC9RESULTSISE bit is set to 1.

#### 15.4.4.13.3.1.2 ECC Enabling

The [GPMC\\_ECC\\_CONFIG](#)[3:1] ECCCS field selects the allocated chip-select. The [GPMC\\_ECC\\_CONFIG](#)[0] ECCENABLE bit enables ECC computation on the next detected read or write access to the selected chip-select.

The ECCPOINTER, ECCCLEAR, ECCSIZE, ECCjRESULTSISE (where j = 1 to 9), ECC16B, and ECCCS fields must not be changed or cleared while an ECC computation is in progress.

The ECC accumulator and ECC result register must not be changed or cleared while an ECC computation is in progress.

[Table 15-228](#) describes the ECC enable settings.

**Table 15-228. ECC Enable Settings**

Bit Field	Register	Value	Comments
ECCCS	<a href="#">GPMC_ECC_CONFIG</a>	0-3	Selects the chip-select where ECC is computed
ECC16B	<a href="#">GPMC_ECC_CONFIG</a>	0/1	Selects column number for ECC calculation
ECCCLEAR	<a href="#">GPMC_ECC_CONTROL</a>	0-7	Clears all ECC result registers
ECCPOINTER	<a href="#">GPMC_ECC_CONTROL</a>	0-7	A write to this bit field selects the ECC result register where the first ECC computation is stored. Set to 1 by default.
ECCSIZE1	<a href="#">GPMC_ECC_SIZE_CONFIG</a>	0x00-0xFF	Defines ECCSIZE1
ECCSIZE0	<a href="#">GPMC_ECC_SIZE_CONFIG</a>	0x00-0xFF	Defines ECCSIZE0
ECCjRESULTSISE (j from 1 to 9)	<a href="#">GPMC_ECC_SIZE_CONFIG</a>	0/1	Selects the size of ECCn result register
ECCENABLE	<a href="#">GPMC_ECC_CONFIG</a>	1	Enables the ECC computation

#### 15.4.4.13.3.1.3 ECC Computation

The ECC algorithm is a multiple parity bit accumulation computed on the odd and even bit streams extracted from the byte or Word 16 streams. The parity accumulation is split into row and column accumulations, as shown in [Figure 15-80](#) and [Figure 15-81](#). The intermediate row and column parities are used to compute the upper level row and column parities. Only the final computation of each parity bit is used for ECC comparison and correction.

P1o = bit7 XOR bit5 XOR bit3 XOR bit1 on each byte of the data stream

P1e = bit6 XOR bit4 XOR bit2 XOR bit0 on each byte of the data stream

P2o = bit7 XOR bit6 XOR bit3 XOR bit2 on each byte of the data stream

P2e = bit5 XOR bit4 XOR bit1 XOR bit0 on each byte of the data stream

P4o = bit7 XOR bit6 XOR bit5 XOR bit4 on each byte of the data stream  
 P4e = bit3 XOR bit2 XOR bit1 XOR bit0 on each byte of the data stream  
 Each column parity bit is XORed with the previous accumulated value.

Figure 15-80. Hamming Code Accumulation Algorithm (1/2)

gpmc-026

For line parities, the bits of each new data are XORed together, and line parity bits are computed as described below:

$$P8e = \text{row0 XOR row2 XOR row4 XOR ... XOR row254}$$

$$P8o = \text{row1 XOR row3 XOR row5 XOR ... XOR row255}$$

$$P16e = \text{row0 XOR row1 XOR row4 XOR row5 XOR ... XOR row252 XOR row 253}$$

$$P16o = \text{row2 XOR row3 XOR row6 XOR row7 XOR ... XOR row254 XOR row 255}$$

Figure 15-81. Hamming Code Accumulation Algorithm (2/2)

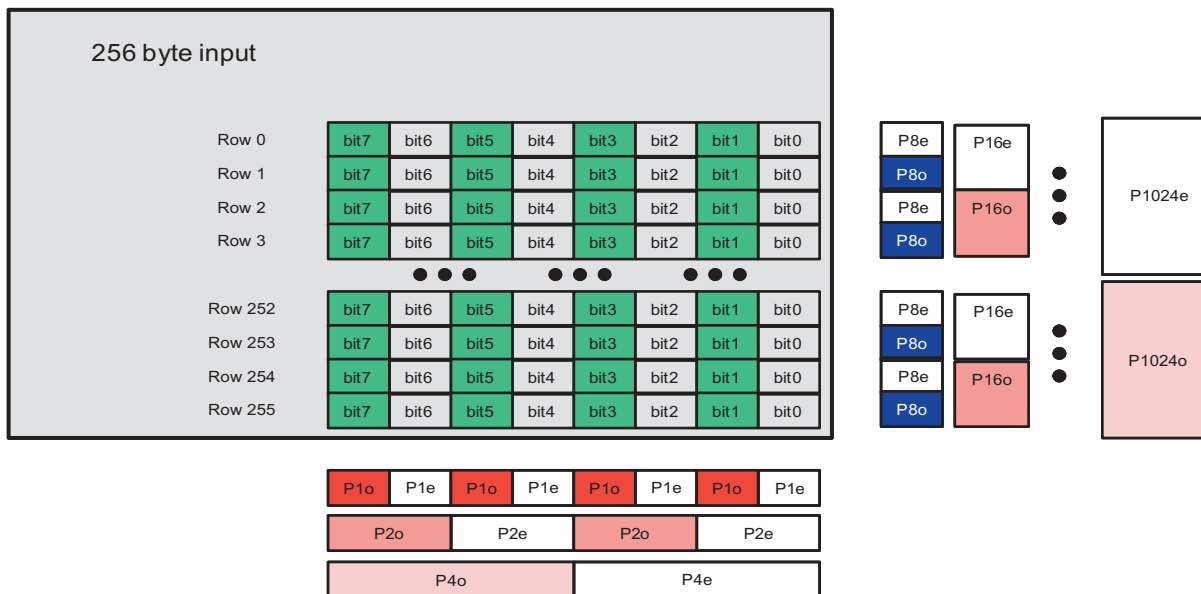

gpmc-027

Unused parity bits in the result registers are set to 0.

Figure 15-82 shows ECC computation for a 256-byte data stream (read or write). The result includes six column parity bits (P1o-P2o-P4o for odd parities, and P1e-P2e-P4e for even parities) and sixteen row parity bits (P8o-P16o-P32o--P1024o for odd parities, and P8e-P16e-P32e--P1024e for even parities).

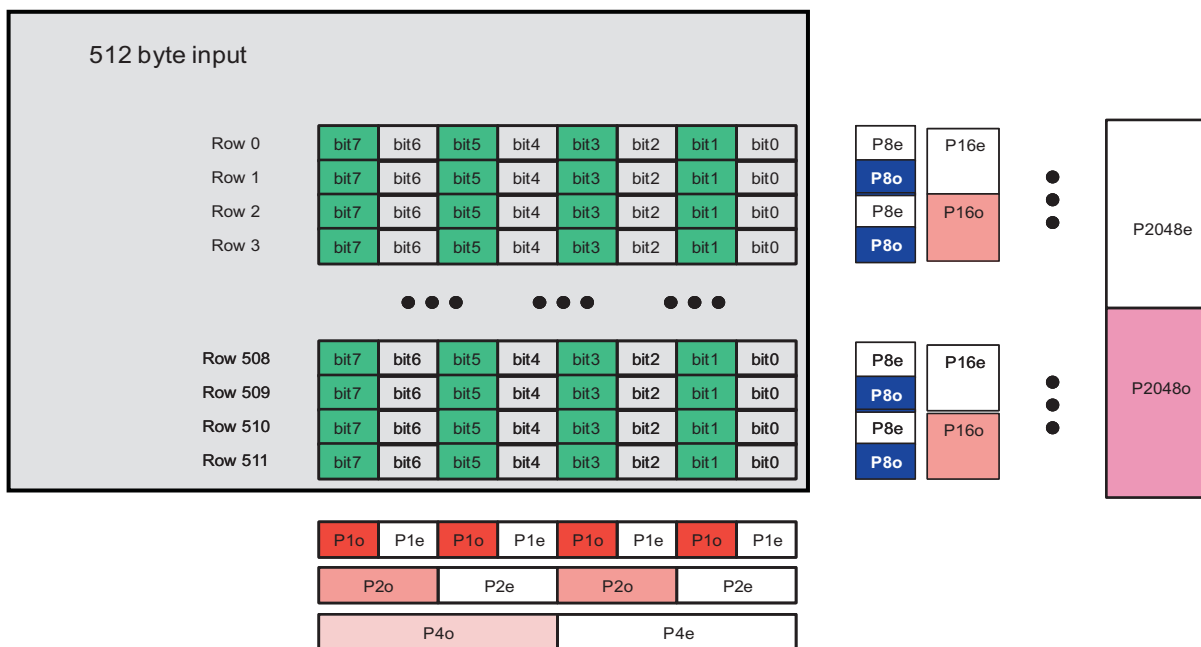

**Figure 15-82. ECC Computation for a 256-Byte Data Stream (Read or Write)**

gpmc-028

Figure 15-83 shows ECC computation for a 512-byte data stream (read or write). The result includes six column parity bits (P1o-P2o-P4o for odd parities, and P1e-P2e-P4e for even parities) and eighteen row parity bits (P8o-P16o-P32o--P1024o- - P2048o for odd parities, and P8e-P16e-P32e--P1024e- P2048e for even parities).

**Figure 15-83. ECC Computation for a 512-Byte Data Stream (Read or Write)**

gpmc-029

For a 2 Kbytes page, four 512 bytes ECC calculations plus one for the spare area are required. Results are stored in the [GPMC\\_ECCj\\_RESULT](#) registers (j = 1 to 9).

**15.4.4.13.3.1.4 ECC Comparison and Correction**

To detect an error, the computed ECC result must be XORed with the parity value stored in the spare area of the accessed page.

- If the result of this logical XOR is all 0s, no error is detected and the read data is correct.
- If every second bit in the parity result is a 1, one bit is corrupted and is located at bit address (P2048o, P1024o, P512o, P256o, P128o, P64o, P32o, P16o, P8o, P4o, P2o, P1o). The software must correct the corresponding bit.
- If only one bit in the parity result is 1, it is an ECC error and the read data is correct.

**15.4.4.13.3.1.5 ECC Calculation Based on 8-Bit Word**

The 8-bit based ECC computation is used for 8-bit wide NAND device interfacing.

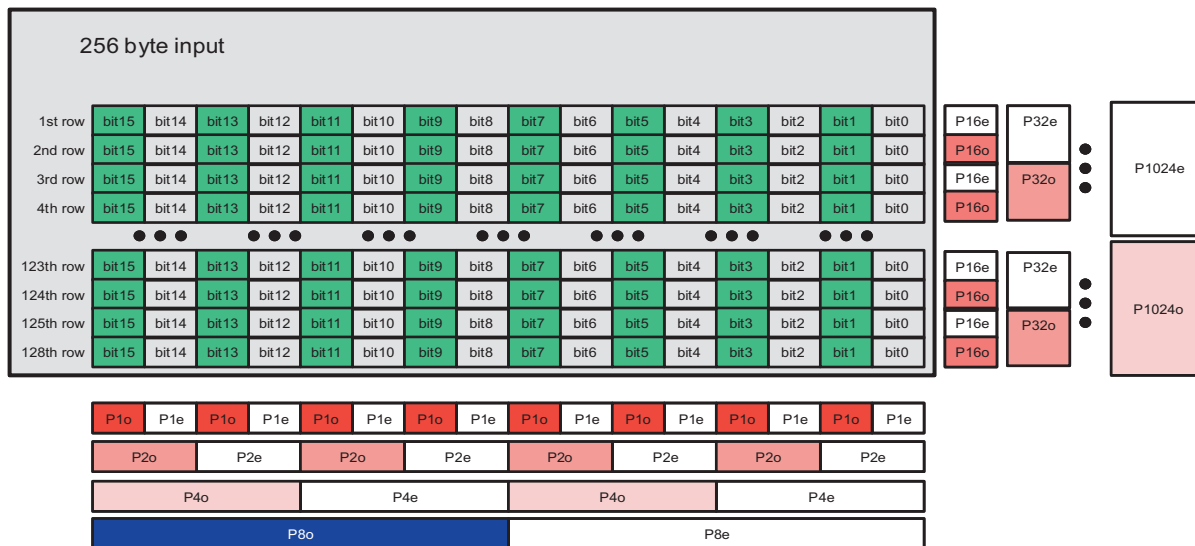

The 8-bit based ECC computation can be used for 16-bit wide NAND device interfacing to get backward compatibility on the error-handling strategy used with 8-bit wide NAND devices. In this case, the 16-bit wide data read from or written to the NAND device is fragmented into 2 bytes. According to little-endian access, the least significant bit (LSB) of the 16-bit wide data is ordered first in the byte stream used for 8-bit based ECC computation.

**15.4.4.13.3.1.6 ECC Calculation Based on 16-Bit Word**

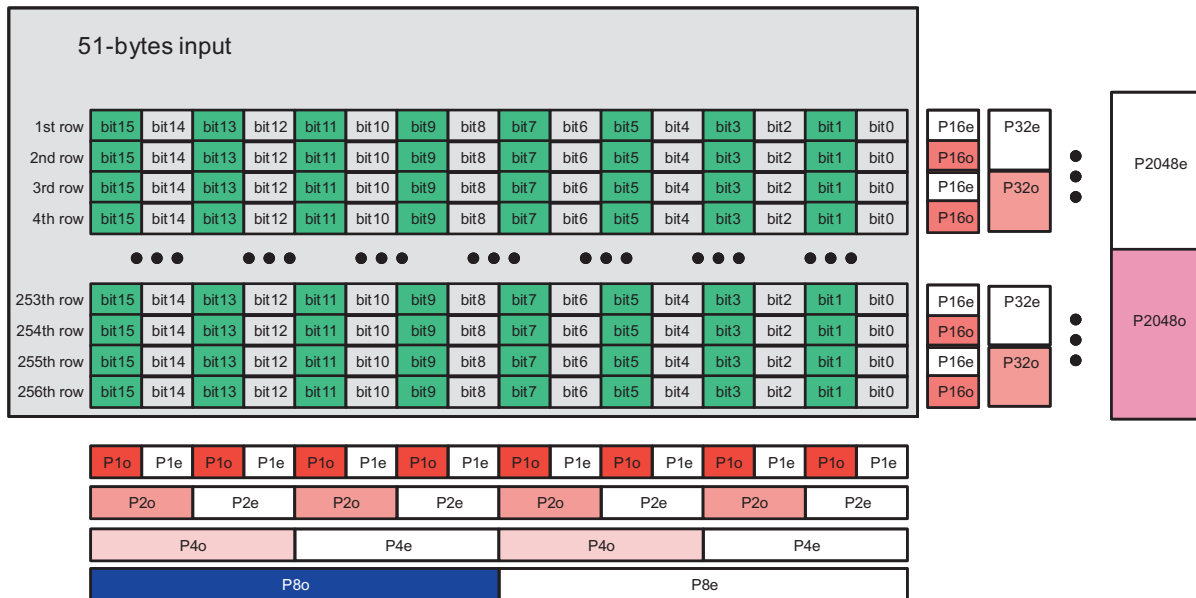

ECC computation based on a 16-bit word is used for 16-bit wide NAND device interfacing. This ECC computation is not supported when interfacing an 8-bit wide NAND device, and the [GPMC\\_ECC\\_CONFIG\[7\]](#) ECC16B bit must be set to 0 when interfacing an 8-bit wide NAND device.

The parity computation based on 16-bit words affects the row and column parity mapping. The main difference is that the odd and even parity bits P8o and P8e are computed on rows for an 8-bit based ECC while there are computed on columns for a 16-bit based ECC. [Figure 15-84](#) and [Figure 15-85](#) show a 128 Word 16 ECC computation scheme and a 256 16-bit word ECC computation scheme.

**Figure 15-84. 128 Word16 ECC Computation**

gpmc-030

**Figure 15-85. 256 Word16 ECC Computation**

gpmc-031

#### 15.4.4.13.3.2 BCH Code (Bose-Chaudhuri-Hocquenghem)

All references to Error Code Correction (ECC) in this subsection refer to the 4- to 16-bit error correction BCH code.

##### 15.4.4.13.3.2.1 Requirements

- Read and write accesses to a NAND flash take place by whole pages, in a predetermined sequence: first the data byte page itself, then some spare bytes, including the BCH ECC (and other information). The NAND IC can cache a full page, including spares, for read and write accesses. Typical page write sequence:
  - Sequential write to NAND cache of main data + spare data, for a page. ECC is calculated on the fly. Calculated ECC may be inserted on the fly in the spares, or replaced by dummy accesses.
  - When the calculated ECC is replaced by dummy accesses, it must be written to the cache in a second, separate phase. The ECC module is disabled during that time.
  - NAND writes its cache line (page) to the array.
 Typical page read sequence:
  - Sequential read of a page. ECC is calculated on the fly.
  - ECC module buffers status determines the presence of errors.
- Accesses to several memories may be interleaved by the GPMC, but only one of those memories can be a NAND using the BCH engine at a time; in other words, only one BCH calculation (for example, for a single page) can be on-going at any time. Note also that the sequential nature of NAND accesses guarantees that the data is always written / read out in the same order. BCH-relevant accesses are selected by the GPMCs chip-select.
- Each page may hold up to 4 Kbytes of data, spare bytes not included. This means up to 8 x 512-byte BCH messages. Since all the data is written / read out first, followed by the BCH ECC, this means that the BCH engine must be able to hold 8 104-bit remainders or syndromes (or smaller, 52-bit ones) at the same time.
 

The BCH module has the capacity to store all remainders internally. After the page start, an internal counter is used to detect the 512-byte sector boundaries. On those boundaries, the current remainder is stored and the divider reset for the next calculation. At the end of the page, the BCH module contains all remainders.
- NAND access cycles hold 8 or 16 bits of data each (1 or 2 bytes); Each NAND cycle takes at least 4

cycles of the GPMCs internal clock. This means the NAND flash timing parameters must define a RDCYCLETIME and a WRCYCLETIME of at least 4 clock cycles after optimization when using the BCH calculator.

- The spare area is assumed to be large enough to hold the BCH ECC, that is, to have at least a message of 13 bytes available per 512-byte sector of data. The zone of unused spare area by the ECC may or may not be protected by the same ECC scheme, by extending the BCH message beyond 512 bytes (maximum codeword is 1023-byte long, ECC included, which leaves a lot of space to cover some spares bytes).

#### 15.4.4.13.3.2.2 Memory-Mapping of the BCH Codeword

BCH encoding considers a block of data to protect as a polynomial message  $M(x)$ . In our standard case, 512 bytes of data (that is,  $2^{12}$  bits = 4096 bits) are seen as a polynomial of degree  $2^{12} - 1 = 4095$ , with parameters ranging from M0 to M4095. For 512 bytes of data, 52 bits are required for 4-bit error correction, and 104 bits are required for 8-bit error correction and 207 bits are required for 16-bit error correction. The ECC is a remainder polynomial  $R(x)$  of degree 103 (or 51, depending on the selected mode). The complete codeword  $C(x)$  is the concatenation of  $M(x)$  and  $R(x)$  as shown in [Table 15-229](#).

**Table 15-229. Flattened BCH Codeword Mapping (512 Bytes + 104 Bits)**

	Message $M(x)$			ECC $R(x)$		
Bit number	M4095	...	M0	R103	...	R0

If the message is extended by the addition of spare bytes to be protected by the same ECC, the principle is still valid. For example, a 3-byte extension of the message gives a polynomial message  $M(x)$  of degree  $((512 + 3) * 8) - 1 = 4119$ , for a total of  $3+13 = 16$  spare bytes of spare, all protected as part of the same codeword.

The message and the ECC bits are manipulated and mapped in the GPMC byte-oriented system. The ECC bits are stored in [GPMC\\_BCH\\_RESULT0\\_i](#), [GPMC\\_BCH\\_RESULT1\\_i](#), [GPMC\\_BCH\\_RESULT2\\_i](#), and [GPMC\\_BCH\\_RESULT3\\_i](#) (where  $i = 0$  to 7).

#### 15.4.4.13.3.2.2.1 Memory-Mapping of the Data Message

The data message mapping shall follow the following rules:

- Bit endianness within a byte is little-endian, that is, the bytes LS bit is also the lowest-degree polynomial parameter: a byte  $b7-b0$  (with  $b0$  the LS bit) represents a segment of polynomial  $b7 * x^{(7+i)} + b6 * x^{(6+i)} + \dots + b0 * x^i$
- The message is mapped in the NAND starting with the highest-order parameters, that is, in the lowest addresses of a NAND page.
- Byte endianness within the NANDs 16-bit words is big endian. This means that the same message mapped in 8- and 16-bit memories has the same content at the same byte address.

---

**NOTE:** The BCH module has no visibility over actual addresses. The most important point is the sequence of data word the BCH sees. However, the NAND page is always scanned incrementally in read and write accesses, and this produces the mapping patterns described below.

---

The following tables represent the mapping of the same 512-byte vector (typically a BCH message) in the NANDs memory space. Note that the byte 'address' is only an offset modulo 512 (0x200), since the same page may contain several contiguous 512-byte sectors (BCH blocks). The LSB and MSB are respectively the bits M0 and  $M(2^{12}-1)$  of the codeword mapping given above. In both cases the data vectors are aligned, that is, their boundaries coincide with the RAMs data word boundaries.

**Table 15-230. Aligned Message Byte Mapping in 8-bit NAND**

Byte offset	8-bit word
0x000	(msb) Byte 511 (0x1FF)
0x001	Byte 510 (0x1FE)
...	...
0x1FF	Byte 0 (0x0) (lsb)

**Table 15-231. Aligned Message Byte Mapping in 16-bit NAND**

Byte offset	16-bit words MSB	16-bit words LSB
0x000	Byte 510 (0x1FE)	(msb) Byte 511 (0x1FF)
0x002	Byte 508 (0x1FC)	Byte 509 (0x1FD)
...	...	...
0x1FE	Byte 0 (0x0)	(lsb) Byte 1 (0x1)

The following tables show the mapping in memory of arbitrarily-sized messages, starting on access (byte or 16-bit word) boundaries for more clarity. Note that message may actually start and stop on arbitrary nibbles. A nibble is a 4-bit entity. The unused nibbles are not discarded, and they can still be used by the BCH module, but as part of the next message section (for example, on another sectors ECC).

**Table 15-232. Aligned Nibble Mapping of Message in 8-bit NAND**

Byte offset	8-bit word	
	4-bit most significant Nibble	4-bit less significant Nibble
1	(msb) Nibble S-1	Nibble S-2
2	Nibble S-3	Nibble S-4
...	...	...
S/2 - 2	Nibble 3	Nibble 2
S/2 - 1	Nibble 1	Nibble 0 (lsb)

**Table 15-233. Misaligned Nibble Mapping of Message in 8-bit NAND**

Byte offset	8-bit word	
	4-bit most significant Nibble	4-bit less significant Nibble
1	(msb) Nibble S-1	Nibble S-2
2	Nibble S-3	Nibble S-4
...	...	...
$(S+1)/2 - 2$	Nibble 2	Nibble 1
$(S+1)/2 - 1$	Nibble 0 (lsb)	

**Table 15-234. Aligned Nibble Mapping of Message in 16-bit NAND**

Byte offset	16-bit word			
	4-bit most significant Nibble		4-bit less significant Nibble	
0	Nibble S-3	Nibble S-4	(msb) Nibble S-1	Nibble S-2
2	Nibble S-7	Nibble S-8	Nibble S-5	Nibble S-6
...	...	...	...	...
$S/2 - 4$	Nibble 5	Nibble 4	Nibble 7	Nibble 6
$S/2 - 2$	Nibble 1	Nibble 0 (lsb)	Nibble 3	Nibble 2

**Table 15-235. Misaligned Nibble Mapping of Message in 16-bit NAND (1 Unused Nibble)**

Byte offset	16-bit word			
	4-bit most significant Nibble		4-bit less significant Nibble	
0	Nibble S-3	Nibble S-4	(msb) Nibble S-1	Nibble S-2
2	Nibble S-7	Nibble S-8	Nibble S-5	Nibble S-6
...	...	...	...	...
$(S+1)/2 - 4$	Nibble 4	Nibble 3	Nibble 6	Nibble 5
$(S+1)/2 - 2$	Nibble 0 (lsb)		Nibble 2	Nibble 1

**Table 15-236. Misaligned Nibble Mapping of Message in 16-bit NAND (2 Unused Nibbles)**

Byte offset	16-bit word			
	4-bit most significant Nibble		4-bit less significant Nibble	
0	Nibble S-3	Nibble S-4	(msb) Nibble S-1	Nibble S-2
2	Nibble S-7	Nibble S-8	Nibble S-5	Nibble S-6
...	...	...	...	...
$(S+2)/2 - 4$	Nibble 3	Nibble 2	Nibble 5	Nibble 4
$(S+2)/2 - 2$			Nibble 1	Nibble 0 (lsb)

**Table 15-237. Misaligned Nibble Mapping of Message in 16-bit NAND (3 Unused Nibbles)**

Byte offset	16-bit word			
	4-bit most significant Nibble		4-bit less significant Nibble	
0	Nibble S-3	Nibble S-4	(msb) Nibble S-1	Nibble S-2
2	Nibble S-7	Nibble S-8	Nibble S-5	Nibble S-6
...	...	...	...	...
$(S+3)/2 - 4$	Nibble 2	Nibble 1	Nibble 4	Nibble 3
$(S+3)/2 - 2$			Nibble 0 (lsb)	

Note that many other cases exist than the ones represented above, for example, where the message does not start on a word boundary.

#### 15.4.4.13.3.2.2 Memory-Mapping of the ECC

The ECC (or remainder) is presented by the BCH module as a single 104-bit (or 52-bit), little-endian vector. It is up to the software to fetch those 13 bytes (or 6 bytes) from the modules interface, then store them to the NANDs spare area (page write) or to an intermediate buffer for comparison with the stored ECC (page read). There are no constraints on the ECC mapping inside the spare area: it is a softwarecontrolled operation.

However, it is advised to maintain a coherence in the respective formats of the message or the ECC remainder once they have been read out of the NAND. The error correction algorithm works from the complete codeword (concatenated message and remainder) once an error as been detected. The creation of this codeword should be made as straightforward as possible.

There are cases where the same NAND access contains both data and the ECC protecting that data. This is the case when the data/ECC boundary (which can be on any nibble) does not coincide with an access boundary. The ECC is calculated on-the-fly following the write. In that case, the write must also contain part of the ECC because it is impossible to insert the ECC on-the-fly. Instead:

- During the initial page write (BCH encoding), the ECC is replaced by dummy bits. The BCH encoder is by definition turned OFF during the ECC section, so the BCH result is unmodified.
- During a second phase, the ECC is written to the correct location, next to the actual data.
- The completed line buffer is then written to the NAND array.

#### 15.4.4.13.3.2.3 Wrapping Modes

For a given wrapping mode, the module automatically goes through a specific number of sections, as data is being fed into the module. For each section, the BCH core can be enabled (in which case the data is fed to the BCH divider) or not (in which case the BCH simply counts to the end of the section). When enabled, the data is added to the ongoing calculation for a given sector number (for example, number 0).

Wrapping modes are described below. To get a better understanding and see the real-life read and write sequences implemented with each mode, see [Section 15.4.4.13.3.2.3, Supported NAND Page Mappings and ECC Schemes](#).

For each mode:

- a sequence describes the mode in pseudo-language, with for each section the size and the buffer used for ECC processing (if ON). The programmable lengths are size, size0 and size1.
- a checksum condition is given. If the checksum condition is not respected for a given mode, the modules behavior is unpredictable. S is the number of sectors in the page; size0 and size1 are the section sizes programmed for the mode, in nibbles.

Note that wrapping modes 8, 9, 10, and 11 insert a 1-nibble padding where the BCH processing is OFF. This is intended for  $t = 4$  ECC, where ECC is 6 bytes long and the ECC area is expected to include (at least) 1 unused nibble to remain byte-aligned.

**15.4.4.13.3.2.2.4 Manual Mode (0x0)**

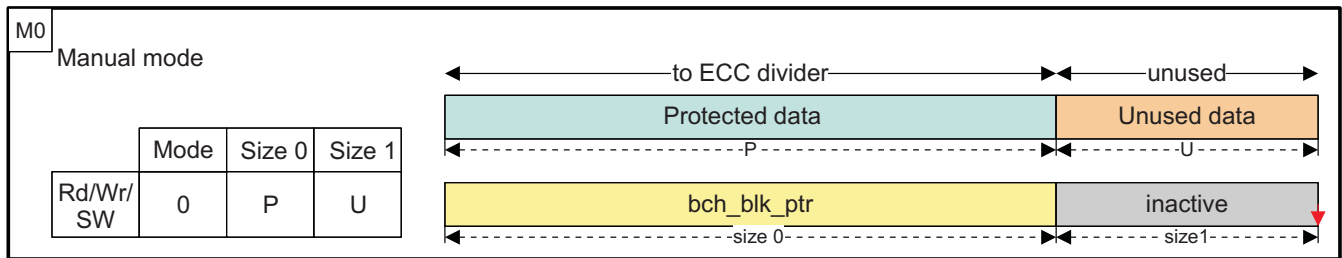

This mode is intended for short sequences, added manually to a given buffer through the software data port input. A complete page may be built out of several such sequences.

To process an arbitrary sequence of 4-bit nibbles, accesses to the software data port must be made, containing the appropriate data. If the sequence end does not coincide with an access boundary (for example, to process 5 nibbles = 20 bits in 16-bit access mode) and those nibbles need to be skipped, a number of unused nibbles must be programmed in `GPMC_ECC_SIZE_CONFIG[29:22] ECCSIZE1`. (In the same example: 5 nibbles to process + 3 to discard = 8 nibbles = exactly 2 x 16-bit accesses. Software must set:

- `GPMC_ECC_SIZE_CONFIG[19:12] ECCSIZE0 = 0x5`
- `GPMC_ECC_SIZE_CONFIG[29:22] ECCSIZE1 = 0x3`

**NOTE:** In the following figures size and size0 are the same parameter.

**Figure 15-86. Manual Mode Sequence and Mapping**

gpmc-032

Section processing sequence:

- One time with buffer
  - size0 nibbles of data, processing ON
  - size1 nibbles of unused data, processing OFF

Checksum: size0 + size1 nibbles must fit in a whole number of accesses.

In the following sections, S is the number of sectors in the page.

**15.4.4.13.3.2.2.5 Mode 0x1**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
  - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = S x (size0 + size1)

**15.4.4.13.3.2.2.6 Mode 0xA (10)**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
  - 1 nibble pad spare, processing OFF

- size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) =  $S \times (\text{size0} + 1 + \text{size1})$

#### 15.4.4.13.3.2.2.7 Mode 0x2

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing OFF
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) =  $S \times (\text{size0} + \text{size1})$

#### 15.4.4.13.3.2.2.8 Mode 0x3

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time with buffer 0
  - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) =  $\text{size0} + (S \times \text{size1})$

#### 15.4.4.13.3.2.2.9 Mode 0x7

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time with buffer 0
  - size0 nibbles spare, processing ON
- Repeat S times (no buffer used)
  - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) =  $\text{size0} + (S \times \text{size1})$

#### 15.4.4.13.3.2.2.10 Mode 0x8

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time with buffer 0
  - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
  - 1 nibble padding spare, processing OFF
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) =  $\text{size0} + (S \times (1 + \text{size1}))$

#### 15.4.4.13.3.2.2.11 Mode 0x4

Page processing sequence:

- Repeat with buffer 0 to S-1
    - 512-byte data, processing ON
  - One time (no buffer used)
    - size0 nibbles spare, processing OFF
  - Repeat with buffer 0 to S-1
    - size1 nibbles spare, processing ON
- Checksum: Spare area size (nibbles) = size0 + (S × size1)

#### **15.4.4.13.3.2.2.12 Mode 0x9**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time (no buffer used)
  - size0 nibbles spare, processing OFF
- Repeat with buffer 0 to S-1
  - 1 nibble padding spare, processing OFF
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = size0 + (S × (1+size1))

#### **15.4.4.13.3.2.2.13 Mode 0x5**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = S × (size0 + size1)

#### **15.4.4.13.3.2.2.14 Mode 0xB (11)**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
  - 1 nibble padding spare, processing OFF
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = S × (size0 + 1 + size1)

#### **15.4.4.13.3.2.2.15 Mode 0x6**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1

- size0 nibbles spare, processing ON
- Repeat S times (no buffer used)
- size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) =  $S \times (\text{size0} + \text{size1})$

#### 15.4.4.13.3.2.3 Supported NAND Page Mappings and ECC Schemes

The following rules apply throughout the entire mapping description:

- Main data area (sectors) size is hardcoded to 512 bytes.
- Spare area size is programmable.
- All page sections (of main area data bytes, protected spare bytes, unprotected spare bytes, and ECC) are defined as explained in [Section 15.4.4.13.3.2.1](#), *Memory-Mapping of the Data Message*.

Each one of the following sections shows a NAND page mapping example (per-sector spare mappings, pooled spare mapping, per-sector spare mapping, with ECC separated at the end of the page).

In the mapping diagrams, sections that belong to the same BCH codeword have the same color (blue or green); unprotected sections are not covered (orange) by the BCH scheme.

Below each mapping diagram, a write (encoding) and read (decoding: syndrome generation) sequence is given, with the number of the active buffers at each point in time (yellow). In the inactive zones (grey), no computing is taking place but the data counter is still active.

In [Figure 15-87](#) to [Figure 15-89](#), tables on the left summarize the mode, size0, size1 parameters to program for respectively write and read processing of a page, with the given mapping, where :

- P is the size of spare byte section Protected by the ECC (in nibbles)
- U is the size of spare byte section Unprotected by the ECC (in nibbles)
- E is the size of the ECC itself (in nibbles)
- S is the number of Sectors per page (2 in the current diagrams)

Each time the processing of a BCH block is complete (ECC calculation for write/encoding, syndrome generation for read/decoding, indicated by red arrows), the update pointer is pulsed. Note that the processing for block 0 can be the first or the last to complete, depending on the NAND page mapping and operation (read or write). All examples show a page size of 1kByte + spares, that is,  $S = 2$  sectors of 512 bytes. The same principles can be extended to larger pages by adding more sectors.

The actual BCH codeword size is used during the error location work to restrict the search range: by definition, errors can only happen in the codeword that was actually written to the NAND, and not in the mathematical codeword of  $n = 2^{13} - 1 = 8191$  bits. That codeword (higher-order bits) is all-zero and implicit during computations.

The actual BCH codeword size depends on the mode, on the programmed sizes and on the sector number (all sizes in nibbles):

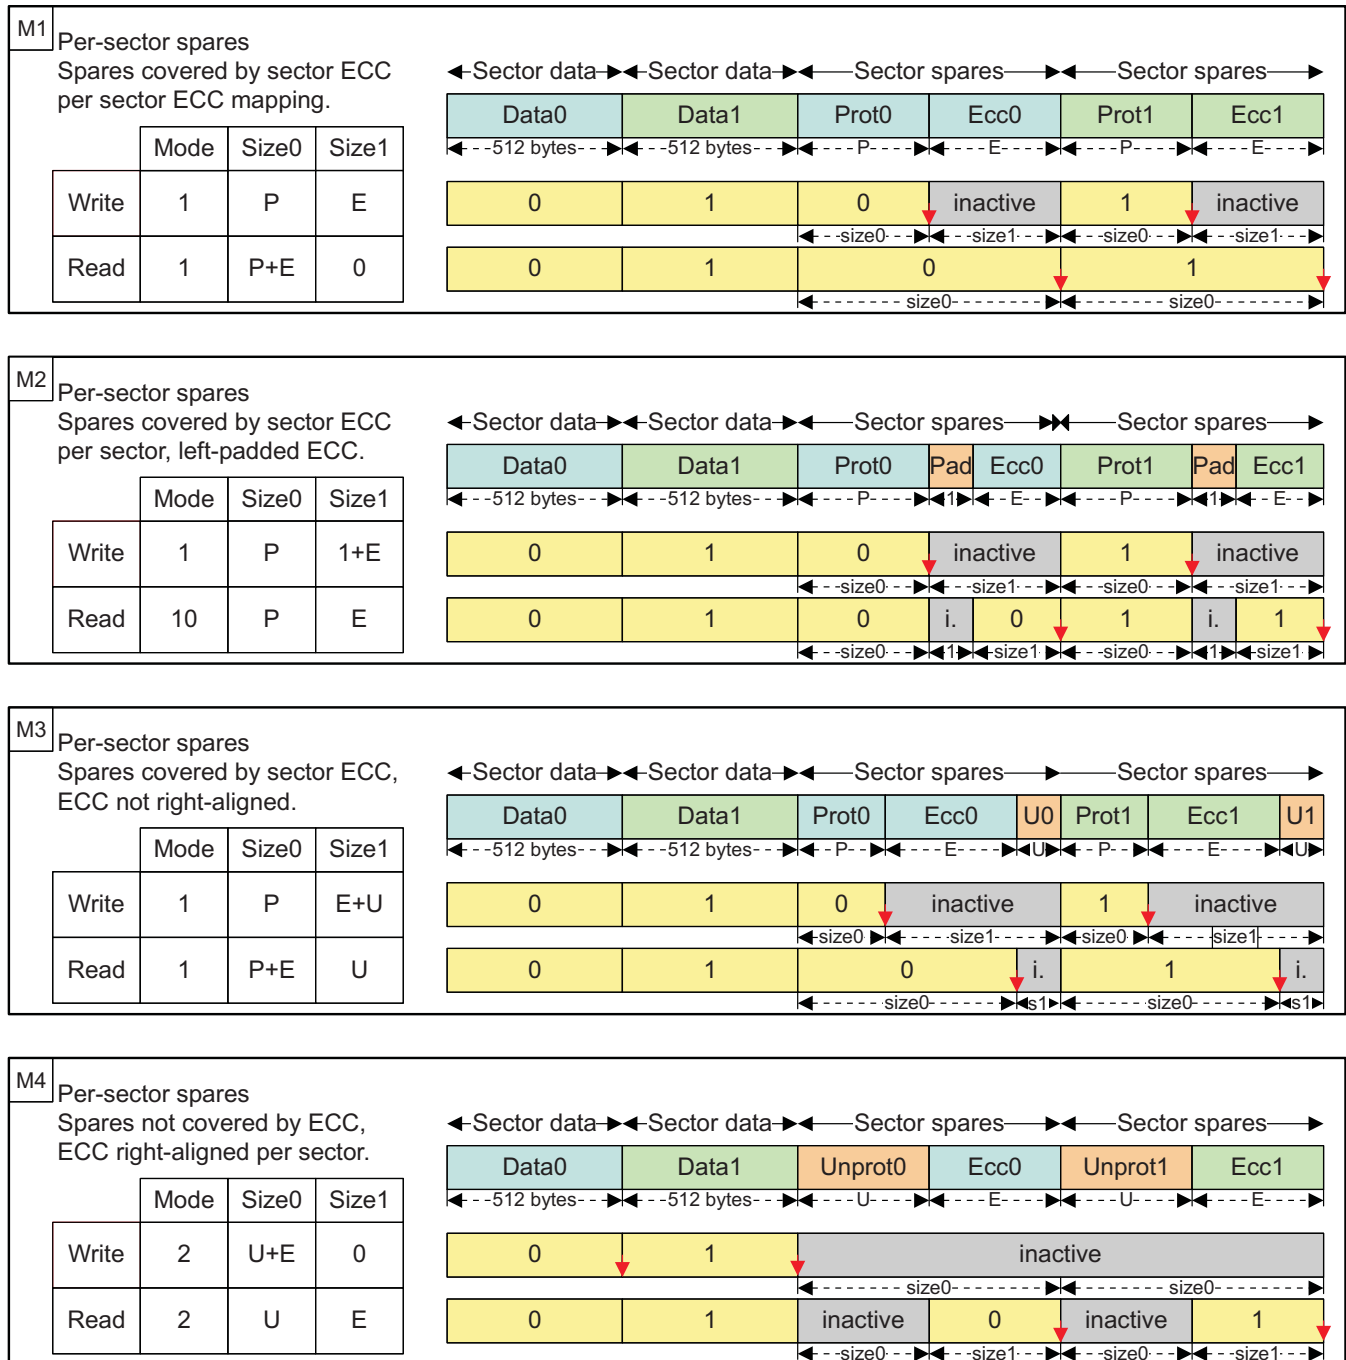

- Spares mapped and protected per sector (below: see M1-M2-M3-M9-M10):
  - all sectors:  $(512) + P + E$
- Spares pooled and protected by sector 0 (below: see M5-M6):
  - sector 0 codeword:  $(512) + P + E$
  - other sectors:  $(512) + E$
- Unprotected spares (below: see M4-M7-M8-M11-M12):
  - all codewords  $(512) + E$

#### 15.4.4.13.3.2.3.1 Per-Sector Spare Mappings

In these schemes, each 512-byte sector of the main area has its own dedicated section of the spare area. The spare area of each sector is composed of :

- ECC, which must be located after the data it protects
- other data, which may or may not be protected by the sectors ECC

Figure 15-87. NAND Page Mapping and ECC: Per-Sector Schemes

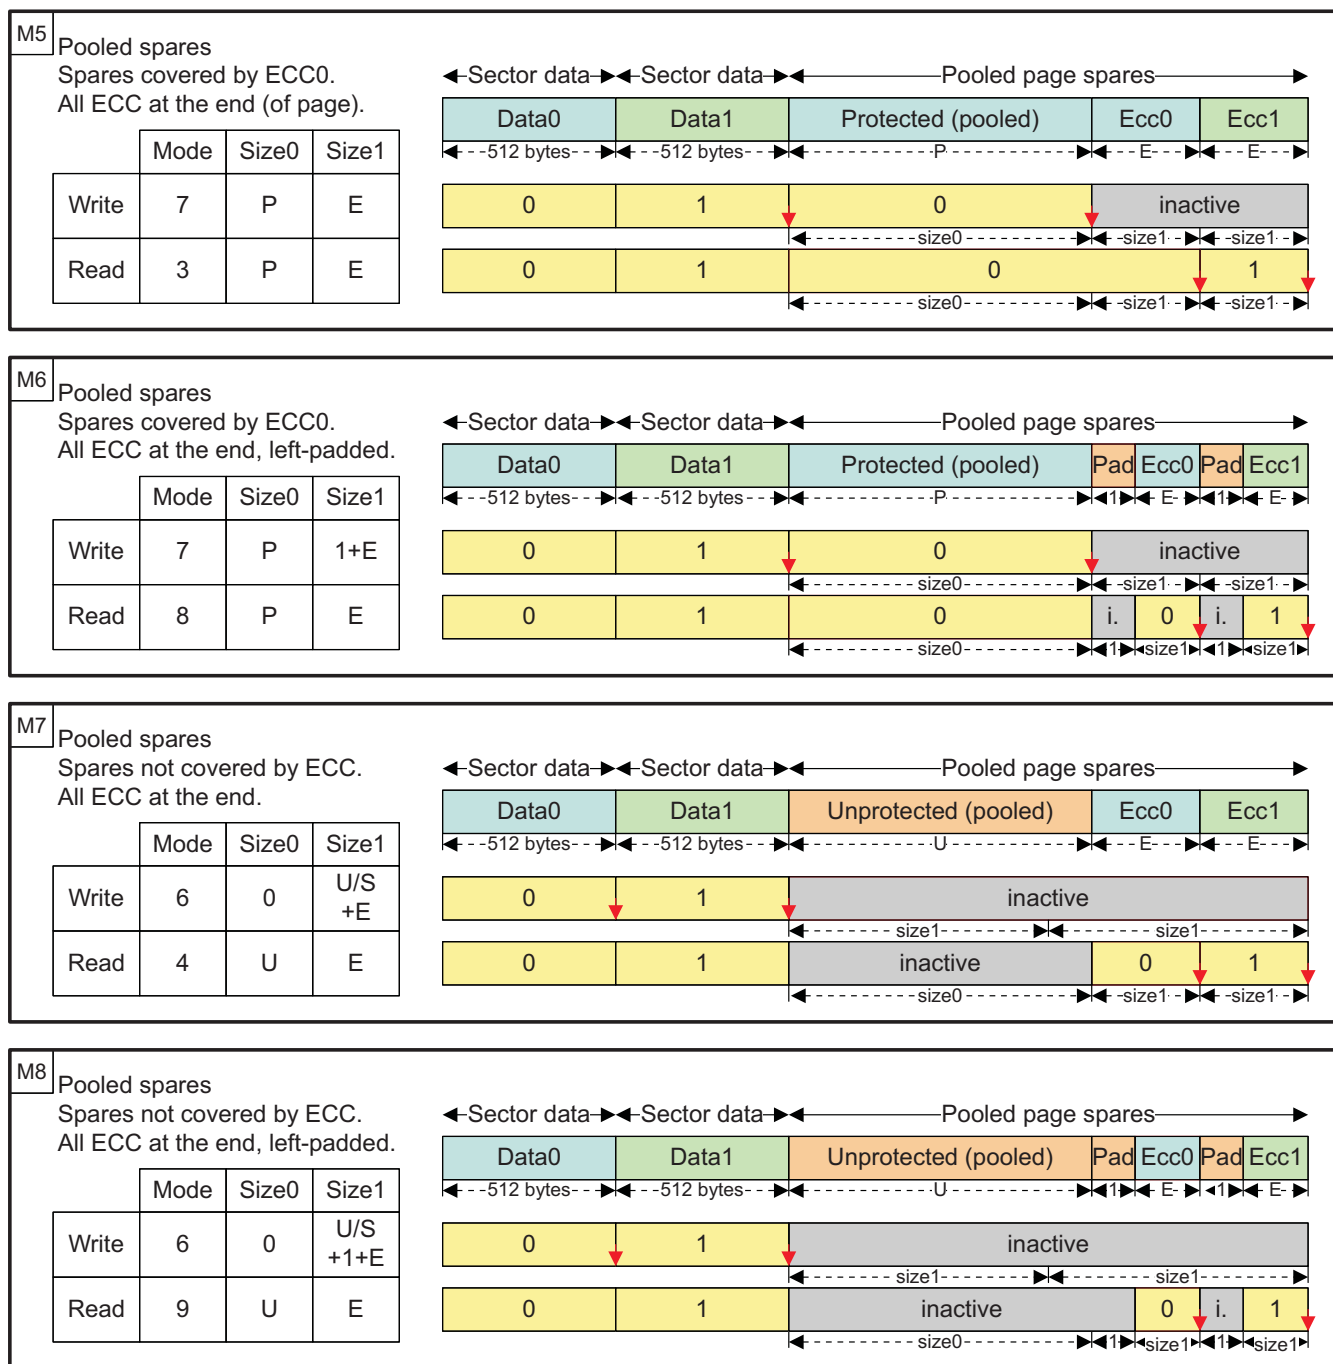

gpmc-033

### 15.4.4.13.3.2.3.2 Pooled Spare Mapping

In the schemes below, the spare area is pooled for the page.

- The ECC of each sector is aligned at the end of the spare area.
- The non-ECC spare data may or may not be covered by the ECC of sector 0

**Figure 15-88. NAND Page Mapping and ECC: Pooled Spare Schemes**

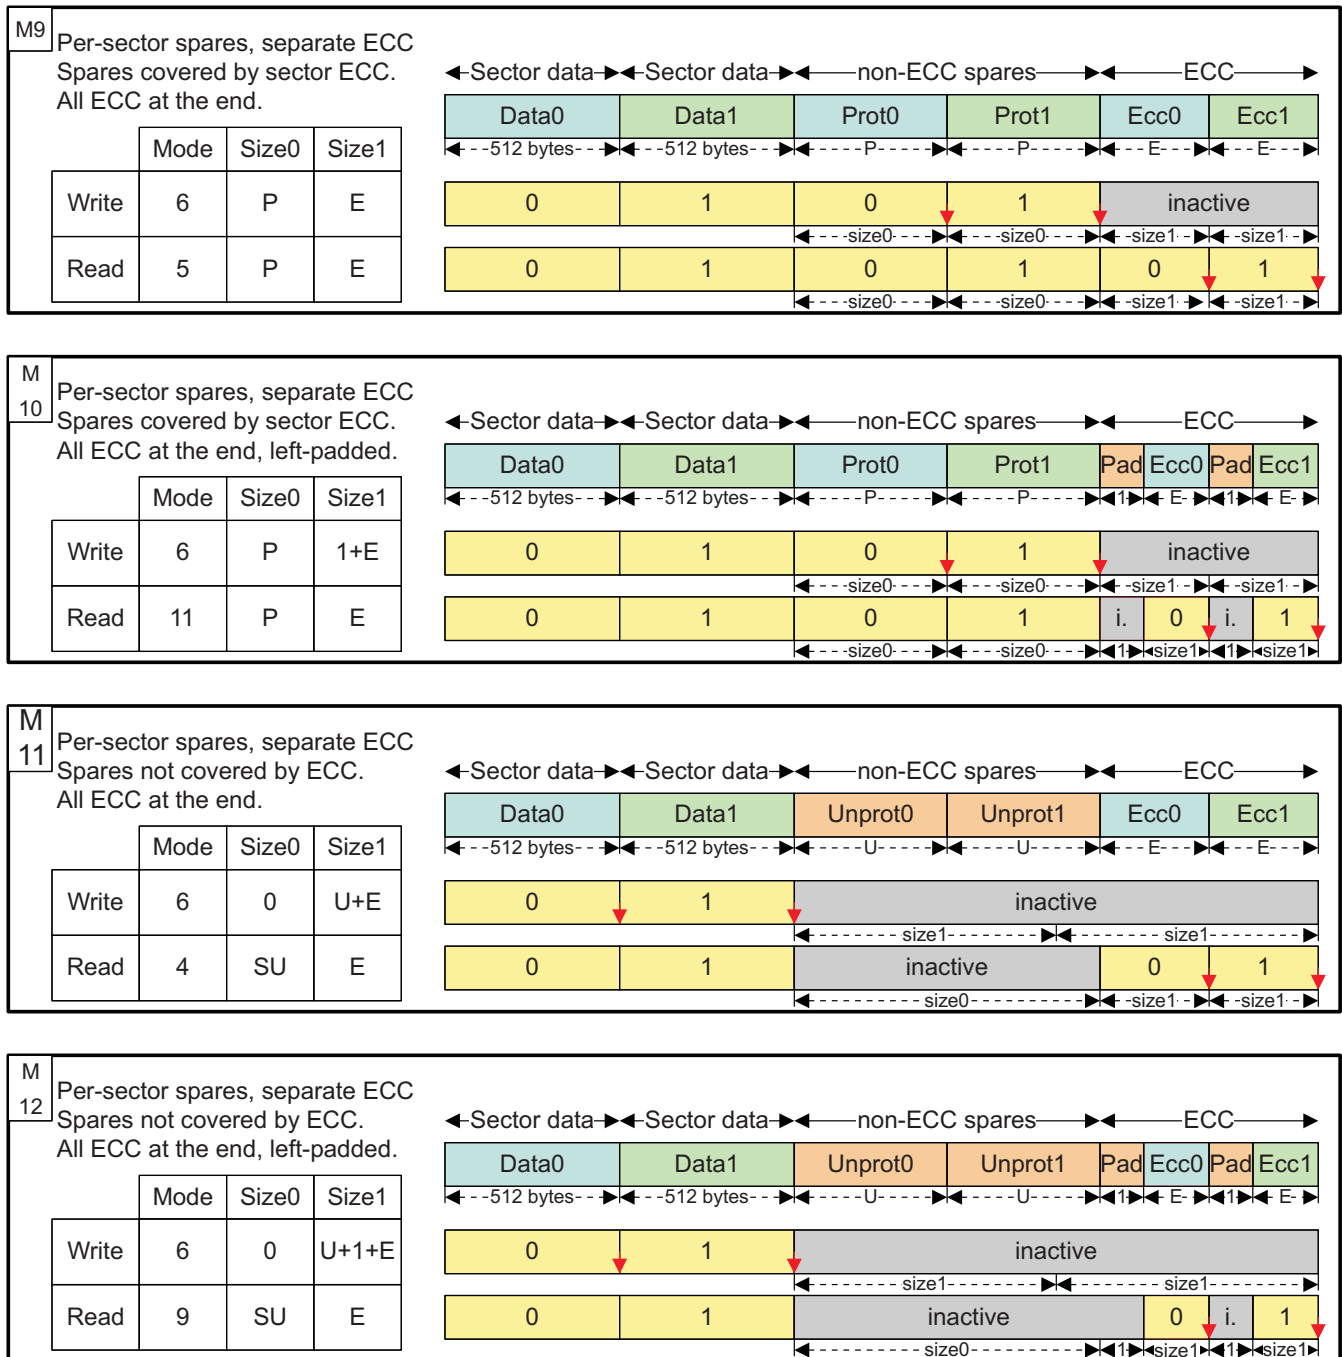

gpmc-034

**15.4.4.13.3.2.3.3 Per-Sector Spare Mapping, with ECC Separated at the End of the Page**

In these schemes, each 512-byte sector of the main area is associated with 2 sections of the spare area.

- ECC section, all aligned at the end of the page
- other data section, aligned before the ECCs, each of which may or may not be protected by its sectors ECC

Figure 15-89. NAND Page Mapping and ECC: Per-Sector Schemes, with Separate ECC

gpmc\_035

#### 15.4.4.13.4 Prefetch and Write-Posting Engine

NAND device data access cycles are usually much slower than the MPU system frequency; such NAND read or write accesses issued by the processor will impact the overall system performance, especially considering long read or write sequences required for NAND page loading or programming. To minimize this effect on system performance, the GPMC includes a prefetch and write-posting engine, which can be used to read from or write to any chip-select location in a buffered manner.

The prefetch and write-posting engine is a simplified embedded-access requester that presents requests to the access engine on a user-defined chip-select target. The access engine interleaves these requests with any request coming from the L3 interface; as a default the prefetch and write-posting engine has the lowest priority.

The prefetch and write-posting engine is dedicated to data-stream access (as opposed to random data access); thus, it is primarily dedicated to NAND support. The engine does not include an address generator; the request is limited to chip-select target identification. It includes a 64-byte FIFO associated with a DMA request synchronization line, for optimal DMA-based use.

The prefetch and write-posting engine uses an embedded 64 bytes (32 16-bit word) FIFO to prefetch data from the NAND device in read mode (prefetch mode) or to store host data to be programmed into the NAND device in write mode (write-posting mode). The FIFO draining and filling (read and write) can be controlled either by the MPU through interrupt synchronization (an interrupt is triggered whenever a programmable threshold is reached) or the sDMA through DMA request synchronization, with a programmable request byte size in both prefetch or posting mode.

The prefetch and write-posting engine includes a single memory pool. Therefore, only one mode, read or write, can be used at any given time. In other words, the prefetch and write-posting engine is a single-context engine that can be allocated to only one chip-select at a time for a read prefetch or a write-posting process.

The engine does not support atomic command and address phase programming and is limited to linear memory read or write access. In consequence, it is limited to NAND data-stream access. The engine relies on the MPU NAND software driver to control block and page opening with the correct data address pointer initialization, before the engine can read from or write to the NAND memory device.

Once started, the engine data reads and writes sequencing is solely based on FIFO location availability and until the total programmed number of bytes is read or written.

Any host-concurrent accesses to a different chip-select are correctly interleaved with ongoing engine accesses. The engine has the lowest priority access so that host accesses to a different chip-select do not suffer a large latency.

A round-robin arbitration scheme can be enabled to ensure minimum bandwidth to the prefetch and write-posting engine in the case of back-to-back direct memory requests to a different chip-select. If the [GPMC\\_PREFETCH\\_CONFIG1\[23\] PFPWENROUNDROBIN](#) bit is enabled, the arbitration grants the prefetch and write posting engine access to the GPMC bus for a number of requests programmed in the [GPMC\\_PREFETCH\\_CONFIG1\[19:16\] PFPWWEIGHTEDPRIO](#) field.

The prefetch/write-posting engine read or write request is routed to the access engine with the chip-select destination ID. After the required arbitration phase, the access engine processes the request as a single access with the data access size equal to the device size specified in the corresponding chip-select configuration.

---

**NOTE:** The destination chip-select configuration must be set to the NAND protocol-compatible configuration for which address lines are not used (the address bus is not changed from its current value). Selecting a different chip-select configuration can produce undefined behavior.

---

#### 15.4.4.13.4.1 General Facts About the Engine Configuration

The engine can be configured only if the [GPMC\\_PREFETCH\\_CONTROL\[0\] STARTENGINE](#) bit is deasserted.

The engine must be correctly configured in prefetch or write-posting mode and must be linked to a NAND chip-select before it can be started. The chip-select is linked using the [GPMC\\_PREFETCH\\_CONFIG1\[26:24\] ENGINECSSELECTOR](#) field.

In both prefetch and write-posting modes, the engine respectively uses byte or 16-bit word access requests for an 8- or 16-bit-wide NAND device attached to the linked chip-select. The FIFOTHRESHOLD and TRANSFERCOUNT fields must be programmed accordingly as a number of bytes.

When the [GPMC\\_PREFETCH\\_CONFIG1\[7\] ENABLEENGINE](#) bit is set, the FIFO entry on the L3 interconnect port side is accessible at any address in the associated chip-select memory region. When the [ENABLEENGINE](#) bit is set, any host access to this chip-select is rerouted to the FIFO input. Directly accessing the NAND device linked to this chip-select from the host is still possible through the [GPMC\\_NAND\\_COMMAND\\_i](#), [GPMC\\_NAND\\_ADDRESS\\_i](#), and [GPMC\\_NAND\\_DATA\\_i](#) registers (where  $i = 0$  to 7).

The FIFO entry on the L3 interconnect port can be accessed with byte, 16-bit word, or 32-bit word access size, according to little-endian format, even though the FIFO input is 32 bits wide.

The FIFO control is made easier through the use of interrupts or DMA requests associated with the [FIFOTHRESHOLD](#) bit field. The [GPMC\\_PREFETCH\\_STATUS\[30:24\] FIFOPOINTER](#) field monitors the number of available bytes to be read in prefetch mode or the number of free empty slots which can be written in write-posting mode. The [GPMC\\_PREFETCH\\_STATUS\[13:0\] COUNTVALUE](#) field monitors the number of remaining bytes to be read or written by the engine according to the [TRANSFERCOUNT](#) value. The [FIFOPOINTER](#) and [COUNTVALUE](#) bit fields are always expressed as a number of bytes even if a 16-bit wide NAND device is attached to the linked chip-select.

In prefetch mode, when the [FIFOPOINTER](#) equals 0, that is, the FIFO is empty, a host read access receives the byte last read from the FIFO as its response. In case of 32-bit word or 16-bit word read accesses, the last byte read from the FIFO is copied the required number of times to fit the requested word size. In write-posting mode, when the [FIFOPOINTER](#) equals 0, that is, the FIFO is full, a host write overwrites the last FIFO byte location. There is no underflow or overflow error reporting in the GPMC.

#### 15.4.4.13.4.2 Prefetch Mode

The prefetch mode is selected when the [GPMC\\_PREFETCH\\_CONFIG1\[0\] ACCESSMODE](#) bit is cleared.

The MPU NAND software driver must issue the block and page opening (READ) command with the correct data address pointer initialization before the engine can be started to read from the NAND memory device. The engine is started by asserting the [GPMC\\_PREFETCH\\_CONTROL\[0\] STARTENGINE](#) bit. The [STARTENGINE](#) bit automatically clears when the prefetch process completes.

If required, the ECC calculator engine must be initialized (that is, reset, configured, and enabled) before the prefetch engine is started, so that the ECC is correctly computed on all data read by the prefetch engine.

When the [GPMC\\_PREFETCH\\_CONFIG1\[3\] SYNCHROMODE](#) bit is cleared, the prefetch engine starts requesting data as soon as the [STARTENGINE](#) bit is set. If using this configuration, the host must monitor the NAND device-ready pin so that it only sets the [STARTENGINE](#) bit when the NAND device is in a ready state, meaning data is valid for prefetching.

When the [SYNCHROMODE](#) bit is set, the prefetch engine starts requesting data when an active to inactive wait signal transition is detected. The transition detector must be cleared before any transition detection; see [Section 15.4.4.13.2.2, Ready Pin Monitored by Hardware Interrupt](#). The [GPMC\\_PREFETCH\\_CONFIG1\[5:4\] WAITPINSELECTOR](#) field selects which `gpmc_wait` pin edge detector triggers the prefetch engine in this synchronized mode.

If the [STARTENGINE](#) bit is set after the NAND address phase (page opening command), the engine is effectively started only after the actual NAND address phase completion. To prevent GPMC stall during this NAND address phase, set the [STARTENGINE](#) bit field before NAND address phase completion when in synchronized mode. The prefetch engine will start when an active to inactive wait signal transition is detected. The [STARTENGINE](#) bit is automatically cleared on prefetch process completion.

The prefetch engine issues a read request to fill the FIFO with the amount of data specified by [GPMC\\_PREFETCH\\_CONFIG2\[13:0\] TRANSFERCOUNT](#) field.

**Table 15-238. Prefetch Mode Configuration**

Bit Field	Register	Value	Comments
STARTENGINE	<a href="#">GPMC_PREFETCH_CONTROL[0]</a>	0	Prefetch engine can be configured only if <a href="#">STARTENGINE</a> is set to 0.
ENGINECSSELECTOR	<a href="#">GPMC_PREFETCH_CONFIG1[26:24]</a>	0 to 3	Selects the chip-select associated with a NAND device where the prefetch engine is active.

**Table 15-238. Prefetch Mode Configuration (continued)**

Bit Field	Register	Value	Comments
ACCESSMODE	<a href="#">GPMC_PREFETCH_CONFIG1</a> [0]	0	Selects prefetch mode
FIFOTHRESHOLD	<a href="#">GPMC_PREFETCH_CONFIG1</a> [14:8]		Selects the maximum number of bytes read or written by the host on DMA or interrupt request
TRANSFERCOUNT	<a href="#">GPMC_PREFETCH_CONFIG2</a> [13:0]		Selects the number of bytes to be read or written by the engine to the selected chip-select
SYNCHROMODE	<a href="#">GPMC_PREFETCH_CONFIG1</a> [3]	0/1	Selects when the engine starts the access to the chip-select
WAITPINSELECT	<a href="#">GPMC_PREFETCH_CONFIG1</a> [17:16]	0 to 1	Selects wait pin edge detector (if <a href="#">GPMC_PREFETCH_CONFIG1</a> [3] SYNCHROMODE = 0x1)
ENABLEOPTIMIZEDACCESS	<a href="#">GPMC_PREFETCH_CONFIG1</a> [27]	0/1	See <a href="#">Section 15.4.4.13.4.6, Optimizing NAND Access Using the Prefetch and Write-Posting Engine</a> .
CYCLEOPTIMIZATION	<a href="#">GPMC_PREFETCH_CONFIG1</a> [30:28]		Number of clock cycle removed to timing parameters
ENABLEENGINE	<a href="#">GPMC_PREFETCH_CONFIG1</a> [7]	1	Engine enabled
STARTENGINE	<a href="#">GPMC_PREFETCH_CONTROL</a> [0]	1	Starts the prefetch engine

#### 15.4.4.13.4.3 FIFO Control in Prefetch Mode

The FIFO can be drained directly by the MPU or by an sDMA channel.

In MPU draining mode, the FIFO status can be monitored through the [GPMC\\_PREFETCH\\_STATUS](#)[30:24] FIFOPINTER field or through the [GPMC\\_PREFETCH\\_STATUS](#)[16] FIFOTHRESHOLDSTATUS bit. The FIFOPINTER indicates the current number of available data to be read; FIFOTHRESHOLDSTATUS set to 1 indicates that at least FIFOTHRESHOLD bytes are available from the FIFO.

An interrupt can be triggered by the GPMC if the [GPMC\\_IRQENABLE](#)[0] FIFOEVENTENABLE bit is set. The FIFO interrupt event is logged, and the [GPMC\\_IRQSTATUS](#)[0] FIFOEVENTSTATUS bit is set. To clear the interrupt, the MPU must read all the available bytes, or at least enough bytes to get below the programmed FIFO threshold, and the FIFOEVENTSTATUS bit must be cleared to enable further interrupt events. The FIFOEVENTSTATUS bit must always be reset prior to asserting the FIFOEVENTENABLE bit to clear any out-of-date logged interrupt event. This interrupt generation must be enabled after enabling the STARTENGINE bit.

Prefetch completion can be monitored through the [GPMC\\_PREFETCH\\_STATUS](#)[13:0] COUNTVALUE field. COUNTVALUE indicates the number of currently remaining data to be requested according to the TRANSFERCOUNT value. An interrupt can be triggered by the GPMC when the prefetch process is complete (that is, COUNTVALUE equals 0) if the [GPMC\\_IRQENABLE](#)[1] TERMINALCOUNTEVENTENABLE bit is set. At prefetch completion, the TERMINALCOUNT interrupt event is also logged, and the [GPMC\\_IRQSTATUS](#)[1] TERMINALCOUNTSTATUS bit is set. To clear the interrupt, the MPU must clear the TERMINALCOUNTSTATUS bit. The TERMINALCOUNTSTATUS bit must always be cleared prior to asserting the TERMINALCOUNTEVENTENABLE bit to clear any out-of-date logged interrupt event.

---

**NOTE:** The COUNTVALUE value is only valid when the prefetch engine is active (started), and an interrupt is only triggered when COUNTVALUE reaches 0, that is, when the prefetch engine automatically goes from an active to an inactive state.

---

The number of bytes to be prefetched (programmed in TRANSFERCOUNT) must be a multiple of the programmed FIFOTHRESHOLD to trigger the correct number of interrupts allowing a deterministic and transparent FIFO control. If this guideline is respected, the number of ISR accesses is always required and the FIFO is always empty after the last interrupt is triggered. In other cases, the TERMINALCOUNT interrupt must be used to read the remaining bytes in the FIFO (the number of remaining bytes being lower than the FIFOTHRESHOLD value).

In DMA draining mode, the [GPMC\\_PREFETCH\\_CONFIG1\[2\]](#) DMAMODE bit must be set so that the GPMC issues a DMA hardware request when at least FIFOTHRESHOLD bytes are ready to be read from the FIFO. The DMA channel owning this DMA request must be programmed so that the number of bytes programmed in FIFOTHRESHOLD is read from the FIFO during the DMA request process. The DMA request is kept active until this number of bytes has effectively been read from the FIFO, and no other DMA request can be issued until the ongoing active request is complete.

In prefetch mode, the TERMINALCOUNT event is also a source of DMA requests if the number of bytes to be prefetched is not a multiple of FIFOTHRESHOLD, the remaining bytes in the FIFO can be read by the DMA channel using the last DMA request. This assumes that the number of remaining bytes to be read is known and controlled through the DMA channel programming model.

Any potentially active DMA request is cleared when the prefetch engine goes from inactive to active prefetch (the STARTENGINE bit is set to 1). The associated DMA channel must always be enabled by the MPU after setting the STARTENGINE bit so that the out-of-date active DMA request does not trigger spurious DMA transfers.

#### 15.4.4.13.4.4 Write-Posting Mode

The write-posting mode is selected when the [GPMC\\_PREFETCH\\_CONFIG1\[0\]](#) ACCESSMODE bit is set.

The MPU NAND software driver must issue the correct address pointer initialization command (page program) before the engine can start writing data into the NAND memory device. The engine starts when the [GPMC\\_PREFETCH\\_CONTROL\[0\]](#) STARTENGINE bit is set to 1. The STARTENGINE bit clears automatically when posting completes. When all data have been written to the NAND memory device, the MPU NAND software driver must issue the second cycle program command and monitor the status for programming process completion (adding ECC handling, if required).

If used, the ECC calculator engine must be started (configured, reset, and enabled) before the posting engine is started so that the ECC parities are properly calculated on all data written by the prefetch engine to the associated chip-select.

In write-posting mode, the [GPMC\\_PREFETCH\\_CONFIG1\[3\]](#) SYNCHROMODE bit must be cleared so that posting starts as soon as the STARTENGINE bit is set and the FIFO is not empty.

If the STARTENGINE bit is set after the NAND address phase (page program command), the STARTENGINE setting is effective only after the actual NAND command completion. To prevent GPMC stall during this NAND command phase, set the STARTENGINE bit field before the NAND address completion and ensure that the associated DMA channel is enabled after the NAND address phase.

The posting engine issues a write request when valid data are available from the FIFO and until the programmed [GPMC\\_PREFETCH\\_CONFIG2\[13:0\]](#) TRANSFERCOUNT accesses have been completed.

The STARTENGINE bit clears automatically when posting completes. When all data have been written to the NAND memory device, the MPU NAND software driver must issue the second cycle program command and monitor the status for programming process completion. The closing program command phase must only be issued when the full NAND page has been written into the NAND flash write buffer, including the spare area data and the ECC parities, if used.

**Table 15-239. Write-Posting Mode Configuration**

Bit Field	Register	Value	Comments
STARTENGINE	<a href="#">GPMC_PREFETCH_CONTROL[0]</a>	0	Write-posting engine can be configured only if STARTENGINE is set to 0.
ENGINECSSELECTOR	<a href="#">GPMC_PREFETCH_CONFIG1[26:24]</a>	0 to 3	Selects the chip-select associated with a NAND device where the prefetch engine is active

**Table 15-239. Write-Posting Mode Configuration (continued)**

Bit Field	Register	Value	Comments
ACCESSMODE	<a href="#">GPMC_PREFETCH_CONFIG1</a> [0]	1	Selects write-posting mode
FIFOTHRESHOLD	<a href="#">GPMC_PREFETCH_CONFIG1</a> [14:8]		Selects the maximum number of bytes read or written by the host on DMA or interrupt request
TRANSFERCOUNT	<a href="#">GPMC_PREFETCH_CONFIG2</a> [13:0]		Selects the number of bytes to be read or written by the engine from/to the selected chip-select
SYNCHROMODE	<a href="#">GPMC_PREFETCH_CONFIG1</a> [3]	0	Engine starts the access to chip-select as soon as STARTENGINE is set.
ENABLEOPTIMIZEDACCESS	<a href="#">GPMC_PREFETCH_CONFIG1</a> [27]	0/1	See <a href="#">Section 15.4.4.13.4.6, Optimizing NAND Access Using the Prefetch and Write-Posting Engine</a> .
CYCLOPTIMIZATION	<a href="#">GPMC_PREFETCH_CONFIG1</a> [30:28]		
ENABLEENGINE	<a href="#">GPMC_PREFETCH_CONFIG1</a> [7]	1	Engine enabled
STARTENGINE	<a href="#">GPMC_PREFETCH_CONTROL</a> [0]	1	Starts the prefetch engine

#### 15.4.4.13.4.5 FIFO Control in Write-Posting Mode

The FIFO can be filled directly by the MPU or by an sDMA channel.

In MPU filling mode, the FIFO status can be monitored through the [FIFOPOINTER](#) or through the [GPMC\\_PREFETCH\\_STATUS](#)[16] [FIFOTHRESHOLDSTATUS](#) bit. [FIFOPOINTER](#) indicates the current number of available free byte places in the FIFO, and the [FIFOTHRESHOLDSTATUS](#) bit, when set, indicates that at least [FIFOTHRESHOLD](#) free byte places are available in the FIFO.

An interrupt can be issued by the GPMC if the [GPMC\\_IRQENABLE](#)[0] [FIFOEVENTENABLE](#) bit is set. When the interrupt is fired, the [GPMC\\_IRQSTATUS](#)[0] [FIFOEVENTSTATUS](#) bit is set. To clear the interrupt, the MPU must write enough bytes to fill the FIFO, or enough bytes to get below the programmed threshold, and the [FIFOEVENTSTATUS](#) bit must be cleared to get further interrupt events. The [FIFOEVENTSTATUS](#) bit must always be cleared prior to asserting the [FIFOEVENTENABLE](#) bit to clear any out-of-date logged interrupt event. This interrupt must be enabled after enabling the [STARTENGINE](#) bit.

The posting completion can be monitored through the [GPMC\\_PREFETCH\\_STATUS](#)[13:0] [COUNTVALUE](#) field. [COUNTVALUE](#) indicates the current number of remaining data to be written based on the [TRANSFERCOUNT](#) value. An interrupt is issued by the GPMC when the write-posting process completes (that is, [COUNTVALUE](#) equal to 0) if the [GPMC\\_IRQENABLE](#)[1] [TERMINALCOUNTEVENTENABLE](#) bit is set. When the interrupt is fired, the [GPMC\\_IRQSTATUS](#)[1] [TERMINALCOUNTSTATUS](#) bit is set. To clear the interrupt, the MPU must clear the [TERMINALCOUNTSTATUS](#) bit. The [TERMINALCOUNTSTATUS](#) bit must always be cleared prior to asserting the [TERMINALCOUNTEVENTENABLE](#) bit to clear any out-of-date logged interrupt event.

---

**NOTE:** The [COUNTVALUE](#) value is only valid if the write-posting engine is active and started, and an interrupt is only issued when [COUNTVALUE](#) reaches 0, that is, when the posting engine automatically goes from active to inactive.

---

In DMA filling mode, the [DMAMode](#) bit field in the [GPMC\\_PREFETCH\\_CONFIG1](#)[2] [DMAMODE](#) bit must be set so that the GPMC issues a DMA hardware request when at least [FIFOTHRESHOLD](#) bytes-free places are available in the FIFO. The DMA channel owning this DMA request must be programmed so that a number of bytes equal to the value programmed in the [FIFOTHRESHOLD](#) bit field are written into the FIFO during the DMA access. The DMA request remains active until the associated number of bytes has effectively been written into the FIFO, and no other DMA request can be issued until the ongoing active request has been completed.

Any potentially active DMA request is cleared when the prefetch engine goes from inactive to active prefetch (STARTENGINE set to 1). The associated DMA channel must always be enabled by the MPU after setting the STARTENGINE bit so that an out-of-date active DMA request does not trigger spurious DMA transfers.

In write-posting mode, the DMA or the MPU fill the FIFO with no consideration to the associated byte enables. Any byte stored in the FIFO is written into the memory device.

#### **15.4.4.13.4.6 Optimizing NAND Access Using the Prefetch and Write-Posting Engine**

Access time to a NAND memory device can be optimized for back-to-back accesses if the associated nCS signal is not deasserted between accesses. The GPMC access engine can track prefetch engine accesses to optimize the access timing parameter programmed for the allocated chip-select, if no accesses to other chip-selects (that is, interleaved accesses) occur. Similarly, the access engine also eliminates the CYCLE2CYCLEDELAY even if CYCLE2CYCLESAMEECSEN is set. This capability is limited to the prefetch and write-posting engine accesses, and MPU accesses to a NAND memory device (through the defined chip-select memory region or through the [GPMC\\_NAND\\_DATA\\_i](#) location, i = 0 to 7) are never optimized.

The [GPMC\\_PREFETCH\\_CONFIG1](#)[27] ENABLEOPTIMIZEDACCESS bit must be set to enable optimized accesses. To optimize access time, the [GPMC\\_PREFETCH\\_CONFIG1](#)[30:28] CYCLEOPTIMIZATION field defines the number of GPMC\_FCLK cycles to be suppressed from the RDCYCLETIME, WRCYCLETIME, RDACCESSTIME, WRACCESSTIME, CSOFFTIME, ADVOFFTIME, OEOFFTIME, and WEOFFTIME timing parameters.

[Figure 15-90](#) highlights that, in the case of back-to-back accesses to the NAND flash through the prefetch engine, CYCLE2CYCLESAMEECSEN is forced to 0 when using optimized accesses. The first access uses the regular timing settings for this chip-select. All accesses after this one use settings reduced by x clock cycles, x being defined by the [GPMC\\_PREFETCH\\_CONFIG1](#)[30:28] CYCLEOPTIMIZATION field.

**Figure 15-90. NAND Read Cycle Optimization Timing Description**

gpmc-036

#### 15.4.4.13.4.7 Interleaved Accesses Between Prefetch and Write-Posting Engine and Other Chip-Selects

Any on-going read or write access from the prefetch and write-posting engine is completed before an access to any other chip-select can be initiated. As a default, the arbiter uses a fixed-priority algorithm, and the prefetch and write-posting engine has the lowest priority. The maximum latency added to access starting time in this case equals the RDCYCLETIME or WRCYCLETIME (optimized or not) plus the requested BUSTURNAROUND delay for bus turnaround completion programmed for the chip-select to which the NAND device is connected to.

Alternatively, a round-robin arbitration can be used to prioritize accesses to the external bus. This arbitration scheme is enabled by setting the [GPMC\\_PREFETCH\\_CONFIG1\[23\] PFPWENROUNDROBIN](#) bit. When a request to another chip-select is received while the prefetch and write-posting engine is active, priority is given to the new request. The request processed thereafter is the prefetch and write-posting engine request, even if another interconnect request is passed in the mean time. The engine keeps control of the bus for an additional number of requests programmed in the [GPMC\\_PREFETCH\\_CONFIG1\[19:16\] PFPWWEIGHTEDPRIO](#) bit field. Control is then passed to the direct interconnect request.

As an example, the round-robin arbitration scheme is selected with PFPWWEIGHTEDPRIO set to 0x2. Considering the prefetch and write-posting engine and the interconnect interface are always requesting access to the external interface, the GPMC grants priority to the direct interconnect access for one request. The GPMC then grants priority to the engine for three requests, and finally back to the direct interconnect access, until the arbiter is reset when one of the two initiators stops initiating requests.

## **15.4.5 GPMC Basic Programming Model**

### **15.4.5.1 GPMC High-Level Programming Model Overview**

The goal of the basic high-level programming model is to introduce a top down approach to users that need to configure the GPMC module.

[Figure 15-91](#), [Table 15-240](#), [Table 15-241](#) and [Table 15-242](#) show a programming model top level diagram for the GPMC, and the description of each step. Each block of the diagram is detailed in one of the following subsections through a set of registers to configure.

Figure 15-91. Programming Model Top Level Diagram

gpmc-uc-001

**Table 15-240. GPMC Initialization**

Step	Description
Enable GPMC clocks	Module interface and functional clocks must be enabled. See <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Enable GPMC pads	Module-specific pad muxing and configuration must be set in the control module. See <a href="#">Chapter 18, Control Module</a> .
Reset GPMC	See <a href="#">Table 15-243</a>

**Table 15-241. GPMC Configuration in NOR Mode**

Step	Description
NOR Memory Type	See <a href="#">Table 15-244</a>
NOR Chip-Select Configuration	See <a href="#">Table 15-245</a>
NOR Timings Configuration	See <a href="#">Table 15-246</a>
Wait Pin Configuration	See <a href="#">Table 15-254</a>
Enable Chip-Select	See <a href="#">Table 15-255</a>

**Table 15-242. GPMC Configuration in NAND Mode**

Step	Description
NAND Memory Type	See <a href="#">Table 15-249</a>
NAND Chip-Select Configuration	See <a href="#">Table 15-250</a>
Write Operations (Asynchronous)	See <a href="#">Table 15-251</a>
Read Operations (Asynchronous)	See <a href="#">Table 15-251</a>
ECC Engine	See <a href="#">Table 15-252</a>
Prefetch and Write-Posting Engine	See <a href="#">Table 15-253</a>

Enable Chip-Select	See <a href="#">Table 15-255</a>

### 15.4.5.2 GPMC Initialization

[Table 15-271](#) describes the settings required to prepare the GPMC, that is enabling its clock, its pads, and proceeding to a GPMC reset.

**Table 15-243. Reset GPMC**

Sub-process Name	Register / Bit Field	Value
Start a software reset	<a href="#">GPMC_SYSCONFIG[1]</a> SOFTRESET	0x1
Wait until	<a href="#">GPMC_SYSSTATUS[0]</a> RESETDONE =	0x1

### 15.4.5.3 GPMC Configuration in NOR Mode

This section gives a generic configuration for parameters related to the NOR memory connected to the GPMC.

**Table 15-244. NOR Memory Type**

Sub-process Name	Register / Bit Field	Value
Set the NOR protocol	<a href="#">GPMC_CONFIG1_i[11:10]</a> DEVICETYPE	0x0
Set a device size	<a href="#">GPMC_CONFIG1_i[13:12]</a> DEVICESIZE	x
Select an address and data multiplexing protocol	<a href="#">GPMC_CONFIG1_i[9]</a> MUXADDDATA	x
Set the attached device page length	<a href="#">GPMC_CONFIG1_i[24:23]</a> ATTACHEDDEVICEPAGELENGTH	x
Set the wrapping burst capabilities	<a href="#">GPMC_CONFIG1_i[31]</a> WRAPBURST	x

**Table 15-244. NOR Memory Type (continued)**

Sub-process Name	Register / Bit Field	Value
Select a timing signals latencies factor	GPMC_CONFIG1_i[4] TIMEPARAGRANULARITY	x
Select an output clock frequency <sup>(1)</sup>	GPMC_CONFIG1_i[1:0] GPMCFCLKDIVIDER	x
Choose an output clock activation time <sup>(1)</sup>	GPMC_CONFIG1_i[26:25] CLKACTIVATIONTIME	x
Set a single or multiple access for read operations <sup>(1)</sup>	GPMC_CONFIG1_i[30] READMULTIPLE	x
Set a synchronous or asynchronous mode for read operations	GPMC_CONFIG1_i[29] READTYPE	x
Set a single or multiple access for write operations	GPMC_CONFIG1_i[28] WRITEMULTIPLE	x
Set a synchronous or asynchronous mode for write operations	GPMC_CONFIG1_i[27] WRITETYPE	x

<sup>(1)</sup> Only applies to synchronous configurations (or non-multiplexed async for the multiple access one).

**Table 15-245. NOR Chip-Select Configuration**

Sub-process Name	Register / Bit Field	Value
Select the chip-select base address	GPMC_CONFIG7_i[5:0] BASEADDRESS	x
Select the chip-select mask address	GPMC_CONFIG7_i[11:8] MASKADDRESS	x

**Table 15-246. NOR Timings Configuration**

Sub-process Name	Register / Bit Field	Value
Configure adequate timing parameters in various memory modes	See <a href="#">Section 15.4.5.6, GPMC Timing Parameters</a>	

**Table 15-247. Wait Pin Configuration**

Sub-process Name	Register / Bit Field	Value
Enable or disable wait pin monitoring for read operations	GPMC_CONFIG1_i[22] WAITREADMONITORING	x
Enable or disable wait pin monitoring for write operations	GPMC_CONFIG1_i[21] WAITWRITEMONITORING	x
Select a wait pin monitoring time	GPMC_CONFIG1_i[19:18] WAITMONITORINGTIME	x
Choose the input wait pin for the chip-select	GPMC_CONFIG1_i[17:16] WAITPINSELECT	x

**Table 15-248. Enable Chip-Select**

Sub-process Name	Register / Bit Field	Value
When all parameters are configured, enable the chip-select	GPMC_CONFIG7_i[6] CSVALID	x

#### 15.4.5.4 GPMC Configuration in NAND Mode

This section gives a generic configuration for parameters related to the NAND memory connected to the GPMC.

**Table 15-249. NAND Memory Type**

Sub-process Name	Register / Bit Field	Value
Set the NAND protocol	GPMC_CONFIG1_i[11:10] DEVICETYPE	0x2
Set a device size	GPMC_CONFIG1_i[13:12] DEVICESIZE	x
Set the address and data multiplexing protocol to non-multiplexed attached device	GPMC_CONFIG1_i[9] MUXADDDATA	0x0
Select a timing signals latencies factor	GPMC_CONFIG1_i[4] TIMEPARAGRANULARITY	x
Set a synchronous or asynchronous mode and a single or multiple access for read and write operations	See <a href="#">Section 15.4.5.5, Set Memory Access</a>	x

**Table 15-250. NAND Chip-Select Configuration**

Sub-process Name	Register / Bit Field	Value
Select the chip-select base address	<a href="#">GPMC_CONFIG7_i[5:0]</a> BASEADDRESS	x
Select the chip-select minimum granularity (16M bytes)	<a href="#">GPMC_CONFIG7_i[11:8]</a> MASKADDRESS	x

**Table 15-251. Asynchronous Read and Write Operations**

Sub-process Name	Register / Bit Field	Value
Configure adequate timing parameters in asynchronous modes	See <a href="#">Section 15.4.5.6</a> , <i>GPMC Timing Parameters</i>	

**Table 15-252. ECC Engine**

Sub-process Name	Register / Bit Field	Value
Select the ECC result register where the first ECC computation is stored (Only applies to Hamming)	<a href="#">GPMC_ECC_CONTROL[3:0]</a> ECCPOINTER	x <sup>(1)</sup>
Clear all ECC result registers	<a href="#">GPMC_ECC_CONTROL[8]</a> ECCCLEAR	Write '1' to clear.
Define ECCSIZE0 and ECCSIZE1	<a href="#">GPMC_ECC_SIZE_CONFIG[19:12]</a> ECCSIZE0 and <a href="#">[29:22]</a> ECCSIZE1	x <sup>(2)</sup>
Select the size of each of the 9 result registers (size specified by ECCSIZE0 or ECCSIZE1)	<a href="#">GPMC_ECC_SIZE_CONFIG[j-1]</a> ECCjRESULTSIZE where j = 1 to 9	x
Select the chip-select where ECC is computed	<a href="#">GPMC_ECC_CONFIG[3:1]</a> ECCCS	x
Select the Hamming code or BCH code ECC algorithm in use	<a href="#">GPMC_ECC_CONFIG[16]</a> ECCALGORITHM	x
Select word size for ECC calculation	<a href="#">GPMC_ECC_CONFIG[7]</a> ECC16B	x
If the BCH code is used, Set an error correction capability and Select a number of sectors to process	<a href="#">GPMC_ECC_CONFIG[13:12]</a> ECCBCHTSEL and <a href="#">GPMC_ECC_CONFIG[6:4]</a> ECCTOPSECTOR	x
Enable the ECC computation	<a href="#">GPMC_ECC_CONFIG[0]</a> ECCENABLE	0x1

<sup>(1)</sup> This parameter depends on the numbers of sectors in a page.

<sup>(2)</sup> Depends on the size of each sector in the NAND page.

**Table 15-253. Prefetch and Write-Posting Engine**

Sub-process Name	Register / Bit Field	Value
Disable the engine before configuration	<a href="#">GPMC_PREFETCH_CONTROL[0]</a> STARTENGINE	0x0
Select the chip-select associated with a NAND device where the prefetch engine is active	<a href="#">GPMC_PREFETCH_CONFIG1[26:24]</a> ENGINECSSELECTOR	x
Select access direction through prefetch engine, read or write.	<a href="#">GPMC_PREFETCH_CONFIG1[0]</a> ACCESSMODE	x
Select the threshold used to issue a DMA request	<a href="#">GPMC_PREFETCH_CONFIG1[14:8]</a> FIFOTHRESHOLD	x
Select either DMA synchronized mode or software manual mode.	<a href="#">GPMC_PREFETCH_CONFIG1[2]</a> DMAMODE	x
Select if the engine immediately starts accessing the memory upon STARTENGINE assertion or if hardware synchronization based on a WAIT signal is used.	<a href="#">GPMC_PREFETCH_CONFIG1[3]</a> SYNCHROMODE	x
Select which wait pin edge detector should start the engine in synchronized mode	<a href="#">GPMC_PREFETCH_CONFIG1[5:4]</a> WAITPINSELECTOR	x
Enter a number of clock cycles removed to timing parameters (For all back-to-back accesses to the NAND flash but not the first one)	<a href="#">GPMC_PREFETCH_CONFIG1[30:28]</a> CYCLEOPTIMIZATION	x
Enable the prefetch postwrite engine	<a href="#">GPMC_PREFETCH_CONFIG1[7]</a> ENABLEENGINE	0x1
Select the number of bytes to be read or written by the engine to the selected chip-select	<a href="#">GPMC_PREFETCH_CONFIG2[13:0]</a> TRANSFERCOUNT	x
Start the prefetch engine	<a href="#">GPMC_PREFETCH_CONTROL[0]</a> STARTENGINE	0x1

**Table 15-254. Wait Pin Configuration**

Sub-process Name	Register / Bit Field	Value
Selects when the engine starts the access to CS	GPMC_PREFETCH_CONFIG1[3] SYNCHROMODE	x
Select which wait pin edge detector should start the engine in synchronized mode	GPMC_PREFETCH_CONFIG1[5:4] WAITPINSELECTOR	x

**Table 15-255. Enable Chip-Select**

Sub-process Name	Register / Bit Field	Value
When all parameters are configured, enable the chip-select	GPMC_CONFIG7_[6] CSVALID	x

### 15.4.5.5 Set Memory Access

This section details the bit field to configure to set the GPMC in various memory modes.

**Table 15-256. Mode Parameters Check List Table**

Register	Bit	Bit field name	Asynchronous				Synchronous			
			Single Read Access	Single Write Access	Multiple Read (Page) Access	Multiple Write (Page) Access	Single Read Access	Single Write Access	Multiple Read (Burst) Access	Multiple Write (Burst) Access
GPMC_CONFIG1_i	30	READMULTIPLE	0x0	-	0x1 <sup>(1)</sup>	N/S	0x0	-	0x1	-
GPMC_CONFIG1_i	29	READTYPE	0x0	-	0x0 <sup>(1)</sup>	N/S	0x1	-	0x1	-
GPMC_CONFIG1_i	28	WRITEMULTIPLE	-	0x0	- <sup>(1)</sup>	N/S	-	0x0	-	0x1
GPMC_CONFIG1_i	27	WRITETYPE	-	0x0	- <sup>(1)</sup>	N/S	-	0x1	-	0x1

<sup>(1)</sup> Multiple read is not supported in address/data- and AAD-multiplexed modes. Multiple read is supported in Nonmultiplexed mode.

**Table 15-257. Access Type Parameters Check List Table**

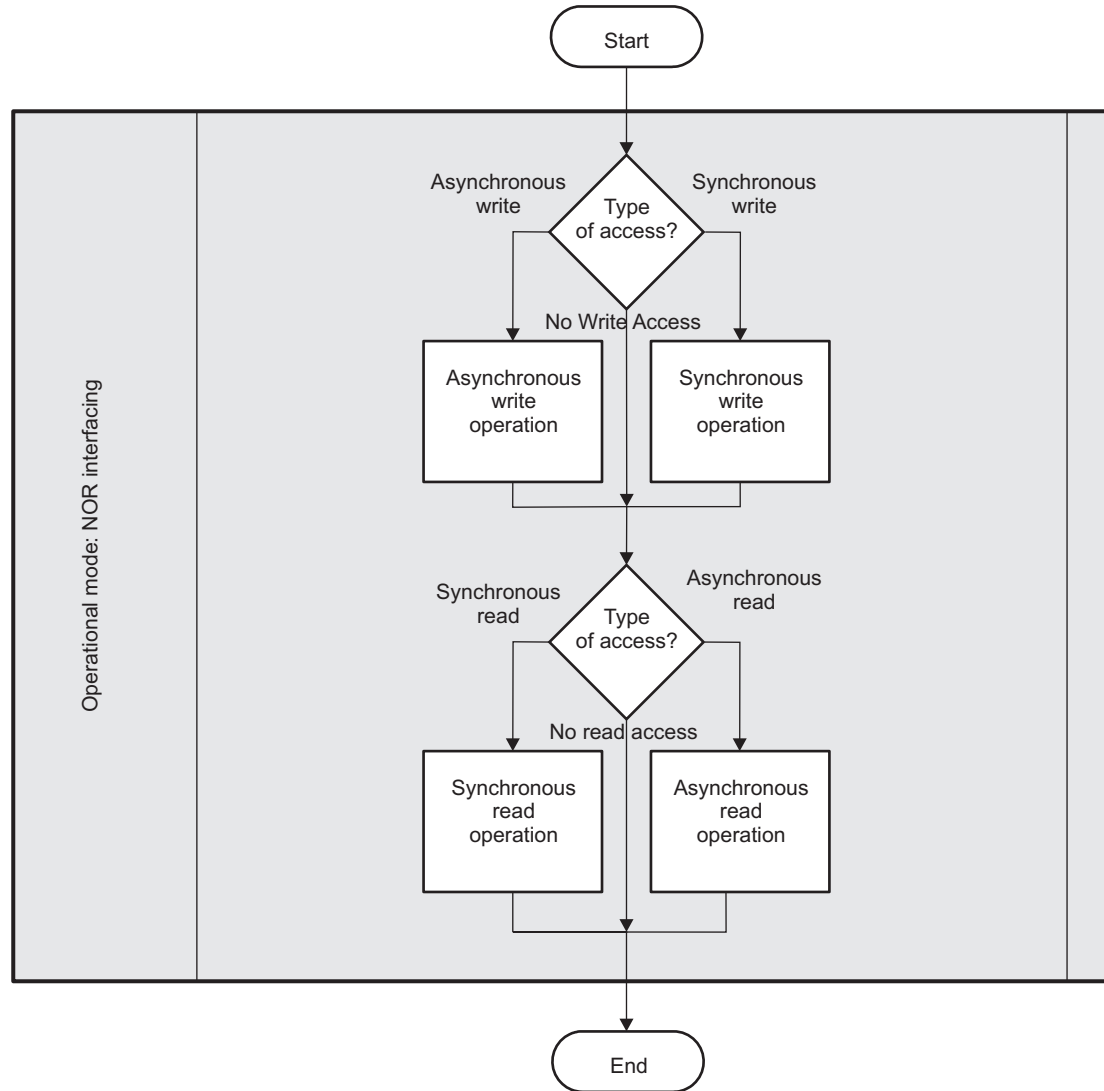

Register	Bit	Bit field name	Access Type		
			Non-mux	Address /Data Mux	AAD-mux
GPMC_CONFIG1_i	9:8	MUXADDDATA	0x0	0x2	0x1
GPMC_CONFIG	1	LIMITEDADDRESS <sup>(1)</sup>	0x1	0x0	0x0

<sup>(1)</sup> This parameter applies to all chip-selects. There is no per-CS configuration for this parameter.

15.4.5.6 GPMC Timing Parameters

Figure 15-92 shows a programming model diagram for the NOR interfacing timing parameters.

Figure 15-92. NOR Interfacing Timing Parameters Diagram

gpmc-uc-002

Table 15-258 lists bit fields to configure adequate timing parameter in various memory modes.

**Table 15-258. Timing Parameters**

Register	Bit	Bit field name	Asynchronous			Synchronous				Access Type		
			Single Read Access	Single Write Access	Multiple Read (Page) access	Single Read Access	Single Write Access	Multiple Read (Burst) Access	Multiple Write (Burst) Access	Non-multiplexed	Address/Data-multiplexed	AAD-multiplexed
GPMC_CONFIG1_j	9	MUXADDDATA	y	y	y	y	y	y	y	y	y	y
GPMC_CONFIG1_j	29	READTYPE	y		y	y		y		y	y	y

### 15.4.5.6.1 GPMC Timing Parameters Formulas

This section intends to help the user to calculate the GPMC timing bit fields values. Formulas are not listed exhaustively.

The section details:

- NAND Flash Interface Timing Parameters Formulas
- Synchronous NOR Flash Timing Parameters Formulas
- Asynchronous NOR Flash Timing Parameters Formulas

#### 15.4.5.6.1.1 NAND Flash Interface Timing Parameters Formulas

This section lists formulas to use in order to calculate NAND timing parameters. This is the case when `GPMC_CONFIG1_j[11:10] DEVICETYPE = 0x2`. [Table 15-259](#) details NAND timing parameters.

**Table 15-259. NAND Formulas Description Table**

Configuration Parameter	Unit	Description
A	ns	Pulse duration - gpmc_nwe valid time
B	ns	Delay time - gpmc_ncs valid to gpmc_nwe valid
C	ns	Delay time - gpmc_nbe0_cle/gpmc_nadv_ale high to gpmc_nwe valid
D	ns	Delay time - gpmc_ad[15:0] valid to gpmc_nwe valid
E	ns	Delay time - gpmc_nwe invalid to gpmc_ad[15:0] invalid
F	ns	Delay time - gpmc_nwe invalid to gpmc_nbe0_cle/gpmc_nadv_ale invalid
G	ns	Delay time - gpmc_nwe invalid to gpmc_ncs invalid
H	ns	Cycle time - Write cycle time
I	ns	Delay time - gpmc_ncs valid to gpmc_noe valid
J	ns	Setup time - gpmc_ad[15:0] valid to gpmc_noe invalid
K	ns	Pulse duration - gpmc_noe valid time
L	ns	Cycle time - Read cycle time
M	ns	Delay time - gpmc_noe invalid to gpmc_ncs invalid

The configuration parameters are calculated through the following formulas.

$$A = (\text{WEOffTime} - \text{WEOnTime}) * (\text{TimeParaGranularity} + 1) * \text{GPMC\_FCLK period}$$

$$B = ((\text{WEOnTime} - \text{CSONTime}) * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{WEEExtraDelay} - \text{CSEExtraDelay})) * \text{GPMC\_FCLK period}$$

$$C = ((\text{WEOnTime} - \text{ADVOnTime}) * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{WEEExtraDelay} - \text{ADVEExtraDelay})) * \text{GPMC\_FCLK period}$$

$$D = (\text{WEOnTime} * (\text{TimeParaGranularity} + 1) + 0.5 * \text{WEEExtraDelay}) * \text{GPMC\_FCLK period}$$

$$E = (\text{WrCycleTime} - \text{WEOffTime} * (\text{TimeParaGranularity} + 1) - 0.5 * \text{WEEExtraDelay}) * \text{GPMC\_FCLK period}$$

$$F = (\text{ADVWrOffTime} - \text{WEOffTime} * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{ADVEExtraDelay} - \text{WEEExtraDelay})) * \text{GPMC\_FCLK period}$$

$$G = (\text{CSWrOffTime} - \text{WEOffTime} * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{CSEExtraDelay} - \text{WEEExtraDelay})) * \text{GPMC\_FCLK period}$$

$$H = \text{WrCycleTime} * (1 + \text{TimeParaGranularity}) * \text{GPMC\_FCLK period}$$

$$I = ((\text{OEOnTime} - \text{CSONTime}) * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{OEEExtraDelay} - \text{CSEExtraDelay})) * \text{GPMC\_FCLK period}$$

$$J = ((\text{AccessTime} - \text{OEOffTime}) * (\text{TimeParaGranularity} + 1) - 0.5 * \text{OEEExtraDelay}) * \text{GPMC\_FCLK period}$$

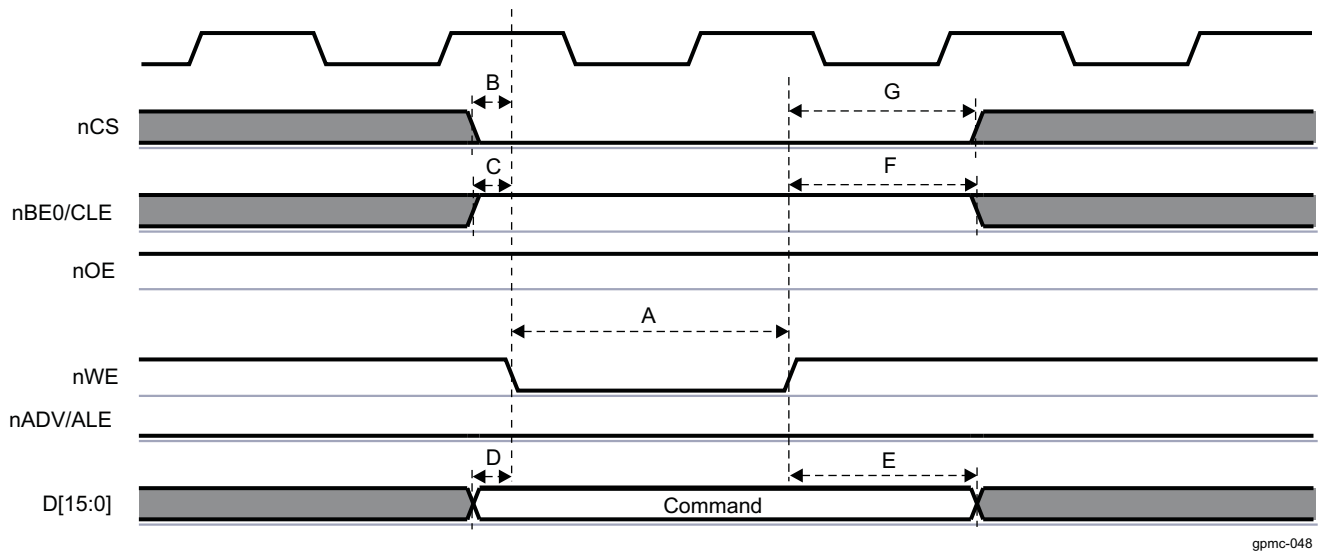

$$K = (\text{OEOffTime} - \text{OEOnTime}) * (1 + \text{TimeParaGranularity}) * \text{GPMC\_FCLK period}$$

$$L = \text{RdCycleTime} * (1 + \text{TimeParaGranularity}) * \text{GPMC\_FCLK period}$$

$$M = (\text{CSRdOffTime} - \text{OEOffTime} * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{CSExtraDelay} - \text{OEEExtraDelay}) * \text{GPMC\_FCLK period}$$

Figure 15-93 shows a command latch cycle timing simplified example where formulas are associated with signal waves.

Figure 15-93. NAND Command Latch Cycle Timing Simplified Example

gpmc-048

15.4.5.6.1.2 Synchronous NOR Flash Timing Parameters Formulas

This section lists all formulas to use in order to calculate synchronous NOR timing parameters. This is the case when GPMC\_CONFIG1\_[11:10] DEVICETYPE = 0x0 and when READTYPE or WRITETYPE are set to synchronous mode.

Table 15-260. Synchronous NOR Formulas Description Table

Configuration Parameter	Unit	Description
A	ns	Pulse duration - gpmc_ncs low
B	ns	Delay time - address bus valid to gpmc_clk first edge Delay time - gpmc_nbe0_cle/gpmc_nbe1 valid to gpmc_clk first edge
C	ns	Pulse duration - gpmc_nbe0_cle/gpmc_nbe1 low
D	ns	Delay time - gpmc_clk rising edge to gpmc_nbe0_cle/gpmc_nbe1 invalid Delay time - gpmc_clk rising edge to gpmc_nadv_ale invalid
E	ns	Delay time - gpmc_clk rising edge to gpmc_ncs invalid Delay time - gpmc_clk rising edge to gpmc_noe invalid
F	ns	Delay time - gpmc_clk rising edge to gpmc_ncs transition
G	ns	Delay time - gpmc_clk rising edge to gpmc_nadv_ale transition
H	ns	Delay time - gpmc_clk rising edge to gpmc_noe transition
I	ns	Delay time - gpmc_clk rising edge to gpmc_nwe transition
J	ns	Delay time - gpmc_clk rising edge to gpmc_ad data bus transition Delay time - gpmc_clk rising edge to gpmc_nbe0_cle/gpmc_nbe1 transition
K	ns	Pulse duration - gpmc_nadv_ale low
L	ns	Delay time - gpmc_wait invalid to first data latching gpmc_clk edge

The configuration parameters are calculated through the following formulas.

1. For single read accesses:
  - A = (CSRDOFFTIME - CSONTIME) \* (TIMEPARAGRANULARITY + 1) \* GPMC\_FCLK period
  - C = RDCYCLETIME \* (TIMEPARAGRANULARITY + 1) \* GPMC\_FCLK period
  - D = (RDCYCLETIME - ACCESSTIME) \* GPMC\_FCLK period
  - E = (CSRDOFFTIME - ACCESSTIME) \* GPMC\_FCLK period
2. For burst read accesses (where n is the page burst access number):
  - A = (CSRDOFFTIME - CSONTIME + (n - 1) \* PAGEBURSTACCESSTIME) \* (TIMEPARAGRANULARITY + 1) \* GPMC\_FCLK period
  - C = (RDCYCLETIME + (n - 1) \* PAGEBURSTACCESSTIME) \* (TIMEPARAGRANULARITY + 1) \* GPMC\_FCLK period
  - D = (RDCYCLETIME - (ACCESSTIME + (n - 1) \* PAGEBURSTACCESSTIME) \* GPMC\_FCLK period
  - E = (CSRDOFFTIME - (ACCESSTIME + (n - 1) \* PAGEBURSTACCESSTIME) \* GPMC\_FCLK period
3. For burst write accesses (where n is the page burst access number):
  - A = (CSWROFFTIME - CSONTIME + (n - 1) \* PAGEBURSTACCESSTIME) \* (TIMEPARAGRANULARITY + 1) \* GPMC\_FCLK period
  - C = (WRCYCLETIME + (n - 1) \* PAGEBURSTACCESSTIME) \* (TIMEPARAGRANULARITY + 1) \* GPMC\_FCLK period
  - D = (WRCYCLETIME - (ACCESSTIME + (n - 1) \* PAGEBURSTACCESSTIME) \* GPMC\_FCLK period
  - E = (CSWROFFTIME - (ACCESSTIME + (n - 1) \* PAGEBURSTACCESSTIME) \* GPMC\_FCLK period
4. For all accesses:
  - For nCS falling edge (CS activated):
    - Case where [GPMC\\_CONFIG1\\_j\[1:0\]](#) GPMCFCLKDIVIDER = 0x0:
      - F = 0.5 \* CSEXTRADELAY \* GPMC\_FCLK period
    - Case where GPMCFCLKDIVIDER = 0x1:
      - F = 0.5 \* CSEXTRADELAY \* GPMC\_FCLK period, when (CLKACTIVATIONTIME and CSONTIME are odd) or (CLKACTIVATIONTIME and CSONTIME are even)
      - F = (1 + 0.5 \* CSEXTRADELAY) \* GPMC\_FCLK period otherwise.
    - Case where GPMCFCLKDIVIDER = 0x2:
      - F = 0.5 \* CSEXTRADELAY \* GPMC\_FCLK period, when (CSONTIME - CLKACTIVATIONTIME) is a multiple of 3
      - F = (1 + 0.5 \* CSEXTRADELAY) \* GPMC\_FCLK period, when (CSONTIME - CLKACTIVATIONTIME - 1) is a multiple of 3
      - F = (2 + 0.5 \* CSEXTRADELAY) \* GPMC\_FCLK period, when (CSONTIME - CLKACTIVATIONTIME - 2) is a multiple of 3
  - For nCS rising edge (CS deactivated) in reading mode:
    - Case where [GPMC\\_CONFIG1\\_j\[1:0\]](#) GPMCFCLKDIVIDER = 0x0:
      - F = 0.5 \* CSEXTRADELAY \* GPMC\_FCLK period
    - Case where GPMCFCLKDIVIDER = 0x1:
      - F = 0.5 \* CSEXTRADELAY \* GPMC\_FCLK period, when (CLKACTIVATIONTIME and CSRDOFFTIME are odd) or (CLKACTIVATIONTIME and CSRDOFFTIME are even)
      - F = (1 + 0.5 \* CSEXTRADELAY) \* GPMC\_FCLK period otherwise.
    - Case where GPMCFCLKDIVIDER = 0x2:
      - F = 0.5 \* CSEXTRADELAY \* GPMC\_FCLK period, when (CSRDOFFTIME - CLKACTIVATIONTIME) is a multiple of 3
      - F = (1 + 0.5 \* CSEXTRADELAY) \* GPMC\_FCLK period, when (CSRDOFFTIME - CLKACTIVATIONTIME - 1) is a multiple of 3
      - F = (2 + 0.5 \* CSEXTRADELAY) \* GPMC\_FCLK period, when (CSRDOFFTIME - CLKACTIVATIONTIME - 2) is a multiple of 3
  - For nCS rising edge (CS deactivated) in writing mode:
    - Case where [GPMC\\_CONFIG1\\_j\[1:0\]](#) GPMCFCLKDIVIDER = 0x0:
      - F = 0.5 \* CSEXTRADELAY \* GPMC\_FCLK period
    - Case where GPMCFCLKDIVIDER = 0x1:
      - F = 0.5 \* CSEXTRADELAY \* GPMC\_FCLK period, when (CLKACTIVATIONTIME and CSWROFFTIME are odd) or (CLKACTIVATIONTIME and CSWROFFTIME are even)
      - F = (1 + 0.5 \* CSEXTRADELAY) \* GPMC\_FCLK period otherwise.

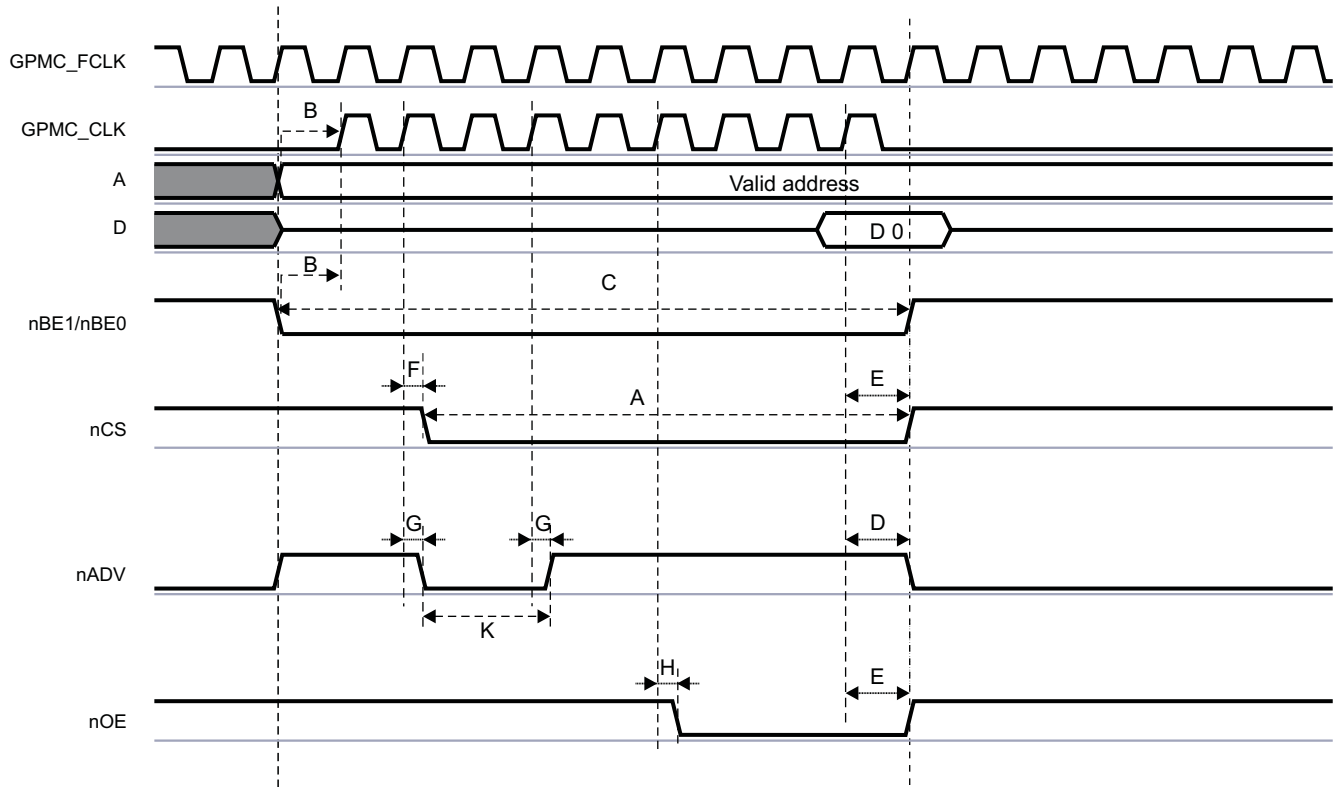

- Case where GPMCFCLKDIVIDER = 0x2:  
 $F = 0.5 * CSEXTRADelay * GPMC\_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$   
 $F = (1 + 0.5 * CSEXTRADelay) * GPMC\_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$   
 $F = (2 + 0.5 * CSEXTRADelay) * GPMC\_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
- For nADV falling edge (nADV activated):
- Case where GPMC\_CONFIG1\_j[1:0] GPMCFCLKDIVIDER = 0x0:  
 $G = 0.5 * ADVEXTRADelay * GPMC\_FCLK \text{ period}$
- Case where GPMCFCLKDIVIDER = 0x1:  
 $G = 0.5 * ADVEXTRADelay * GPMC\_FCLK \text{ period, when } (CLKACTIVATIONTIME \text{ and } ADVONTIME \text{ are odd}) \text{ or } (CLKACTIVATIONTIME \text{ and } ADVONTIME \text{ are even})$   
 $G = (1 + 0.5 * ADVEXTRADelay) * GPMC\_FCLK \text{ period otherwise.}$
- Case where GPMCFCLKDIVIDER = 0x2:  
 $G = 0.5 * ADVEXTRADelay * GPMC\_FCLK \text{ period, when } (ADVONTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$   
 $G = (1 + 0.5 * ADVEXTRADelay) * GPMC\_FCLK \text{ period, when } (ADVONTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$   
 $G = (2 + 0.5 * ADVEXTRADelay) * GPMC\_FCLK \text{ period, when } (ADVONTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
- For nADV rising edge (nADV deactivated) in reading mode:
- Case where GPMC\_CONFIG1\_j[1:0] GPMCFCLKDIVIDER = 0x0:  
 $G = 0.5 * ADVEXTRADelay * GPMC\_FCLK \text{ period}$
- Case where GPMCFCLKDIVIDER = 0x1:  
 $G = 0.5 * ADVEXTRADelay * GPMC\_FCLK \text{ period, when } (CLKACTIVATIONTIME \text{ and } ADVRDOFFTIME \text{ are odd}) \text{ or } (CLKACTIVATIONTIME \text{ and } ADVRDOFFTIME \text{ are even})$   
 $G = (1 + 0.5 * ADVEXTRADelay) * GPMC\_FCLK \text{ period otherwise.}$
- Case where GPMCFCLKDIVIDER = 0x2:  
 $G = 0.5 * ADVEXTRADelay * GPMC\_FCLK \text{ period, when } (ADVRDOFFTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$   
 $G = (1 + 0.5 * ADVEXTRADelay) * GPMC\_FCLK \text{ period, when } (ADVRDOFFTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$   
 $G = (2 + 0.5 * ADVEXTRADelay) * GPMC\_FCLK \text{ period, when } (ADVRDOFFTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
- For nADV rising edge (nADV deactivated) in writing mode:
- Case where GPMC\_CONFIG1\_j[1:0] GPMCFCLKDIVIDER = 0x0:  
 $G = 0.5 * ADVEXTRADelay * GPMC\_FCLK \text{ period}$
- Case where GPMCFCLKDIVIDER = 0x1:  
 $G = 0.5 * ADVEXTRADelay * GPMC\_FCLK \text{ period, when } (CLKACTIVATIONTIME \text{ and } ADVWROFFTIME \text{ are odd}) \text{ or } (CLKACTIVATIONTIME \text{ and } ADVWROFFTIME \text{ are even})$   
 $G = (1 + 0.5 * ADVEXTRADelay) * GPMC\_FCLK \text{ period otherwise.}$
- Case where GPMCFCLKDIVIDER = 0x2:  
 $G = 0.5 * ADVEXTRADelay * GPMC\_FCLK \text{ period, when } (ADVWROFFTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$   
 $G = (1 + 0.5 * ADVEXTRADelay) * GPMC\_FCLK \text{ period, when } (ADVWROFFTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$   
 $G = (2 + 0.5 * ADVEXTRADelay) * GPMC\_FCLK \text{ period, when } (ADVWROFFTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
- For nOE falling edge (nOE activated):

15.4.5.6.1.3 Asynchronous NOR Flash Timing Parameters Formulas

This section lists all formulas to use in order to calculate asynchronous NOR timing parameters. This is the case when GPMC\_CONFIG1\_i[11:10] DEVICETYPE = 0x0 and when READTYPE or WRITETYPE are set to asynchronous mode.

Table 15-261. Asynchronous NOR Formulas Description Table

Configuration Parameter	Unit	Description
A	ns	Pulse duration - gpmc_ncs low
B	ns	Delay time - gpmc_ncs valid to gpmc_nadv_ale invalid
C	ns	Delay time - gpmc_ncs valid to gpmc_noe invalid (single read)
D	ns	Pulse duration - address bus valid - 2nd, 3rd and 4th accesses
E	ns	Delay time - gpmc_ncs valid to gpmc_nwe valid
F	ns	Delay time - gpmc_ncs valid to gpmc_nwe invalid
G	ns	Address invalid duration between 2 successive R/W accesses
H	ns	Setup time - read data valid before gpmc_noe high
I	ns	Delay time - gpmc_ncs valid to gpmc_noe invalid (burst read)
J	ns	Delay time - address bus valid to gpmc_ncs valid
		Delay time - data bus valid to gpmc_ncs valid
		Delay time - gpmc_nbe0_cle/gpmc_nbe1 valid to gpmc_ncs valid
K	ns	Delay time - gpmc_ncs valid to gpmc_nadv_ale valid

**Table 15-261. Asynchronous NOR Formulas Description Table (continued)**

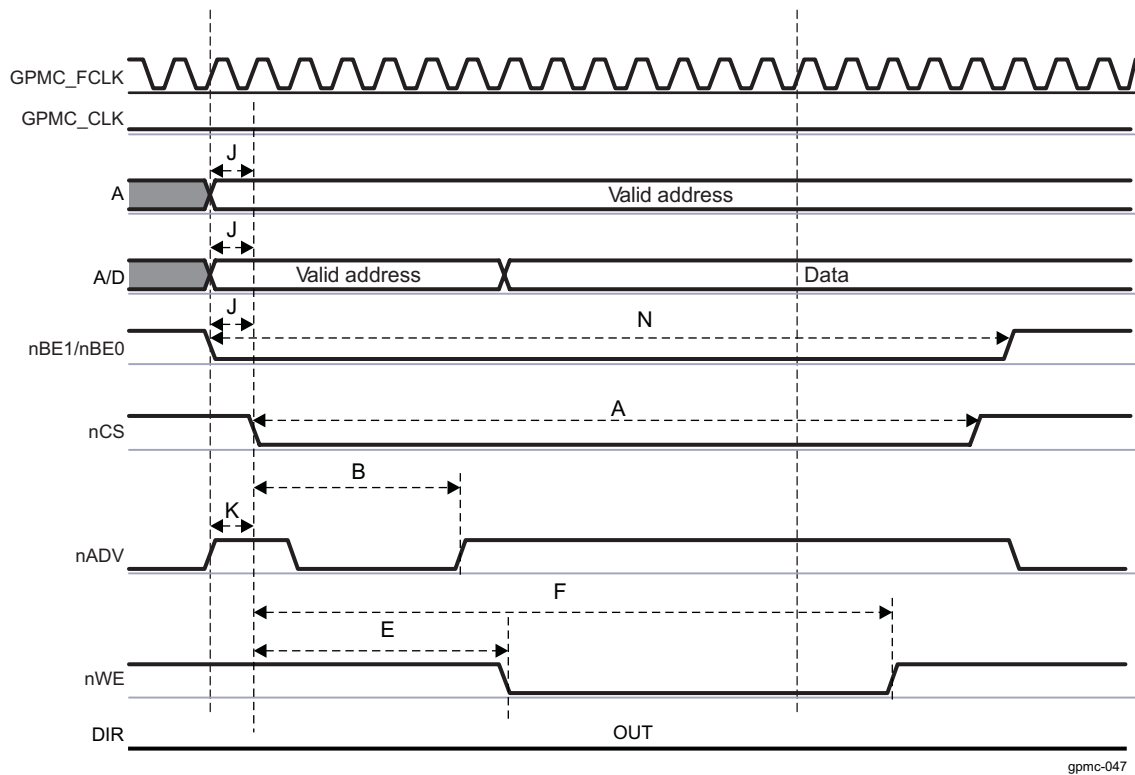

Configuration Parameter	Unit	Description
L	ns	Delay time - gpmc_ncs valid to gpmc_noe valid
M	ns	Delay time - gpmc_ncs valid to first data latching edge
N	ns	Pulse duration - gpmc_nbe0_cle/gpmc_nbe1 valid time
O	ns	Delay time - gpmc_ncs valid to gpmc_nadv_ale valid

The configuration parameters are calculated through the following formulas. Note that these formulas are not exhaustive.

- gpmc\_ncs low pulse:  
For single read:  $A = (\text{CSRDOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$   
For burst read:  $A = (\text{CSRDOFFTIME} - \text{CSONTIME} + (\text{N} - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$ , where N = page burst access number  
For single write:  $A = (\text{CSWROFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$   
For burst write:  $A = (\text{CSWROFFTIME} - \text{CSONTIME} + (\text{N} - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$ , where N = page burst access number
- gpmc\_ncs valid to gpmc\_nadv\_ale invalid delay:  
For reading:  $B = ((\text{ADVRDOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$   
For writing:  $B = ((\text{ADVWROFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$
- $C = ((\text{OEOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{OEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$
- $D = \text{PAGEBURSTACCESSTIME} * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$
- $E = ((\text{WEONTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{WEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$
- $F = ((\text{WEOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{WEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$
- $G = \text{CYCLE2CYCLEDELAY} * \text{GPMC\_FCLK period}$
- $H = ((\text{OEOFFTIME} - \text{ACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * \text{OEEXTRADELAY}) * \text{GPMC\_FCLK period}$
- $I = ((\text{OEOFFTIME} + (\text{N} - 1) * \text{PAGEBURSTACCESSTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{OEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$ , where N = page burst access number
- $J = (\text{CSONTIME} * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC\_FCLK period}$
- $K = ((\text{ADVONTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$
- $L = ((\text{OEONTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{OEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$
- $M = ((\text{ACCESSTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) - 0.5 * \text{CSEXTRADELAY}) * \text{GPMC\_FCLK period}$
- gpmc\_nbe0\_cle/gpmc\_nbe1 pulse:  
For single read:  $N = \text{RDCYCLETIME} * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$   
For burst read:  $N = (\text{RDCYCLETIME} + (\text{N} - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$ , where N = page burst access number  
For burst write:  $N = (\text{WRCYCLETIME} + (\text{N} - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$ , where N = page burst access number
- $O = ((\text{WRCYCLETIME} + (\text{N} - 1) * \text{PAGEBURSTACCESSTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$

Figure 15-95 shows an asynchronous NOR single write simplified example where formulas are associated with signal waves.

**Figure 15-95. Asynchronous NOR Single Write Simplified Example**

**NOTE:** Write multiple access is not supported in asynchronous mode. If WRITEMULTIPLE is enabled with WRITETYPE as asynchronous, the GPMC processes single asynchronous accesses.

## 15.4.6 GPMC Use Cases And Tips

### 15.4.6.1 How to Set GPMC Timing Parameters for Typical Accesses

#### 15.4.6.1.1 External Memory Attached to the GPMC Module

As discussed in the introduction to this chapter, the GPMC module supports the following external memory types:

- Asynchronous or synchronous, 8-bit or 16-bit-width memory or device
- 16-bit address/data-multiplexed or not multiplexed NOR flash device
- 8- or 16-bit NAND flash device

The following examples show how to calculate GPMC timing parameters by showing a typical parameter setup for the access to be performed.

The example is based on a 512-Mb multiplexed NOR flash memory with the following characteristics:

- Type: NOR flash (address/data-multiplexed mode)
- Size: 512M bits
- Data Bus: 16 bits wide
- Speed: 104 MHz clock frequency
- Read access time: 80 ns

#### 15.4.6.1.2 Typical GPMC Setup

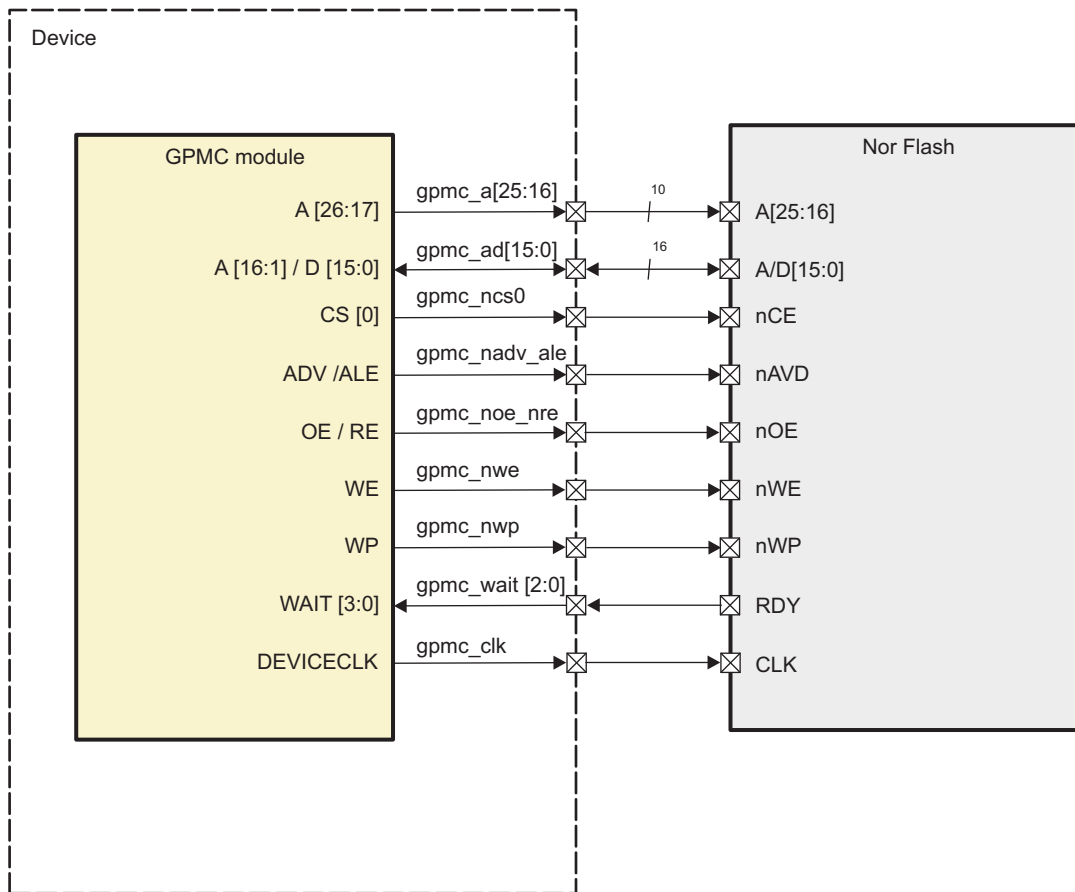

Table 15-262 lists some of the I/Os of the GPMC module.

**Table 15-262. GPMC Signals**

Signal Name	I/O	Description
GPMC_FCLK	Internal	Functional and interface clock. Acts as the time reference.
gpmc_clk	O	External clock provided to the external device for synchronous operations
gpmc_a[25:16]	O	Address
gpmc_ad[15: 0]	I/O	Data-multiplexed with addresses A[16:1] on memory side
gpmc_ncsx	O	Chip-select (where x = 0, or 1)
gpmc_nadv_ale	O	Address valid enable
gpmc_noe_nre	O	Output enable (read access only)
gpmc_nwe	O	Write enable (write access only)
gpmc_wait[2:0]	I	Ready signal from memory device. Indicates when valid burst data is ready to be read

Figure 15-96 shows the typical connection between the GPMC module and an attached NOR Flash memory.

Figure 15-96. GPMC Connection to an External NOR Flash Memory

gpmc-037

The following sections demonstrate how to calculate GPMC parameters for three access types:

- Synchronous burst read
- Asynchronous read
- Asynchronous single write

#### 15.4.6.1.2.1 GPMC Configuration for Synchronous Burst Read Access

The clock runs at 104 MHz (  $f = 104 \text{ MHz}$ ;  $T = 9,615 \text{ ns}$ ).

Table 15-263 shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

Table 15-264 shows how to calculate timings for the GPMC using the memory parameters.

Figure 15-97 shows the synchronous burst read access.

Table 15-263. Useful Timing Parameters on the Memory Side

AC Read Characteristics on the Memory Side	Description	Duration (ns)
tCES	nCS setup time to clock	0
tACS	Address setup time to clock	3
tIACC	Synchronous access time	80

**Table 15-263. Useful Timing Parameters on the Memory Side (continued)**

AC Read Characteristics on the Memory Side	Description	Duration (ns)
tBACC	Burst access time valid clock to output delay	5,2
tCEZ	Chip-select to High-Z	7
tOEZ	Output enable to High-Z	7
tAVC	nADV setup time	6
tAVD	nAVD pulse	6
tACH	Address hold time from clock	3

The following terms, which describe the timing interface between the controller and its attached device, are used to calculate the timing parameters on the GPMC side:

- Read Access time (GPMC side): Time required to activate the clock + read access time requested on the memory side + data setup time required for optimal capture of a burst of data
- Data setup time (GPMC side): Ensures a good capture of a burst of data (as opposed to taking a burst of data out). One word of data is processed in one clock cycle ( $T = 9,615$  ns). The read access time between 2 bursts of data is  $tBACC = 5,2$  ns. Therefore, data setup time is a clock period -  $tBACC = 4,415$  ns of data setup.
- Access completion (GPMC side): (Different from page burst access time) Time required between the last burst access and access completion: nCS/nOE hold time (nCS and nOE must be released at the end of an access. These signals are held to allow the access to complete).
- Read cycle time (GPMC side): Read Access time + access completion
- Write cycle time for burst access: Not supported for NOR flash memory

**Table 15-264. Calculating GPMC Timing Parameters**

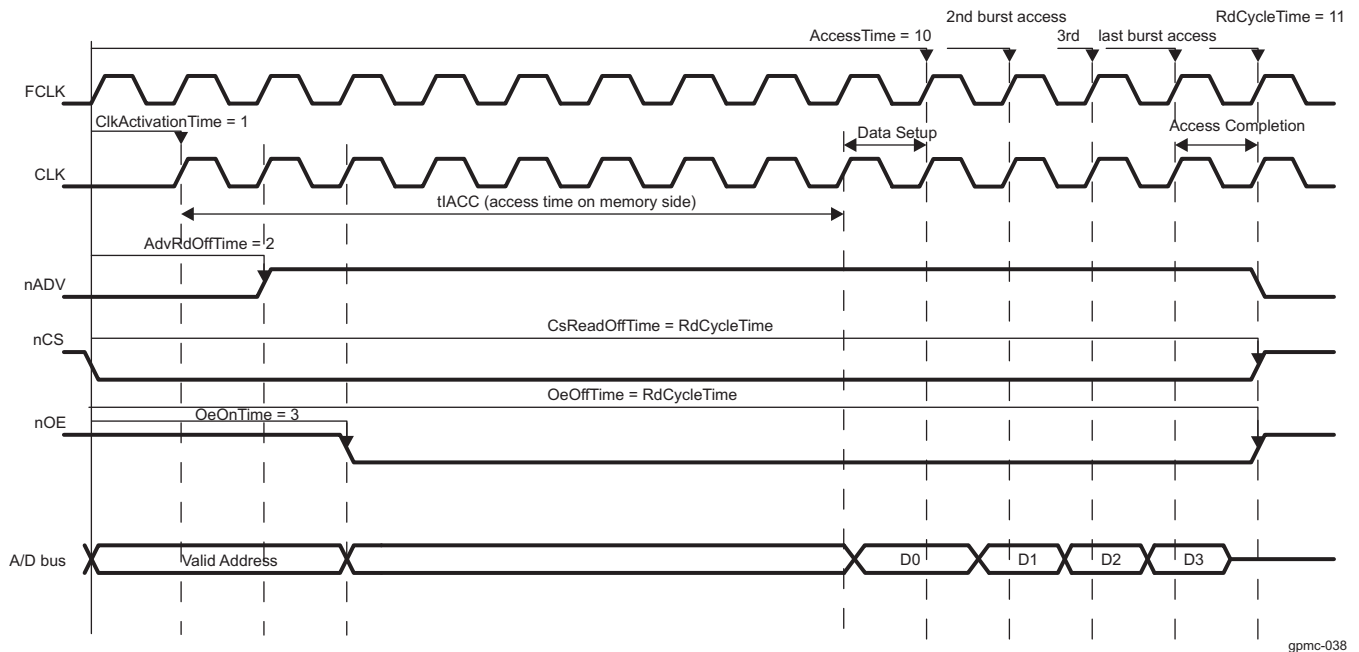

Parameter Name on GPMC Side	Formula	Duration (ns)	Number of Clock Cycles (F = 104 MHz)	GPMC Register Configurations
GPMC FCLK Divider	-	-	-	GPMCFCLKDIVIDER = 0x0
ClkActivation Time	$\min (tCES, tACS)$	3	1	CLKACTIVATIONTIME = 0x1
RdAccessTime	$\text{roundmax} (\text{ClkActivationTime} + tIACC + \text{DataSetupTime})$	94,03: (9,615 + 80 + 4,415)	10 : $\text{roundmax} (94,03 / 9,615)$	ACCESSTIME = 0x0A
PageBurst AccessTime	$\text{roundmax} (tBACC)$	$\text{roundmax} (5,2)$	1	PAGEBURSTACCESSTIME = 0x1
RdCycleTime	$\text{AccessTime} + \max (tCEZ, tOEZ)$	101, 03: (94, 03 + 7)	11	RDCYCLETIME = 0x0B
CsOnTime	tCES	0	0	CSONTIME = 0x0
CsReadOffTime	RdCycleTime	-	11	CSRDOFFTIME = 0x0B
AdvOnTime	tAVC <sup>(1)</sup>	0	0	ADVONTIME = 0x0
AdvRdOffTime	tAVD + tAVC <sup>(2)</sup>	12	2	ADVRDOFFTIME = 0x02
OeOnTime <sup>(3)</sup>	$(\text{ClkActivationTime} + tACH) < \text{OeOnTime} (\text{ClkActivationTime} + tIACC)$	-	3 for instance.	OEONTIME = 0x3
OeOffTime	RdCycleTime	-	11	OEOFFTIME = 0x0B

<sup>(1)</sup> The external clock provided to the NOR flash is not yet available.

<sup>(2)</sup>  $\text{AdvRdOffTime} - \text{AdvOnTime} = tAVD$ ; thus,  $\text{AdvRdOffTime} = tAVD + \text{AdvOnTime} = tAVD + tAVC$ .

<sup>(3)</sup> OeOnTime must guarantee that addresses are available. It must not exceed the availability of the first burst of data.

**Figure 15-97. Synchronous Burst Read Access (Timing Parameters in Clock Cycles)**

**15.4.6.1.2.2 GPMC Configuration for Asynchronous Read Access**

The clock runs at 104 MHz ( f = 104 MHz; T = 9, 615 ns).

Table 15-265 shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

Table 15-266 shows how to calculate timings for the GPMC using the memory parameters.

Figure 15-98 shows the asynchronous read access.

**Table 15-265. AC Characteristics for Asynchronous Read Access**

AC Read Characteristics on the Memory Side	Description	Duration (ns)
tCE	Read Access time from nCS low	80
tAAVDS	Address setup time to rising edge of nADV	3
tAVDP	nADV low time	6
tCAS	nCS setup time to nADV	0
tOE	Output enable to output valid	6
tOEZ	Output enable to High-Z	7

Use the following formula to calculate the RdCycleTime parameter for this typical access:

$$RdCycleTime = RdAccessTime + AccessCompletion = RdAccessTime + 1 \text{ clock cycle} + tOEZ:$$

- First, on the memory side, the external memory makes the data available to the output bus. This is the memory-side read access time defined in Table 15-265: the number of clock cycles between the address capture (nADV rising edge) and the data valid on the output bus.

The GPMC requires some hold time to allow the data to be captured correctly and the access to be finished.

- To read the data correctly, the GPMC must be configure to meet the data setup time requirement of the memory; the GPMC module captures the data on the next rising edge. This is access time on the GPMC side.
- There must also be a data hold time for correctly reading the data (checking that there is no nOE/nCS

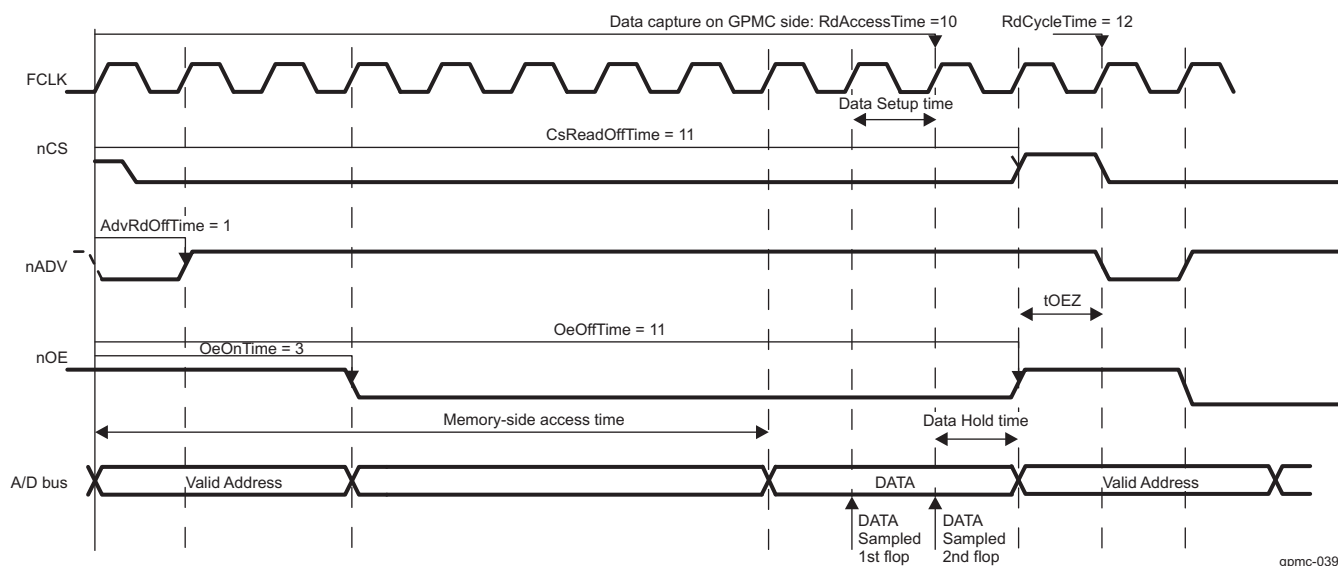

deassertion while reading the data). This data hold time is 1 clock cycle (that is, AccessTime + 1).

- To complete the access, nOE/nCS signals are driven to High-Z. AccessTime + 1 + tOEZ is the read cycle time.
- Addresses can now be relatched and a new read cycle begun.

**Table 15-266. GPMC Timing Parameters for Asynchronous Read Access**

Parameter Name on GPMC side	Formula	Duration (ns)	Number of Clock Cycles (F = 104 MHz)	GPMC Register Configurations
ClkActivationTime		n/a (asynchronous mode)		
AccessTime	round max (tCE)	80	10	ACCESSTIME = 0x0A
PageBurstAccess Time	n/a (single access)			
RdCycleTime	AccessTime + 1cycle + tOEZ	96, 615	12	RDCYCLETIME = 0x0C
CsOnTime	tCAS	0	0	CSONTIME = 0x0
CsReadOffTime	AccessTime + 1 cycle	89, 615	11	CSRDOFFTIME = 0x0B
AdvOnTime	tAAVDS	3	1	ADVONTIME = 0x1
AdvRdOffTime	tAAVDS + tAVDP	9	1	ADVRDOFFTIME = 0x01
OeOnTime	OeOnTime >= AdvRdOffTime (multiplexed mode)	-	3 for instance	OEONTIME = 0x3
OeOffTime	AccessTime + 1cycle	89, 615	11	OEOFFTIME = 0x0B

**Figure 15-98. Asynchronous Single Read Access (Timing Parameters in Clock Cycles)**

gpmc-039

#### 15.4.6.1.2.3 GPMC Configuration for Asynchronous Single Write Access

The clock runs at 104 MHz: (f = 104 MHz; T = 9, 615 ns).

Table 15-268 shows how to calculate timings for the GPMC using the memory parameters.

Table 15-267 shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

Figure 15-99 shows the synchronous burst write access.

**Table 15-267. AC Characteristics for Asynchronous Single Write ( Memory Side)**

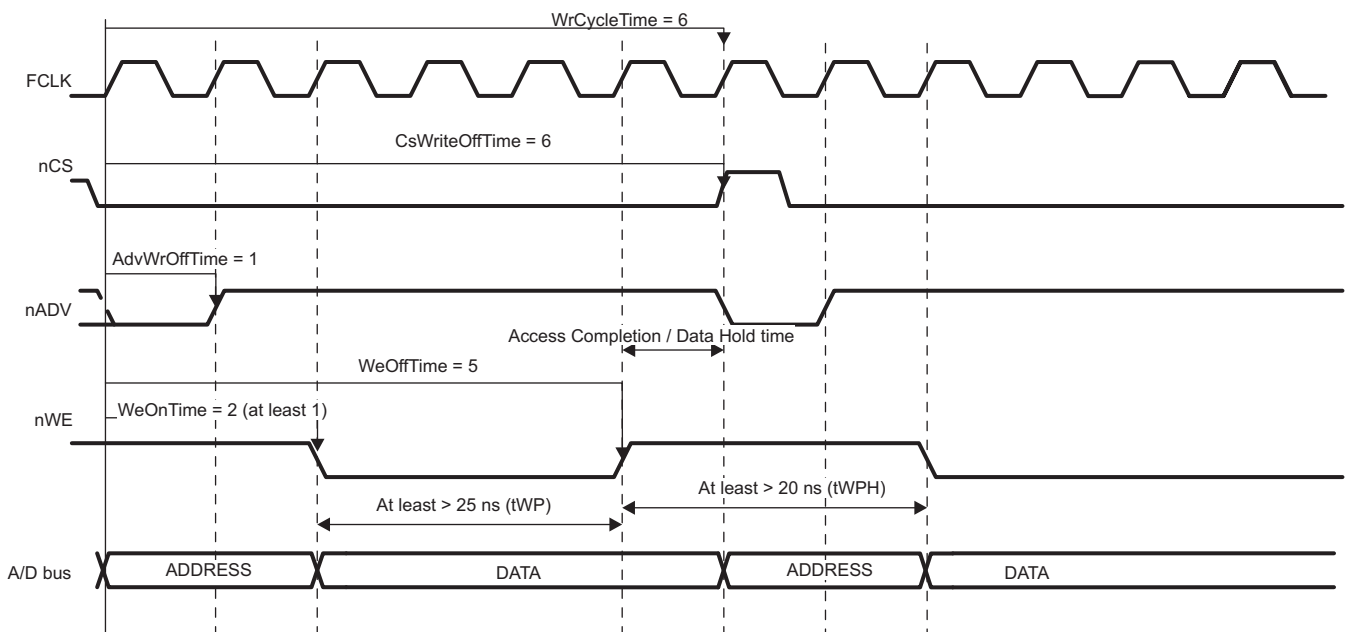

AC Characteristics on the Memory Side	Description	Duration (ns)
tWC	Write cycle time	60
tAVDP	nADV low time	6
tWP	Write pulse width	25
tWPH	Write pulse width high	20
tCS	nCS setup time to nWE	3
tCAS	nCS setup time to nADV	0
tAVSC	nADV setup time	3

For asynchronous single write access, write cycle time is  $WrCycleTime = WeOffTime + AccessCompletion = WeOffTime + 1$ . For the AccessCompletion, the GPMC requires 1 cycle of data hold time (nCS deassertion).

**Table 15-268. GPMC Timing parameters for Asynchronous Single Write**

Parameter Name on GPMC side	Formula	Duration (ns)	Number of Clock Cycles (F = 104 MHz)	GPMC Registers Configuration
ClkActivationTime		n/a (asynchronous mode)		
AccessTime	Applicable only to WAITMONITORING (the value is the same as for read access)			
PageBurstAccessTime		n/a (single access)		
WrCycleTime	$WeOffTime + AccessCompletion$	57, 615	6	WRCYCLETIME = 0x06
CsOnTime	tCAS	0	0	CSONTIME = 0x0
CsWrOffTime	$WeOffTime + 1$	57, 615	6	CSWROFFTIME = 0x06
AdvOnTime	tAVSC	3	1	ADVONTIME = 0x1

### 15.4.6.2 How to choose a suitable memory to use with the GPMC

This section is intended to help the user select a suitable memory device to interface with the GPMC controller.

#### 15.4.6.2.1 Supported Memories or Devices

NAND flash and NOR flash architectures are the two flash technologies. The GPMC supports various types of external memory or device, basically any one that supports NAND or NOR protocols:

- 8- and 16-bit width asynchronous or synchronous memory or device (8-bit: non burst device only)
- 16-bit address and data multiplexed NOR flash devices (pSRAM, OneNAND™, ...)
- 8- and 16-bit NAND flash device

---

**NOTE:** Non-multiplexed NOR flash devices are supported by the GPMC but their usage is highly limited. As only ten address pins are available on the GPMC interface, the maximum device size supported is 2KB.

---

##### 15.4.6.2.1.1 Memory Pin Multiplexing

This section highlights the interfacing differences of the GPMC supported memories.

**Table 15-269. Supported memories interfaces**

Function	16-bit Address/Data muxed pSRAM or NOR Flash <sup>(1)</sup>	OneNAND	16-bit NAND	8-bit NAND

#### 15.4.6.2.1.2 NAND Interface Protocol

NAND flash architecture, introduced in 1989, is a flash technology. NAND is a page-oriented memory device, that is, read and write accesses are done by pages. NAND achieves great density by sharing common areas of the storage transistor, which creates strings of serially connected transistors (in NOR devices, each transistor stands alone). Thanks to its high density NAND is best suited to devices requiring high capacity data storage, such as pictures, music, or data files. NAND non-volatility, makes of it a good storage solution for many applications where mobility, low power, and speed are key factors. Low pin count and simple interface are other advantages of NAND.

Table 15-270 summarizes the NAND interface signals level applied to external device or memories.

**Table 15-270. NAND Interface Bus Operations Summary**

Bus operation	CLE	ALE	nCE	nWE <sup>(1)</sup>	nRE <sup>(1)</sup>	nWP
Read (cmd input)	H	L	L	RE	H	x
Read (add input)	L	H	L	RE	H	x
Write (cmd input)	H	L	L	RE	H	H
Write (add input)	L	H	L	RE	H	H
Data input	L	L	L	RE	H	H
Data output	L	L	L	H	FE	x
Busy (during read)	x	x	H <sup>(2)</sup>	H <sup>(2)</sup>	H <sup>(2)</sup>	x
Busy (during program)	x	x	x	x	x	H
Busy (during erase)	x	x	x	x	x	H
Write protect	x	x	x	x	x	L
Stand-by	x	x	H	x	x	H/L <sup>(3)</sup>

<sup>(1)</sup> RE stands for rising edge, FE stands for falling edge

<sup>(2)</sup> Can be either nCE high, or WE and nRE high.

<sup>(3)</sup> nWP should be biased to CMOS high or CMOS low for standby

### 15.4.6.2.1.3 NOR Interface Protocol

NOR flash architecture, introduced in 1988, is a flash technology. Unlike NAND which is a sequential access device, NOR is directly addressable, that is, is designed to be a random access device. NOR is best suited to devices used to store and run code or firmware, usually in small capacities. While NOR has fast read capabilities it has slow write and erase functions compared to NAND architecture.

Table 15-271 summarizes the NOR interface signals level applied to external device or memories.

**Table 15-271. NOR Interface Bus Operations Summary**

Bus operation	CLK	nADV	nCS	nOE	nWE	WAIT	DQ[15:0]
Read (asynchronous)	x	L	L	L	H	Asserted	Output
Read (synchronous)	Running	L	L	L	H	Driven	Output
Read (burst suspend)	Halted	x	L	H	H	Active	Output
Write	x	L	L	H	L	Asserted	Input
Output disable	x	x	L	H	H	Asserted	High-Z
Standby	x	x	H	x	x	High-Z	High-Z

### 15.4.6.2.1.4 Other Technologies

Other supported device type interact with the GPMC through the NOR interface protocol.

OneNAND™ is a high density and low-power memory device. OneNAND™ is based on single- or multi-level-cell NAND core with SRAM and logic, and interfaces as a synchronous NOR Flash, plus has synchronous write capability. It reads faster than conventional NAND and write faster than conventional NOR flash. Hence, it is appropriate for both mass storage and code storage.

pSRAM stands for pseudo-static random access memory. pSRAM is a low-power memory device for mobile applications. pSRAM is based on the DRAM cell with internal refresh and address control features, and interfaces as a synchronous NOR Flash, plus has synchronous write capability.

### 15.4.6.2.1.5 Supported Protocols

The GPMC supports the following interface protocols when communicating with external memory or external devices:

- Asynchronous read/write access
- Asynchronous read page access (4-8-16 Word16)
- Synchronous read/write access
- Synchronous read burst access without wrap capability (4-8-16 Word16)
- Synchronous read burst access with wrap capability (4-8-16 Word16)

### 15.4.6.2.2 GPMC Features and Settings

This section lists GPMC features and settings:

- Supported device type: up to four NAND or NOR protocol external memories or devices
- Operating Voltage: 1.8V;
- Maximum GPMC addressing capability: 1 GByte divided into eight chip-selects
- Maximum supported memory size: 256 MBytes (must be a power-of-2)
- Minimum supported memory size: 16 MBytes (must be a power-of-2). Aliasing occurs when addressing smaller memories.
- Data path to external memory or device: 8- and 16-bit wide
- Burst and page access: burst of 4-8-16 Word16
- Supports bus keeping
- Supports bus turn around

### 15.4.7 GPMC Register Manual

This section provides information about the GPMC instance in this product. [Table 15-273](#) provides a summary of the GPMC registers. The remaining parts of this section describe the registers within the module instance.

#### 15.4.7.1 GPMC Register Summary

**Table 15-272. GPMC Instance Summary**

### 15.4.7.2 GPMC Register Descriptions

**NOTE:** All GPMC registers are aligned to 32-bit address boundaries. All register file accesses, except to [GPMC\\_NAND\\_DATA\\_i](#) register, are little endian. If the [GPMC\\_NAND\\_DATA\\_i](#) register location is accessed, the endianness is access-dependent.

In the whole section *i* corresponds to the chip-select number, *i* = 0 to 7.

## 15.5 Error Location Module

### 15.5.1 Error Location Module Overview

Non-managed NAND flash memories can be dense and nonvolatile in their own nature, but error-prone. When reading from NAND flash memories, some level of error-correction is required. In the case of NAND modules with no internal correction capability, sometimes referred to as *bare NANDs*, the correction process is delegated to the memory controller.

The general-purpose memory controller (GPMC) probes data read from an external NAND flash and uses this to compute checksum-like information, called syndrome polynomials, on a per-block basis. Each syndrome polynomial gives a status of the read operations for a full block, including 512 bytes of data, parity bits, and an optional spare-area data field, with a maximum block size of 1023 bytes. Computation is based on a Bose-Chaudhuri-Hocquenghem (BCH) algorithm. The error-location module (ELM) extracts error addresses from these syndrome polynomials.

Based on the syndrome polynomial value, the ELM can detect errors, compute the number of errors, and give the location of each error bit. The actual data is not required to complete the error-correction algorithm. Errors can be reported anywhere in the NAND flash block, including in the parity bits.

The maximum acceptable number of errors that can be corrected depends on a programmable configuration parameter. 4-, 8-, and 16-bit error-correction levels are supported. The ELM relies on a static and fixed definition of the generator polynomial for each error-correction level that corresponds to the generator polynomials defined in the GPMC (there are three fixed polynomial for the three correction error levels). A larger number of errors than the programmed error-correction level may be detected, but the ELM cannot correct them all. The offending block is then tagged as *uncorrectable* in the associated computation exit status register. If the computation is successful, that is, if the number of errors detected does not exceed the maximum value authorized for the chosen correction capability, the exit status register contains the information on the number of detected errors.

When the error-location process completes, an interrupt is triggered to inform the central processing unit (CPU) that its status can be checked. The number of detected errors and their locations in the NAND block can be retrieved from the module through register accesses.

#### 15.5.1.1 ELM Features

The ELM has the following features:

- 4, 8, and 16 bits per 512-byte block error-location based on BCH algorithms
- Eight simultaneous processing contexts
- Page-based and continuous modes
- Interrupt generation on error-location process completion:
  - When the full page has been processed in page mode
  - For each syndrome polynomial in continuous mode

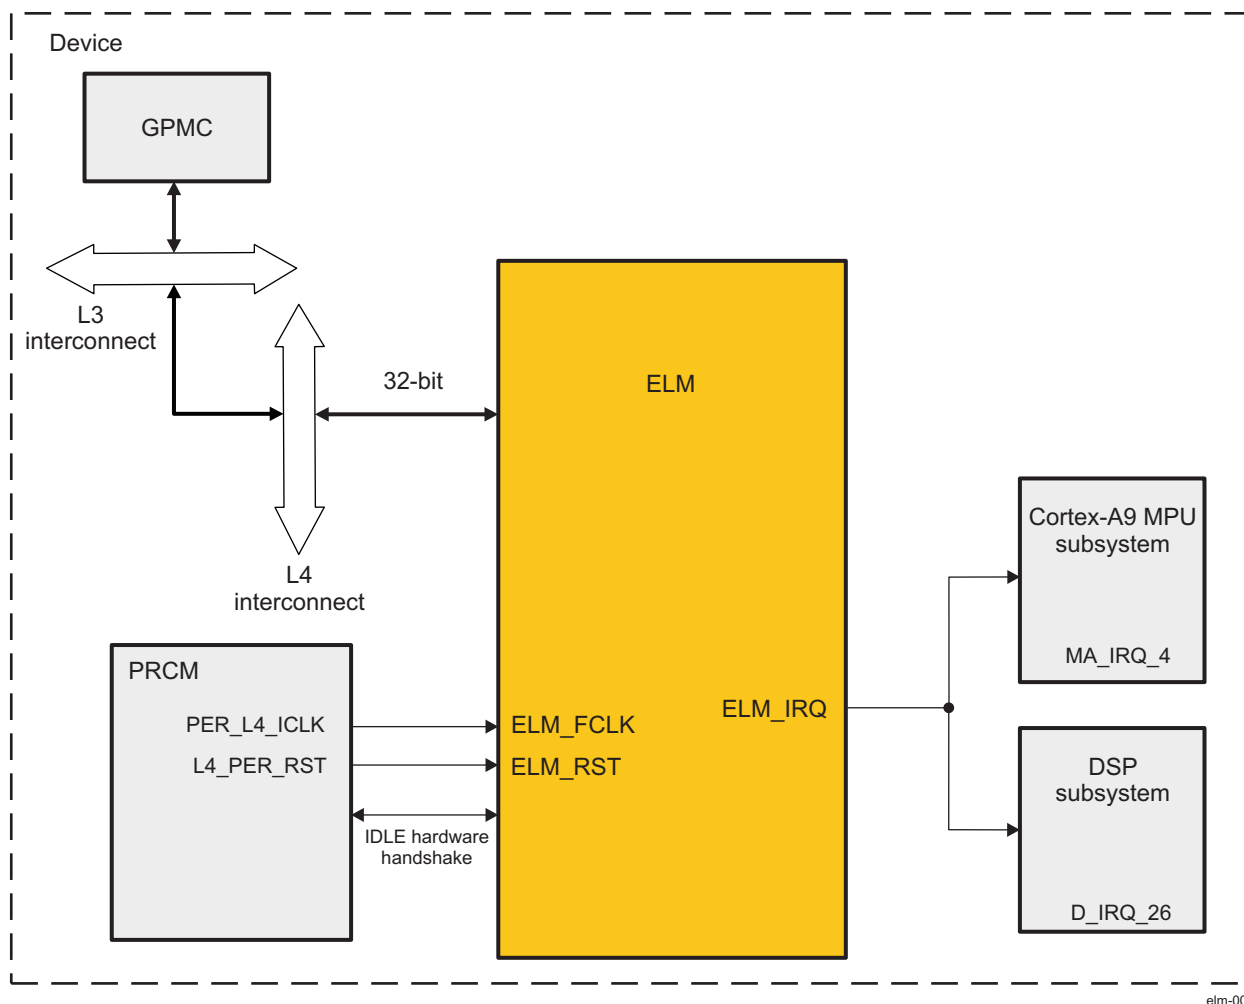

### 15.5.2 ELM Integration

The ELM extracts error addresses from generated syndrome polynomials.

The ELM is used with the GPMC. Syndrome polynomials generated on-the-fly when reading a NAND flash page and stored in GPMC registers are passed to the ELM. The microprocessor unit (MPU) can then correct the data block by flipping the bits to which the ELM error-location outputs point.

Figure 15-100 shows the integration of the ELM subsystem in the device.

**Figure 15-100. ELM Integration**

elm-001

**Table 15-346. Integration Attributes**

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect

ELM	ELM_RST	L4_PER_RST	PRCM	Power domain hardware reset For information about PRCM reset sources and distribution, see <a href="#">Section 3.5.4, Reset Domains</a> in <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .

**Table 15-348. Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
ELM	ELM_IRQ	MA_IRQ_4	Cortex-A9	BCH error-location module interrupt For information about Cortex-A9 interrupt control, see <a href="#">Section 17.3.2, Interrupt Requests to Cortex-A9 MPU INTc</a> .
		D_IRQ_26	DSP	BCH error-location module interrupt For information about DSP interrupt control, see <a href="#">Section 5.3.7, Interrupts Requests</a> .

### 15.5.3 ELM Functional Description

The ELM is designed around the error-location engine, which handles the computation based on the input syndrome polynomials.

The ELM maps the error-location engine to a standard interconnect interface by using a set of registers to control inputs and outputs.

#### 15.5.3.1 ELM Software Reset

To perform a software reset, write a 1 to the [ELM\\_SYSCONFIG\[1\] SOFTRESET](#) bit. The [ELM\\_SYSSTATUS\[0\] RESETDONE](#) bit indicates that the software reset is complete when its value is 1. When the software reset completes, the [ELM\\_SYSCONFIG\[1\] SOFTRESET](#) bit is automatically reset.

#### 15.5.3.2 ELM Power Management

[Table 15-349](#) describes the power-management features available to the ELM module.

##### NOTE:

- For information about source clock gating and sleep/wake-up transitions description, see the [Section 3.6.8, CD\\_L4\\_PER Clock Domain](#) in [Chapter 3, Power, Reset, and Clock Management](#).
- For a general description of `EnaWakeUp`, `IdleMode`, `ClockActivity`, and `StandbyMode` features, see [Section 3.6 Clock Management](#) in [Chapter 3, Power, Reset, and Clock Management](#)

**Table 15-349. Local Power Management Features**

Feature	Registers	Description
Clock autogating	<a href="#">ELM_SYSCONFIG</a> [0] AUTOGATING bit	This bit allows a local power optimization inside the module by gating the ELM_FCLK clock upon the interface activity.
Slave idle modes	<a href="#">ELM_SYSCONFIG</a> [4:3] SIDLEMODE bit field	Force-idle, No-idle, and Smart-idle modes are available.
Clock activity	<a href="#">ELM_SYSCONFIG</a> [8] CLOCKACTIVITY bit	The clock can be switched-off or maintained during the wake-up period.
Master Standby modes	N/A	
Global Wake-up Enable	N/A	
Wake-up Sources Enable	N/A	

**CAUTION**

The PRCM module has no hardware means of reading CLOCKACTIVITY settings. Thus, software must ensure consistent programming between the ELM CLOCKACTIVITY and ELM clock PRCM control bits. For a description of the ClockActivity feature, see [Chapter 3, Power, Reset, and Clock Management](#).

**15.5.3.3 ELM Interrupt Requests**

[Table 15-350](#) lists the event flags, and their masks, that can cause module interrupts.

**Table 15-350. Events**

Event Flag	Event Mask	Map to	Description
<a href="#">ELM_IRQSTATUS</a> [8] PAGE_VALID	<a href="#">ELM_IRQENABLE</a> [8] PAGE_MASK	ELM_IRQ	Page interrupt

**15.5.3.4 Processing Initialization**

[ELM\\_LOCATION\\_CONFIG](#) global setting parameters must be set before using the error-location engine. The [ELM\\_LOCATION\\_CONFIG](#)[1:0] ECC\_BCH\_LEVEL bit defines the error-correction level used (4-, 8-, or 16-bit error-correction). The [ELM\\_LOCATION\\_CONFIG](#)[26:16] ECC\_SIZE bit field defines the maximum buffer length beyond which the engine processing no longer looks for errors.

The CPU can choose to use the ELM in continuous mode or page mode. If all [ELM\\_PAGE\\_CTRL](#)[i] SECTOR\_i bits are reset (i is the syndrome polynomial number, i = 0 to 7), continuous mode is used. In any other case, page mode is implicitly selected.

- Continuous mode: Each syndrome polynomial is processed independently – results for a syndrome

can be retrieved and acknowledged at any time, whatever the status of the other seven processing contexts.

- Page mode: Syndrome polynomials are grouped into atomic entities – only one page can be processed at any given time, even if all eight contexts are not used for this page. Unused contexts are lost and cannot be affected to any other processing. The full page must be acknowledged and cleared before moving to the next page.

For completion interrupts to be generated correctly, all [ELM\\_IRQENABLE\[i\]](#) LOCATION\_MASK\_i bits (i = 0 to 7) must be forced to 0 when in page mode, and set to 1 in continuous mode. Additionally, the [ELM\\_IRQENABLE\[8\]](#) PAGE\_MASK bit must be set to 1 when in page mode.

The CPU initiates error-location processing by writing a syndrome polynomial into one of the eight possible register sets. Each of these register sets includes seven registers: [ELM\\_SYNDROME\\_FRAGMENT\\_0\\_i](#) to [ELM\\_SYNDROME\\_FRAGMENT\\_6\\_i](#). The first six registers can be written in any order, but [ELM\\_SYNDROME\\_FRAGMENT\\_6\\_i](#) must be written last because it includes the validity bit, which instructs the ELM that this syndrome polynomial must be processed (the [ELM\\_SYNDROME\\_FRAGMENT\\_6\\_i\[16\]](#) SYNDROME\_VALID bit).

As soon as one validity bit is asserted ([ELM\\_SYNDROME\\_FRAGMENT\\_6\\_i\[16\]](#) SYNDROME\_VALID = 0x1, with i = 0 to 7), error-location processing can start for the corresponding syndrome polynomial. The associated [ELM\\_LOCATION\\_STATUS\\_i](#) and [ELM\\_ERROR\\_LOCATION\\_0\\_i](#) to [ELM\\_ERROR\\_LOCATION\\_15\\_i](#) registers are not reset (i = 0 to 7). The software must not consider them until the corresponding [ELM\\_IRQSTATUS\[i\]](#) LOC\_VALID\_i bit is set.

### 15.5.3.5 Processing Sequence

While the error-location engine is busy processing one syndrome polynomial, further syndrome polynomials can be written. They are processed when the current processing completes.

The engine completes early when:

- No error is detected; that is, when the [ELM\\_LOCATION\\_STATUS\\_i\[8\]](#) ECC\_CORRECTABLE bit is set to 1 and the [ELM\\_LOCATION\\_STATUS\\_i\[4:0\]](#) ECC\_NB\_ERRORS bit field is set to 0x0.
- Too many errors are detected; that is, when the [ELM\\_LOCATION\\_STATUS\\_i\[8\]](#) ECC\_CORRECTABLE bit is set to 0 while the [ELM\\_LOCATION\\_STATUS\\_i\[4:0\]](#) ECC\_NB\_ERRORS bit field is set with the value output by the error-location engine. The reported number of errors is not ensured if ECC\_CORRECTABLE is 0.

If the engine completes early, the associated error-location registers [ELM\\_ERROR\\_LOCATION\\_0\\_i](#) to [ELM\\_ERROR\\_LOCATION\\_15\\_i](#) are not updated (i = 0 to 7).

In all other cases, the engine goes through the entire error-location process. Each time an error-location is found, it is logged in the associated ECC\_ERROR\_LOCATION bit field. The first error detected is logged in the [ELM\\_ERROR\\_LOCATION\\_0\\_i\[12:0\]](#) ECC\_ERROR\_LOCATION bit field; the second in the [ELM\\_ERROR\\_LOCATION\\_1\\_i\[12:0\]](#) ECC\_ERROR\_LOCATION bit field, and so on.

**Table 15-351. ELM\_LOCATION\_STATUS\_i Value Decoding Table**

ECC_CORRECTABLE Value	ECC_NB_ERRORS Value	Status	Number of Errors Detected	Action Required
1	0	OK	0	None
1	≠ 0	OK	ECC_NB_ERRORS	Correct the data buffer read based on the <a href="#">ELM_ERROR_LOCATION_0_i</a> to <a href="#">ELM_ERROR_LOCATION_15_i</a> results.
0	Any	Failed	Unknown	Software-dependant

### 15.5.3.6 Processing Completion

When the processing for a given syndrome polynomial completes, its [ELM\\_SYNDROME\\_FRAGMENT\\_6\\_i\[16\]](#) SYNDROME\_VALID bit is reset. It must not be set again until the exit status registers, [ELM\\_LOCATION\\_STATUS\\_i](#) (i = 0 to 7), for this processing are checked. Failure to comply with this rule leads to potential loss of the first polynomial process data output.

The error-location engine signals the process completion to the ELM. When this event is detected, the corresponding `ELM_IRQSTATUS[i] LOC_VALID_i` bit is set ( $i = 0$  to  $7$ ). The processing-exit status is available from the associated `ELM_LOCATION_STATUS_i` register, and error locations are stored in order in the `ECC_ERROR_LOCATION` fields. The software must only read valid error-location registers based on the number of errors detected and located.

Immediately after the error-location engine completes, a new syndrome polynomial can be processed, if any is available, as reported by the `ELM_SYNDROME_FRAGMENT_6_i[16] SYNDROME_VALID` validity bit, depending on the configured error-correction level. If several syndrome polynomials are available, a round-robin arbitration is used to select one for processing.

In continuous mode (that is, all bits in `ELM_PAGE_CTRL` are reset), an interrupt is triggered whenever a `ELM_IRQSTATUS[i] LOC_VALID_i` bit is asserted. The CPU must read the `ELM_IRQSTATUS` register to determine which polynomial is processed and retrieve the exit status and error locations (`ELM_LOCATION_STATUS_i` and `ELM_ERROR_LOCATION_0_i` to `ELM_ERROR_LOCATION_15_i`). When done, the CPU must clear the corresponding `ELM_IRQSTATUS[i] LOC_VALID_i` bit by writing it to 1. Other status bits must be written to 0 so that other interrupts are not unintentionally cleared. When using this mode, the `ELM_IRQSTATUS[8] PAGE_VALID` interrupt is never triggered.

In page mode, the module does not trigger interrupts for the processing completion of each polynomial because the `ELM_IRQENABLE[i] LOCATION_MASK_i` bits are cleared. A page is defined using the `ELM_PAGE_CTRL` register. Each `SECTOR_i` bit set means the corresponding polynomial  $i$  is part of the page processing. A page is fully processed when all tagged polynomials have been processed, as logged in the `ELM_IRQSTATUS[i] LOC_VALID_i` bit fields. The module triggers an `ELM_IRQSTATUS[8] PAGE_VALID` interrupt whenever it detects that the full page has been processed. To make sure the next page can be correctly processed, all status bits in the `ELM_IRQSTATUS` register must be cleared by using a single atomic-write access.

---

**NOTE:** Do not modify page setting parameters in the `ELM_PAGE_CTRL` register unless the engine is idle, no polynomial input is valid, and all interrupts have been cleared.

---

Because no polynomial-level interrupt is triggered in page mode, polynomials cleared in the `ELM_PAGE_CTRL[i] SECTOR_i` bit fields ( $i = 0$  to  $7$ ) are processed as usual, but are essentially ignored. The CPU must manually poll the `ELM_IRQSTATUS` bits to check for their status.

## 15.5.4 ELM Basic Programming Model

### 15.5.4.1 ELM Low Level Programming Model

#### 15.5.4.1.1 Processing Initialization

**Table 15-352. ELM Processing Initialization**

Step	Register/ Bit Field / Programming Model	Value
Resets the module	<code>ELM_SYSCONFIG[1] SOFTRESET</code>	0x1
Wait until reset is done.	<code>ELM_SYSSTATUS[0] RESETDONE</code>	0x1
Configure the slave interface power management.	<code>ELM_SYSCONFIG[4:3] SIDLEMODE</code>	Set value
Defines the error-correction level used	<code>ELM_LOCATION_CONFIG[1:0] ECC_BCH_LEVEL</code>	Set value
Defines the maximum buffer length	<code>ELM_LOCATION_CONFIG[26:16] ECC_SIZE</code>	Set value
Sets the ELM in continuous mode or page mode	<code>ELM_PAGE_CTRL</code>	Set value
<b>If</b> continuous mode is used	All <code>ELM_PAGE_CTRL[i] SECTOR_i</code> ( $i = 0$ to $7$ )	0x0
Enables interrupt for syndrome polynomial $i$	<code>ELM_IRQENABLE[i] LOCATION_MASK_i</code>	0x1
<b>else</b> (page mode is used)	One syndrome polynomial $i$ is set <code>ELM_PAGE_CTRL[i] SECTOR_i</code> ( $i = 0$ to $7$ )	0x1
Disable all interrupts for syndrome polynomial and enable <code>PAGE_MASK</code> interrupt.	All <code>ELM_IRQENABLE[i] LOCATION_MASK_i = 0x0</code> and <code>ELM_IRQENABLE[8] PAGE_MASK = 0x1</code>	Set value
<b>endif</b>		Set value

**Table 15-352. ELM Processing Initialization (continued)**

Step	Register/ Bit Field / Programming Model	Value
Set the input syndrome polynomial i.	<a href="#">ELM_SYNDROME_FRAGMENT_0_i</a>	Set value
	<a href="#">ELM_SYNDROME_FRAGMENT_1_i</a>	Set value
	<a href="#">ELM_SYNDROME_FRAGMENT_5_i</a>	Set value
	<a href="#">ELM_SYNDROME_FRAGMENT_6_i</a>	Set value
Initiates the computation process	<a href="#">ELM_SYNDROME_FRAGMENT_6_i</a> [16] SYNDROME_VALID	0x1

### 15.5.4.1.2 Read Results

The engine goes through the entire error-location process and results can be read. [Table 15-353](#) and [Table 15-354](#) describe the processing completion for continuous and page modes, respectively.

**Table 15-353. ELM Processing Completion for Continuous Mode**

Step	Register/ Bit Field / Programming Model	Value
Wait until process is complete for syndrome polynomial i: Wait until the ELM_IRQ interrupt is generated, or poll the status register.		
Read for which i the error-location process is complete.	<a href="#">ELM_IRQSTATUS</a> [i] LOC_VALID_i	0x1
<b>if</b> the process fails (too many errors) It is software dependant.	<a href="#">ELM_LOCATION_STATUS_i</a> [8] ECC_CORRECTABLE	0x0
<b>else</b> (process successful, the engine completes)	<a href="#">ELM_LOCATION_STATUS_i</a> [8] ECC_CORRECTABLE	0x1
Read the number of errors.	<a href="#">ELM_LOCATION_STATUS_i</a> [4:0] ECC_NB_ERRORS	
Read the error-location bit addresses for syndrome polynomial i of the ECC_NB_ERRORS first registers. It is the software responsibility to correct errors in the data buffer.	<a href="#">ELM_ERROR_LOCATION_0_i</a> [12:0] ECC_ERROR_LOCATION	
	<a href="#">ELM_ERROR_LOCATION_1_i</a> [12:0] ECC_ERROR_LOCATION	
	... <a href="#">ELM_ERROR_LOCATION_15_i</a> [12:0] ECC_ERROR_LOCATION	
<b>endif</b>		
Clear the corresponding i interrupt.	<a href="#">ELM_IRQSTATUS</a> [i] LOC_VALID_i	0x1

A new syndrome polynomial can be processed after the end of processing ([ELM\\_SYNDROME\\_FRAGMENT\\_6\\_i](#)[16] SYNDROME\_VALID = 0x0) and after the exit status register check ([ELM\\_LOCATION\\_STATUS\\_i](#)).

**Table 15-354. ELM Processing Completion for Page Mode**

Step	Register/ Bit Field / Programming Model	Value
Wait until process is complete for syndrome polynomial i: Wait until the ELM_IRQ interrupt is generated, or poll the status register.		
Wait for page completed interrupt: All error locations are valid.	<a href="#">ELM_IRQSTATUS</a> [8] PAGE_VALID	0x1
<b>Repeat</b> the following actions the necessary number of times. That is, once for each valid defined block in the page.		
Read the process exit status.	<a href="#">ELM_LOCATION_STATUS_i</a> [8] ECC_CORRECTABLE	
<b>if</b> the process fails (too many errors) It is software dependant.	<a href="#">ELM_LOCATION_STATUS_i</a> [8] ECC_CORRECTABLE	0x0
<b>else</b> (process successful, the engine completes)	<a href="#">ELM_LOCATION_STATUS_i</a> [8] ECC_CORRECTABLE	0x1
Read the number of errors.	<a href="#">ELM_LOCATION_STATUS_i</a> [4:0] ECC_NB_ERRORS	

**Table 15-354. ELM Processing Completion for Page Mode (continued)**

Step	Register/ Bit Field / Programming Model	Value
Read the error-location bit addresses for syndrome polynomial $i$ of the ECC_NB_ERRORS first registers.	<a href="#">ELM_ERROR_LOCATION_0_i</a> [12:0] ECC_ERROR_LOCATION	
	<a href="#">ELM_ERROR_LOCATION_1_i</a> [12:0] ECC_ERROR_LOCATION	
	...	
	<a href="#">ELM_ERROR_LOCATION_15_i</a> [12:0] ECC_ERROR_LOCATION	
<b>endif</b>		
<b>End Repeat</b>		
Clear the <a href="#">ELM_IRQSTATUS</a> register.	<a href="#">ELM_IRQSTATUS</a>	0x1FF

Next page can be correctly processed after a page is fully processed, when all tagged polynomials have been processed ([ELM\\_IRQSTATUS](#)[ $i$ ] LOC\_VALID\_ $i$  = 0x1 for all syndrome polynomials  $i$  used in the page).

#### 15.5.4.2 Use Case: ELM Used in Continuous Mode

In this example, the ELM module is programmed for an 8-bit error-correction capability in continuous mode. After reading a 528-byte NAND flash sector (512B data plus 16B spare area) with a 16-bit interface, a non-zero polynomial syndrome is reported from the GPMC (Polynomial syndrome 0 is used in the ELM):

- $P = 0x0A16ABE115E44F767BFB0D0980$

**Table 15-355. Use Case: Continuous Mode**

Step	Register/ Bit Field / Programming Model	Value
Resets the module	<a href="#">ELM_SYSCONFIG</a> [1] SOFTRESET	0x1
Wait until reset is done.	<a href="#">ELM_SYSSTATUS</a> [0] RESETDONE	0x1
Configure the slave interface power management: Smart idle is used.	<a href="#">ELM_SYSCONFIG</a> [4:3] SIDLEMODE	0x2
Defines the error-correction level used: 8 bits	<a href="#">ELM_LOCATION_CONFIG</a> [1:0] ECC_BCH_LEVEL	0x1
Defines the maximum buffer length: 528 bytes (2x528 = 1056)	<a href="#">ELM_LOCATION_CONFIG</a> [26:16] ECC_SIZE	0x420
Sets the ELM in continuous mode	<a href="#">ELM_PAGE_CTRL</a>	0
Enables interrupt for syndrome polynomial 0	<a href="#">ELM_IRQENABLE</a> [0] LOCATION_MASK_0	0x1
Set the input syndrome polynomial 0.	<a href="#">ELM_SYNDROME_FRAGMENT_0_i</a> (i=0)	0xFB0D0980
	<a href="#">ELM_SYNDROME_FRAGMENT_1_i</a> (i=0)	0xE44F767B
	<a href="#">ELM_SYNDROME_FRAGMENT_2_i</a> (i=0)	0x16ABE115
	<a href="#">ELM_SYNDROME_FRAGMENT_3_i</a> (i=0)	0x0000000A
Initiates the computation process	<a href="#">ELM_SYNDROME_FRAGMENT_6_i</a> [16] SYNDROME_VALID (i=0)	0x1
Wait until process is complete for syndrome polynomial 0: IRQ_ELM is generated or poll the status register.		
Read that error-location process is complete for syndrome polynomial 0.	<a href="#">ELM_IRQSTATUS</a> [0] LOC_VALID_0	0x1
Read the process exit status: All errors were successfully located.	<a href="#">ELM_LOCATION_STATUS_i</a> [8] ECC_CORRECTABLE (i=0)	0x1
Read the number of errors: Four errors detected.	<a href="#">ELM_LOCATION_STATUS_i</a> [4:0] ECC_NB_ERRORS (i=0)	0x4

**Table 15-355. Use Case: Continuous Mode (continued)**

Step	Register/ Bit Field / Programming Model	Value
Read the error-location bit addresses for syndrome polynomial 0 of the 4 first registers: Errors are located in the data buffer at decimal addresses 431, 1062, 1909, 3452.	<a href="#">ELM_ERROR_LOCATION_0_i</a> (i=0)	0x1AF
	<a href="#">ELM_ERROR_LOCATION_1_i</a> (i=0)	0x426
	<a href="#">ELM_ERROR_LOCATION_2_i</a> (i=0)	0x775
	<a href="#">ELM_ERROR_LOCATION_3_i</a> (i=0)	0xD7C
Clear the corresponding interrupt for polynomial 0.	<a href="#">ELM_IRQSTATUS[0] LOC_VALID_0</a>	0x1

The NAND flash data in the sector are seen as a polynomial of degree 4223 (number of bits in a 528 byte buffer minus 1), with each data bit being a coefficient in the polynomial. When reading from a NAND flash using the GPMC module, computation of the polynomial syndrome assumes that the first NAND word read at address 0x0 contains the highest-order coefficient in the message. Furthermore, in the 16-bit NAND word, bits are ordered from bit 7 to bit 0, then from bit 15 to bit 8. Based on this convention, an address table of the data buffer can be built. NAND memory addresses in [Table 15-356](#) are given in decimal format.

**Table 15-356. 16-bit NAND Sector Buffer Address Map**

NAND Memory Address	Message bit addresses in the memory word															
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	4215	4214	4213	4212	4211	4210	4209	4208	4223	4222	4221	4220	4219	4218	4217	4216
1	4175	4174	4173	4172	4171	4170	4169	4168	4183	4182	4181	4180	4179	4178	4177	4176
...																
47	3463	3462	3461	3460	3459	3458	3457	3456	3471	3470	3469	3468	3467	3466	3465	3464
48	3447	3446	3445	3444	3443	3442	3441	3440	3455	3454	3453	3452	3451	3450	3449	3448

50	3415	3414	3413	3412	3411	3410	3409	3408	3423	3422	3421	3420	3419	3418	3417	3416
...																
255	135	134	133	132	131	130	129	128	143	142	141	140	139	138	137	136
256	119	118	117	116	115	114	113	112	127	126	125	124	123	122	121	120
257	103	102	101	100	99	98	97	96	111	110	109	108	107	106	105	104
258	87	86	85	84	83	82	81	80	95	94	93	92	91	90	89	88
259	71	70	69	68	67	66	65	64	79	78	77	76	75	74	73	72
260	55	54	53	52	51	50	49	48	63	62	61	60	59	58	57	56
261	39	38	37	36	35	34	33	32	47	46	45	44	43	42	41	40
262	23	22	21	20	19	18	17	16	31	30	29	28	27	26	25	24
263	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8

The table can now be used to determine which bits in the buffer were incorrect and must be flipped. In this example, the first bit to be flipped is bit 4 from the 49th byte read from memory. It is up to the processor to correctly map this word to the copied buffer and to flip this bit. The same process must be repeated for all detected errors.

### 15.5.4.3 Use Case: ELM Used in Page Mode

In this example, the ELM module is programmed for an 16-bit error-correction capability in page mode. After reading a 528-byte NAND flash sector (512B data plus 16B spare area) with a 16-bit interface, four non-zero polynomial syndromes are reported from the GPMC (Polynomial syndrome 0, 1, 2, and 3 are used in the ELM):

- P0 = 0xE8B0 12ADDB5A318E05BE B0693DB28330B5CC A329AA05E0B718EF
- P1 = 0xBAD0 49A0D932C22E6669 0948DF08BE093336 79C6BA10E5F935EB
- P2 = 0x69D9 B86ABCD5EC3697FA A6498FEE54556EA0 1579EF7D60BA3189
- P3 = 0x0

**Table 15-357. Use Case: Page Mode**

Step	Register/ Bit Field / Programming Model	Value
Resets the module	ELM_SYSCONFIG[1] SOFTRESET	0x1
Wait until reset is done.	ELM_SYSSTATUS[0] RESETDONE	0x1

**Table 15-357. Use Case: Page Mode (continued)**

Step	Register/ Bit Field / Programming Model	Value
Wait until process is complete for syndrome polynomial 0, 1, 2, and 3: Wait until the ELM_IRQ interrupt is generated or poll the status register.		
Wait for page completed interrupt: All error locations are valid.	ELM_IRQSTATUS[8] PAGE_VALID	0x1
Read the process exit status for syndrome polynomial 0: All errors were successfully located.	ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE (i=0)	0x1
Read the process exit status for syndrome polynomial 1: All errors were successfully located.	ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE (i=1)	0x1
Read the process exit status for syndrome polynomial 2: All errors were successfully located.	ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE (i=2)	0x1
Read the process exit status for syndrome polynomial 3: All errors were successfully located.	ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE (i=3)	0x1
Read the number of errors for syndrome polynomial 0: 4 errors detected.	ELM_LOCATION_STATUS_i[4:0] ECC_NB_ERRORS (i=0)	0x4
Read the number of errors for syndrome polynomial 1: 2 errors detected.	ELM_LOCATION_STATUS_i[4:0] ECC_NB_ERRORS (i=1)	0x2
Read the number of errors for syndrome polynomial 2: 1 error detected.	ELM_LOCATION_STATUS_i[4:0] ECC_NB_ERRORS (i=2)	0x1
Read the number of errors for syndrome polynomial 3: 0 errors detected.	ELM_LOCATION_STATUS_i[4:0] ECC_NB_ERRORS (i=3)	0x0
Read the error-location bit addresses for syndrome polynomial 0 of the 4 first registers:	ELM_ERROR_LOCATION_0_i (i=0) ELM_ERROR_LOCATION_1_i (i=0) ELM_ERROR_LOCATION_2_i (i=0) ELM_ERROR_LOCATION_3_i (i=0)	0x1FE 0x617 0x650 0xA83
Read the error-location bit addresses for syndrome polynomial 1 of the 2 first registers:	ELM_ERROR_LOCATION_0_i (i=1) ELM_ERROR_LOCATION_1_i (i=1)	0x4 0x1036
Read the errors location bit addresses for syndrome polynomial 2 of the first registers:	ELM_ERROR_LOCATION_0_i (i=1)	0x3E8
Clear the ELM_IRQSTATUS register.	ELM_IRQSTATUS	0x1FF

## 15.5.5 ELM Register Manual

### 15.5.5.1 ELM Instance Summary

**Table 15-362. ELM\_SYSCONFIG**

<b>Address Offset</b>	0x0000 0010	<b>Instance</b>	ELM
<b>Physical Address</b>	0x4807 8010		
<b>Description</b>	This register allows controlling various parameters of the OCP interface.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																CLOCKACTIVITYOCP	RESERVED			SIDLEMODE		RESERVED	SOFTRESET	AUTOGATING							

Bits	Field Name	Description	Type	Reset
31:9	RESERVED	Reserved	R	0x000000
8	CLOCKACTIVITYOCP	OCP Clock activity when module is in IDLE mode (during wake up mode period) 0x0: OCP Clock can be switch-off 0x1: OCP Clock is maintained during wake up period	RW	0
7:5	RESERVED	Reserved	R	0x0
4:3	SIDLEMODE	Slave interface power management (IDLE req/ack control) 0x0: FORCE Idle. IDLE request is acknowledged unconditionally and immediately (Default <i>Dumb</i> mode for safety) 0x1: NO idle. IDLE request is never acknowledged. 0x2: SMART Idle. The acknowledgment to an IDLE request is given based on the internal activity. 0x3: Reserved - do not use	RW	0x2
2	RESERVED	Reserved	R	0
1	SOFTRESET	Module software reset This bit is automatically reset by hardware (During reads, it always returns 0.) It has same effect as the OCP hardware reset. 0x0: Normal mode 0x1: Start soft reset sequence.	RW	0
0	AUTOGATING	Internal OCP clock gating strategy (no module visible impact other than saving power) 0x0: OCP clock is free-running 0x1: Automatic internal OCP clock gating strategy is applied based on the OCP interface activity.	RW	1

## 15.6 On-Chip Memory (OCM) Subsystem

### 15.6.1 OCM Subsystem Overview

There are three on-chip memories in the device.

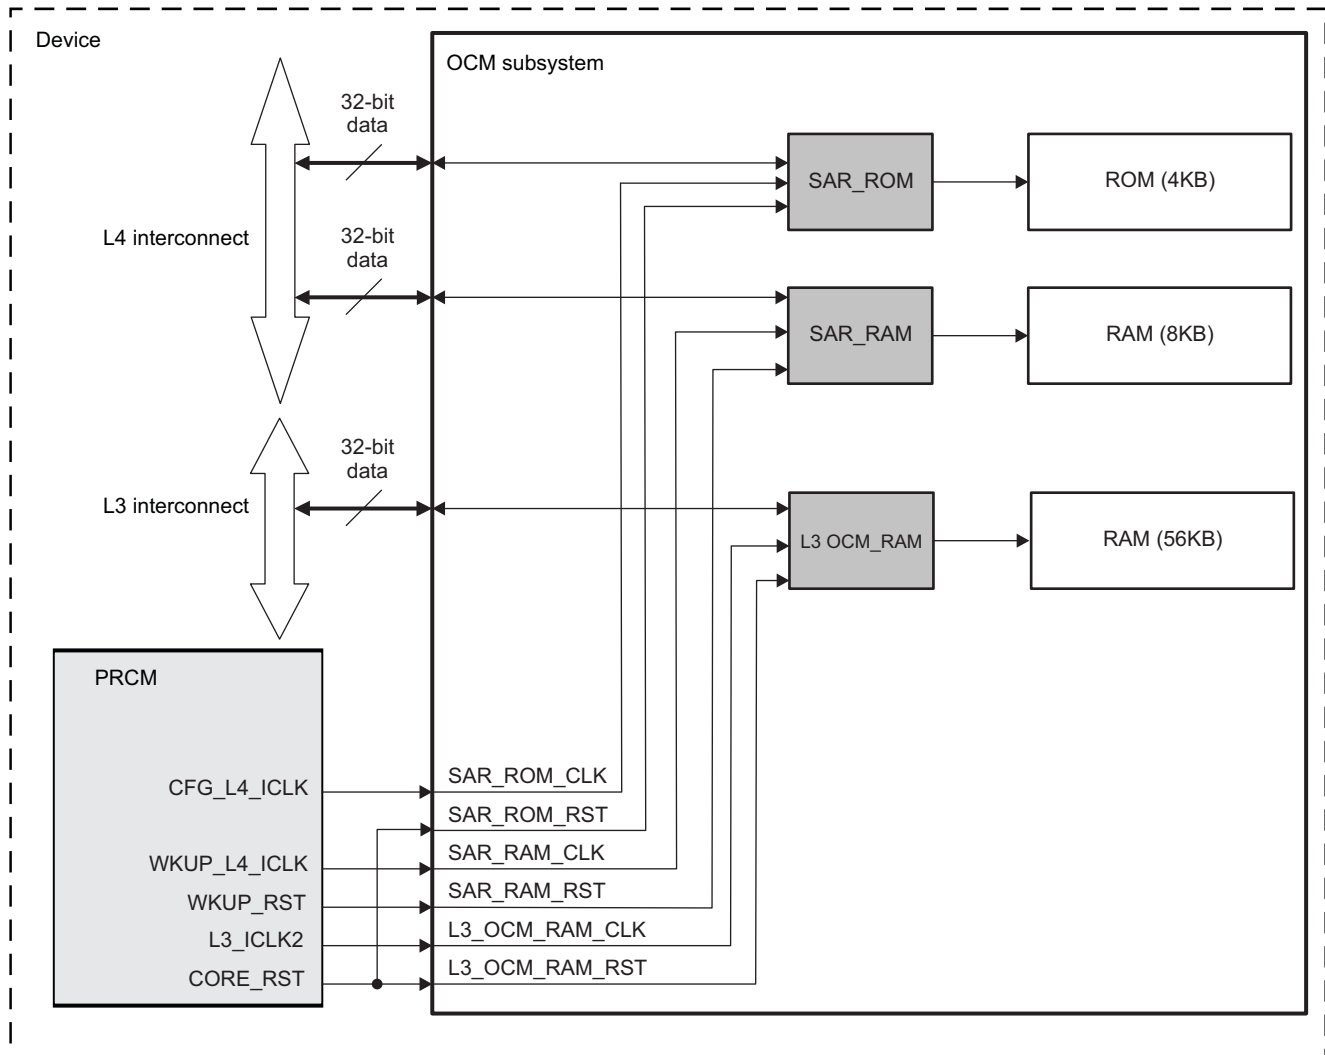

- A 4K-byte SAR read-only memory (ROM)
- A 8K-byte SAR random-access memory (RAM)
- A 56K-byte L3 static random-access memory (L3 OCM\_RAM)

There are other on-chip memories located inside other subsystems (Cortex-A9 MPU, DSP IVA-HD, ABE, Cortex-M3 MPU) that are not described in the following sections. Refer to each subsystem chapter for more details.

### 15.6.2 OCM Subsystem Integration

[Figure 15-101](#) shows the integration of the OCM subsystem to the device.

Figure 15-101. OCM Subsystem Integration to the Device

Ocm-004

Table 15-422 through Table 15-423 summarize the integration of the module in the device.

### 15.6.3 OCM Subsystem Functional Description

#### 15.6.3.1 SAR ROM

This on-chip ROM contains 4K bytes of memory and a linked list of descriptors used by the system DMA (sDMA) during the restore context operation (when device transitions from OFF to ON modes).

The device-embedded SAR ROM has the following characteristics:

- 4K-bytes ROM
- 32-bit access per cycle
- Support for single and burst access transactions

The memory space of the embedded ROM starts at 0x4A05 E000 and ends at 0x4A05 FFFF (8K bytes are reserved, but only 4K bytes are used).

#### 15.6.3.2 SAR RAM

The on-chip SAR RAM contains 8K bytes and is mapped as 4 blocks with irregular region sizes. This memory content is preserved when the device goes into OFF mode (as long as the wake-up voltage domain remains supplied). It is used as context-saving memory to be written by the software, so that the sDMA restores its saved content when the device transitions from OFF to ON mode. Locations not used by the sDMA can be used as a scratch-pad memory by the software. It is mapped on the wake-up voltage domain.

The device-embedded SAR RAM has the following characteristics:

- Support for single-access transactions
  - Operates at full L4-PER interconnect clock frequency
  - 32-bit access per cycle

The SAR RAM space is at the following location:

- SAR space 1 (4KB): Starts at 0x4A32 6000 and ends at 0x4A32 6FFF

- SAR space 2 (1KB): Starts at 0x4A32 7000 and ends at 0x4A32 73FF
- SAR space 3 (2KB): Starts at 0x4A32 8000 and ends at 0x4A32 87FF
- SAR space 4 (1KB): Starts at 0x4A32 9000 and ends at 0x4A32 93FF

### 15.6.3.3 L3 OCM\_RAM

The on-chip L3 OCM\_RAM contains 56K bytes of RAM, partitioning is defined by the L3 firewall logic.

The device-embedded L3 OCM\_RAM has the following characteristics:

- Support for single and burst access transactions:
  - Operates at full L3 interconnect clock frequency
  - Fully pipelined, one 32-bit access per cycle
- Restricted access support based on:
  - A region-based partitioning (refer to L3 firewall description)
  - The module owner of the access, with respect to its read and write permissions to that region
  - The transaction attributes of the access, with respect to the region permission properties. See [Section 13.2, L3 Interconnect](#) for details.

The memory space of the embedded RAM starts at 0x4030 0000 and ends at 0x4030 DFFF.

This chapter describes the system direct memory access (SDMA) module.

## 16.1 SDMA Module Overview

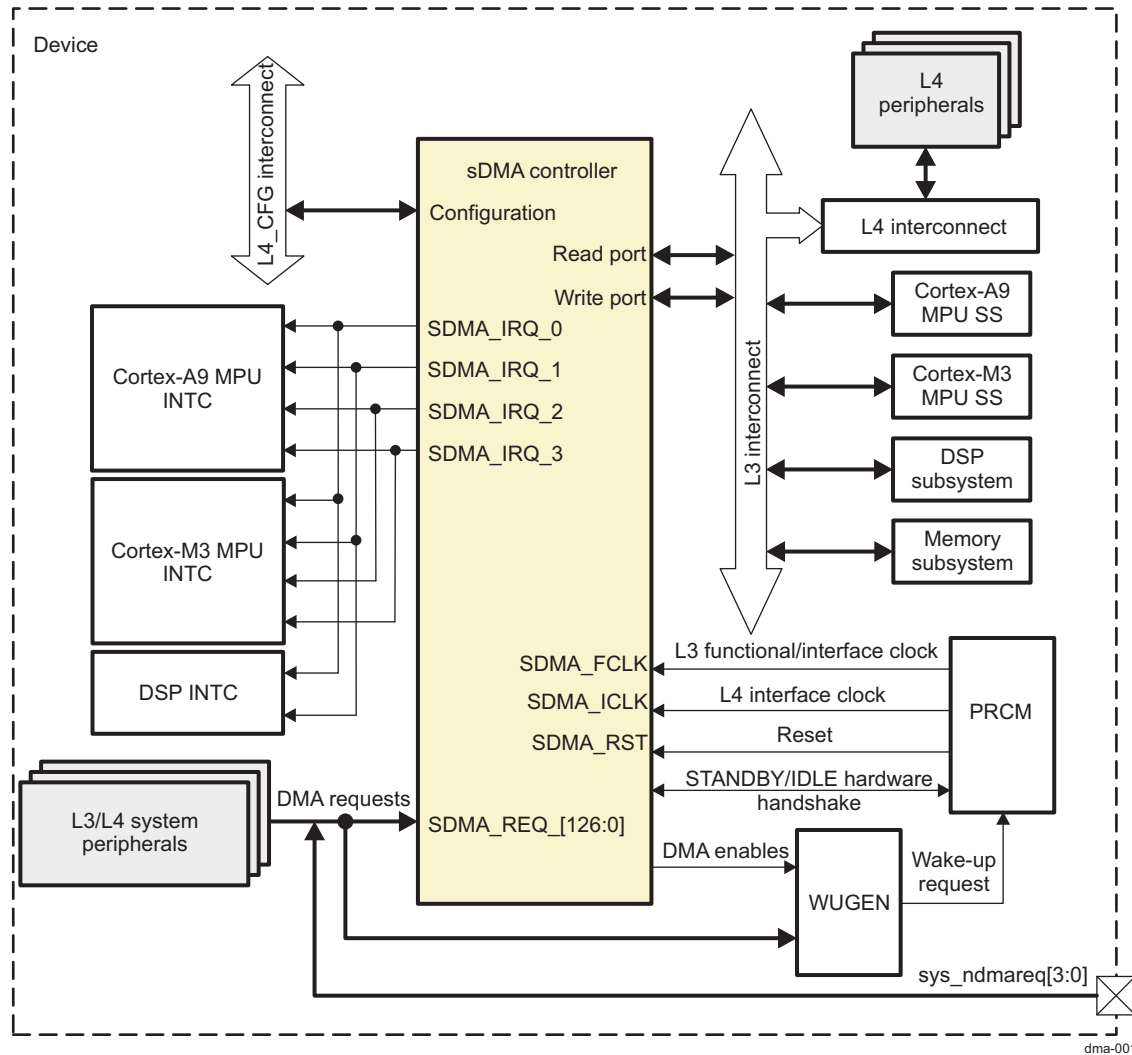

The system direct memory access (SDMA) module, also called DMA4, performs high-performance data transfers between memories and peripheral devices without microprocessor unit (MPU) or digital signal processor (DSP) support during transfer. A DMA transfer is programmed through a logical DMA channel, which allows the transfer to be optimally tailored to the requirements of the application.

The DMA controller includes the following main features:

- Data transfer support in either direction between:
  - Memory and memory
  - Memory and peripheral device
- 32 logical DMA channels supporting:
  - Multiple concurrent transfers
  - Independent transfer profile for each channel
  - 8-bit, 16-bit, or 32-bit data element transfer size
  - Software-triggered or hardware-synchronized transfers
  - Flexible source and destination address generation
  - Burst read and write
  - Chained multiple-channel transfers
  - Endianism conversion
  - Draining
  - Linked-list support for descriptor types 1, 2, and 3
- First-come, first-serve DMA scheduling with fixed priority
- Up to 127 DMA requests
- Constant fill
- Transparent copy
- Four programmable interrupt request output lines
- FIFO depth: 256 × 64-bit
- Data buffering
- FIFO budget allocation
- Power-management support
- Auto-idle power-saving support
- Implementation of retention flip-flops (RFFs) to support dynamic power switching (DPS) between system power modes without MPU involvement. For more information about DPS, see [Section 3.1.2.3, Dynamic Power Switching](#), in [Chapter 3, Power, Reset and Clock Management](#).

Figure 16-1 shows an overview of the SDMA module.

**Figure 16-1. SDMA Overview**

The SDMA module has three ports: one read, one write, and one configuration port, and provides multiple logical channel support. A dynamically allocated FIFO queue memory pool provides buffering between the read and write ports, which are multithreaded (two threads for the write port and four threads for the read port); this means that each transaction is flagged by a thread ID (0, 1, 2, or 3) in the request direction and in the response direction. This allows the read port to have four outstanding requests at a time. The write port has two threads budget available.

The MPU (or DSP) configures the SDMA through the L4-CFG interconnect.

## 16.2 SDMA Controller Environment

The SDMA controller supports external DMA requests through the sys\_ndmareq[3:0] pins (see Table 16-1). A logical channel can be configured to respond to an external synchronization request.

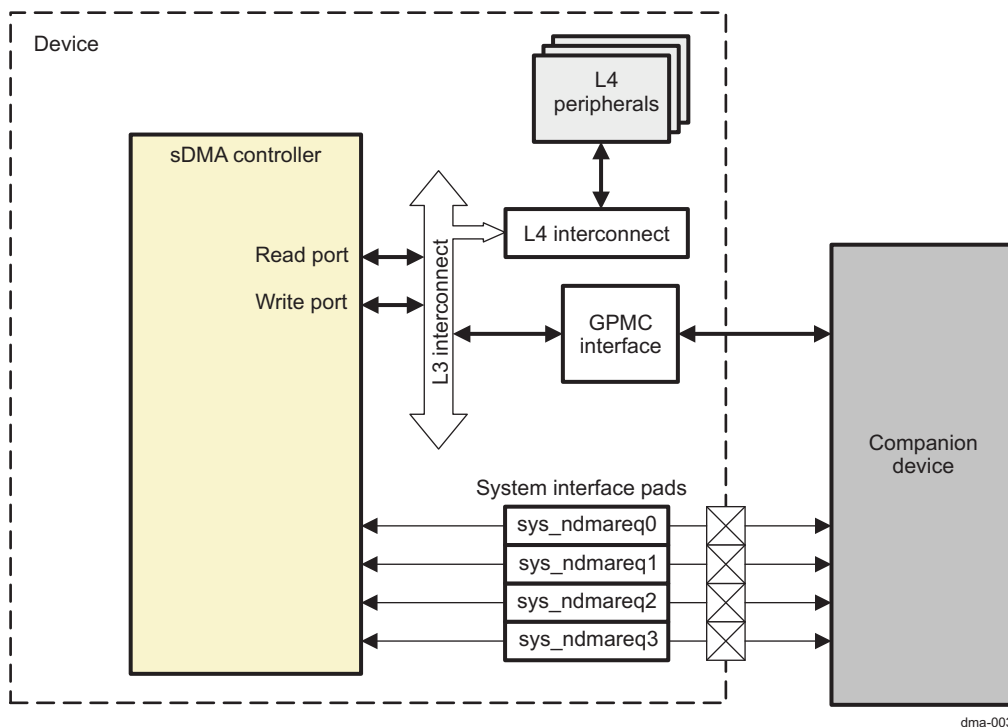

**Table 16-1. External SDMA Request Signals**

Signal Name	I/O <sup>(1)</sup>	Description	Reset Value
sys_ndmareq0	I	External DMA request 0 (system expansion)	Z
sys_ndmareq1	I	External DMA request 1 (system expansion)	Z
sys_ndmareq2	I	External DMA request 2 (system expansion)	Z
sys_ndmareq3	I	External DMA request 3 (system expansion)	Z

<sup>(1)</sup> I = Input; O = Output; I/O = Bidirectional

Figure 16-2 shows an example of how to use the external hardware DMA request pins in the SDMA environment.

**Figure 16-2. Example of External DMA Requests Use**

An external device can use the external DMA request pins to start a logical channel transfer over the general-purpose memory controller (GPMC) interface. The transfer can be a memory-to-memory transfer in which the source memory is in the external device.

By default, the external DMA request signals are not available on external pins after a cold reset. For more information about multiplexing out the four signal lines to pins, see Chapter 18, Control Module.

All 127 DMA request lines are transition-sensitive.

For a transition-sensitive DMA request (see Figure 16-3), the line must be maintained low (asserted) until the first DMA access is complete, after which the line must be maintained high (deasserted) for greater than one clock cycle (DMA\_L3\_ICLK):

- When the deassertion time is less than one clock cycle, the SDMA may not detect the deassertion.
- When the channel is enabled one cycle after a DMA request is disabled, the channel detects the DMA request and starts the corresponding transfer.
- When the channel is enabled two cycles after the DMA request is disabled, the channel does not

detect the DMA request.

**Figure 16-3. Transition-Sensitive DMA Request Scheme**

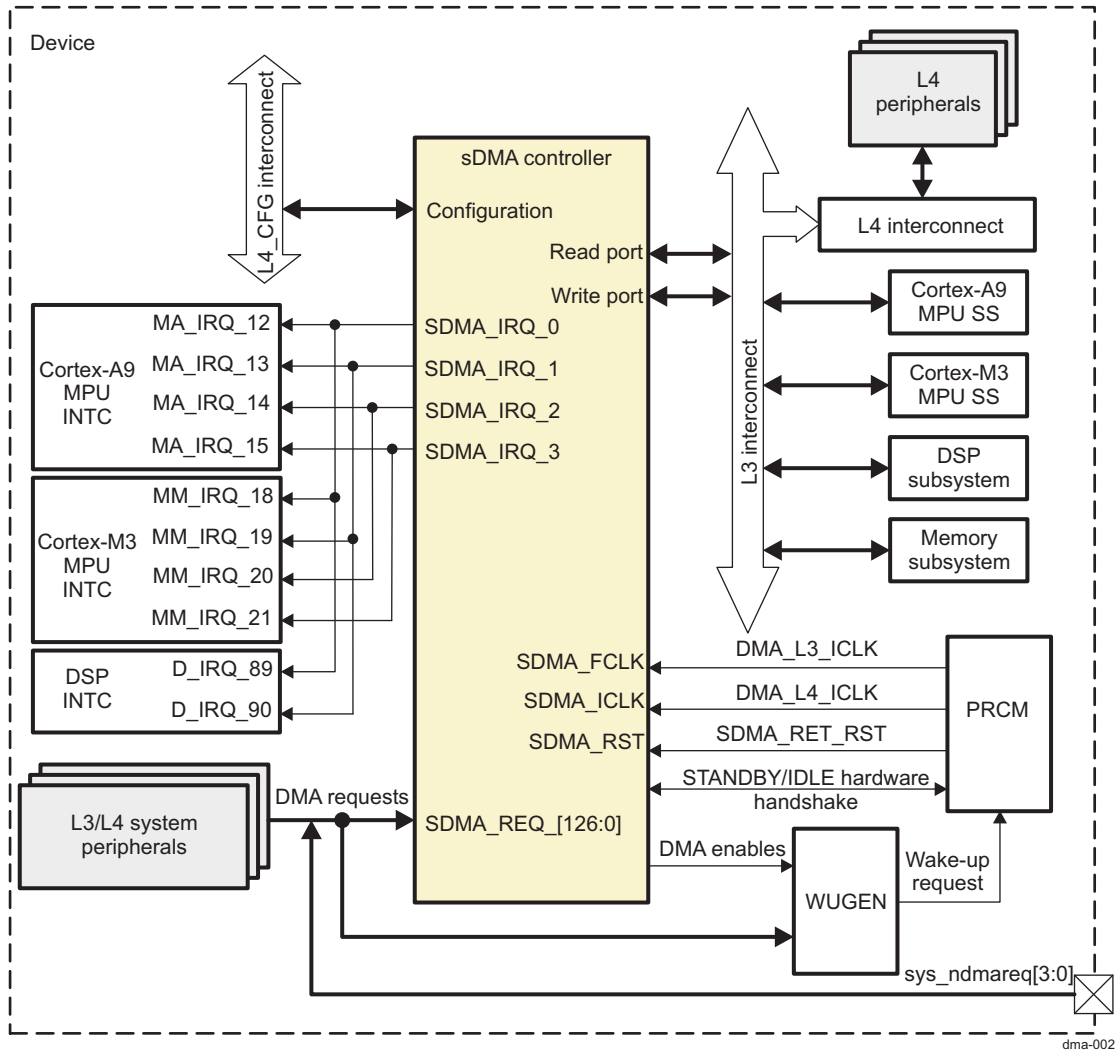

### 16.3 SDMA Module Integration

This section describes the integration of the module in the device, including information about clocks, resets, and hardware requests.

Figure 16-4 shows the SDMA controller integration.

Figure 16-4. SDMA Controller Integration

**NOTE:** For more information about the wake-up generator (WUGEN), the STANDBY/IDLE hardware handshake, and the wake-up request, see Section 3.1.1.1, Clock Management, in Chapter 3, Power, Reset, and Clock Management.

Table 16-2 through Table 16-4 summarize the integration of the module in the device.

Table 16-2. Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
SDMA	PD_CORE	L3 and L4-CFG

**Table 16-3. Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
SDMA	SDMA_FCLK	DMA_L3_ICLK	PRCM	Functional clock for all internal logic and for the two master read and write ports. For information about the power, reset, and clock management (PRCM) clock gating and management, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
	SDMA_ICLK	DMA_L4_ICLK		Interface clock. It supports the configuration port. For information about PRCM clock gating and management, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
SDMA	SDMA_RST	SDMA_RET_RST	PRCM	Hardware reset. It initializes all internal logic of the SDMA module, all global registers, and some of the per-channel registers, implemented in flip-flops. However, all remaining per-channel registers are memory-based, and, therefore, are not reset (have undefined values). Thus, when programming a channel for the first time, all bits that have undefined reset values must be configured before enabling the channel. For information about PRCM reset sources and distribution, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .

**Table 16-4. Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
SDMA	SDMA_IRQ_0	MA_IRQ_12	Cortex™-A9 MPU INTC	SDMA interrupt request 0. For information about the Cortex-A9 MPU INTC, see <a href="#">Section 17.3.2</a> .

## 16.4 SDMA Functional Description

The SDMA module provides high-performance data transfers between memories and peripheral devices with low processor use. A DMA transfer is programmed through a logical DMA channel, which allows the transfer to be optimally tailored to the requirements of the application.

Figure 16-5 shows the SDMA controller top-level block diagram.

**Figure 16-5. SDMA Controller Top-Level Block Diagram**

### 16.4.1 SDMA Controller Power Management

Table 16-6 describes power-management features available for the SDMA controller.

**NOTE:**

- For information about source clock gating and sleep/wake-up transitions, see [Section 3.1.1.1, Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).
- For a description of the EnaWakeUp, IdleMode, ClockActivity, and StandbyMode features, see [Section 3.1.1.2, Module Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

**Table 16-6. Local Power-Management Features**

Feature	Registers	Description
Clock auto gating	<a href="#">DMA4_OCP_SYSCONFIG</a> [0] AUTOIDLE bit	This bit allows local power optimization inside the module by gating the SDMA_ICLK clock upon the interface activity.
Slave idle modes	<a href="#">DMA4_OCP_SYSCONFIG</a> [4:3] SIDLEMODE bit field	Force-idle, no-idle, and smart-idle modes are available.
Clock activity	<a href="#">DMA4_OCP_SYSCONFIG</a> [9:8] CLOCKACTIVITY bit field	For configuration details, see <a href="#">Table 16-7</a> .
Master standby modes	<a href="#">DMA4_OCP_SYSCONFIG</a> [13:12] MIDLEMODE bit field	Force-standby, no-standby, and smart-standby modes are available.
Global wake-up enable	N/A	Feature not available
Wake-up sources enable	N/A	Feature not available

**Table 16-7. Clock Activity Settings**

SDMA_CLOCKACTIVITY Values	Clock State When Module is in IDLE State	
	SDMA_ICLK	SDMA_FCLK
00	Off	Off
10	Off	On
01	On	Off
11	On	On

#### CAUTION

Because the PRCM module cannot read CLOCKACTIVITY settings through hardware, software must ensure consistent programming between the SDMA\_CLOCKACTIVITY and SDMA clock PRCM control bits. For a description of the ClockActivity feature, see [Section 3.1.1.1.2, Module Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

### 16.4.2 SDMA Controller Interrupt Requests

DMA4 has four interrupt lines (L<sub>j</sub>, where j = 0, 1, 2, 3). Each logical channel can request an interrupt over any line. The attachment of a channel interrupt event to one of these four external lines is programmable. Software determines whether it attaches a channel interrupt to a single IRQ line or to multiple IRQ lines.

There are two different registers per interrupt line:

- The [DMA4\\_IRQSTATUS\\_Lj](#) CH\_31\_0\_Lj field shows the status of the different sources of interrupt. If the [DMA4\\_IRQENABLE\\_Lj](#) bit is 1, channel *i* is the source of interrupt in line *j*. In contrast to the [DMA4\\_CSRI](#) registers, the [DMA4\\_IRQSTATUS\\_Lj](#) registers are updated regardless of the corresponding bits in the [DMA4\\_IRQENABLE\\_Lj](#) registers.
- The [DMA4\\_IRQENABLE\\_Lj](#) CH\_31\_0\_Lj\_EN field masks/unmasks the channel interrupt. If the [DMA4\\_IRQENABLE\\_Lj](#) bit is set to 0, channel interrupt *i* of the line *j* is masked.

Each logical channel can generate a number of different interrupt events when enabled (that is, set to 1) in the [DMA4\\_CICRI](#) register. Each status bit is updated in the [DMA4\\_CSRI](#) register only when the corresponding enable bit is enabled in the [DMA4\\_CICRI](#) register.

To determine an interrupt source when an interrupt rises on an interrupt line L<sub>j</sub>:

- Identify the channel (LCH<sub>i</sub>) generating the interrupt.  
Read [DMA4\\_IRQSTATUS\\_Lj.LCHi](#) (LCH0 to LCH31). If LCH<sub>i</sub> = 1, channel *i* is the originator of the interrupt.
- Identify the interrupt event.  
Read the LCH<sub>i</sub> [DMA4\\_CSRI](#). For example, if the drop event (the [DMA4\\_CSRI](#)[1] DROP bit) is 1, a

request collision will occur.

The interrupt event status bit in the [DMA4\\_CSRi](#) register is immediately reset after it is written to 1.

The interrupt status bit in the [DMA4\\_IRQSTATUS\\_Lj](#) register is cleared after it is written to 1.

### 16.4.2.1 Interrupt Generation

The SDMA module has four interrupt request output lines, SDMA\_IRQ\_0 to SDMA\_IRQ\_3. One or more logical channels can be programmed to generate an interrupt request on any of these lines when any one of the maskable DMA events listed in [Table 16-8](#) occurs.

**Table 16-8. Logical DMA Channel Events**

Event	Description
End of packet	A packet transfer completed.
End of block	A block transfer completed.
End of frame	A frame transfer completed.
End of super block	A super block transfer completed.
Half of frame	Half of the current frame transferred.
Start of last frame	The first element of the last frame transferred.
Transaction error	A transaction error is returned by the interconnect in either the read or write port.
Address error	An attempt was made to perform a DMA access to an address not aligned on an ES boundary. Condition to occur: if DMA4_CEN[23:0] CHANNEL_ELMNT_NBR = 0x000000 or DMA4_CFN[15:0] CHANNEL_FRAME_NBR = 0x0000 or DMA4_CSDP[1:0] DATA_TYPE = 0x3.
Supervisor transaction error	An error occurred, for example, when an unauthorized initiator (that is not a supervisor ) tries to use a supervisor transfer.
Drain end	Drain is completed ( <a href="#">DMA4_CCRi</a> [10] WR_ACTIVE becomes 0).
Drop error	A drop event interrupt is generated when a DMA request is being serviced while a second one is asserted and a third one arrives before the second DMA request is serviced.

The logical DMA channels that generate an interrupt on a particular IRQ output are specified through the [DMA4\\_IRQENABLE\\_Lj](#) register (where *j* is the IRQ number: 0, 1, 2, or 3). The events that generate an interrupt for a particular channel can be configured through the channel [DMA4\\_CICRi](#) register.

When an interrupt is detected, the logical DMA channel generating the event can first be identified by reading the [DMA4\\_IRQSTATUS\\_Lj](#) register. The event causing the interrupt then can be identified by reading the interrupt status via the relevant DMA channel [DMA4\\_CSRi](#) register.

### 16.4.3 Logical Channel Transfer Overview

As [Figure 16-5](#) shows, the SDMA module has one read port and one write port operating independently of one another. Buffering is provided between the read and write ports through a FIFO queue memory pool that is shared dynamically between the active logical channels.

- Logical channel synchronization

A logical channel is described as hardware-synchronized when the DMA transfers are triggered by DMA requests from a hardware device. Alternatively, a logical channel is described as nonsynchronized when the DMA transfer is triggered by software.

- Logical channel activation

A logical channel becomes active as follows:

- For hardware-synchronized transfers, when the logical channel is enabled and the hardware DMA request line is asserted
- For software-triggered (nonsynchronized) transfers, as soon as software enables the logical channel

- Logical channel transfer composition

A DMA transfer is divided automatically into a number of transactions. Depending on the logical channel context configured, the transfer size, start address alignment, addressing mode, and

configured maximum burst size, each transaction can be a single access or a burst of accesses.

- Logical channel scheduling

When several logical channels are active at the same time, schedulers manage the read and write ports. The scheduling of logical channel transfers is similar for both read and write ports. When a logical channel becomes active, it is added to the tail of a scheduling queue. If more than one logical channel becomes active at the same time, the one with the lower number is queued first. This mechanism provides a first-come, first-serve scheduling scheme between the concurrently active logical channels.

In addition, each read and write port has a high-priority queue and a low-priority queue. The priority bits (WRITE\_PRIORITY and READ\_PRIORITY) in the logical channel DMA4\_CCRi register determine whether a logical channel is queued as high or low priority. A software-configurable 8-bit priority counter gives weighting to the priority write queue. For every N (1 to 255) schedules from the priority write queue, one is scheduled from the regular write queue. A channel that is scheduled goes to the end of the queue after it completes its turn on the port. The relative weighting of the scheduling of the high-priority queue to the low priority queue is programmable from 1:1 to 1:256 through the DMA global channel register using the DMA4\_GCR[23:16] ARBITRATION\_RATE bit field.

---

**NOTE:** The DMA4\_GCR[23:16] ARBITRATION\_RATE bit field does not depend on the DMA4\_GCR[13:12] HI\_THREAD\_RESERVED bit field. The ARBITRATION\_RATE bit field depends on the DMA4\_CCRi[26] WRITE\_PRIORITY bit and the DMA4\_CCRi[6] READ\_PRIORITY bit.

---

- Read/write port access scheduling policy

When either the read or write port becomes available, the port access scheduler selects the next logical channel for which to perform a DMA transaction from either the high- or low-priority queue.

When the current DMA transaction (single or burst access) is complete and the full DMA transfer is not finished, the logical channel returns to the tail of the queue. Because the port access scheduling is on a per-transaction basis, a logical channel can be queued repeatedly this way several times during its block transfer.

The SDMA module can have up to four outstanding read transactions and two outstanding write transactions in the system interconnect; four read and two write thread IDs exist. For an arbitration cycle to occur, these two conditions must be met:

- At least one channel is requesting
- At least one free thread ID is available

On an arbitration cycle, the scheduler grants the highest priority channel that has an active request, allocates the thread ID, and tags this thread as busy. At a given time, a channel cannot be allocated for more than one thread ID.

---

**NOTE:** If more than one channel is active, each channel is given a thread ID for the current service only, not for the whole channel transfer.

---

When only one channel is enabled, only one thread is allocated for the channel. In such a situation the channel can have maximum of four outstanding commands (without getting the responses) without rescheduling the channel at the end of each transaction. Each command can be either single access (8-bit, 16-bit or 32-bit) or burst access (2 × M, 4 × M, 8 × M or 16 × M, where M can be 8, 16, or 32 bits).

When nonburst alignment is at the beginning of the transfer, the channel is rescheduled for each smaller access until burst-aligned. When the end of the transfer is not burst-aligned, the channel is rescheduled for each of the remaining smaller accesses.

For a logical channel transfer completion, when the last access is written to the destination, the logical channel becomes inactive. If enabled, an interrupt request is generated (see [Section 16.4.2.1, Interrupt Generation](#)).

### 16.4.4 FIFO Queue Memory Pool

A FIFO queue memory pool provides buffering between the read and write ports. The hardware allocates the space dynamically to a number of FIFO queues, and each queue is associated with an active logical channel.

To avoid a memory pool overflow, if there are fewer entries in the FIFO queue memory pool than are required for the maximum configured source burst size of the next logical channel to be scheduled, the logical channel is returned to the tail of the queue, and the port access scheduler continues to search the queue until it finds a logical channel that can be scheduled.

The maximum FIFO depth that can be allocated to each individual logical channel can be limited globally through the `DMA4_GCR[7:0] MAX_CHANNEL_FIFO_DEPTH` bit field. This value should be configured to allow a fair allocation of the memory pool between the active channels.

A logical channel is scheduled if it has not yet reached its allocation limit, even if the access to be performed will exceed this limit. This means that the effective number of entries used by a particular logical channel is limited to the configured maximum entries per channel + channel maximum configured burst size (in words) 1.

### 16.4.5 Addressing Modes

A DMA transfer block consists of a number of frames (FN). Each frame consists of a number of elements (EN), and each element can have a size of 8, 16, or 32 bits (ES), as follows:

$$\text{transfer block size} = \text{FN} \times \text{EN} \times \text{ES}$$

The FN, EN, and ES are common for the source and destination. However, the way in which the data is represented (addressing profile/mode) is independently programmable for the source and destination devices, using one of these four addressing modes:

- Constant: The address remains the same for consecutive element accesses.
- Post-increment: The address increases by the ES, even across consecutive frames.
- Single-index: The address increases by the ES plus the element index (EI) value minus 1 (even across consecutive frames).
- Double-index: The address increases by the ES plus the EI value minus 1 within a frame. When a full frame is transferred, the address increases by the ES plus the frame index (FI) value minus 1.

The ES, EI, and FI values are expressed in bytes. The EI and FI values can be positive or negative.

When calculating the EI and FI values, it is critical to note that, after an element is accessed, the logical channel address pointer equals the address of the last byte (highest address) of the accessed element. The correct value for the EI or FI must be such that, when added to the logical channel address pointer, it results in the address of the first byte (lowest address) of the next element to be accessed.

The EI and FI values must be configured so that the address of each element in the transfer is aligned on an ES boundary.

Consequently, the single-index addressing mode with EI = 1 or double-index addressing mode with EI = 1 and FI = 1 is equivalent to post-increment addressing.

---

**NOTE:** The source and destination start addresses must also be aligned on an ES boundary.

---

When the address of an element to be accessed is not aligned on an ES boundary, the transfer is stopped and a misaligned address error interrupt occurs, if enabled (see [Section 16.4.2.1, Interrupt Generation](#)).

The `DMA4_CFNi` register configures the FN in a block.

The `DMA4_CENi` register configures the EN.

The `DMA4_CSDPi` register configures the ES.

The `DMA4_CSSAi` and `DMA4_CDSAi` registers configure the source and destination start addresses.

The `DMA4_CCRi` register configures the source and destination addressing modes.

The [DMA4\\_CSEIi](#), [DMA4\\_CSFIi](#), [DMA4\\_CDEIi](#), and [DMA4\\_CDFIi](#) registers configure the source EI, source FI, destination EI, and destination FI, respectively.

The addressing profiles are expressed as equations as follows:

Equation 1. Constant addressing:

$$A(n + 1) = A(n)$$

**Note:** Constant addressing mode with DMA4 to/from DDR memory is not supported on the OMAP4460 device.  
To fill DDR memory with a single value, the constant fill feature of DMA4 must be used instead of a constant addressing mode transfer.

Equation 2. Post-increment addressing:

$$A(n + 1) = A(n) + ES$$

Equation 3. Single-indexed addressing:

$$A(n + 1) = A(n) + ES + (EI - 1)$$

Equation 4. Double-indexed addressing:

When not at the end of a frame or transfer (that is, when the element counter  $\neq 0$ ):

$$A(n + 1) = A(n) + ES + (EI - 1)$$

When at the end of a frame but not at the end of the transfer (that is, when the element counter = 0 and the frame counter  $\neq 0$ ):

$$A(n + 1) = A(n) + ES + (FI - 1)$$

Calculate the element and frame index as follows:

Equation 5. Element index

$$EI = [(Stride - EI - 1) * ES] + 1$$

Equation 6. Frame index

$$FI = [(Stride - FI - 1) * ES] + 1$$

where:

$A(n)$ : Byte address of the element  $n$  within the transfer.

ES is in bytes, ES{1, 2, 4}.

EI is in bytes, specified in a configuration register, 32768 EI 32767.

Stride EI: The difference in the number of elements between the start of the current element  $n$  to the start of next element,  $n+1$ .

Element counter: A counter that is (re)initiated with the number of elements per frame or per transfer. Decreased by 1 for each element transferred. The initial value is configured in the register DMA channel element number, [DMA4\\_CENi](#).

FI is in bytes, specified in a configuration register, 2147483648 FI 2147483647.

Stride FI: The difference in the number of elements between the start of the last element of the current frame and the beginning of the first element of the next frame.

Frame counter: A counter that is (re)initiated with the FN per transfer. Decreased by 1 for each frame transferred. The initial value is configured in the register DMA channel frame number, [DMA4\\_CFNi](#).

[Figure 16-6](#) shows how a stride EI and FI are defined. When handling complex configurations, using strides can make it easier to calculate EI and FI because you can calculate in elements instead of bytes. (This approach is used in the 90-degree clockwise image rotation example shown in [Figure 16-10](#).) The double-index addressing example shown in [Figure 16-6](#) uses ES = 4, EN = 2, EI = 5, FI = 5, and FN = 2.

[Figure 16-6](#) through [Figure 16-9](#) show examples of addressing mode configurations. [Table 16-9](#) lists parameter values for the examples.

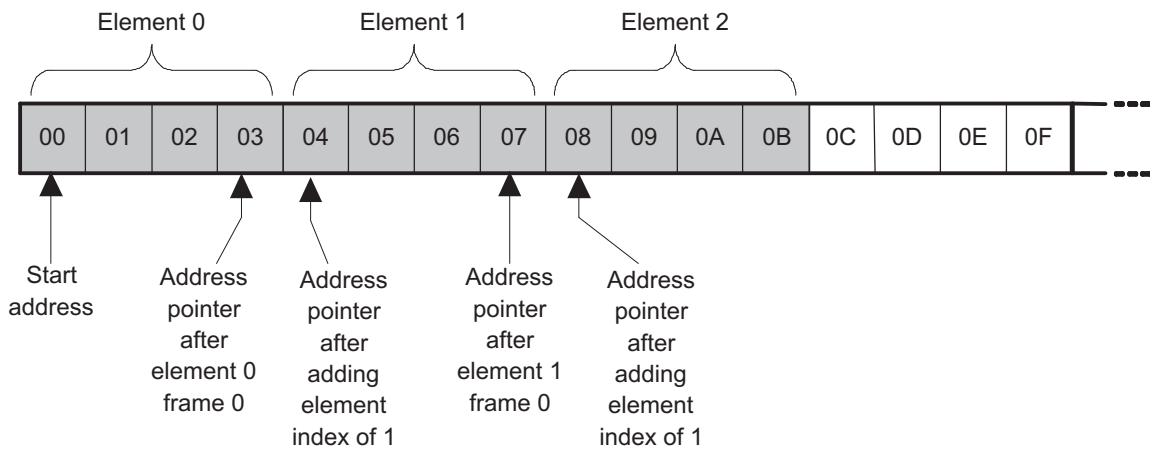

**Figure 16-6. Example Showing Double-Index Addressing, Elements, Frames, and Strides**

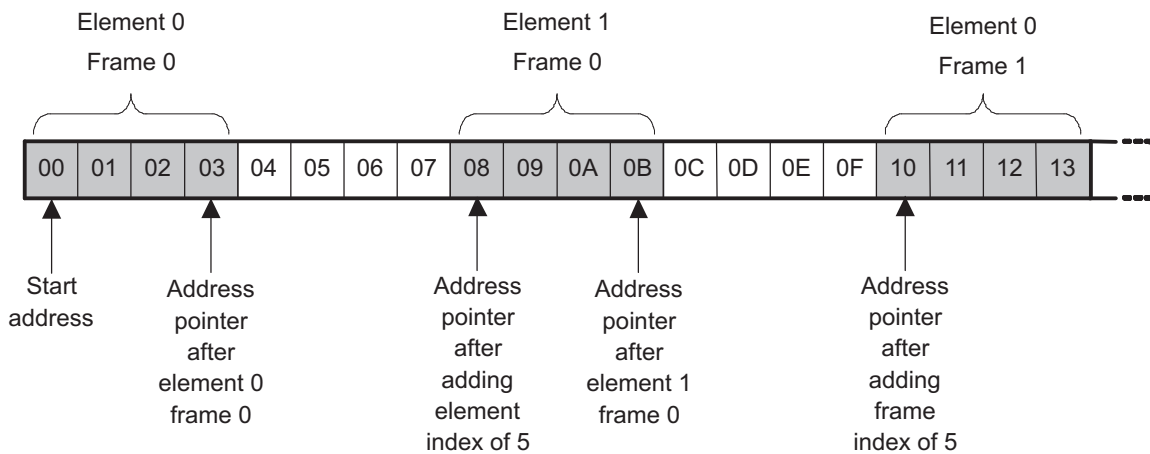

dma-011

**Figure 16-7. Addressing Mode Example (a)**

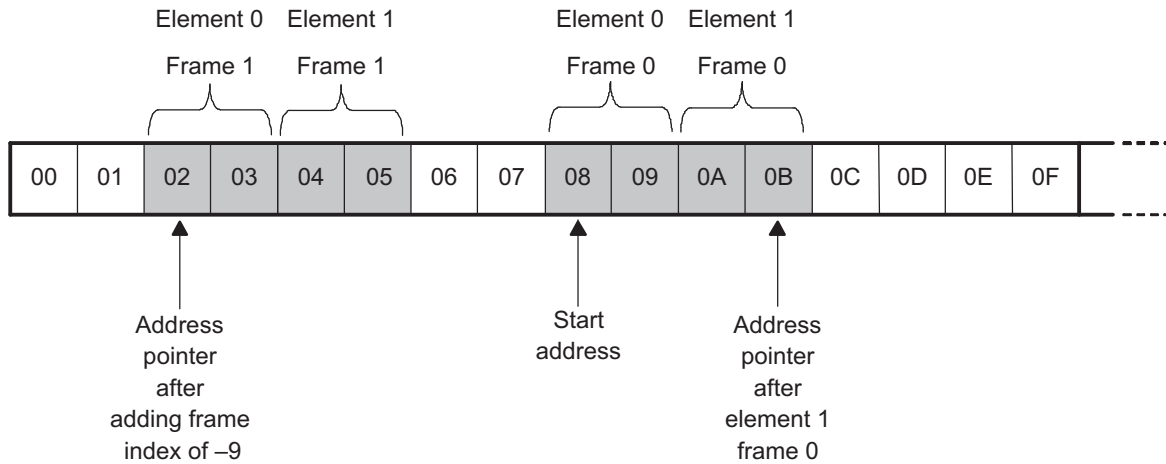

dma-010

**Figure 16-8. Addressing Mode Example (b)**

dma-009

Figure 16-9. Addressing Mode Example (c)

dma-008

Table 16-9. Parameter Values for Addressing Mode Examples (a), (b), and (c)

Parameter	Example (a)	Example (b)	Example (c)
Addressing mode	Single index (or post-increment)	Double index	Double index
Start address	0	0	8
ES	4 (32-bit)	4 (32-bit)	2 (16-bit)
EN	3	2	2
EI	1	5	1
FN	1	2	2
Frame index	N/A	5	-9

Double indexing can occur on source (read) or destination (write). Equations for rotation of xx degrees on destination are obtained by taking equations for rotation of (360 – xx) degrees on source, and swapping the width (x) and height (y) of the image in them. The opposite is also true. Table 16-10 lists the equations for 90-, 180-, and 270-degree rotations.

Table 16-10. Equations for Rotation

		90° Rotation	180° Rotation	270° Rotation
Double indexing on destination (write)	Base address	$ES*(y-1)$	$ES*(x*y-1)$	$ES*y*(x-1)$
	EI	$ES*(y-1) + 1$	$1-2*ES$	$1-ES*(y + 1)$
	FI	$1 ES*[(x-1)*y + 2]$	$1-2*ES$	$1+ES*(x-1)*y$
Double indexing on source (read)	Base address	$ES*x*(y-1)$	$ES*(x*y-1)$	$ES*(x-1)$
	EI	$1-ES*(x + 1)$	$1-2*ES$	$ES*(x-1) + 1$
	FI	$1+ES*(y-1)*x$	$1-2*ES$	$1 ES*[(y-1)*x + 2]$

Table 16-11 and Figure 16-10 show the configuration required to perform a 90-degree clockwise rotation of a 240 x 160 pixel, 32-bit image. The EI, frame size, and FI values are configured so that the image is rotated line-by-line starting at the left end of the top line.

**NOTE:** The FI value for the destination is negative so that the first pixel of each subsequent line of the source image is written to the correct location at the destination.

Equation 5 and Equation 6 calculate the destination, FI and EI. The example assumes that the image lines are stored at consecutive addresses in memory, meaning that both EI and FI on the source side are 1.

**Rotations:**

[Section 16.5.7, 90-Degree Clockwise Image Rotation](#), describes how to program an example of a 90-degree clockwise image rotation.

Observe that:

- One pixel = one element
- One line = one DMA frame
- Pixel size = element size = ES

**Table 16-11. Example Parameter Values for a 90-Degree Clockwise Image Rotation**

Parameter	Source Value	Destination Value
Bits per pixel	32	32
ES	4	4
Image width	SW	SH
Image height	SH	SW
Stride elements (stride EI)	1 element	SH
Stride frames (stride FI)	1 element	$-\text{[(SW-1)*SH + 1]} = 38,241$ elements
Start address	0x100000	$0x200000 + (\text{SH} - 1) \times \text{ES} = 0x20027C$
EN	SW	SW
EI	$\text{[(Stride EI 1) * ES]} + 1 = 1$	$\text{[(Stride EI 1) * ES]} + 1 = 637$
FN	SH	SH
FI	$\text{[(Stride FI 1) * ES]} + 1 = 1$	$\text{[(Stride FI 1) * ES]} + 1 = 152,967$

**Figure 16-10. Example of a 90-Degree Clockwise Image Rotation**

### 16.4.6 Packed Accesses

To pack data means to group data to match the bus size, thus optimizing a transfer. When the logical channel ES is less than the DMA module read/write port size, and the addressing profile supports it (post-increment mode or single- or double-index mode with EI = 1), the number of elements to transfer in each read/write port access can be maximized by specifying that the source or destination is packed through the channel `DMA4_CSDPi` register. Thus:

- For a read/write port size of 32 bits, the source or destination can be configured as packed for transfer ESs of 8 bits (four elements per access) and 16 bits (two elements per access).

- For a read/write port size of 64 bits, the source or destination can be configured as packed for transfer ESs of 8 bits (eight elements per access), 16 bits (four elements per access), and 32 bits (two elements per access).

Depending on the start address and transfer length, the first or last packed access can be only partially filled. This is indicated to the source or destination using the byte-enable signals.

### 16.4.7 Burst Transactions

Transfer performance can be improved so that the source or destination and addressing profile supports it. This can be achieved by configuring the logical channel to perform burst transactions consisting of multiple instead of single accesses. The channel can be programmed to use burst sizes equal to 16, 32, or 64 bytes through the [DMA4\\_CSDPi](#) register, with the read burst size programmable independently of the write burst size. Typically, the optimal burst size is 64 bytes (16 accesses for a 32-bit read/write port size or 8 accesses for a 64-bit read/write port size).

To obtain the maximum benefit from burst transactions, the source and destination start addresses must be aligned with the burst size. If this is not the case, the start of the transfer can consist of a number of smaller (single or burst) transactions until the first burst size boundary is reached.

Similarly, if the end of the transfer is not aligned on a burst size boundary, the final part of the transfer can consist of a number of smaller transactions.

---

**NOTE:** If post-incrementing is used, data must be packed to DMA data-port width, to use burst.

---

### 16.4.8 Endianism Conversion

The source and destination are each specified as little-endian or big-endian through the [DMA4\\_CSDPi](#) register for the particular logical channel. If the endianism of the source and destination differ, and if the logical channel ES is less than the SDMA module read/write port size, an endianism conversion is applied to the data before it is written to the destination.

When transferring data between a source and a destination with different endianism, it is important to specify an ES that equals the type of data being transferred to preserve the correct data image at the destination.

In the system, endianism conversion can be performed in more than one place. It is possible to instruct the source and/or destination to lock the endianism (that is, to not perform a conversion) through the logical DMA channel [DMA4\\_CSDPi](#) register.

---

**NOTE:** Because the device is little-endian by construction, the SDMA endianism registers must never be set to big-endian.

If SDMA is used to execute endian conversion by the setting source and destination to different endianism values, it is important to consider that the L3 interconnect also executes endian conversion if the SDMA and the source or destination have a different data bus width.

---

### 16.4.9 Transfer Synchronization

A logical channel can be programmed for software-triggered or hardware synchronized transfers.

#### 16.4.9.1 Software Synchronization

A transfer is software-triggered when the logical channel is set up and started by software. To specify a software-triggered transfer, set the channel DMA [DMA4\\_CCRi\[4:0\]](#) and [DMA4\\_CCRi\[20:19\]](#) bit fields to 0. The transfer starts as soon as the DMA [DMA4\\_CCRi\[7\]](#) bit is set (when it enters the scheduling process).

### 16.4.9.2 Hardware Synchronization

A transfer is hardware-synchronized if the logical channel activation is driven by hardware requests from the source or destination target. A hardware-synchronized transfer is specified by configuring the DMA request line number in the channel `DMA4_CCRi` register to a value that corresponds to the DMA request line from the source or destination that generates the DMA requests. The DMA request numbers to be configured are specified in the DMA request mapping (see [Table 16-8](#)).

Specify the DMA request number in the `DMA4_CCRi[4:0]` SYNCHRO\_CONTROL and `DMA4_CCRi[20:19]` SYNCHRO\_CONTROL\_UPPER bit fields. After the `DMA4_CCRi[7]` ENABLE bit is set, the logical channel becomes enabled but not activated (it does not enter the scheduling process), which means that channel registers are not updated until the first DMA request is received.

---

**NOTE:** The channel synchronization control registers are 1-based. For example, to enable the `S_DMA_1` request, the `DMA4_CCRi[4:0]` SYNCHRO\_CONTROL bit field must be set to `0x2` (DMA request number + 1).

---

---

**NOTE:** A DMA request line must not be shared between concurrently enabled DMA channels. However, a DMA request line can be shared among several chained logical channels.

---

For hardware synchronization, the amount of data to be transferred for each assertion of the DMA request line is configured through the frame synchronization (FS) and block synchronization (BS) bits in the logical channel `DMA4_CCRi` register and the `DMA4_CCRi[5]` FS and `DMA4_CCRi[18]` BS bits, respectively.

The amount of data can be any of the following:

- A single element transfer: A complete element defined by data type. For example, 8/16/32 bits are transferred in response to a DMA request.
- A full frame: A complete frame of several elements is transferred in response to a DMA request.
- A full block (a full channel transfer): A complete block of several frames is transferred in response to a DMA request.
- A full packet (a full channel transfer): A complete packet of several elements is transferred in response to a DMA request.

Packets allow the size of each part of the full DMA transfer to be configured independently of the organization of the data to be transferred (typically a number of elements). This can be useful when the source or destination has a buffer (such as a FIFO queue) with a size unrelated to the frame size of the transfer. The packet size then can be set to the size of the buffer.

Packet transfer must be used only where the source or destination is addressed in constant addressing mode, because FI registers are reused to specify the packet size.

To support the burst mode, the logical channel must also be configured in target-port packed access mode.

The packet size is configured based on the `DMA4_CCRi[24]` SEL\_SRC\_DST\_SYNC bit through either the channel `DMA4_CDFli` register (source synchronized) or the `DMA4_CSFl` register (destination synchronized).

When the logical channel transfer block is not an exact multiple of the packet size, the final packet consists of the remaining elements in the transfer, using burst or single accesses to complete the block transfer.

The maximum transfer size, regardless of the packet size, is always as follows:

$$\text{Block\_size} = \text{Number\_of\_Frame\_in\_Block} * \text{Number\_of\_Element\_in\_Frame} * \text{Element\_Size}$$

- Synchronized at the source

The DMA module optimizes the transfer with respect to the number and size of burst transactions for the given source and destination addressing profiles and configured maximum burst sizes. When writing to the destination is slower than reading from the source, data is buffered in the channel FIFO queue. If the transfer is packet-synchronized at the source, the end-of-packet interrupt is disabled (see [Section 16.4.13, Reprogramming an Active Channel](#)).

For a source synchronized transfer, buffering can be enabled or disabled by setting the [DMA4\\_CCRi\[25\] BUFFERING\\_DISABLE](#) bit. For a packet source synchronization with buffering disabled and the packed/burst across the packet boundary, the last packed/burst write transaction is split in optimized smaller accesses to complete the packet transfer size. However, for a packet source synchronized transfer with buffering enabled and with the packed/burst across the packet boundary, the DMA module waits for the next DMA request(s) to read enough data to issue an atomic packed/burst write transaction (assuming that the address is packed/burst aligned).

---

**NOTE:** Buffering is not performed between frames, even if it is enabled. If the packed/burst is across the frame boundary, the last packed/burst write transaction is split in optimized smaller accesses to complete the frame transfer size.

---

- Synchronized at the destination

The performance of a hardware-synchronized transfer can be improved by using the prefetch mode, enabled through the channel [DMA4\\_CCRi\[23\] PREFETCH](#) bit. Data is prefetched on the read port side before the DMA request received and buffered in the FIFO queue. Up to a full transfer block can be prefetched, although this can be limited by the specified maximum channel FIFO queue depth (see [Section 16.4.4, FIFO Queue Memory Pool](#)).

Buffering disable is not allowed for a destination-synchronized transfer.

---

**NOTE:** Behavior is undefined when prefetch is enabled and a transfer is synchronized to the source.

Regardless of whether buffering is enabled, the last transaction in the frame or in the block is write nonposted (WNP) even if the write mode is specified as write last nonposted (WLNP; the [DMA4\\_CSDPi\[17:16\] WRITE\\_MODE](#) bit field = 0x2). However, in a packet synchronization mode, the last transaction of each packet in the transfer is WNP only if the buffering disable is on (even if the write mode is specified as WLNP).

Regardless of whether buffering is enabled, the packet interrupt is not generated in the packet source synchronized mode.

---

### CAUTION

The [DMA4\\_CCRi\[25\] BUFFERING\\_DISABLE](#) bit must be filled with an allowed value, as specified in [Table 16-12](#).

**Table 16-12. Buffering Disable**

	<b>BUFFERING_DISABLE</b> (0: Buffering enable, 1: Buffering disable)	
Destination synchronized	0	Allowed
	1	Not allowed
Source synchronized	0	Allowed
	1	Allowed

- Synchronized transfer monitoring using CDAC ([DMA4\\_CDACi](#)):  
Context is restored only when the channel becomes active on a DMA request (not at software enable). The channel is software-enabled first, and then a DMA request is asserted followed by the first context restore.  
The CDAC register is writable; thus, the CDAC can be initialized to monitor the transfer and determine whether the transfer is started (for more information, see [Section 16.5.4, Synchronized Transfer Monitoring Using CDAC](#)).

---

**NOTE:** For 16-bit transactions, start reading from or writing to the LSByte first to enable the register update. This is not an issue for 32-bit read-write transactions.

---

### 16.4.10 Thread Budget Allocation

When several concurrent channels are latency critical and hardware synchronized, a specific latency cannot be ensured until the target is served. This situation occurs when the number of concurrent channels is greater than the number of available threads.

---

**NOTE:** Four threads are available on the read port, and two threads are available on the write port.

---

For a hardware-synchronized transfer (memory to peripheral), a minimum bandwidth for a latency-critical transfer must be ensured to avoid collisions between two hardware requests.

Because it is latency critical, the software user is responsible for the following:

- Programming the synchronized channel as a high-priority channel
- Reserving one or several threads for high-priority channels

The proposed implementation is as follows (see [Section 16.5.5, Concurrent Software and Hardware Synchronization](#)):

Prevent the regular channel queue from exceeding more than a programmable (3, 2, or 1) number of threads on the read port and no more than one thread on the write port. This number can be set in the global register [DMA4\\_GCR\[13:12\]](#) .

The thread reservation is programmable for maximum use of thread resources for concurrent, low-priority channel transfer. Programmability can also allow a partial throughput control by limiting in software the number of concurrent outstanding requests that break the pipelining.

Depending on the [DMA4\\_GCR \[13:12\]](#) value, the following threadID on the read/write ports are allocated for a high-priority channel:

Read port priority thread reservation:

- [DMA4\\_GCR\[13:12\]](#) => 0x0 = No ThreadID is reserved for high-priority channels.
- [DMA4\\_GCR\[13:12\]](#) => 0x1 = Read ThreadID 0 is reserved for high-priority channels.
- [DMA4\\_GCR\[13:12\]](#) => 0x2 = Read ThreadID 0 and Read ThreadID 1 are reserved for high-priority channels.
- [DMA4\\_GCR\[13:12\]](#) => 0x3 = Read ThreadID 0, Read ThreadID 1, and Read ThreadID 2 are reserved for high-priority channels.

Write port priority thread reservation:

- [DMA4\\_GCR\[13:12\]](#) => 0x0 = No ThreadID is reserved for high-priority channels
- [DMA4\\_GCR\[13:12\]](#) => 0x1 = Write ThreadID 0 is reserved for high-priority channels.
- [DMA4\\_GCR\[13:12\]](#) => 0x2 = Write ThreadID 0 is reserved for high-priority channels.
- [DMA4\\_GCR\[13:12\]](#) => 0x3 = Write ThreadID 0 is reserved for high-priority channels.

Regardless of whether the enabled channels are high priority, only the setting of the [DMA4\\_GCR\[13:12\]](#) value forces the thread reservation to these values. Set the appropriate value to avoid losing threads using only regular channels.

To have an independent read and write priority context, a per-channel bit ([DMA4\\_CCRi\[26\]](#)) is added for write priority, and the previous priority bit becomes read priority bit ([DMA4\\_CCRi\[6\]](#)).

---

**NOTE:** The device has one priority bit per logical channel, not one priority bit per port.

---

### 16.4.11 FIFO Budget Allocation

To avoid fully occupying the FIFO with a high-priority transfer while low-priority channels wait in the arbitration queue, two separate FIFO budgets are specified: one for high-priority channels and one for low-priority channels. This is defined in the [DMA4\\_GCR](#) register, allowing the user to share the FIFO budget between the low- and high-priority channels. The amount of the FIFO allocated by the low- and high-priority channels is fixed by the value set in the [DMA4\\_GCR\[15:14\] HI\\_LO\\_FIFO\\_BUDGET](#) field. The maximum channel FIFO depth is limited by the [HI\\_LO\\_FIFO\\_BUDGET](#) field as follows:

If the channel is low priority:

- When [HI\\_LO\\_FIFO\\_BUDGET](#) = 0x1, then low priority cannot exceed 75 percent of the total FIFO.
- When [HI\\_LO\\_FIFO\\_BUDGET](#) = 0x2, then low priority cannot exceed 25 percent of the total FIFO.
- When [HI\\_LO\\_FIFO\\_BUDGET](#) = 0x3, then low priority cannot exceed 50 percent of the total FIFO.

If channel is high priority

- When [HI\\_LO\\_FIFO\\_BUDGET](#) = 0x1, then high priority cannot exceed 25 percent of the total FIFO.
- When [HI\\_LO\\_FIFO\\_BUDGET](#) = 0x2, then high priority cannot exceed 75 percent of the total FIFO.
- When [HI\\_LO\\_FIFO\\_BUDGET](#) = 0x3, then high priority cannot exceed 50 percent of the total FIFO.

The user must perform the following equation:

- For a high-priority channel:  $(\text{Per\_Channel\_Maximum FIFO Depth} + 1) \times \text{Number of High Channel} \leq \text{High Budget FIFO}$
- For a low-priority channel:  $(\text{Per\_Channel\_Maximum FIFO Depth} + 1) \times \text{Number of Low Channel} \leq \text{Low Budget FIFO}$

---

**NOTE:** Ensure that *Number of High Channel* means *Number of Active High-Priority Channel* and that *Number of Low Channel* means *Number of Active Low-Priority Channel*.

---

### 16.4.12 Chained Logical Channel Transfers

Chaining multiple logical channels permits transfers consisting of multiple parts to be executed without repeated software intervention. This results in better performance than the alternative of software setting up and starting each transfer separately. Each part of a chained transfer can have the data addressed in a different manner that permits the programming of a variety of complex transfers. For example:

- Interlaced video data with one logical channel configured to transfer the even lines and another logical channel configured to transfer the odd lines
- Protocol headers with a separate DMA4 channel configured to transfer each field in the header

Channels can be chained through each channel [DMA4\\_CLNK\\_CTRLi](#) register. When the transfer for the first channel completes, the next channel in the chain is enabled. The number of channels in the chain that are configured for hardware-synchronized transfers is flexible (although typically it may be all, none, or simply the first one). The DMA request line number must be set to 0 to specify that any or all of the channels in a chain are software-triggered or nonsynchronized.

The last channel in a chain can be chained to the first channel to create a continuously looping chain. The continuously looping transfer can be stopped on the fly at a specific channel by disabling the [DMA4\\_CLNK\\_CTRLi\[15\] ENABLE\\_LNK](#) bit. The looping transfer stops after the specified channel transfer is complete.

---

**NOTE:** A DMA request line must not be shared between concurrently enabled DMA channels. However, a DMA request line can be shared between several chained logical channels.

---

For more information about the programming model, see [Section 16.5, SDMA Basic Programming Model](#).

### 16.4.13 Reprogramming an Active Channel

A currently active logical DMA channel can be disabled through the `DMA4_CCRi[7]` ENABLE bit. When an ongoing transaction is complete and the read-active and write-active bits in the `DMA4_CCRi` register (`DMA4_CCRi[9]` RD\_ACTIVE and `DMA4_CCRi[10]` WR\_ACTIVE) are reset, the channel can be reprogrammed for a new transfer.

### 16.4.14 Packet Synchronization

A packet transfer notion is related to the behavior of some peripherals, which have certain buffering capability and requires to transfer the buffer content once an element number threshold is reached (a hardware DMA request is generated). To associate a frame synchronization to each DMA request is possible, but this limits the maximum transfer size. Indeed the maximum transfer size is proportional to the FIFO depth of the peripheral:

$$\text{maximum\_transfer\_size} = \text{peripheral\_FIFO\_depth} \times \text{number\_of\_frame\_in\_block}$$

The packet synchronization allows to dissociate the transfer size from the FIFO depth of the peripheral. Only Constant addressing mode is allowed on a read port or a write port if source target or destination target is packet synchronized respectively.

Example:

Consider a camera interface with a FIFO\_depth of 128 words and a FIFO\_element\_number\_threshold of 128, and a picture to transfer with a size 320 lines by 240 columns. If frame synchronization is associated with each DMA request then the maximum transfer size that can be performed is  $128 \times 2^{16}$  words. In this case, a frame is 128-word long, which does not fit the size of a line, and it is not possible to generate an interrupt at the end of line. However, by introducing the packet transfer notion, which is related to the peripheral FIFO behavior/structure, the maximum transfer size ( $\text{maximum\_transfer\_size} = 2^{24} \times 2^{16}$  words) is independent of both peripheral\_FIFO\_depth and FIFO\_element\_number\_threshold. This allows a long-enough transfer within one channel context and rotation operation on a large image format.

The main features of DMA Packet transfer are as follows:

- **DMA Packet\_Data\_Size** for each DMA Request: The Peripheral\_element\_number\_threshold (the number of elements in a packet) shares the `DMA4_CSFli` and `DMA4_CDFli` configuration registers. If the peripheral is the source target, the addressing mode is constant, and the `DMA4_CSFli[15:0]` bit field is used to specify the packet data size in the `DMA4_CSFli` register. The user must set the `DMA.SDMA4_CCRi[24]` SEL\_SRC\_DST\_SYNC bit to 1. If the peripheral is the destination target, the addressing mode is constant, the `DMA4_CDFli[15:0]`, is used to specify the packet data size (PKT\_ELNT\_NBR), and the bit field [31:16] is unused. To specify the packet data size in the `DMA4_CDFli` register, the user must set the `DMA4_CCRi[24]` SEL\_SRC\_DST\_SYNC bit to 0.

---

**NOTE:** The packet size can be a submultiple or non-submultiple of a frame size. If DMA Packet\_Data\_Size is aligned on the DMA channel block data size boundary, then DMA transfers the last data in the channel block boundary and stops at the block boundary for the last packet DMA Request. If the Packet\_Data\_size is not aligned on the block boundary, the remaining data smaller than a packet size are transferred using burst or single accesses to complete the block.

---

- **DMA Packet\_Data\_Transfer** does not affect DMA channel capabilities in term of packing and bursting. The packet synchronization mode is active when `DMA4_CCRi[5]` FS = `DMA4_CCRi[18]` BS = 1. Then:
  - If `DMA4_CCRi[24]` SEL\_SRC\_DST\_SYNC = 0, the `DMA4_CDFli[15:0]` bit field gives the number of elements in the packet and the `DMA4_CDFli[31:16]` bit field is unused for the packet size.
  - If `DMA4_CCRi[24]` SEL\_SRC\_DST\_SYNC = 1, the `DMA4_CSFli[15:0]` bit field gives the number of element in the packet and the `DMA4_CSFli[31:16]` bit field is unused for the packet size.

**NOTE:** The maximum transfer size, regardless of the packet size, is always:

$$\text{Block\_size} = \text{Number\_of\_Frame\_in\_Block} \times \text{Number\_of\_Element\_in\_Frame} \times \text{Element\_Size}.$$

If DMA channel packet/burst access is across the packet boundary, the DMA hardware automatically splits this packing/burst access into multiple smaller accesses that are aligned on the packet boundary. Otherwise, the DMA transfers data as a usual packing/burst access.

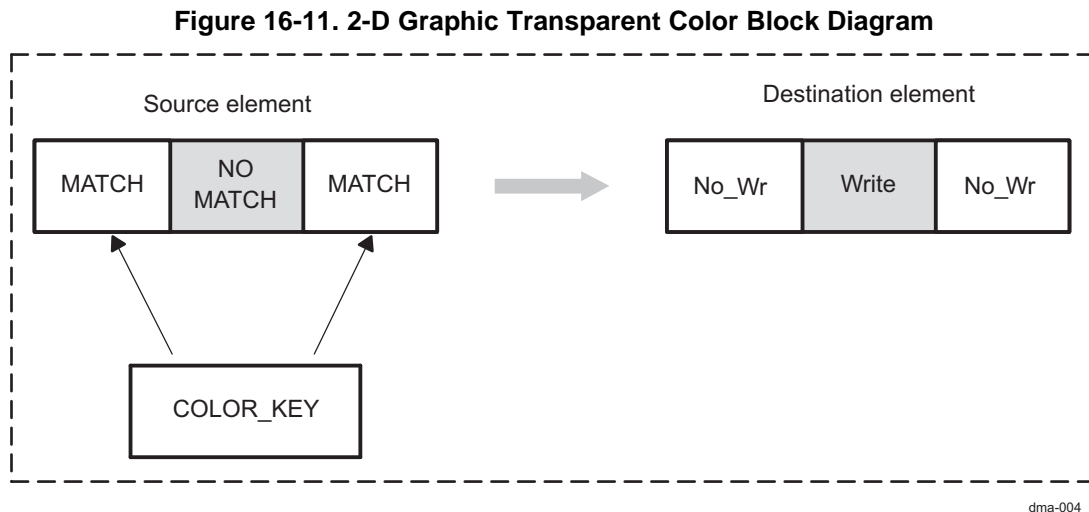

### 16.4.15 Graphics Acceleration Support

The SDMA supports two graphic acceleration features: transparent copy and constant fill.

Only one of these features can be enabled at a time through the [DMA4\\_CCRi](#) register for the particular logical DMA channel.

The transparent copy feature enables specification of a particular color through the [DMA4\\_COLORi](#) register so that when it is recognized in the data from the source, it is not copied to the corresponding location in the destination but instead leaves the data in the corresponding location in the destination as it is.

Figure 16-11 shows the 2-D graphic transparent color block diagram.

The constant fill feature provides the ability to specify a particular color through the [DMA4\\_COLORi](#) register for every specified location in the destination. In this case, the transfer consists only of writing to the destination without reading from a source.

Both features support 8, 16, and 24 bpp, depending on what is specified as the DMA transfer ES through the [DMA4\\_CSDPi](#) register. An ES of 32 bits corresponds to 24 bpp. During a 32-bit (24 bpp) transfer, the 8 most-significant bits (MSBs) ([31:24]) are 0. Both features are compatible with packed and burst transactions.

### 16.4.16 Supervisor Modes

A logical DMA channel can be configured to operate in supervisor mode through the [DMA4\\_CCRi](#)[22] SUPERVISOR bit. This must be done using supervisor access. Once a channel is configured in supervisor mode, the channel configuration is protected from nonsupervisor accesses. All DMA transactions on a supervisor channel are supervisor transactions.

### 16.4.17 Posted and Nonposted Writes

A logical channel can be configured in its [DMA4\\_CSDPi](#)[17:16] bits to use one of three write access handshake modes for the destination:

- Nonposted write: Each write must complete before transfer can continue or complete.

- Posted write: Transfer continues without waiting for each write to complete (may improve performance with slow devices).
- Posted with final write nonposted: Transfer continues without waiting for each write to complete, but final write completes before transfer can complete.

### 16.4.18 Disabling a Channel During Transfer

When a channel is disabled during a transfer, the channel undergoes an abort, unless it is hardware-source-synchronized with buffering enabled ([DMA4\\_CCRi\[25\] BUFFERING\\_DISABLE = 0](#)). If this is the case, the FIFO is drained to prevent the loss of data. For more information about this feature, see [Section 16.4.19, FIFO Draining Mechanism](#).

### 16.4.19 FIFO Draining Mechanism

When a source-synchronized channel is disabled during a transfer, the current hardware request (element/packet/frame/block) service completes and the channel [DMA4\\_CCRi\[9\] RD\\_ACTIVE](#) bit is set to 0, which means the channel is not active on the read port. The remaining data in the corresponding disabled channel FIFO is drained onto the write port and transferred to the programmed destination as in normal transfer.

At the end of the draining the [DMA4\\_CCRi\[10\] WR\\_ACTIVE](#) bit is set to 0 (channel is no longer active on the write port) and if the [DMA4\\_CICRi\[12\] DRAIN\\_END\\_IE](#) is set to 1, the [DMA4\\_CSRi\[12\] DRAIN\\_END](#) status bit is updated and an interrupt is generated.

Once a channel is disabled during a transfer, it must wait for the [DMA4\\_CCRi\[9\] RD\\_ACTIVE](#) and [DMA4\\_CCRi\[10\] WR\\_ACTIVE](#) bits to become 0 before being reenabled for a new transfer. The FIFO drain for a channel occurs only in the following cases:

- If the channel is a source synchronized channel and [DMA4\\_CCRi\[25\] BUFFERING\\_DISABLE = 0](#) and
- If the channel is not a solid fill channel and
- If the channel is not a transparent and copy channel and
- If the channel is a hardware, synchronized channel

---

**NOTE:** For a self-linked or chain-linked channel, the user must disable the [DMA4\\_CLNK\\_CTRLi\[15\] ENABLE\\_LINK](#) bit before disabling the channel.

---

In all other cases, the channel undergoes an abort.

### 16.4.20 Linked List

#### 16.4.20.1 Overview

The SDMA supports the logical transfer-descriptor loader feature. A transfer descriptor represents a set of values that maps to a set of logical channel configuration registers.

A logical channel transfer descriptor can be loaded by DMA from memories, and then successive transfer descriptors can be autonomously loaded based on a linked-list scheme. This enables DMA4 scatter-gather transfers with minimum MPU support by removing successive channel configuration processing and associated interrupt handling overheads. It also optimizes DMA4 channel resources by enabling efficient transfer serialization on a single logical channel versus concurrent (multiple) logical channel use.

Different types of transfer descriptors are supported (full or partial logical channel configuration registers are set). This optimizes the memory size required for storing a long linked list, because parameter changes are limited to only a few logical channel configuration registers.

### 16.4.20.2 Link-List Transfer Profile

A linked-list transfer can be seen as a super-block transfer (where the block is composed of FN frames and each frame includes EN elements). The block size (FN x EN x ES) can be changed in the linked list by loading an updated transfer descriptor.

The end of the super block is signaled in the last descriptor associated with the last block. Generally, for a given link-list transfer, the logical channel is set at the beginning of the transfer and the logical channel configurations for the subsequent blocks are slightly changed. Thus, the descriptor can be limited to an update of only few parameters, such as FN or EN. This assumes that the content of unmodified registers is preserved when a new descriptor is loaded.

A transfer descriptor is composed of a set of channel configuration register values with the addition of the next-descriptor pointer register ([DMA4\\_CNDPi](#)) and a channel-descriptor parameter register ([DMA4\\_CDPi](#)). The next-descriptor pointer is the 32-bit address pointer from where the next transfer descriptor is to be loaded. The next-descriptor pointer is mapped depending on the descriptor type (1, 2, or 3).

### 16.4.20.3 Descriptors

A transfer descriptor is a set of values that maps to a set of logical channel configuration registers. The descriptor contains the parameters associated with a transfer profile (transfer size, source or destination addresses, etc). Four different types of transfer descriptors are supported to optimize the memory size required to store a long linked list and to minimize MPU use to create and maintain the descriptor list.

A transfer descriptor is a list of 32-bit values. A descriptor must be 32-bit aligned in memory. Only the 30 least-significant bits (LSBs) of the next-descriptor address pointer are updated from the descriptor, and the DMA4 forces the 2 LSBs to 0 on generation of the pointer address. The descriptor size is variable, depending on the descriptor type and the `Nxt_Dv` and `Nxt_Sv` bit fields.

Transfer descriptor bit mapping is the same as DMA4 logical-channel configuration register bit mapping, with the following exceptions:

- `Src_Element_index` and `Dst_Element_index` are concatenated in the same 32-bit location.
- [DMA4\\_CICRi](#) (interrupt event mask)
- CFN (frame number)
- Bit fields:
  - `P`: Corresponds to the `PAUSE_LINK_LIST` bit:
    - When set to 1 in the descriptor, the channel is suspended when the descriptor load completes.
    - The user must not set the `PAUSE_LINK_LIST` bit through the configuration port. Otherwise, behavior is undefined.
    - When set to 0 (through the configuration port) after pause, the linked-list channel resumes its transfer (descriptor load or data load).
  - `B`: Corresponds to the end-of-block enable bit (`BLOCK_IE`) of the [DMA4\\_CICRi](#) register; valid only for type 3. This value is don't care for descriptor types 1 and 2, where [DMA4\\_CICRi](#) is fully specified.
  - `Nxt_Dv`, `Nxt_Sv`: Mapped in the [DMA4\\_CDPi](#) register. They indicate one of the following possibilities:
    - Next descriptor contains an updated destination or source address.
    - Next descriptor does not update the source or destination address, but increments the last source or destination address (from the end of the last transfer).
    - The next source address and/or destination address are the last valid ones in the configuration memory. This means that the corresponding location in the configuration memory is not updated (assuming that they were initialized at least once in the past). This is also called wrapping addressing.
  - `Next_Descriptor_Type`: Specifies the next descriptor type that corresponds to the `NEXT_DESCRIPTOR_TYPE` bit field in the [DMA4\\_CDPi](#) register

### 16.4.20.3.1 Type 1

A type 1 descriptor includes the overall channel configuration register value to be loaded (global registers are not part of the type 1 descriptor). This descriptor is used primarily when major changes are required:

- Channel read or write access profiles must be modified; for example, bursting and packing (included in the [DMA4\\_CSDPi](#) register)
- Attach a new DMA request to the same channel or change the priority or access privilege (included in the [DMA4\\_CCRi](#) register)
- Enable solid or transparent color fill (included in the [DMA4\\_CCRi](#) and [DMA4\\_COLORi](#) registers)
- Enable a channel link (included in the [DMA4\\_CLNK\\_CTRLi](#) register)

Table 16-13 shows a type 1 descriptor.

Table 16-13. Type 1

### 16.4.20.3.2 Type 2

A type 2 descriptor includes the overall logical channel transfer address register and transfer format register to be loaded. This descriptor enables 2D addressing linked-list transfer (for example, a multimedia application where 2D objects are moved in a link). Table 16-14 shows a type 2 descriptor with source and destination address updates. Table 16-15 shows a type 2 descriptor with one source or destination address update.

**Table 16-14. Type 2 With Source and Destination Address Updates**

	3	3	2	2	2	2	2	2	2	2	2	1	1	1	1	1	1	1	1	1	1	9	8	7	6	5	4	3	2	1	0

**16.4.20.3.3 Type 3**

A type 3 descriptor is limited to a few logical channel transfer address registers and transfer format registers to be loaded. This descriptor enables simple 1D addressing link transfer (for example, scatter-gather or ping-pong memory movement using a linked list). [Table 16-16](#) shows a type 3 descriptor with source and destination address updates. [Table 16-17](#) shows a type 3 descriptor with one source or address destination update.

#### 16.4.20.4 Linked-List Control and Monitoring

##### 16.4.20.4.1 Transfer Mode Setting

Four descriptor types are available in [DMA4\\_CDPi\[9:8\]](#) TRANSFER\_MODE to distinguish the different transfer modes:

- [DMA4\\_CDPi\[9:8\]](#) TRANSFER\_MODE = 00: The current channel is using normal mode.
- [DMA4\\_CDPi\[9:8\]](#) TRANSFER\_MODE = 01: The current channel is using link-list channel mode for a type 1, 2, or 3 descriptor.

The reset value is normal mode ([DMA4\\_CDPi\[9:8\]](#) TRANSFER\_MODE = 0).

##### 16.4.20.4.2 Starting a Linked List

Like a nonlinked-list transfer, a link transfer starts under host control by enabling the associated logical channel (set the [DMA4\\_CCRi\[7\]](#) ENABLE bit to 1). The [DMA4\\_CDPi\[10\]](#) FAST bit sets the start mode of the link-list transfer:

In nonfast-start mode, the logical channel configuration is fully initialized so that the transfer can start without descriptor loading.

In fast-start mode, the descriptor pointer and other inputs are given. The channel starts by loading the descriptor and then starts the data transfer phase.

##### 16.4.20.4.3 Monitoring a Linked-List Progression

In addition to the [DMA4\\_CCENi](#) (remaining elements) and [DMA4\\_CCFNi](#) (remaining frames) registers that are used to monitor the transfer progress, a per-channel register, [DMA4\\_CCDNi](#) (channel current active descriptor number), monitors which descriptor in the list is active. The user must initialize the [DMA4\\_CCDNi](#) register to 0 during the initial configuration. When the [DMA4\\_CCDNi](#) register is updated, the [DMA4\\_CCFNi](#) and the [DMA4\\_CCENi](#) registers are updated. The user must also initialize the [DMA4\\_CCFNi](#) and [DMA4\\_CCENi](#) registers to 0xFFFF and to 0xFFFFFFFF, respectively, to track the effective transfer start of synchronized transfer.

##### 16.4.20.4.4 Interrupt During Linked-List Execution

Any logical channel source of interrupt can be triggered during a linked-list execution, if the interrupt source is enabled during the initial configuration in [CICR](#). The [DMA4\\_CICRi](#) register can also be updated during the linked-list execution if descriptor types 1 and 2 are used.

The use of an interrupt event in a link execution can be difficult, because the link can progress in parallel with interrupt service routine (ISR) execution. This makes it difficult to synchronize them unless system assumptions are used. The most appropriate synchronization model is to get an interrupt-only on linked-list completion, when the last transfer block is complete. This prevents the interrupt from occurring during the link execution. An end-of-super-block interrupt event available in the [DMA4\\_CICRi](#) and [DMA4\\_CSRi](#) registers can be enabled at initial configuration or when using descriptor types 1 and 2. To prevent the use of descriptor type 1 or 2 to update BLOCK\_IE (full [DMA4\\_CICRi](#) update), a dedicated BLOCK\_IE bit field is also available in a type 3 descriptor.

#### 16.4.20.4.5 *Pause a Linked List*

When the channel is suspended, it remains enabled.

The pause behaves differently, depending on the transfer mode:

- Normal transfer mode: If the user sets the [DMA4\\_CDPi\[7\] PAUSE\\_LINK\\_LIST](#) bit to 1, the channel completes the current read and write transactions and then suspends the channel. The channel can be resumed by setting the channel [DMA4\\_CDPi\[7\] PAUSE\\_LINK\\_LIST](#) bit to 0.
- Linked-list type 1, 2, or 3 mode: The user must not set the [DMA4\\_CDPi\[7\] PAUSE\\_LINK\\_LIST](#) bit through the configuration port; otherwise, transfer behavior is undefined.

A [PAUSE\\_LINK\\_LIST](#) bit (P) is set to 1 in the descriptor.

- The channel is suspended after the descriptor load, translation, and configuration memory update are complete.
- The linked list can be resumed by resetting the [DMA4\\_CDPi\[7\] PAUSE\\_LINK\\_LIST](#) bit (through the configuration port).

#### 16.4.20.4.6 *Stop a Linked List (Abort or Drain)*

The channel can be stopped for a drain or an abort. These cases are exclusive.

##### 16.4.20.4.6.1 *Drain*

- Drain conditions:

A channel is a drain candidate if it is a hardware-source-synchronized transfer with [DMA4\\_CCRi\[25\] BUFFERING\\_DISABLE](#) = 0 and should not be doing any of the graphics operation (transparent copy or solid-color fill).

- Drain trigger:

A drain candidate channel is drained if it is disabled ([DMA4\\_CCRi\[7\] ENABLE](#) = 0) or if it receives a transaction error on the read port.

- Drain behavior with a type 1, 2, or 3 descriptor. Drain trigger can occur in two situations:
  - During descriptor loading: Any ongoing current transaction is complete and the channel is aborted.
  - During data loading: The read is completed at the boundary of the request (element/frame/packet/block boundary), the FIFO is drained to the destination, and then a [DRAIN\\_END](#) interrupt can be asserted.

##### 16.4.20.4.6.2 *Abort*

- Abort condition:

A channel is an abort candidate if it is software-synchronized, hardware-destination-synchronized, solid color-fill, transparent-color fill, or hardware-source-synchronized with [DMA4\\_CCRi\[25\] BUFFERING\\_DISABLE](#) = 1.

- Abort trigger:

A channel is an abort candidate if it is disabled ([DMA4\\_CCRi\[7\] ENABLE](#) = 0), if it receives a transaction error on the read or write port, or if there is a [MISALIGNMENT\\_ERROR](#).

- Abort behavior with a type 1, 2, or 3 descriptor:

If an abort trigger occurs, the channel aborts immediately after completion of current read/write transactions and then the FIFO is cleaned up.

In type 1, 2, or 3, if an abort trigger or drain trigger occurs during the descriptor load phase, the channel aborts.

#### 16.4.20.4.7 *Status Bit Behavior*

This section describes the behavior of the [DMA4\\_CSRi\[6\] SYNC](#), [DMA4\\_CCRi\[9\] RD\\_ACTIVE](#) and [DMA4\\_CCRi\[10\] WR\\_ACTIVE](#) status bits:

- For a hardware-synchronized channel in linked-list mode, the [DMA4\\_CSRi\[6\] SYNC](#) bit becomes active ([DMA4\\_CSRi\[6\] SYNC](#) = 1) when the first data load transaction is scheduled and remains active

until the last data load transaction in the block (not super block) is descheduled (`DMA4_CSRI[6] SYNC = 0`). The SYNC bit is not active during the descriptor load phase.

- The `DMA4_CCRi[9] RD_ACTIVE` bit is active during the data load phase and the descriptor load phase. It becomes active when the first read transaction is scheduled. It becomes inactive:
  - When (during the descriptor load phase) the last descriptor write request is descheduled
  - When (during the data load phase) the last read transaction in the block (not super block) is descheduled for software-synchronized transfer or destination-synchronized transfer with prefetch enabled
  - When (during the data load phase) the last read transaction in the request (element/frame/packet/block sync) is descheduled for hardware-source-synchronized transfer or hardware-destination-synchronized transfer without prefetch
- The `DMA4_CCRi[10] WR_ACTIVE` bit is active only during the data load phase. It becomes active when the first write transaction is scheduled and becomes inactive:
  - Until the last write transaction in the block (not super block) is descheduled and the FIFO is cleaned up for software-synchronized transfer
  - Until the last write transaction in the request (element/frame/packet/block sync) is descheduled and the FIFO is cleaned up for hardware-source-synchronized transfer (with `DMA4_CCRi[25] BUFFERING_DISABLE = 0`) or hardware-destination-synchronized transfer.

#### 16.4.20.4.8 *Linked-List Channel Linking*

Channel linking for inter- and intra-super blocks is supported for type 1, 2, and 3 descriptors.

Assume that CHx and CHz are linked-list channels using generic descriptors. If CHx is composed of N descriptors and CHz is composed of M descriptors, then in nonfast mode:

CHx: CHx[Data1]-> CHx[DES1] -> . -> CHx[DESN]->CHx[DataN + 1]

CHz: CHz[Data1]-> CHz[DES1] -> . -> CHz[DESM]->CHz[DataM + 1]

It is possible to link CHx to CHz or CHx to itself after the completion of the CHx transfer (end of super block). To do this, the user must set the `DMA4_CLNK_CTRLi[15] ENABLE_LNK` bit to 1 and the `DMA4_CLNK_CTRLi[4:0] NEXTLCH_ID` bit to z (or to x for self linking) through the last descriptor using a type 1 descriptor. The sequence is:

CHx: CHx[Data1]-> CHx[DES1] -> . -> CHx[DESN]->CHx[DataN+1] -> CHz: CHz[Data1]-> CHz[DES1] -> . -> CHz[DESM]->CHz[DataM+1]

It is also possible to link CHx to CHz during the CHx transfer and before the end of super block. The user must set the `DMA4_CLNK_CTRLi[15] ENABLE_LNK` bit to 1 and the `DMA4_CLNK_CTRLi[4:0] NEXTLCH_ID` bit to z through descriptor p (CHx[DESp]) using a type 1 descriptor. The sequence is:

CHx: CHx[Data1]-> CHx[DES1] ->. -> CHx[DESp]->CHx[Data(p + 1)] -> CHz[Data1]-> CHz[DES1] -> .

The user must continue the linking until channels CHx and CHz complete their super-block transfers; otherwise, the channels remain enabled.

---

**NOTE:** In channel linking, the head of a chain can be in fast mode or nonfast mode. All channels that are not in the head of the chain can be in nonfast mode only. In self-linking, the channel cannot be in fast mode.

---

---

**NOTE:** If channel CHx links to CHz in the middle of the superblock transfer (remember link bit can be set through Type-1 descriptor load), CHx is disabled after the corresponding data load and enables the channel CHz.

---

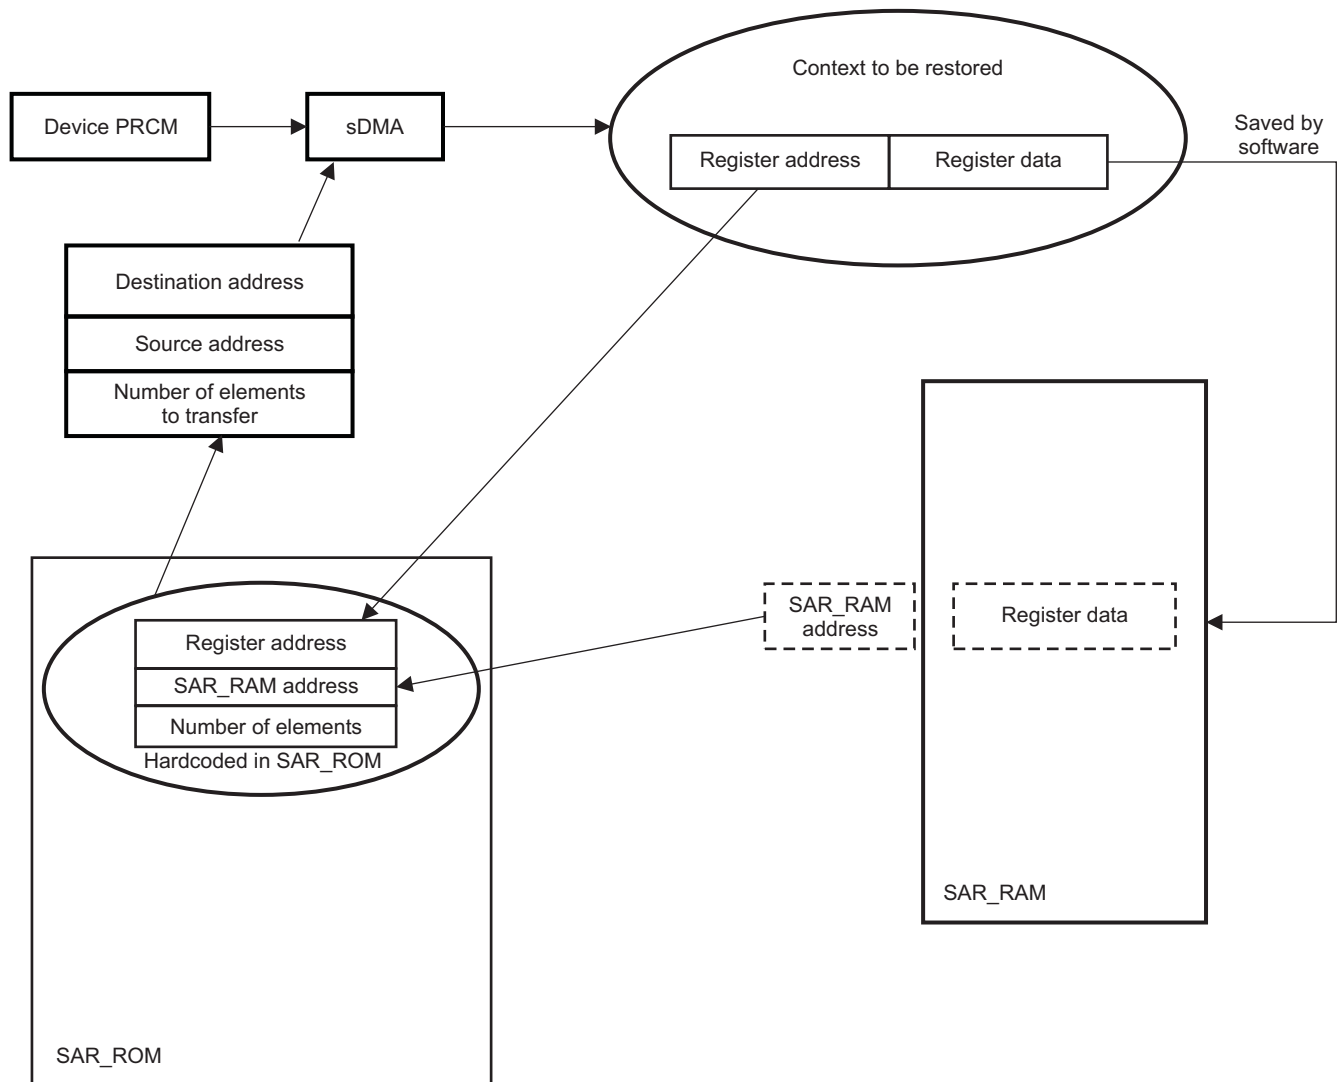

### 16.4.21 Auto-Restore Feature

The auto-restore feature is introduced mainly to accelerate the restore process, which otherwise is complex and time and resource consuming. In many system applications, it is required that the modem wake up and use only a few modules to wake up, without the intervention of the main MPU (Cortex-A9 MPU). The MPU still may be in off mode; however, some modules may need to come out of off mode. The SDMA can be used to restore the register contents of these modules. The auto-restore feature consists in saving the register data into a memory (SAR RAM in the WKUP domain) that remains powered even during off mode, and then in automatically retrieving data when returning from off mode.

The restore feature is enabled by default and cannot be disabled.

Figure 16-12 is an overview of the save-and-restore mechanism using SAR RAM and SAR ROM.

**Figure 16-12. Overview of Save-and-Restore Mechanism Using SAR RAM and SAR ROM**

dma-014

#### 16.4.21.1 Save Process

The save process is done entirely by software; the SDMA module normally is not involved. Software must save the data to be restored in a dedicated location in SAR RAM. To reduce the save sequence execution time, the SDMA can be used with linked-list descriptors. These save descriptors are symmetrical with regards to descriptors in the SAR ROM.

The register content to be saved can be the register value before going into off mode or a value that is required on wake up. This means that the restored register value can differ from the last value of the register before going into off mode.

The following registers are affected:

- CM1 and CM2 configuration  
Bits 0 of the CM\_SHADOW\_FREQ\_CONFIG1 register and the CM\_SHADOW\_FREQ\_CONFIG2 register are self-clearing and must be set at restore time. Thus, these data must always be overwritten in the SAR RAM.
- Because USBHOSTHS and USBTLL restore requires a particular sequencing, software must overwrite data read from the following registers implied in phase2a and phase 2b:
  - CM\_L3INIT\_HSUSBHOST\_CLKCTRL\_RESTORE
  - CM\_L3INIT\_HSUSBTLL\_CLKCTRL\_RESTORE
  - CM\_SDMA\_STATICDEP\_RESTORE

The USBHOSTHS and USBTLL modules must be put in a particular mode when saving (and restoring) their context. In the case of context saving, software must:

- Configure the L3INIT clock domain to SW\_WKUP to ensure module transitions
- Disable both modules
- Assert the SAR\_MODE pins
- Enable back both modules. Optional clocks must be kept gated
- Save both modules context
- Disable both modules
- Deassert SAR\_MODE pins
- At this point, software may enable back both modules and get the L3INIT clock domain out from SW\_WKUP state.

#### 16.4.21.2 Restore Process

As explained earlier, every time modem wakes up, the MPU must not necessarily wake up. This needs an automated way of restore. For example, when mobile is in roaming, and not in active use, it needs to change base stations. For this task, the MPU need not wake up, only a few peripherals/subsystems need to be in ON mode. Before executing any task, we need to restore their register contents.

##### 16.4.21.2.1 PRCM and SDMA interaction During Restore Phase

Restore is performed during three phases. At the end of each phase, the SDMA stops and waits for the PRCM to perform the next phase transfer. For more information, see [Section 3.9.3.2, Device Off Mode Wake-Up Sequences](#), in [Chapter 3, Power, Reset, and Clock Management](#).

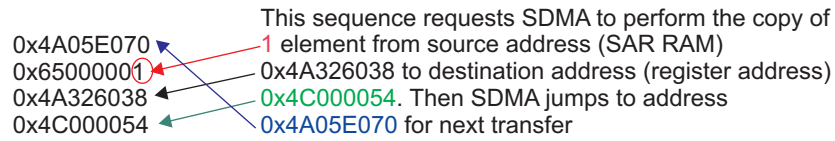

##### 16.4.21.2.2 SDMA Descriptors Description

The restore phase is done automatically by the SDMA. The SDMA gets the register address (destination address), number of elements to transfer, and the address of the data to transfer (Source address) from SAR ROM. As mentioned previously, the register data is stored in the SAR RAM.

The SAR ROM contains two types of descriptors the DMA-4 should use:

- Type-1 descriptors:  
Type-1 descriptors (48 bytes) are used at the beginning of each phase. In addition to the source and destination address and number of elements, these descriptors contain the required data that initializes the SDMA. [Table 16-13](#) shows the Type-1 descriptor structure.
- Type-3 descriptors with source and destination address update:  
Type-3 descriptors (16 bytes) are used for subsequent SDMA transfers and mainly contain the source and destination address and number of elements. [Table 16-16](#) shows the Type-3 descriptor structure. [Figure 16-13](#) is an example of SAR ROM code (Type-3 descriptor).

**Figure 16-13. Type-3 SAR ROM Code Example**

dma-015

Figure 16-14 is an example of last DMA transfer (Type-3 descriptor). To indicate to the DMA that this is the last transfer, the next descriptor address must be set to 0xFFFFFFF0, as shown in the figure.

**Figure 16-14. Type-3 SAR ROM Last Transfer Example**

dma-016

### 16.4.21.3 SAR RAM

The SAR RAM contains the data that needs to be maintained during off mode. The SAR RAM is split into three banks (see Table 16-18).

**Table 16-18. SAR RAM Allocation**

Access Mode	Bank	Address Range
Public	1 (SAR_RAM_1)	0x4A32_6000–0x4A32_6FFF (4KB)
Public, for I/O pad	2 (SAR_RAM_2)	0x4A32_7000–0x4A32_73FF (1KB)
Public	3 (SAR_RAM_3)	0x4A32_8000–0x4A32_87FF (2KB)

### 16.4.21.4 SAR ROM

The SAR ROM contains the list of registers that need to be saved before off mode and then restored after off mode, and where the register data is stored in SAR RAM. The SAR ROM start address is 0x4A05\_E000.

When exiting off mode, PRCM automatically redirects the SDMA to address:

- 0x4A05\_E000 for phase 1 (in SAR ROM)
- 0x4A05\_E030 for phase 2a (in SAR ROM)
- 0x4A05\_E060 for phase 2b (in SAR ROM)

The SAR ROM is built so that SDMA performs all the transfers for each phase. At the end of each phase, the SDMA stops. The PRCM module then requests to perform the next phase transfer, depending on the wake-up source.

#### Remarks:

- Phase 1 is always to happen; the restore mechanism is enabled by default and cannot be disabled.
- Phase 2 (2a and 2b) is to happen depending on the wake-up source from off mode. Therefore, it is mandatory to fill the SAR RAM locations used for USB restore correctly, even if USB is not used, because the restore sequence will happen.
- The USB host restore is to be performed before the USB TLL restore.

**NOTE:** Some consecutive address registers cannot be saved/restored with burst. This is the case for:

- CLK1\_DSS\_BW\_REGULATOR.L3\_BW\_R\_BANDWIDTH and CLK1\_DSS\_BW\_REGULATOR.L3\_BW\_R\_WATERMARK registers
- CLK2\_XXX\_BW\_REGULATOR.L3\_BW\_R\_BANDWIDTH and CLK2\_XXX\_BW\_REGULATOR.L3\_BW\_R\_WATERMARK registers, where XXX = ISS, IVAHD, and SGX.

To avoid the failure of an SDMA transfer, the transfer of the previous registers is performed using a single SDMA transfer.

#### 16.4.21.5 SAR RAM Memory Allocation Reserved for Save and Restore

The memory size of the SAR RAM reserved for the save-and-restore mechanism is:

- 57 percent (2344 bytes) reserved for the SAR mechanism from SAR\_RAM\_1. The whole SAR\_RAM\_1 size is 4KB.
- 40 percent (408 bytes) reserved for the SAR mechanism from SAR\_RAM\_2. The whole SAR\_RAM\_2 size is 1KB.
- 51 percent (1052 bytes) reserved for the SAR mechanism from SAR\_RAM\_3. The whole SAR\_RAM\_3 size is 2KB.

The free part of the SAR RAM can be used by the user software to store any data that needs to be in always-on memory.

#### 16.4.21.6 Register Mapping in SAR RAM

Table 16-19 describes the SAR\_RAM\_1 memory mapping.

**Table 16-19. SAR\_RAM\_1 Memory Mapping**

Order	Register Name	Register Start Address	Register End Address	Size	SAR_RAM_1 Address

## 16.5 SDMA Basic Programming Model

### 16.5.1 Setup Configuration

After a hardware reset, program all fields in the logical channel registers to default values for any channels used, because most fields are undefined following reset.

Before programming any DMA transfers, the priority arbitration rate and the maximum FIFO depth must be configured through the [DMA4\\_GCR](#) register, and any required interrupts must be enabled through the [DMA4\\_IRQENABLE\\_Lj](#) registers and the logical channel [DMA4\\_CICRi](#) registers.

Software clears the [DMA4\\_CSRi](#) register and the IRQSTATUS bit for the different interrupt lines before enabling the channel.

### 16.5.2 Software-Triggered (Nonsynchronized) Transfer

To program a software-triggered DMA transfer:

1. Configure the transfer parameters in the logical DMA channel registers:

- [DMA4\\_CSDPi](#):
  - Transfer ES (8, 16, or 32 bits) in the DMA [DMA4\\_CSDPi\[1:0\]](#) bit field.
  - Read and write port access types (single/burst), DMA [DMA4\\_CSDPi\[8:7\]](#) and [DMA4\\_CSDPi\[15:14\]](#) bit fields
  - Source and destination endianness, DMA [DMA4\\_CSDPi\[21\]](#) and [DMA4\\_CSDPi\[19\]](#) bits
  - Write mode (posted or nonposted) and DMA [DMA4\\_CSDPi\[17:16\]](#) bit field
  - Source or destination packed or nonpacked (if the ES is less than the read/write port size), DMA [DMA4\\_CSDPi\[6\]](#) and [DMA4\\_CSDPi\[13\]](#) bits
- [DMA4\\_CENi](#): EN
- [DMA4\\_CFNi](#): FN per transfer block
- [DMA4\\_CSSAi](#) and [DMA4\\_CDSAi](#): Source and destination start address (aligned with transfer ES)
- [DMA4\\_CCRi](#):
  - Read and write port addressing modes, DMA [DMA4\\_CCRi\[13:12\]](#) and [DMA4\\_CCRi\[15:14\]](#) bit field
  - Priority bit for both read and write ports, DMA [DMA4\\_CCRi\[6\]](#) and [DMA4\\_CCRi\[26\]](#) bits
  - DMA request number (set to 0 for a software-triggered transfer) and DMA register bit fields [DMA4\\_CCRi\[4:0\] = 0](#) and [DMA4\\_CCRi\[20:19\] = 0](#)
- [DMA4\\_CSEIi](#), [DMA4\\_CSFli](#), [DMA4\\_CDEIi](#), and [DMA4\\_CDFli](#): Source and destination element and frame indexes (depending on addressing mode)

2. Start the transfer through the enable bit in the channel [DMA4\\_CCRi](#) register and DMA [DMA4\\_CCRi\[7\]](#) bit

The following example performs a DMA transfer on channel 10 of a 240\*160 picture from RAM to RAM (0x80C00000 to 0x80F00000):

```
UWORD32 RegVal = 0;
DMA4_t *DMA4;
DMA4 = (DMA4_t *)malloc(sizeof(DMA4_t));

/* Init. parameters */
DMA4->DataType = 0x2; //DMA4_CSDPi[1:0]
DMA4->ReadPortAccessType = 0; //DMA4_CSDPi[8:7]
DMA4->WritePortAccessType = 0; //DMA4_CSDPi[15:14]
DMA4->SourceEndiansim = 0; //DMA4_CSDPi[21]
DMA4->DestinationEndianness = 0; //DMA4_CSDPi[19]
DMA4->WriteMode = 0; //DMA4_CSDPi[17:16]
DMA4->SourcePacked = 0; //DMA4_CSDPi[6]
DMA4->DestinationPacked = 0; //DMA4_CSDPi[13]
DMA4->NumberOfElementPerFrame = 240; //DMA4_CENi
DMA4->NumberOfFramePerTransferBlock = 160; //DMA4_CFNi
```

```

DMA4->SourceStartAddress = 0x80C00000; //DMA4_CSSAi
DMA4->DestinationStartAddress = 0x80F00000; //DMA4_CDSAi
DMA4->SourceElementIndex = 1; //DMA4_CSEIi
DMA4->SourceFrameIndex = 1; //DMA4_CSFii
DMA4->DestinationElementIndex = 1; //DMA4_CDEIi
DMA4->DestinationFrameIndex = 1; //DMA4_CDFii
DMA4->ReadPortAccessMode = 1; //DMA4_CCRi[13:12]
DMA4->WritePortAccessMode = 1; //DMA4_CCRi[15:14]
DMA4->ReadPriority = 0; //DMA4_CCRi[6]
DMA4->WritePriority = 0; //DMA4_CCRi[23]
DMA4->ReadRequestNumber = 0; //DMA4_CCRi[4:0]
DMA4->WriteRequestNumber = 0; //DMA4_CCRi[20:19]

/* 1) Configure the transfer
   parameters in the logical DMA registers
   */
/*-----*/

/*
   a) Set the data type CSDP[1:0], the Read/Write Port access type
   CSDP[8:7]/[15:14], the Source/dest endianism CSDP[21]/CSDP[19], write
   mode CSDP[17:16], source/dest packed or non-packed
   CSDP[6]/CSDP[13]*/

// Read CSDP
RegVal = DMA4_CSDP_CH10;

// Build reg
RegVal = ((RegVal &~ 0x3) | DMA4->DataType);
RegVal = ((RegVal &~(0x3 << 7)) | (DMA4->ReadPortAccessType << 7));
RegVal = ((RegVal &~(0x3 << 14)) | (DMA4->WritePortAccessType << 14));
RegVal = ((RegVal &~(0x1 << 21)) | (DMA4->SourceEndiansim << 21));
RegVal = ((RegVal &~(0x1 << 19)) | (DMA4->DestinationEndianism << 19));
RegVal = ((RegVal &~(0x3 << 16)) | (DMA4->WriteMode << 16));
RegVal = ((RegVal &~(0x1 << 6)) | (DMA4->SourcePacked << 6));
RegVal = ((RegVal &~(0x1 << 13)) | (DMA4->DestinationPacked << 13));

// Write CSDP

DMA4_CSDP_CH10 = RegVal;

/* d) Set the Source/dest start address index CSSA[31:0]/CDSA[31:0]*/

DMA4_CSSA_CH10 = DMA4->SourceStartAddress; // address start
DMA4_CDSA_CH10 = DMA4->DestinationStartAddress; // address dest

/* e) Set the Read Port addressing mode CCR[13:12], the
   Write Port addressing mode CCR[15:14], read/write priority
   CCR[6]/CCR[26], the current LCH CCR[20:19]=00 and CCR[4:0]=00000*/

// Read CCR
RegVal = DMA4_CCR_CH10;

```

```

//
    Build reg
RegVal = ((RegVal & ~(0x3 << 12)) | (DMA4->ReadPortAccessMode << 12));
RegVal = ((RegVal & ~(0x3 << 14)) | (DMA4->WritePortAccessMode << 14));
RegVal = ((RegVal & ~(0x1 << 6)) | (DMA4->ReadPriority << 6));

RegVal = ((RegVal & ~(0x1 << 26)) | (DMA4->WritePriority << 26));

RegVal &= 0xFFCFFFE0 ;

// Write CCR
DMA4_CCR_CH10 = RegVal;

/* f)- Set the source element index CSEI[15:0]*/

DMA4_CSEI_CH10 = DMA4->SourceElementIndex;

/* g)-
    Set the source frame index CSFI[15:0]*/

DMA4_CSFI_CH10 = DMA4->SourceFrameIndex ;

/* h)- Set the destination element
    index CDEI[15:0]*/

DMA4_CDEI_CH10 = DMA4->DestinationElementIndex;

/* i)- Set the destination
    frame index CDFI[31:0]*/

DMA4_CDFI_CH10 = DMA4->DestinationFrameIndex;

/* 2) Start the DMA transfer by
    Setting the enable bit CCR[7]=1 */

/*-----*/

//write enable bit
DMA4_CCR_CH10 |= 1 << 7; /* start */

```

### 16.5.3 Hardware-Synchronized Transfer

To monitor a hardware synchronized DMA transfer, initialize the [DMA4\\_CDACi](#) register before the software enable.

To configure an LCh to synchronize by element, packet, frame, or block, the frame synchronization [DMA4\\_CCRi\[5\]](#) FS bit and the block synchronization [DMA4\\_CCRi\[18\]](#) BS bit must be programmed. For all the following synchronized transfers (element, packet, and frame or block-synchronized transfers), the user must first set the [DMA4\\_CCRi\[24\]](#) SEL\_SRC\_DST\_SYNC bit to 1 when the source triggers on the DMA request and set it the [DMA4\\_CCRi\[24\]](#) SEL\_SRC\_DST\_SYNC bit to 0 when the destination triggers on the DMA request.

---

**NOTE:** The user must take care when setting the [DMA4\\_CCRi\[23\]](#) PREFETCH bit it is in conjunction with [DMA4\\_CCRi\[24\]](#) SEL\_SRC\_DST\_SYNC bit.

---

- To configure an LCh to transfer one element per DMA request:
  1. Set the number of DMA request associated with the current LCH in the [DMA4\\_CCRi\[20:19\]](#) SYNCHRO\_CONTROL\_UPPER and [DMA4\\_CCRi\[4:0\]](#) SYNCHRO bit field.
  2. Set the data type, also referenced as element size (ES), in the [DMA4\\_CSDP\[1:0\]](#) DATA\_TYPE bit field.

3. Set the Read Port access type (single or burst access) in the [DMA4\\_CSDPi\[8:7\]](#) SRC\_BURST\_EN bit field.
  4. Set the Write Port access type (single or burst access) in the [DMA4\\_CSDPi\[15:14\]](#) DST\_BURST\_EN bit field.
  5. Set the Read Port addressing mode in the [DMA4\\_CCRi\[13:12\]](#) SRC\_AMODE bit field.
  6. Set the Write Port addressing mode in the [DMA4\\_CCRi\[15:14\]](#) DST\_AMODE bit field.
  7. Set the Read start address in the [DMA4\\_CSSAi\[31:0\]](#) SRC\_START\_ADRS bit field.
  8. Set the Write start address in the [DMA4\\_CDSAi\[31:0\]](#) DST\_START\_ADRS bit field.
  9. Set both FS and BS to 0 in [DMA4\\_CCRi\[5\]](#) FS and [DMA4\\_CCRi\[18\]](#) BS.
  10. Set to 1 the channel enable bit [DMA4\\_CCRi\[7\]](#) EN.
- To configure an LCh to transfer one frame per DMA request:
    1. Set the number of DMA request associated to the current LCH in the [DMA4\\_CCRi\[20:19\]](#) SYNCHRO\_CONTROL\_UPPER and [DMA4\\_CCRi\[4:0\]](#) SYNCHRO bit field.
    2. Set the data type, also referenced as element size (ES), in the [DMA4\\_CSDPi\[1:0\]](#) DATA\_TYPE bit field.
    3. Set the number of element per frame in the [DMA4\\_CENi\[23:0\]](#) CHANNEL\_ELMNT\_NBR bit field.
    4. Set the Read Port access type (single or burst access) in the [DMA4\\_CSDPi\[8:7\]](#) SRC\_BURST\_EN bit field.
    5. Set the Write Port access type (single or burst access) in the [DMA4\\_CSDPi\[15:14\]](#) DST\_BURST\_EN bit field.
    6. Set the Read Port addressing mode in the [DMA4\\_CCRi\[13:12\]](#) SRC\_AMODE bit field.
    7. Set the Write Port addressing mode in the [DMA4\\_CCRi\[15:14\]](#) DST\_AMODE bit field.
    8. Set the Read start address in the [DMA4\\_CSSAi\[31:0\]](#) SRC\_START\_ADRS bit field.
    9. Set the Write start address in the [DMA4\\_CDSAi\[31:0\]](#) DST\_START\_ADRS bit field.
    10. Set FS to 1 and BS to 0, respectively, in [DMA4\\_CCRi\[5\]](#) FS and [DMA4\\_CCRi\[18\]](#) BS.
    11. Set to 1 the channel enable bit [DMA4\\_CCRi\[7\]](#) EN.
  - To configure an LCh to transfer one block per DMA request:
    1. Set the number of DMA request associated to the current LCH in the [DMA4\\_CCRi\[20:19\]](#) SYNCHRO\_CONTROL\_UPPER and [DMA4\\_CCRi\[4:0\]](#) SYNCHRO bit field.
    2. Set the data type, also referenced as element size (ES), in the [DMA4\\_CSDPi\[1:0\]](#) DATA\_TYPE bit field.
    3. Set the number of element per frame in the [DMA4\\_CENi\[23:0\]](#) CHANNEL\_ELMNT\_NBR bit field.
    4. Set in the [DMA4\\_CFNi\[15:0\]](#) CHANNEL\_FRAME\_NBR bit field the number of frame (transfers), to take place before the LCH gets disabled.
    5. Set the Read Port access type (single or burst access) in the [DMA4\\_CSDPi\[8:7\]](#) SRC\_BURST\_EN bit field.
    6. Set the Write Port access type (single or burst access) in the [DMA4\\_CSDPi\[15:14\]](#) DST\_BURST\_EN bit field.
    7. Set the Read Port addressing mode in the [DMA4\\_CCRi\[13:12\]](#) SRC\_AMODE bit field.
    8. Set the Write Port addressing mode in the [DMA4\\_CCRi\[15:14\]](#) DST\_AMODE bit field.
    9. Set the Read start address in the [DMA4\\_CSSAi\[31:0\]](#) SRC\_START\_ADRS bit field.
    10. Set the Write start address in the [DMA4\\_CDSAi\[31:0\]](#) DST\_START\_ADRS bit field.
    11. Set FS to 0 and BS to 1, respectively, in [DMA4\\_CCRi\[5\]](#) FS and [DMA4\\_CCRi\[18\]](#) BS.
    12. Set to 1 the channel enable bit [DMA4\\_CCRi\[7\]](#) EN.
  - To configure an LCh to transfer one packet per DMA request:
    1. Set the number of DMA request associated to the current LCH in the [DMA4\\_CCRi\[20:19\]](#) SYNCHRO\_CONTROL\_UPPER and [DMA4\\_CCRi\[4:0\]](#) SYNCHRO bit field.
    2. Set the data type, also referenced as element size (ES), in the [DMA4\\_CSDPi\[1:0\]](#) DATA\_TYPE bit field.

3. Set the number of elements per packet to transfer: If the packet requestor is in the source, set [DMA4\\_CCRi](#) [24] SEL\_SRC\_DST\_SYNC to 1 and set the packet element number in the [DMA4\\_CSFli](#) register and set the addressing mode of source to constant addressing in [DMA4\\_CCRi](#)[13:12] SRC\_AMODE bit field; else, if the packet requestor is in the destination, set the [DMA4\\_CCRi](#)[24] SEL\_SRC\_DST\_SYNC to 0 and set the packet element number in the [DMA4\\_CDFli](#) register and set the addressing mode of destination to constant addressing in [DMA4\\_CCRi](#)[15:14] DST\_AMODE bit field.
4. Set the number of elements per frame in the [DMA4\\_CENi](#)[23:0] CHANNEL\_ELMNT\_NBR bit field.
5. Set in the [DMA4\\_CFNi](#)[15:0] CHANNEL\_FRAME\_NBR bit field the number of frames (transfers), to take place before the LCH gets disabled.
6. Set the element number in the packet in the [DMA4\\_CSFli](#)[15:0] PKT\_ELNT\_NBR, if constant addressing or post-incremented addressing modes are used in the source side. However, the number of element in the packet is set in the [DMA4\\_CDFli](#)[15:0] PKT\_ELNT\_NBR if constant addressing mode is used in the destination side.
7. Set the Read Port access type (single or burst access) in the [DMA4\\_CSDPi](#)[8:7] SRC\_BURST\_EN bit field.
8. Set the Write Port access type (single or burst access) in the [DMA4\\_CSDPi](#)[15:14] DST\_BURST\_EN bit field.
9. Set the Read Port addressing mode in the [DMA4\\_CCRi](#)[13:12] SRC\_AMODE bit field.
10. Set the Write Port addressing mode in the [DMA4\\_CCRi](#)[15:14] DST\_AMODE bit field.
11. Set the Read start address in the [DMA4\\_CSSAi](#)[31:0] SRC\_START\_ADRS bit field.
12. Set the Write start address in the [DMA4\\_CDSAi](#)[31:0] DST\_START\_ADRS bit field.
13. Set FS to 1 and BS to 1, respectively, in [DMA4\\_CCRi](#)[5] FS and [DMA4\\_CCRi](#)[18] BS.
14. Set to 1 the channel enable bit [DMA4\\_CCRi](#)[7] EN.

---

**NOTE:** It is possible to stop a transfer by disabling the channel by resetting the [DMA4\\_CCRi](#)[7] ENABLE bit.

---

### 16.5.4 Synchronized Transfer Monitoring Using CDAC

The [DMA4\\_CDACi](#) register is writable and non-initialized (value undefined). It can be initialized to monitor a transfer by applying the following programming model:

1. Write 0 in the [DMA4\\_CDACi](#) register.
2. Enable the channel.
3. If a time-out occurs, read [DMA4\\_CDACi](#) register.
4. If [DMA4\\_CDACi](#) != 0 (it is the value configured in [DMA4\\_CDACi](#)):

This indicates that the corresponding transfer has started. The user can then rely on [DMA4\\_CCENi](#) and [DMA4\\_CCFNi](#) element and frame counters.

Otherwise, if [DMA4\\_CDACi](#) = 0 (it is the value configured in the [DMA4\\_CDACi](#)):

This indicates that the corresponding transfer did not start.

### 16.5.5 Concurrent Software and Hardware Synchronization

This section describes thread allocation only; it does not describe the entire transfer. Because synchronized transfers are latency critical, you must allocate a thread at least on the synchronized target side.

Even for multiple concurrent channels, thread reservation ensures that when a hardware DMA request arrives, the read/write scheduler finds available thread(s) to initiate a channel schedule and issue a read/write transaction.

Consider six concurrent channels:

- Channels 0, 1, 2, and 3 are dedicated to memory-memory transfer; they are software triggered and not synchronized.

- Channel 4 is dedicated to memory-peripheral transfer, hardware triggered, and synchronized on the write side.
- Channel 5 is dedicated to peripheral-memory transfer, hardware triggered, and synchronized on the read side.

To perform thread reservation:

1. Allow thread reservation for priority channel 4 and channel 5:

Reserve one thread (Read ThreadID 0) on the read port and one thread (Write ThreadID 0) on the write port: set the `DMA4_GCR[13:12]` `HI_THREAD_RESERVED` bit field to 0x1.

2. Specify channel priority:

Channel 4 is a write high priority channel: set `DMA4_CCRi[26]` `WRITE_PRIORITY` = 1.

Channel 5 is a read high priority channel: set `DMA4_CCRi[6]` `READ_PRIORITY` = 1.

### 16.5.6 Chained Transfer

A chained DMA transfer can be programmed as follows:

1. Configure the transfer parameters for each logical DMA channel in the chain as in step 1 for either the synchronized or non-synchronized transfers describe in [Section 16.5.5, Concurrent Software and Hardware Synchronization](#).
2. For each channel in the chain, configure the `DMA4_CLNK_CTRLi` register as follows:
  - Next logical DMA channel number (for a looping chained transfer link last channel to first channel number), in the `DMA4_CLNK_CTRLi[4:0]` `NEXTLCH_ID` bit field.
  - Include the logical channel to the chain and enable link by setting the `DMA4_CLNK_CTRLi[15]` `ENABLE_LNK` bit.
  - For a non-looping chain, the last logical channel in the chain must have the `DMA4_CLNK_CTRLi[15]` `ENABLE_LNK` bit set to 0 to indicate the end of the chain.
3. Enable the transfer through the enable bit in the first logical channel `DMA4_CCRi[7]` `ENABLE` bit. All other channels in the chain must be disabled. Each channel is enabled automatically in turn when the previous logical channel transfer completes. A non-synchronized transfer starts immediately; a hardware-synchronized transfer starts when the DMA request line corresponding to the first DMA channel in the chain is asserted.

To stop a looping chained transfer, disable the `DMA4_CLNK_CTRLi[15]` `ENABLE_LNK` bit (by setting it to 0x0), of the final channel transfer.

In the RAM-to-RAM copy example, to copy in loop, it is possible to link channel 10 on itself. The following line can be added in the channel configuration:

```
/* g) Set link for loop */
DMA4_CLNK_CTRL_CH10 =
    0x0000800A;
```

### 16.5.7 90-Degree Clockwise Image Rotation

The 90-degree clockwise image rotation example described in [Section 16.4.5, Addressing Modes](#), can be programmed as follows:

1. Configure the transfer parameters in the logical DMA channel registers:

- **DMA4\_CSDPi:**
  - Transfer ES = 32-bit (32 bpp), `DMA4_CSDPi[1:0]` `DATA_TYPE` bit field
  - Read and write port access types = maximum burst size supported by memory device, `DMA4_CSDPi[8:7]` `SRC_BURST_EN` and `DMA4_CSDPi[15:14]` `DST_BURST_EN` bit fields
  - Source and destination endianness, `DMA4_CSDPi[21]` `SRC_ENDIAN` and `DMA4_CSDPi[19]` `DST_ENDIAN` bits
  - Write mode = posted with last element nonposted, `DMA4_CSDPi[17:16]` `WRITE_MODE` bit field
  - Source and destination packed = Yes (although destination writes do not benefit because E11),

**DMA4\_CSDPi**[6] SRC\_PACKED and **DMA4\_CSDPi**[13] DST\_PACKED bits

- **DMA4\_CENi**: EN = 240
- **DMA4\_CFNi**: FN per transfer block = 160
- **DMA4\_CSSAi**: Source start address = 0x100000
- **DMA4\_CDSAi**: destination start address = 0x20013E
- **DMA4\_CCRi**:
  - Read and write port addressing modes = double-index addressing mode for both or post-increment addressing on source and double-index addressing on destination, **DMA4\_CCRi**[13:12] SRC\_AMODE and **DMA4\_CCRi**[15:14] DST\_AMODE bit fields
  - Low or high priority, **DMA4\_CCRi**[6] READ\_PRIORITY bit
  - DMA request number = 0 (for software-triggered transfer), **DMA4\_CCRi**[4:0] SYNCHRO\_CONTROL and **DMA4\_CCRi**[20:19] SYNCHRO\_CONTROL\_UPPER bit fields
- **DMA4\_CSEIi**: Source EI = 1
- **DMA4\_CSFII**: Source frame index = 1
- **DMA4\_CDEIi**: destination EI = 637
- **DMA4\_CDFII**: destination frame index = 152967

2. Start the transfer through the enable bit in the channel **DMA4\_CCRi** register.

The following parameters are used to perform this rotation from 0x80C00000 RAM address to 0x80F00000, with the same code used in [Section 16.5.2, Software-Triggered \(Nonsynchronized\) Transfer](#):

```

/* Init. parameters */
DMA4->DataType = 0x2; //
    DMA4_CSDPi[1:0]
DMA4->ReadPortAccessType = 0x3; // DMA4_CSDPi[8:7]

DMA4->WritePortAccessType = 0x3; // DMA4_CSDPi[15:14]

DMA4->SourceEndiansim = 0; // DMA4_CSDPi[21]

DMA4->DestinationEndianism = 0; // DMA4_CSDPi[19]

DMA4->WriteMode = 0x2; // DMA4_CSDPi[17:16]
DMA4->SourcePacked
    = 0x1; // DMA4_CSDPi[6]
DMA4->DestinationPacked = 0x1; //
    DMA4_CSDPi[13]
DMA4->NumberOfElementPerFrame = 240; // DMA4_CENi

DMA4->NumberOfFramePerTransferBlock = 160; // DMA4_CFNi

DMA4->SourceStartAddress = 0x80C00000; // DMA4_CSSAi

DMA4->DestinationStartAddress = 0x80F00000; // DMA4_CDSAi

DMA4->SourceElementIndex = 1; // DMA4_CSEIi

DMA4->SourceFrameIndex = 1; // DMA4_CSFII

DMA4->DestinationElementIndex = 637; // DMA4_CDEIi

DMA4->DestinationFrameIndex = -152967; // DMA4_CDFII

DMA4->ReadPortAccessMode = 0x3; // DMA4_CCRi[13:12]

DMA4->WritePortAccessMode = 0x3; // DMA4_CCRi[15:14]

DMA4->ReadPriority = 0; // DMA4_CCRi[6]
DMA4->WritePriority =
    0; // DMA4_CCRi[23]
DMA4->ReadRequestNumber = 0; // DMA4_CCRi[4:0]

```

```
DMA4->WriteRequestNumber = 0; // DMA4_CCRi[20:19]
```

### 16.5.8 Graphic Operations

- Transparent copy:
  1. Set the [DMA4\\_CCRi\[17\]](#) TRANSPARENT\_COPY\_ENABLE bit to 1
  2. Set the [DMA4\\_CCRi\[16\]](#) CONST\_FILL\_ENABLE bit to 0
  3. Set the value of the key color in the [DMA4\\_COLORi\[15:0\]](#) COLOR\_KEY bit field

To perform this graphic operation, the following lines can be added to the example of [Section 16.5.2, Software-Triggered \(Nonsynchronized\) Transfer](#).

```
DMA4_CCR_CH10 &= ~(0x1 << 16);
DMA4_CCR_CH10 |= 0x1 << 17;
```

```
DMA4_COLOR_CH10 = 0x00000003;
```

- Solid Color fill:
  1. Set the [DMA4\\_CCRi\[16\]](#) CONST\_FILL\_ENABLE bit to 1
  2. Set the [DMA4\\_CCRi\[17\]](#) TRANSPARENT\_COPY\_ENABLE bit to 0
  3. Set the value of key the color in the [DMA4\\_COLORi\[15:0\]](#) SOLID\_COLOR bit field

To perform this graphic operation, the following lines can be added to the example of [Section 16.5.2, Software-Triggered \(Nonsynchronized\) Transfer](#).

```
DMA4_CCR_CH10 &= ~(0x1 << 17);
DMA4_CCR_CH10 |= 0x1 << 16;
```

```
DMA4_COLOR_CH10 = 0x00000003;
```

### 16.5.9 Linked-List Programming Guidelines

- With the exception of the [DMA4\\_CCRi\[7\]](#) ENABLE bit and the [DMA4\\_CDPi\[7\]](#) PAUSE\_LINK\_LIST bit during a linked-list transfer (descriptor load phase or data load phase), avoid programming any register through the configuration port.
- Before enabling any linked-list transfer, ensure that all global registers and all registers in the descriptor are initialized. Some static channel registers (registers that are not updated by the descriptor to be loaded) must also be initialized correctly:
  - For type 2, the following registers must be initialized with consistent values:
    - All global registers
    - [DMA4\\_CCRi](#)
    - [DMA4\\_CSDPi](#)
    - [DMA4\\_CLNK\\_CTRLi](#)
  - For type 3, the following registers must be initialized with consistent values:
    - All global registers
    - [DMA4\\_CCRi](#)
    - [DMA4\\_CSDPi](#)
    - [DMA4\\_CLNK\\_CTRLi](#)
    - [DMA4\\_CICRi](#)
    - [DMA4\\_CFNi](#)
- In case of a linked list with descriptor types 2 and 3, the content of the [DMA4\\_CCRi](#) register must not change during super-block life.
- The PAUSE\_LINK\_LIST bit must not be set in the initialization phase.

## 16.6 SDMA Register Manual

### 16.6.1 SDMA Instance Summary

**Table 16-22. SDMA Instance Summary**

Module Name	Base Address	Size
SDMA	0x4A05 6000	4KB

### 16.6.2 SDMA Registers

#### 16.6.2.1 SDMA Register Summary

Index  $i$  represents the logical channel number (where  $i = 0$  to  $31$ ). The offset address for some registers is calculated from the channel  $c$  number. For example, the DMA4\_CCR10 (channel 10) register has an offset address of  $10 \times 0x60 = 0x3C0$ , and thus a physical address of  $0x4A05\ 6080 + 0x3C0 = 0x4A05\ 6440$ .

Index  $j$  represents the interrupt line number (where  $j = 0$  to  $3$ ). The offset address for some registers is calculated from the channel  $c$  number. For example, the DMA4\_IRQSTATUS\_L3 (line 3) register has an offset address of  $3 \times 0x4 = 0xC$ , and thus a physical address of  $0x4A05\ 6008 + 0xC = 0x4A05\ 6014$ .

### 16.6.2.2 SDMA Register Description

**NOTE:** Some registers have no reset value (marked with -) because of hardware implementation in memory. Software must ensure the correct programming of these registers, if needed.

Shadow registers are used to read run-time registers such as CCEN, CCFN, CDAC, and CSAC. Typically, when accessed in 8-bit or 16-bit access for two consecutive accesses, the value of the previous registers can change. A shadow register holds the entire value to let the next access recover the remaining 24 or 16 bits.

For non-32-bit transactions, start reading or writing from the LSByte first to enable the register update. There is no issue for 32-bit read-write transactions.

7	PKT_INTERRUPT_CPBLTY	End of Packet detection capability. Read 0x0: Does not support end of packet interrupt generation capability Read 0x1: Supports end of packet interrupt generation capability	R	1
6	SYNC_STATUS_CPBLTY	Sync_status_capability Read 0x0: Does not support synchronized transfer status bit generation Read 0x1: Supports synchronized transfer status bit generation	R	1
5	BLOCK_INTERRUPT_CPBLTY	End of block detection capability. Read 0x0: Does not support end of block interrupt generation capability Read 0x1: Supports end of block interrupt generation capability	R	1
4	LAST_FRAME_INTERRUPT_CPBLTY	Start of last frame detection capability. Read 0x0: Does not support last frame interrupt generation capability Read 0x1: Supports last frame interrupt generation capability	R	1
3	FRAME_INTERRUPT_CPBLTY	End of frame detection capability. Read 0x0: Does not support end of frame interrupt generation capability Read 0x1: Supports end of frame interrupt generation capability	R	1
2	HALF_FRAME_INTERRUPT_CPBLTY	Detection capability of the half of frame end. Read 0x0: Does not support half of frame interrupt generation capability Read 0x1: Supports half of frame interrupt generation capability	R	1
1	EVENT_DROP_INTERRUPT_CPBLTY	Request collision detection capability. Read 0x0: Does not support event drop interrupt generation capability Read 0x1: Supports event drop interrupt generation capability	R	1
0	RESERVED	Write 0's for future compatibility. Read returns 0.	RW	0

**Table 16-42. DMA4\_GCR**

<b>Address Offset</b>	0x0000 0078	<b>Instance</b>	SDMA
<b>Physical Address</b>	0x4A05 6078		
<b>Description</b>	DMA4_GCR		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																
RESERVED								CHANNEL_ID_GATE								ARBITRATION_RATE								HI_LO_FIFO_BUDGET				HI_THREAD_RESERVED				RESERVED								MAX_CHANNEL_FIFO_DEPTH							

Bits	Field Name	Description	Type	Reset
31:25	RESERVED	Write 0's for future compatibility. Read returns 0.	RW	0x00
24	CHANNEL_ID_GATE	Gates the Channel ID bus monitoring on both Read and Write ports 0x0: Gates the Channel ID qualifiers on both Read and Write Ports 0x1: Does not gate the Channel ID qualifiers on both Read and Write Ports	RW	0x0
23:16	ARBITRATION_RATE	Arbitration switching rate between prioritized and regular channel queues	RW	0x01
15:14	HI_LO_FIFO_BUDGET	Allow to have a separate Global FIFO budget for high and low priority channels. For Hi priority Channel: (Per_channel_Maximum FIFO depth + 1) x Number of active High priority Channel <= High Budget FIFO For Low priority channel: (Per_channel_Maximum FIFO depth + 1) x Number of active Low priority Channel <= Low Budget FIFO 0x0: no fixed budget for neither higher nor lower priority channel 0x1: 75% of FIFO for low priority and 25% for high priority channels 0x2: 25% of FIFO for low priority and 75% for high priority channels 0x3: 50% of FIFO for low priority and 50% for high priority channels	RW	0x0
13:12	HI_THREAD_RESERVED	Allow thread reservation for high priority channel on both read and write ports. 0x0: No ThreadID is reserved on the Read Port for high priority channels. No ThreadID is reserved on the Write Port for high priority channels. 0x1: Read Port ThreadID 0 is reserved for high priority channels. Write Port ThreadID 0 is reserved for high priority channels. 0x2: Read port ThreadID 0 and ThreadID 1 are reserved for high priority channels. Write Port ThreadID 0 is reserved for high priority channels. 0x3: Read Port ThreadID 0, ThreadID 1 and ThreadID 2 are reserved for high priority channels. Write Port ThreadID 0 is reserved for high priority channels.	RW	0x0
11:8	RESERVED	Write 0's for future compatibility. Read returns 0.	RW	0x0

Bits	Field Name	Description	Type	Reset
7:0	MAX_CHANNEL_FIFO_DEPTH	Maximum FIFO depth allocated to one logical channel. Maximum FIFO depth can not be 0x0. It should be at least 0x1 or greater. Note that If channel limit is less than destination burst size enough data will not be accumulated in the data FIFO and it will never be sent out on the WR port. The burst size should be less than the FIFO limit specified in this bit field.	RW	0x10

Bits	Field Name	Description	Type	Reset
31:30	RESERVED	Write 0's for future compatibility. Read returns 0.	RW	0x0
29:27	RESERVED	Reserved for non-GP devices	RW	0x0
26	WRITE_PRIORITY	Channel priority on the Write side  0x0: Channel has low priority on the write side during the arbitration process.  0x1: Channel has high priority on write sided during the arbitration process.	RW	0

Bits	Field Name	Description	Type	Reset
25	BUFFERING_DISABLE	This bit allows to disable the default buffering functionality when transfer is source synchronized.  0x0: Buffering is enabled across element/packet when source is synchronized to element, packet, frame or blocks.  0x1: Buffering is disabled across element/packet when source is synchronized to element, packet, frame or blocks.	RW	-
24	SEL_SRC_DST_SYNC	Specifies that element, packet, frame or block transfer (depending on CCR.bs and CCR.fs) is triggered by the source or the destination on the DMA request  0x0: Transfer is triggered by the destination. If synch on packet the packet element number is specified in the CDFI register.  0x1: Transfer is triggered by the source. If synchronized on packet the packet element number is specified in the CSFI register.	RW	-
23	PREFETCH	Enables the prefetch mode  0x0: Prefetch mode is disabled. When Sel_Src_Dst_Sync=1 transfers are buffered and pipelined between DMA requests.  0x1: Prefetch mode is enabled. Prefetch mode is active only when destination is synchronized. It is software user responsibility not to have at the same time Prefetch=1 when Sel_Src_Dst_Sync=1. This mode is not supported.	RW	0
22	SUPERVISOR	Enables the supervisor mode  0x0: Supervisor mode is disabled.  0x1: Supervisor mode is enabled.	RW	0
21	RESERVED	Reserved for non-GP devices	RW	0
20:19	SYNCHRO_CONTROL_UPPER	Channel Synchronization control upper (used in conjunction with the 5 bits of synchro channel <a href="#">DMA4_CCRi[4:0]</a> ) Used in conjunction, as 2 MSB, with the 5 bits of the synchro channel bit field.	RW	0b00
18	BS	Block synchronization This bit used in conjunction with the fs to see how the DMA request is serviced in a synchronized transfer.	RW	-
17	TRANSPARENT_COPY_ENABLE	Transparent copy enable  0x0: Transparent copy mode is disabled.  0x1: Transparent copy mode is enabled.	RW	-
16	CONST_FILL_ENABLE	Constant fill enable  0x0: Constant fill mode is disabled.  0x1: Constant fill mode is enabled.	RW	0
15:14	DST_AMODE	Selects the addressing mode on the Write Port of a channel.  0x0: Constant address mode  0x1: Post-incremented address mode  0x2: Single index address mode  0x3: Double index address mode	RW	0bxx
13:12	SRC_AMODE	Selects the addressing mode on the Read Port of a channel.  0x0: Constant address mode  0x1: Post-incremented address mode  0x2: Single index address mode  0x3: Double index address mode	RW	0bxx
11	RESERVED	Write 0s for future compatibility. Read returns 0.	RW	0

Bits	Field Name	Description	Type	Reset
10	WR_ACTIVE	Indicates if the channel write context is active or not Read 0x0: Channel is not active on the write port. Read 0x1: Channel is currently active on the write port.	R	0
9	RD_ACTIVE	Indicates if the channel read context is active or not Read 0x0: Channel is not active on the read port. Read 0x1: Channel is currently active on the read port.	R	0
8	SUSPEND_SENSITIVE	Logical channel suspend enable bit 0x0: The channel ignores the MSuspend even if EMUFree is set to 0. 0x1: If EMUFree is set to 0 and MSuspend comes in then all current OCP services (single transaction or burst transaction as specified in the corresponding CSDP register) have to be completed before stopping processing any more transactions.	RW	0
7	ENABLE	Logical channel enable. It is SW responsibility to clear the CSR register and the IRQSTATUS bit for the different interrupt lines before enabling the channel. 0x0: The logical channel is disabled. 0x1: The logical channel is enabled.	RW	0
6	READ_PRIORITY	Channel priority on the read side 0x0: Channel has low priority on the read side during the arbitration process. 0x1: Channel has high priority on read sided during the arbitration process.	RW	0
5	FS	Frame synchronization This bit used in conjunction with the BS to see how the DMA request is serviced in a synchronized transfer FS = 0 and BS = 0: An element is transferred once a DMA request is made. FS = 0 and BS = 1: An entire block is transferred once a DMA request is made. FS = 1 and BS = 0: An entire frame is transferred once a DMA request is made. FS = 1 and BS = 1: A packet is transferred once a DMA request is made. All these different transfers can be interleaved on the port with other DMA requests.	RW	-
4:0	SYNCHRO_CONTROL	Channel synchronization control This bit field used in conjunction with the second_level_synchro_control_upper (as 2 MSB) 0000000 : Is reserved for non synchronized LCH transfer xxxxxxx (from 1 to 127)There are 127 possible DMA request to assign to any LCH. <b>Note:</b> The channel synchronization control registers are 1-based. For example, to enable the S_DMA_1 request, DMA4_CCR[4:0] SYNCHRO_CONTROL must be set to 0x2 (DMA request number + 1).	RW	0b00000

## **Interrupt Controllers**

---

---

---

This chapter describes the interrupt controllers (INTCs) in the device.

<b>Topic</b>	<b>Page</b>
<b>17.1 Interrupt Controllers Overview .....</b>	<b>3689</b>
<b>17.2 Interrupt Controllers Environment .....</b>	<b>3691</b>
<b>17.3 Interrupt Controller Integration .....</b>	<b>3692</b>
<b>17.4 Interrupt Controllers Functional Description .....</b>	<b>3698</b>
<b>17.5 Interrupt Controllers Register Manual .....</b>	<b>3699</b>

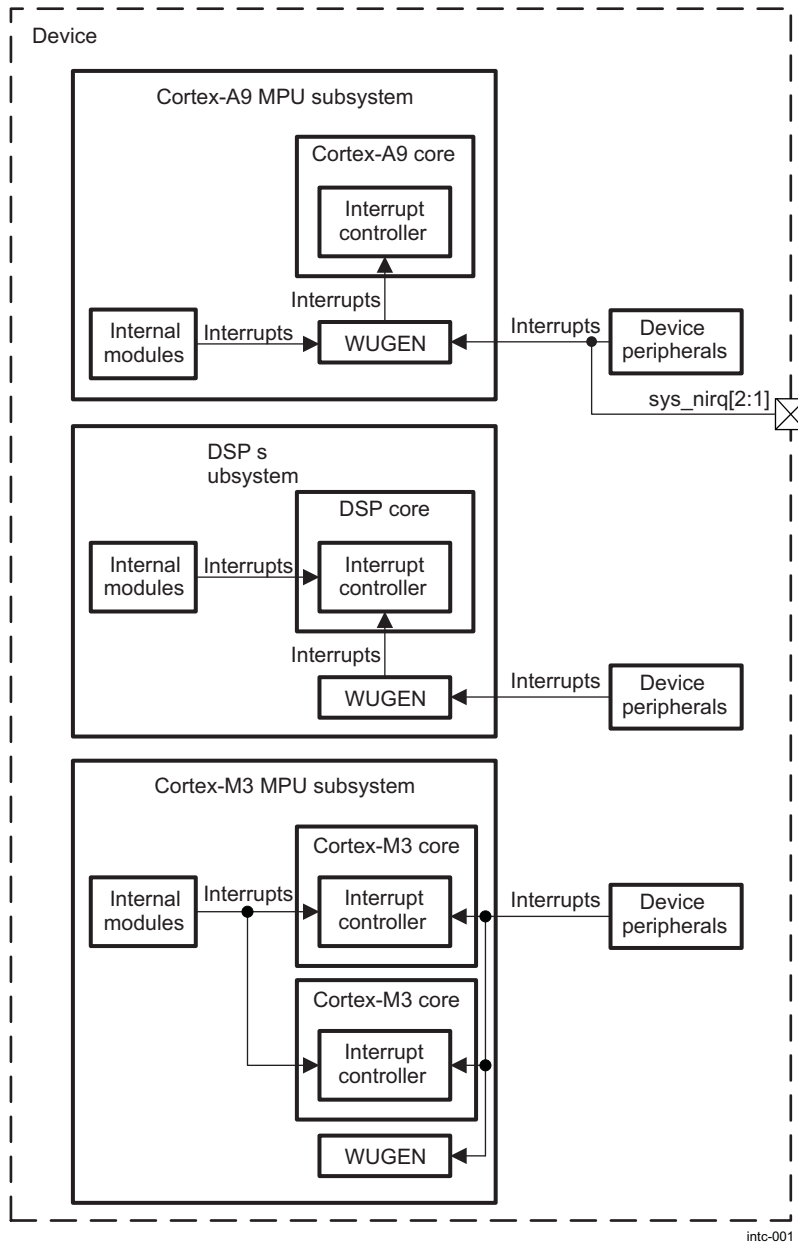

## 17.1 Interrupt Controllers Overview

The device provides three interrupt controller (INTC) modules, which handle interrupts at the device level:

- Cortex™-A9 microprocessor unit (MPU) subsystem interrupt controller (Cortex-A9 MPU INTC): This INTC module is a single functional unit that is integrated in the Cortex-A9 multiprocessor core alongside Cortex-A9 processors. It provides:
  - 128 hardware interrupt inputs
  - Generation of interrupts by software
  - Prioritization of interrupts
  - Masking of any interrupts
  - Distribution of the interrupts to the target Cortex-A9 processor(s)
  - Tracking the status of interrupts
  - Wake-up generator (WUGEN) module on external and local interrupts
- DSP subsystem interrupt controller (INTC): This module is a specific combination of WUGEN and the C64x+™ DSP INTC. It is used in the device but is not described in detail in this chapter. For detailed information about this module, see [Chapter 5, DSP Subsystem](#).
- Cortex™-M3 MPU subsystem INTC (Cortex-M3 MPU INTC): This module is also called Nested Vectored Interrupt Controller (NVIC) and is integrated within each Cortex-M3 so the different interrupt lines are directly connected to each core. The interrupt mapping is the same for the two cores to facilitate parallel processing. The NVIC supports:
  - 64 external interrupts (in addition to 16 Cortex-M3 internal interrupts), which are dynamically prioritized with 16 levels of priority defined for each core
  - Low-latency exception and interrupt handling
  - Prioritization and handling of exceptions
  - Control of the local power management
  - Debug accesses to the processor core
  - WUGEN module on external interrupts, coming from device peripherals

Figure 17-1 shows the internal interrupt scheme of the device.

**Figure 17-1. Interrupt Controllers Overview**

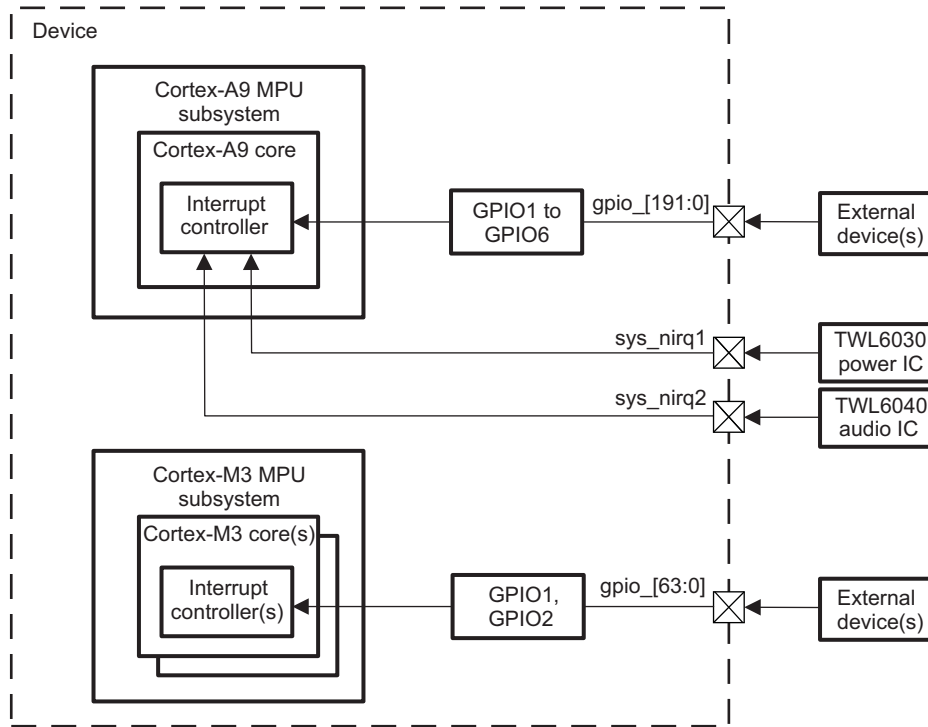

**NOTE:** For more information about the WUGEN module in the Cortex-A9 MPU subsystem (including integration, functional and register description), see [Chapter 4, Cortex-A9 MPU Subsystem](#). For more information about the WUGEN module in the Cortex-M3 MPU subsystem (including integration, functional and register description), see [Chapter 7, Cortex-M3 MPU Subsystem](#).

## 17.2 Interrupt Controllers Environment

This section describes the INTC application fields from the environment point of view (external connections).

Figure 17-2 shows the relationship between the module and external interrupts.

Figure 17-2. Interrupts From External Devices

intc-002

Table 17-1 describes the I/O signals that can be used by external devices to generate interrupts to the Cortex-A9 MPU INTC or Cortex-M3 MPU INTC.

Table 17-1. Interrupt Controllers I/O Signals

Signal Name	I/O <sup>(1)</sup>	Reset Value	Description	Cortex-A9 MPU INTC	Cortex-M3 MPU INTC
sys_nirq1	I	1	The TWL6030 power IC can use this pin to generate a system wake-up event to Cortex-A9 MPU INTC.	x	-
sys_nirq2	I	1	The TWL6040 audio IC can use this pin to generate a system wake-up event to Cortex-A9 MPU INTC.	x	-
gpio_[31:0]	I/O	-	External devices can use GPIO modules to generate interrupts to the Cortex-A9 MPU or Cortex-M3 MPU. There are six dedicated interrupt lines (for GPIO1 to GPIO6) to the Cortex-A9 MPU INTC and two dedicated interrupt lines (for GPIO1 and GPIO2) to the Cortex-M3 MPU INTC. Each GPIO module can generate a single interrupt whenever there is at least one event in any one of the configured 32 GPIO inputs. For more information about GPIO interrupt generation, see <a href="#">Chapter 25, General-Purpose Interface</a> .	x	x
gpio_[63:32]	I/O	-		x	x
gpio_[95:64]	I/O	-		x	-
gpio_[127:96]	I/O	-		x	-
gpio_[159:128]	I/O	-		x	-
gpio_[191:160]	I/O	-		x	-

<sup>(1)</sup> I = Input, O = Output

## 17.3 Interrupt Controller Integration

The Cortex-A9 MPU INTC is integrated inside the Cortex-A9 MPU core. For more information about Cortex-A9 MPU INTC integration, see [Chapter 4, Cortex-A9 MPU Subsystem Integration](#).

The Cortex-M3 MPU INTC is integrated inside each Cortex-M3 MPU core. For more information about Cortex-M3 MPU INTC integration, see [Chapter 7, Dual Cortex-M3 MPU Subsystem Integration](#).

### 17.3.1 Interrupt Mapping

**NOTE:** All device peripherals interrupts (external to the Cortex-A9 MPU, DSP, and Cortex-M3 MPU subsystems) are active-high, level-sensitive.

#### CAUTION

A single interrupt source can be physically mapped to multiple INTCs (Cortex-A9 MPU, DSP, and Cortex-M3 MPU subsystems). With multiple-mapped interrupts, it is strongly recommended to unmask each interrupt source in only one INTC at a time.

### 17.3.2 Interrupt Requests to Cortex-A9 MPU INTC

[Table 17-2](#) lists the Cortex-A9 MPU INTC interrupt mapping.

**Table 17-2. Cortex-A9 MPU INTC Interrupt Mapping**

Interrupt Line (Destination)	Interrupt Line (Source)	Module Name	Description
MA_IRQ_0	L2_CACHE_IRQ	CORTEXA9	L2 cache controller interrupt <sup>(1)</sup>

- (1) Internally generated within the Cortex-M3 MPU subsystem
- (2) Shared with DSP INTC
- (3) Shared with Cortex-A9 MPU INTC
- (4) Shared with DSP and Cortex-A9 MPU INTCs

---

**NOTE:** MM\_IRQ\_0 triggers exception 16 inside the Cortex-M3 core(s).

---

---

**NOTE:** All Cortex-M3 MPU subsystem internal interrupts are edge interrupts, except the one generated from the MMU (XLATE\_MMU\_FAULT), which is level interrupt.

---

## 17.4 Interrupt Controllers Functional Description

### 17.4.1 Cortex-A9 MPU INTC Functional Description

Cortex-A9 MPU INTC is configured to have the following interrupt sources:

- Sixteen interprocessor interrupts (IPI): ID[15:0]
- Two private timer/watchdog interrupts: ID[30:29]
- Two legacy nFIQ nIRQ: one per CPU, bypasses the interrupt distributor logic and drives interrupt requests directly into the CPU, if used in legacy mode (otherwise, treated like other interrupts lines with ID28 and ID31, respectively)
- 128 hardware interrupts: ID[159:32] (rising-edge or high-level sensitive). The interrupt mapping of these interrupts is provided in [Table 17-2, Interrupt Requests to Cortex-A9 MPU INTC](#).

#### CAUTION

Although the hardware interrupts can be configured to be rising-edge or high-level sensitive in the INTC, the device supports only active-high, level-sensitive configuration.

For more information about the functionality of the Cortex-A9 MPU INTC, see the *ARM Cortex-A9 MP Core Technical Reference Manual* (available at [infocenter.arm.com/help/index.jsp](http://infocenter.arm.com/help/index.jsp)).

### 17.4.2 Cortex-M3 MPU INTC Functional Description

The Cortex-M3 MPU INTC has the following configuration in the device:

- 64 hardware interrupts/16 levels of priority for each Cortex-M3 core. The interrupt mapping of these interrupts is provided in [Table 17-3, Interrupt Requests to Cortex-M3 MPU INTC](#).
- The calibration register, which is used to reload the SYSTICK timer to generate a fixed interval, is not supported in the Cortex-M3 core within the Cortex-M3 MPU subsystem. The TENMS field is not available due to the different frequencies during voltage scaling.
- The SYSRESETREQ reset feature is not supported at the Cortex-M3 processor level. Writing to this bit has no effect.

For more information about the functionality of the Cortex-M3 MPU INTC, see *ARM Cortex-M3 Technical Reference Manual* (available at [infocenter.arm.com/help/index.jsp](http://infocenter.arm.com/help/index.jsp)).

## 17.5 Interrupt Controllers Register Manual

### 17.5.1 Interrupt Controllers Instance Summary

For information about the Cortex-A9 MPU INTC and Cortex-M3 MPU INTC instances, see [Chapter 4](#), *Cortex-A9 MPU Subsystem* and [Chapter 7](#), *Dual Cortex-M3 Subsystem*.

### 17.5.2 Cortex-A9 MPU INTC Registers

For information about the Cortex-A9 MPU INTC registers and their description, see the *ARM Cortex-A9 MP Core Technical Reference Manual* (available at [infocenter.arm.com/help/index.jsp](http://infocenter.arm.com/help/index.jsp)).

### 17.5.3 Cortex-M3 MPU INTC Registers

For information about the Cortex-M3 MPU INTC registers and their description, see the *ARM Cortex-M3 Technical Reference Manual* (available at [infocenter.arm.com/help/index.jsp](http://infocenter.arm.com/help/index.jsp)).

## **Control Module**

---

---

---

This chapter describes the system control module for the device.

<b>Topic</b>	<b>Page</b>
<b>18.1 Control Module Overview .....</b>	<b>3701</b>
<b>18.2 Control Module Environment .....</b>	<b>3703</b>
<b>18.3 Control Module Integration .....</b>	<b>3703</b>
<b>18.4 Control Module Functional Description .....</b>	<b>3708</b>
<b>18.5 Control Module Programming Guide .....</b>	<b>3929</b>
<b>18.6 Control Module Register Manual .....</b>	<b>3938</b>

## 18.1 Control Module Overview

The control module allows software control of the various static modes supported by the device. It is composed of two control submodules: general control module and device (padconfiguration) control module.

The general control module has the following features:

- General status and control
- Hardware observability input/output (I/O) multiplexing
- Standard eFuse logic

The device control module provides the following features:

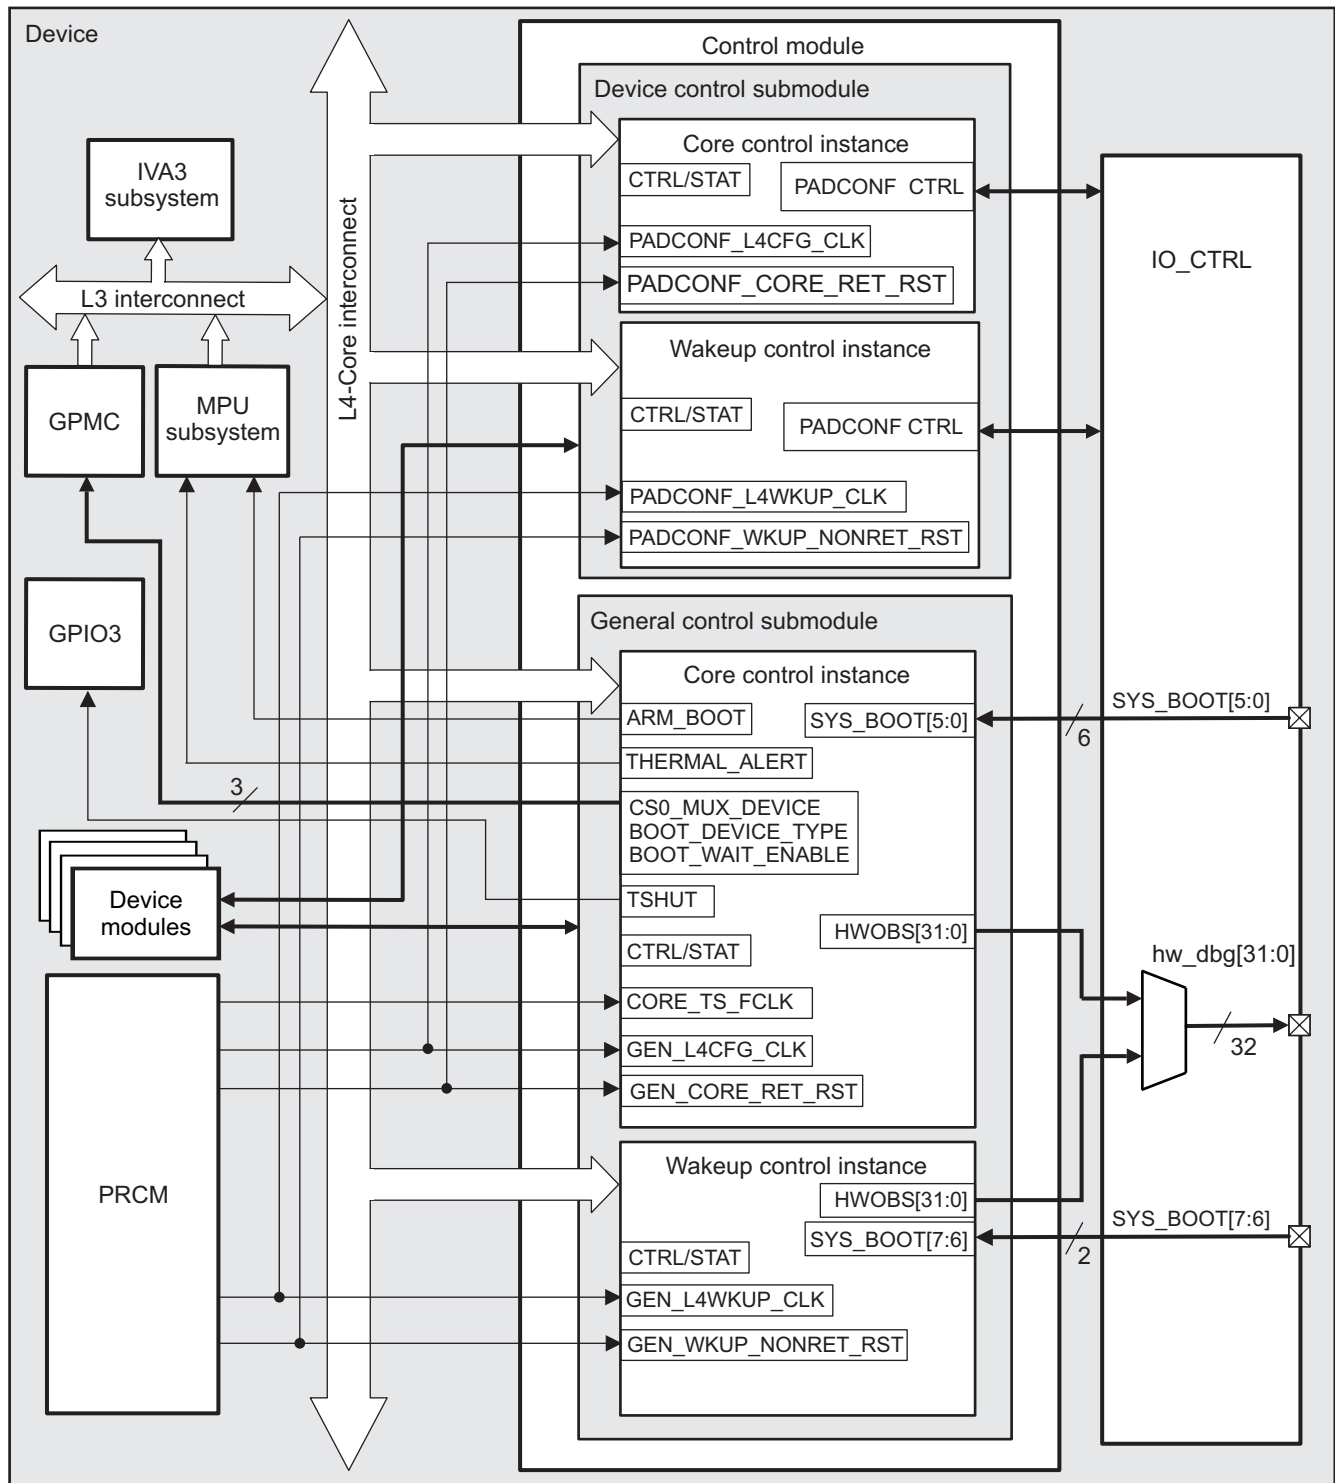

- Pad functional I/O multiplexing
- Pad pullup/down configuration
- Pad groups associated signal integrity controls
- Complex I/O configuration
- Analog function control
- Device-specific eFuse registers

Both control submodules are split into two instances: the control core instance within the CORE power domain, and the control wake-up instance within the WKUP power domain. For more information about the four different control module instances, see [Section 18.3, Control Module Integration](#).

[Figure 18-1](#) is an overview of the control module.

Figure 18-1. Control Module Overview

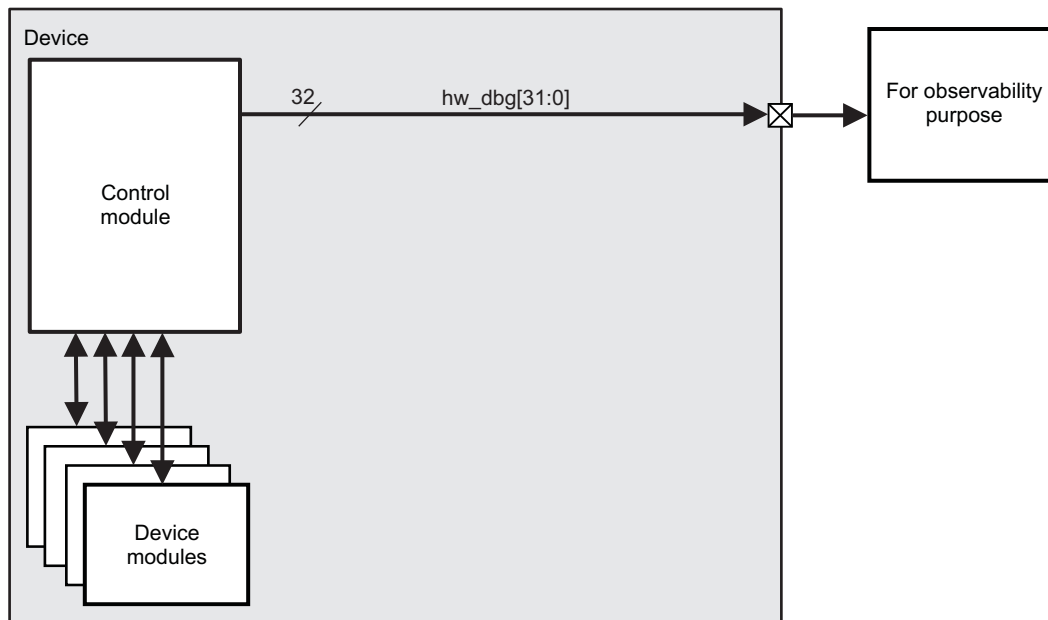

sysctrl-001

## 18.2 Control Module Environment

The control module controls the multiplexing of device internal module signals routed to the external pins (hw\_dbg[31:0]) for hardware debug purposes. For more information, see [Section 18.4.11, Hardware Observability](#), and [Section 18.4.8, PAD Functional Multiplexing and Configuration](#). Using the correct pad configuration, the control module maps these pins at the device boundary to observe the internal signals from the power, reset, and clock management (PRCM) module, direct memory access (DMA) requests, and interrupts. [Figure 18-2](#) is an overview of the control module environment.

**Figure 18-2. Control Module Environment**

sysctrl-002

### 18.2.1 Control Module Signals

[Table 18-1](#) lists the control module hardware observability outputs configured to observe the debug signals of the device module. It describes the module signals and specifies their links to functions.

**Table 18-1. Control Module I/O Description**

Signal	I/O <sup>(1)</sup>	Description	Reset Value <sup>(2)</sup>
hw_dbg[31:0]	O	Internal hardware observability signals 0 to 31	Hi-Z

<sup>(1)</sup> I = Input; O = Output

<sup>(2)</sup> Hi-Z = High impedance

### 18.3 Control Module Integration

The control module of the device is on the L4-Core interconnect. It consists of four module instances:

- General core control module (SYSCTRL\_GENERAL\_CORE)
- General wakeup control module (SYSCTRL\_GENERAL\_WKUP)
- Device core control module (SYSCTRL\_PADCONF\_CORE)
- Device wakeup control module (SYSCTRL\_PADCONF\_WKUP)

For more information about the different control module instances, see [Table 18-4](#).

Each of these four module instances has an associated register set and shares one functional clock and one reset signal with the PRCM module. The exception is general core control module (SYSCTRL\_GENERAL\_CORE) which also receives a secondary functional clock, CORE\_TS\_FCLK. [Table 18-2](#) describes the signals.

**Table 18-2. Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
SYSCTRL_GENERAL_WKUP	GEN_L4WKUP_CLK	WKUP_L4_ICLK2	PRCM	L4_WKUP interface/functional clock propagated to the general wakeup control module
SYSCTRL_GENERAL_CORE	GEN_L4CFG_CLK	CFG_L4_ICLK	PRCM	L4_CFG interface/functional clock propagated to the general core control module
	CORE_TS_FCLK	CORE_TS_FCLK	PRCM	Functional clock for the band gap state-machine instantiated in the general core control module
SYSCTRL_PADCONF_WKUP	PADCONF_L4WKUP_CLK	WKUP_L4_ICLK2	PRCM	L4_WKUP interface/functional clock propagated to the device wakeup control module
SYSCTRL_PADCONF_CORE	PADCONF_L4CFG_CLK	CFG_L4_ICLK	PRCM	L4_CFG interface/functional clock propagated to the device core control module
Resets				
SYSCTRL_GENERAL_WKUP	GEN_WKUP_NONRET_RST	WKUP_PWRON_RST	PRCM	Internal power-on reset (POR) affecting the general wakeup control module
SYSCTRL_GENERAL_CORE	GEN_CORE_RET_RST	CORE_PWRON_RET_RST	PRCM	Internal POR affecting the general core control module
SYSCTRL_PADCONF_WKUP	PADCONF_WKUP_NONRET_RST	WKUP_PWRON_RST	PRCM	Internal POR affecting the device wakeup control module
SYSCTRL_PADCONF_CORE	PADCONF_CORE_RET_RST	CORE_PWRON_RET_RST	PRCM	Internal POR affecting the device core control module

**Table 18-3. Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
SYSCTRL_GENERAL_CORE	THERMAL_ALERT	MA_IRQ_126	CORTEX-A9 INTC	Interrupt generated by general core control module to CORTEX™-A9

**NOTE:** For a description of the interrupt sources, see [Section 17.3.2, Interrupt Requests to the Cortex-A9 MPU Interrupt Controller](#).

The control module is reset by the internal POR, which is active low. The PRCM module provides a retention POR signal (CORE\_PWRON\_RET\_RST) duplicated to both of the core control module instances, and a nonretention POR signal (WKUP\_PWRON\_RST) duplicated to each of the two wake-up control module instances in the control module. For more information, see [Reset Domains](#), in [Chapter 3, Power, Reset, and Clock Management](#). The control module does not respond to a warm reset or to an L4-Core reset.

The main sequential logic within the system control module is accessible in a register file through the L4-Core interconnect. The PRCM module provides the CFG\_L4\_ICLK functional clock signal (L4\_CFG clock domain) separately to each of the two core control submodules. In addition, an instantiated inside the general core control, the band gap state-machine receives its functional clock (CORE\_TS\_FCLK) from the PRCM module. For more information about this signal, see [CM2 Clock Generator](#) in [Chapter 3, Power, Reset, and Clock Management](#).

The PRCM module also supplies the WKUP\_L4\_ICLK2 functional clock signal (L4\_WKUP clock domain) to each of the two wake-up control module instances. For more information about this signal, see , *PRM Clock Source* in [Chapter 3, Power, Reset, and Clock Management](#).

The PRCM module latches the sys\_boot[7:0] pad signals at POR and exports them as vector to the SYSBOOT[7:0] input of the general core control module. It is scanned in the [CONTROL\\_STATUS\[7:0\]](#) SYS\_BOOT bit field. For more information, see [Section 27.2.4.2, Booting Device Order Selection](#), and [Section 27.2.4.1, Clock Source Selection](#).

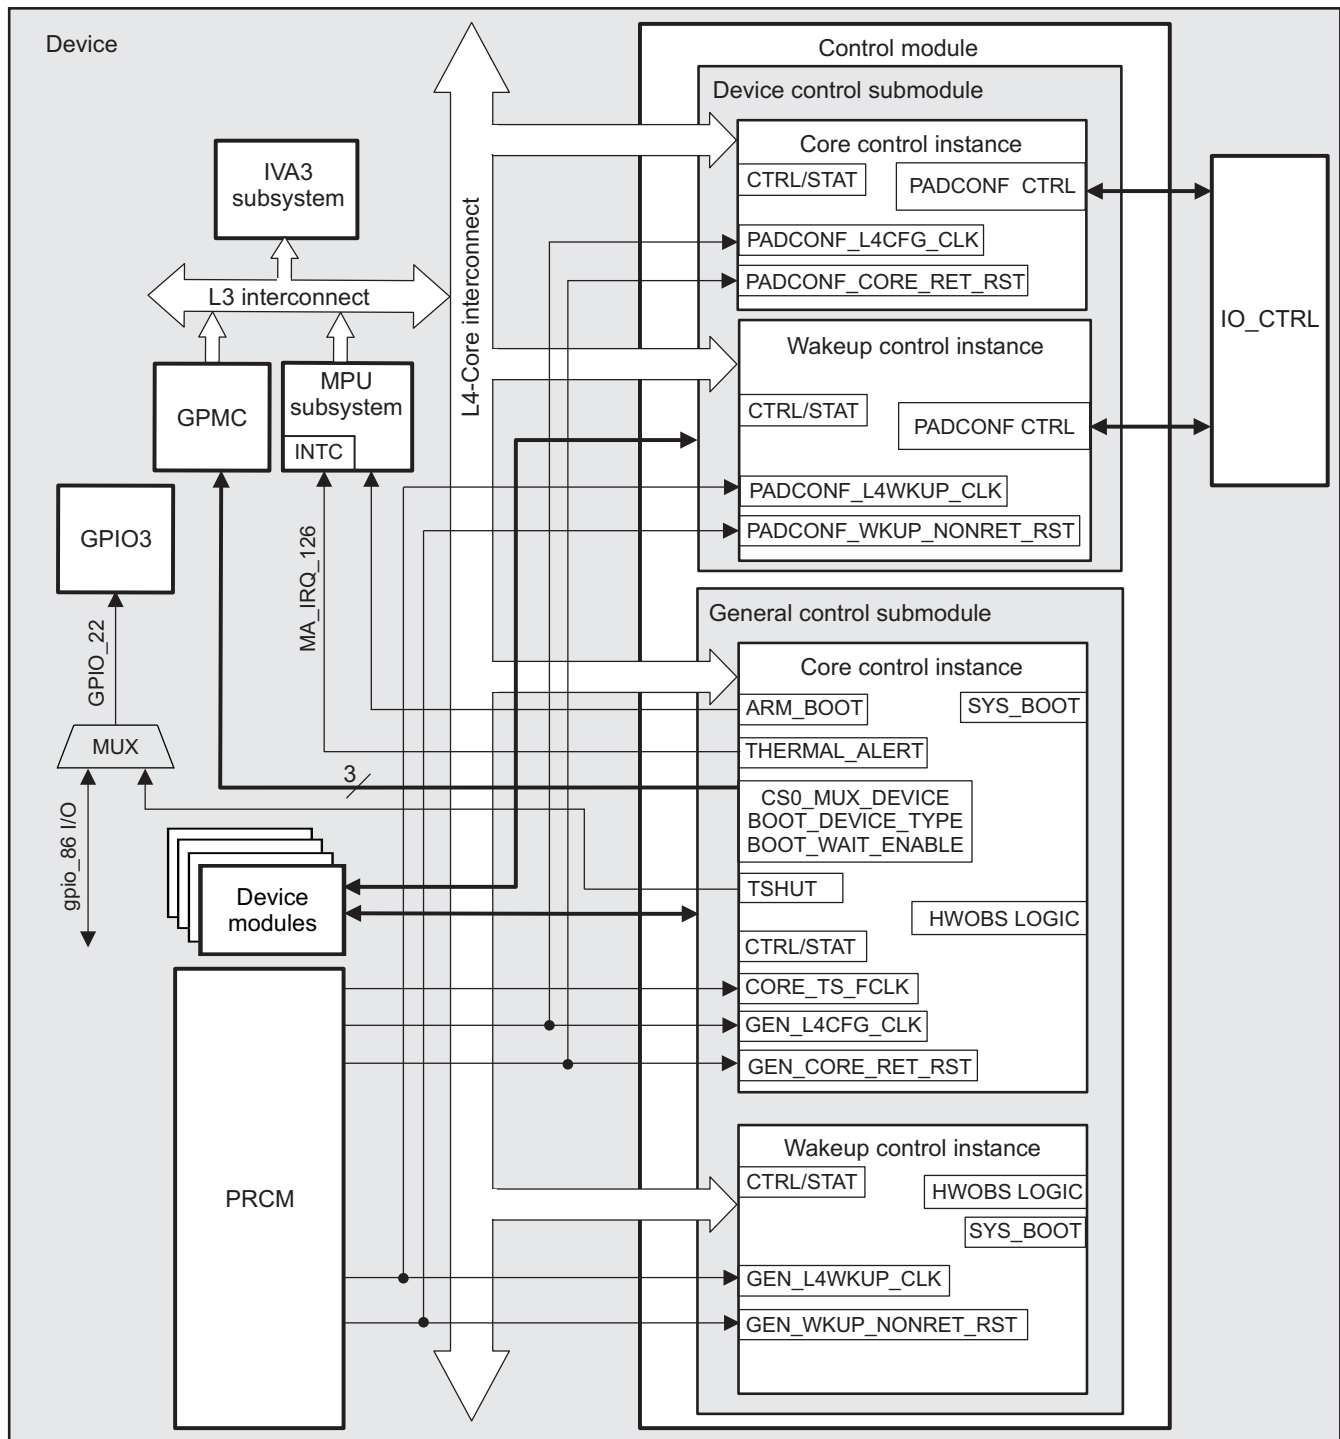

The thermal management subsystem inside the general core control module delivers one interrupt request (THERMAL\_ALERT) to line MA\_IRQ\_126 of the MPU subsystem interrupt controller (INTC) (Cortex-A9 INTC), and delivers a thermal protection output signal (TSHUT) to the GPIO3 instance. For more information about the functional outputs of the thermal management control module, see [Section 18.4.10](#).

The signal integration of the control module features:

- No IDLE hardware handshake
- No STANDBY hardware handshake
- No SAVE and RESTORE hardware handshake
- No wake-up request generation
- No DMA request generation
- One interrupt request (IRQ) – THERMAL\_ALERT to the MPU subsystem
- A thermal shutdown protection signal (TSHUT) delivered to a GPIO3 input.
- Three functional clocks: two clocks in the CFG and one in the WKUP clock domains
- One retention and one nonretention internal power-on-based resets

[Figure 18-3](#) shows the integration of the module in the device.

Figure 18-3. Control Module Integration

sysctrl-003

Table 18-4 lists the integration attributes.

Table 18-4. Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
SYSCTRL_GENERAL_WKUP	PD_WKUP	L4_WKUP

**Table 18-4. Integration Attributes (continued)**

SYSCTRL_GENERAL_CORE	PD_CORE	L4_CFG
SYSCTRL_PADCONF_WKUP	PD_WKUP	L4_WKUP
SYSCTRL_PADCONF_CORE	PD_CORE	L4_CFG

Software sets the configuration registers to the desired values depending on the configuration of the requested device. Static device configuration registers can be set by software any time and are effective immediately.

## 18.4 Control Module Functional Description

### 18.4.1 Control Module Block Diagram

The control module controls the settings of various device modules through the register configuration and internal signals. It also controls the pad configuration, pin functional multiplexing, and the routing of internal signals (such as PRCM signals or DMA requests) to output pins configured for hardware observability.

[Figure 18-4](#) is the control module block diagram.

Figure 18-4. Control Module Block Diagram

The control submodules primarily implement a bank of registers accessible (read/write) by software and some read-only registers that provide status information.

The read/write registers in the general control module can be divided into the following classes:

- Hardware observability registers (32-bit read/write registers)

- Status and configuration registers
- Boot registers
- eFuse ROM registers
- Miscellaneous functional registers

The read/write registers in the device(padconfiguration) control module can be divided into the following classes:

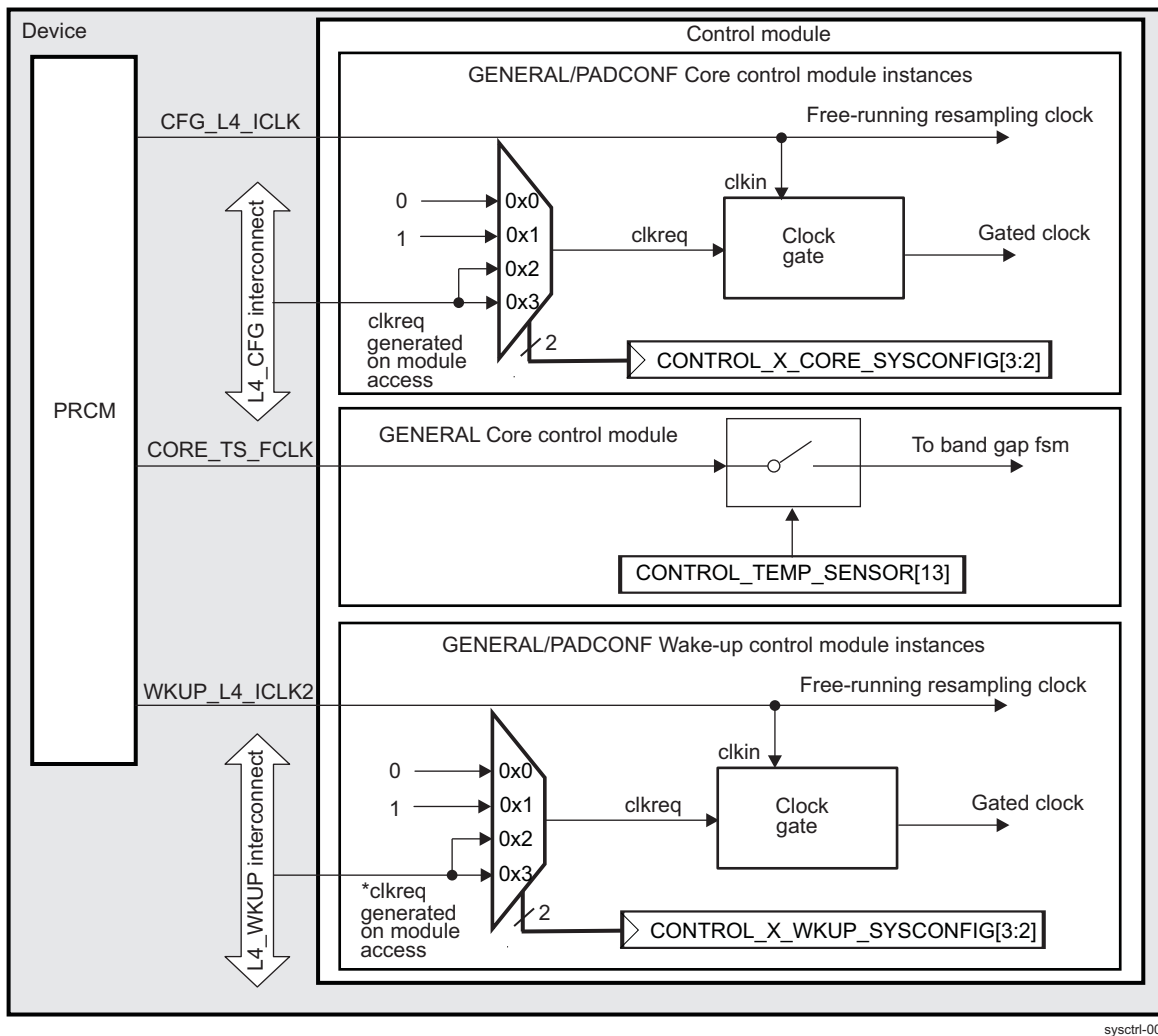

- Pad configuration registers (32-bit registers, one register for two pads)
- Pad groups (not individual per pad) associated registers for signal integrity parameters control (32-bit read/write registers)
- I/O cells associated specific control registers
- Device-specific status and configuration registers
- Miscellaneous functional registers

### 18.4.2 Control Module Clock Configuration

[Figure 18-5](#) shows the distribution schema of the control module internal clock . Each CFG\_L4\_ICLK and WKUP\_L4\_ICLK2 source clock is internally distributed into two clock paths: the first path directly mirrors the source clock and is an always-running clock. It is used to synchronize and resample some of the module inputs. The other clock path can be internally gated within the module.

The CORE\_TS\_FCLK clock, which drives the general core control band gap state-machine, can also be locally gated through a dedicated bit in the [CONTROL\\_TEMP\\_SENSOR](#) register. For more information about the temperature module off mode, see [Section 18.4.10, Band Gap Voltage and Temperature Sensor](#).

Figure 18-5. Control Module Internal Clock Paths

The clock-gating strategy for L4 clocks is selected through the CONTROL\_SYSCONFIG[3:2] IP\_SYSCONFIG\_IDLEMODE bit field available in each of the four control module instances. Table 18-5 describes the different possibilities for clock management. There are no PRCM software controls for the CFG\_L4\_ICLK and WKUP\_L4\_ICLK2 clocks in the control module. There are, however, clock activity status bits in the PRCM module.

The CORE\_TS\_FCLK has the following software controls: enable, status, and divider ratio, in the PRCM module. See , Clock Domain Modes, and , CD\_WKUP Clock Domain , in Chapter 3, Power, Reset, and Clock Management.

Table 18-5. Internal Clock Gating Options

Feature	CONTROL_SYSCONFIG[3:2] IP_SYSCONFIG_IDLEMODE Value	Description
Local clock control	0b00	Clock is manually gated.
Local clock control	0b01	Clock is manually enabled.
Local clock autogating	0b10, 0b11	Clock is automatically gated when there is no access to the control module through the L4-interconnect.

### 18.4.3 Control Module Software Reset

The control module is not sensitive to software reset.

### 18.4.4 Control Module Power Management

#### 18.4.4.1 Retention

The general core module and device core control module instances are fully built with retention flip-flops (RFFs) and are powered in the CORE power domain; thus, they can be in active or retention mode. The core instances lose their content when the CORE power domain is in off mode. In contrast to the core control instances, the control wake-up instances are always powered and active. For more information about the device low-power states, see, *Device Low-Power States*, in [Chapter 3, Power, Reset, and Clock Management](#).

#### 18.4.4.2 Power Management Protocols

The control module, which is slave on the L4 interconnect, does not support standby or idle mode protocols.

#### 18.4.4.3 Save-and-Restore Mechanism

The control core module instances lose their contents when the CORE power domain is in off mode. To prevent this, before going to off mode, the core register context is copied by software into a dedicated SAR\_RAM in the WKUP voltage domain. The save-and-restore (SAR) mechanism, controlled by the PRCM module, allows restoring registers to the value present before going to off mode. Thus, core domain registers have a correct configuration/state immediately after the core power is on again without requesting a software operation to reconfigure them.

Because the SAR mechanism is managed by software-accessible registers, no hardware-specific requirements exist. For more information about SAR, see, *Device Off State Management*, in [Chapter 3, Power, Reset, and Clock Management](#).

### 18.4.5 Hardware Requests

The control module does not generate DMA or wake-up requests. The general core control module generates one IRQ (THERMAL\_ALERT) to the Cortex-A9 INTC (MA\_IRQ\_126 line). For more information, see [Section 17.3.2, Interrupt Requests to the Cortex-A9 MPU Interrupt Controller](#).

### 18.4.6 Control Module Initialization

The control module responds only to the internal POR and device type. At power-on, reset values for the registers define the *safe state* for the device. In the initialization mode, only modules to be used at boot time are associated with the pads. Other module inputs are internally tied and outputs pads are turned off. After POR, software must set the pad functional multiplexing and configuration registers to the desired values according to the requested device configuration. For more information, see [Chapter 27, Initialization](#).

General-purpose (GP) devices include features that are inaccessible or unavailable. These inaccessible registers define the default or fixed device configuration or behavior.

The `CONTROL_STATUS[7:0]` SYS\_BOOT boot field reflects the state of the sys\_boot pins captured at POR in the PRCM module.

## 18.4.7 General Control Module Instances

### 18.4.7.1 General Core Control Module Instance

The SYSCTRL\_GENERAL\_CORE instance contains most of the control logic that provides the hardware observability features for different digital phase-locked loop (DPLL) clockout and DPLL-specific signals, DMA requests, IRQs, and other internal hardware signals. The general core control provides the system boot decoding logic and has control over the standard eFuse settings. The system configuration registers, specific function controls, and some peripheral control and status registers are also mapped there.

The register sets available within the SYSCTRL\_GENERAL\_CORE are:

- Observability control registers:
  - [CONTROL\\_HWOBS\\_CONTROL](#)
  - [CONTROL\\_DEBOBS\\_FINAL\\_MUX\\_SEL](#)
  - [CONTROL\\_CONF\\_SDMA\\_REQ\\_SELx](#)
  - [CONTROL\\_CONF\\_CLK\\_SELx](#) (where x = 0 to 2)
  - [CONTROL\\_CONF\\_DPLL\\_X\\_SEL](#) ( where X = FREQLOCK, TINITZ, PHASELOCK, TENABLE, TENABLEDIV, BYPASSACK, IDLE)
- Part of the debug view channel selection registers: [CONTROL\\_CORE\\_CONF\\_DEBUG\\_SEL\\_TST\\_X](#)
- MMU address translation-related registers: [CONTROL\\_CORTEX\\_M3\\_MMUADDRTRANSLTR](#) and [CONTROL\\_CORTEX\\_M3\\_MMUADDRLOGICTR](#)
- Standard fuse registers: [CONTROL\\_STD\\_FUSE\\_X](#)
- Clock gating configuration register: [CONTROL\\_GEN\\_CORE\\_SYSCONFIG](#)
- Control status register: [CONTROL\\_STATUS](#)
- Peripheral control registers:
  - [CONTROL\\_TEMP\\_SENSOR](#)
  - [CONTROL\\_BANDGAP\\_CTRL](#)
  - [CONTROL\\_BANDGAP\\_COUNTER](#)
  - [CONTROL\\_BANDGAP\\_THRESHOLD](#)
  - [CONTROL\\_TSHUT\\_THRESHOLD](#)
  - [CONTROL\\_BANDGAP\\_STATUS](#)
  - [CONTROL\\_DSS\\_CONTROL](#)
  - [CONTROL\\_USBOTGHS\\_CONTROL](#)
  - [CONTROL\\_LDOSRAM\\_MPU\\_VOLTAGE\\_CTRL](#)
  - Etc.

### 18.4.7.2 General Wakeup Control Module Instance

The registers associated with this module are:

- Clock gating configuration register: [CONTROL\\_GEN\\_WKUP\\_SYSCONFIG](#)
- Register with spare bits: [CONTROL\\_OCPREG\\_SPARE](#)
- Part of the debug view channel selection registers: [CONTROL\\_WKUP\\_CONF\\_DEBUG\\_SEL\\_TST\\_X](#)

### 18.4.7.3 Device Core Control Module Instance

The SYSCTRL\_PADCONF\_CORE instance provides the device-specific pad control features, such as pullup/down I/O configuration and pad functional multiplexing. Wake-up control/status features are also subjects of the device core control.

The registers associated with this module are:

- Clock gating configuration register: [CONTROL\\_PADCONF\\_CORE\\_SYSCONFIG](#)
- Different peripheral pad mode configuration and wake-up status/configuration registers:

- CONTROL\_CORE\_PAD0\_X\_PAD1\_Y
- CONTROL\_PADCONF\_WAKEUPEVENTx
- [CONTROL\\_PADCONF\\_GLOBAL](#)
- CONTROL\_SMARTxIO
- And so on.
- Peripheral pad voltage-level control register: CONTROL\_PADCONF\_MODE
- Miscellaneous controls for different device interface modules: CONTROL\_X registers, such as the [CONTROL\\_MMC1](#) register (including the CONTROL\_EFUSE registers)

#### 18.4.7.4 Device Wake-Up Control Module Instance

Configuration registers for all pads linked to the wake-up voltage domain are in the WKUP device control module. The registers instantiated are:

- Clock gating configuration register: [CONTROL\\_PADCONF\\_WKUP\\_SYSCONFIG](#)
- CONTROL\_WKUP\_PAD0\_X\_PAD1\_Y registers for configuring FREF clock oscillator pads, reset signals, and power mode pad configurations

---

**NOTE:** SYSCTRL\_PADCONF\_X alias notifies a device control module instance.

---

[Table 18-122](#) shows the memory size and base addresses assigned to the different control module instances

### 18.4.8 Pad Functional Multiplexing and Configuration

After POR, software must set the pad functional multiplexing and configuration registers to the desired values according to the requested device configuration. The configuration is controlled by pads or a group of pads. Each configurable pin has its own configuration register for pullup/down control and for assignment to a given module.

Two sets of 32-bit registers provide the pad functional multiplexing and configuration feature of the control module. The first set of registers (CONTROL\_CORE\_PAD0\_X\_PAD1\_Y) configures the pads in the CORE power domain. The second set of registers (CONTROL\_WKUP\_PAD0\_X\_PAD1\_Y) configures the pads in the WKUP power domain.

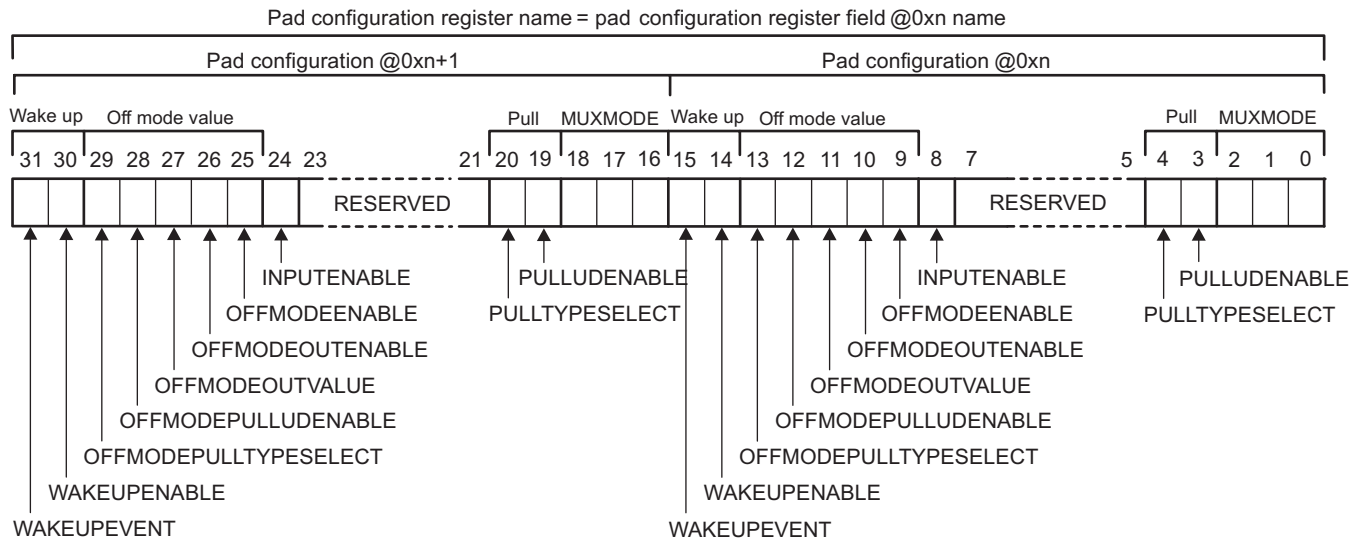

The pad configuration as defined in this module is used in the IO\_CTRL logic along with the gating and protection features. The gating feature is implemented for the output pads. The protection feature is implemented for input lines. These features implement additional control and multiplexing capabilities hard-wired in the IO\_CTRL logic and driven by the state and/or logic of the internal device.

The gating feature allows forcing an output pad to a fixed value (Z, pullup, pulldown, 1, 0) or to a given internal signal. Each gating command is defined with a logic equation and the output state or value to be set on the pad when the logic equation is "True."

The protection feature provides control on each input line of the control module when no pad is assigned to this input (protected value). When POR is released, the value on the pad is driven by the default configuration of the control module. This configuration is usually aligned with the default value selected on the I/O cell. The protected value can be logical level (0 or 1) or a signal from a pad; it is selected when none of the pad\_x.MuxMod selects a device input.

Each 32-bit pad configuration register controls two pads: the first pad is controlled by the 16 least-significant bits (LSBs), and the second pad is controlled by the 16 most-significant bits (MSBs); thus, one pad configuration register provides control for two different pins. After POR, software sets the pad functional multiplexing and configuration registers to the requested device pad configurations. Data written in these registers directly commands the multiplexing of the pad configuration logic. [Figure 18-6](#) shows the 16-bit-wide pad configuration register field associated with each pin.

**Figure 18-6. Pad Configuration Register Functionality**

sysctrl-007

**NOTE:** These registers can be accessed using 8-, 16-, and 32-bit operations.

The functional bits of a pad configuration register field are divided into the following five fields:

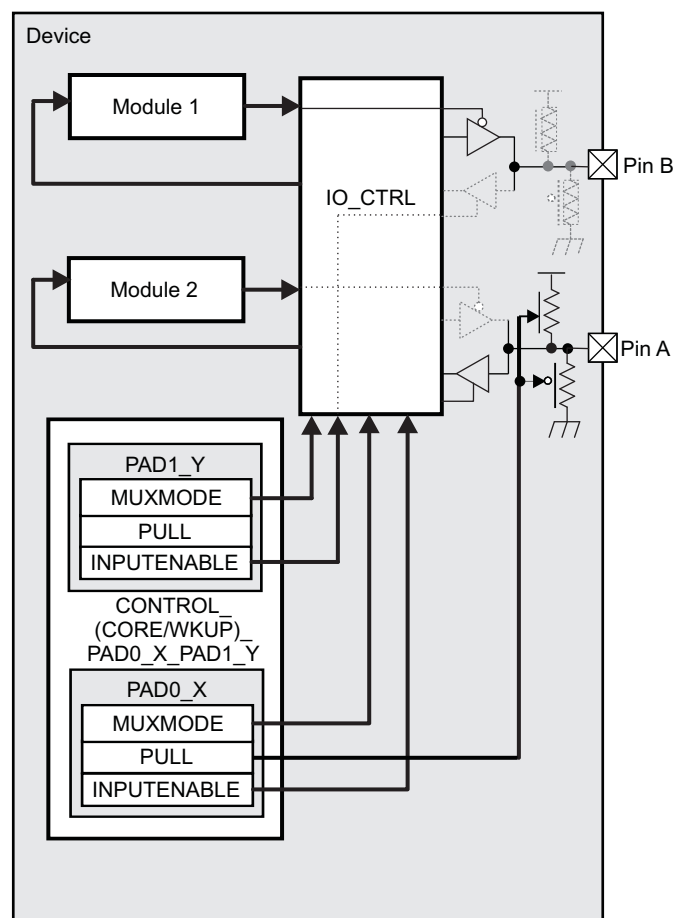

- MUXMODE (3 bits) defines the multiplexing mode applied to the pin. A mode corresponds to the selection of the function mapped on the pin with seven (0 to 6) possible functional modes for each pin.
- PULL (2 bits) for combinational pullup/down configuration:
  - PULLTYPESELECT: Pullup/down type selection for the pin
  - PULLUDENENABLE: Enables pullup/down feature for the pin
- INPUTENABLE (1 bit) drives an input enable signal to the I/O CTRL.
  - INPUTENABLE = 0: Input disable. Pin is configured only in output mode.
  - INPUTENABLE = 1: Input enable. Pin is configured in bidirectional mode.
- Off mode values (1 bit) override the pin state when the OFFMODEENABLE bit in CONTROL\_CORE\_PAD0\_X\_PAD1\_Y is set and off mode is active. This feature allows having separate configurations (5 bits) for the pins when in off mode:
  - OFFMODEENABLE: Off mode pin state override control. Set to 1 to enable the feature and set to 0 to disable it.
  - OFFMODEOUTENABLE: Off mode output enable value. Set to 0 to enable the feature and set to 1 to disable it.
  - OFFMODEOUTVALUE: Off mode output value.
  - OFFMODEPULLUDENENABLE: Off mode pullup/down feature enable
  - OFFMODEPULLTYPESELECT: Off mode pullup/down type selection
- Wake-up bits (2 bits):
  - WAKEUPENABLE: Enable wake-up detection on input. It is also the off mode input enable value.
  - WAKEUPEVENT: Wake-up event status for the pin

**CAUTION**

The OFFOUTENABLE and OFFOUTVALUE bits are functional only if the pad configuration supports output mode on at least one MUXMODE. For a pad that supports only the input feature, the OFFOUTENABLE and OFFOUTVALUE bits cannot be configured (they are don't care and read always returns 0).

**NOTE:** Because off-mode affects pads only in the CORE power domain, OFFMODE-related bits are not present in the pad configuration registers of the WKUP power domain .

Figure 18-7 shows the pad configuration functionality when off mode is inactive. For more information about off mode, see [Section 18.4.8.4, Off Mode PAD Control Overview](#).

**Figure 18-7. Pad Configuration Diagram**

sysctrl-008

The I/O pads are controlled by software by:

- Writing to the CONTROL\_(CORE/WKUP)\_PAD0\_X\_PAD1\_Y registers in the device control module for I/O and pullup/down configuration
- Writing to the GPIOi.GPIO\_OE registers in the GPIO module for I/O configuration

For more information about how to configure the I/O pads, see [Section 18.5.1.2.5, Pad Configuration Programming Points](#).

For more information about the GPIO module, see [Section 25.4.8, General-Purpose Interface Data Input/Output Capabilities](#).

**NOTE:** For the proper functioning of the following modules, the INPUTENABLE bit in the corresponding pad configuration register must be set to 1 for pads configured to drive output clocks:

- GPMC
- I2Ci
- MMCi
- HSUSB HOST
- McPDM

**NOTE:** For a correct configuration of each pin direction (input, output, bidirectional), the CONTROL\_(CORE/WKUP)\_PAD0\_X\_PAD1\_Y and GPIOi.GPIO\_OE registers must be written.

**NOTE:** Software INPUTENABLE controls are not available for the Ipddr21\_x, Ipddr22\_x, usbb1\_hsic\_x, and usbb2\_hsic\_x pads. Once their buffers are enabled they are always bidirectional. For more information, see [Section 18.4.12.9.2, High-Speed I/O Buffers With Impedance, Slew Rate, and Weak Driver Settings](#).

[Table 18-6](#) lists the bit directions of the CONTROL\_(CORE/WKUP)\_PAD0\_X\_PAD1\_Y registers.

**Table 18-6. Bit Meanings for CONTROL\_(CORE/WKUP)\_PAD0\_X\_PAD1\_Y Registers**

Pad Configuration Bit	Bit Meaning	
	0	1
PULLUDENABLE	Not activated	Activated
PULLTYPESELECT	Pulldown	Pullup
INPUTENABLE	Input enable signal is inactive.	Input enable signal is active.
OFFMODEENABLE	Off mode values are invalid.	Off mode values are valid.
OFFMODEOUTENABLE	Output	Input
OFFMODEOUTVALUE	Low	High
OFFMODEPULLUDENABLE	Not activated	Activated
OFFMODEPULLTYPESELECT	Pulldown	Pullup
WAKEUPENABLE	Disable I/O wake-up function.	Enable I/O wake-up function.
WAKEUPEVENT	Wake-up event is not detected.	Wake-up event is detected.
MUXMODE bits	See <a href="#">Table 18-7, Mode Selection</a> .	See <a href="#">Table 18-7, Mode Selection</a> .

### 18.4.8.1 Mode Selection

[Table 18-7](#) lists the multiplexing modes and settings.

**Table 18-7. Mode Selection**

MUXMODE	Selected Mode
0b000	Primary mode = Mode 0
0b001	Mode 1
0b010	Mode 2
0b011	Mode 3
0b100	Mode 4
0b101	Mode 5
0b110	Mode 6
0b111	Safe mode = Mode 7

The MUXMODE field in the CONTROL\_CORE\_PAD0\_X\_PAD1\_Y and CONTROL\_WKUP\_PAD0\_X\_PAD1\_Y registers defines the multiplexing mode applied to the pad. Modes are referred to by their decimal (from 0 to 7) or binary (from 0b000 to 0b111) representation. Functional modes are defined from 0b000 to 0b110; mode 0b111 is referred to as the safe mode.

For most pads, the reset value for the MUXMODE field in the CONTROL\_CORE\_PAD0\_X\_PAD1\_Y and CONTROL\_WKUP\_PAD0\_X\_PAD1\_Y registers is 0b111. The exceptions are pads to be used at boot time to transfer data from selected peripherals to the external flash memory.

Mode 0 is the primary mode. When mode 0 is set, the function mapped to the pin corresponds to the name of the pin.

Modes 1–6 are possible modes for alternate functions. On each pin, some modes are used effectively for alternate functions, while other modes are unused and correspond to no functional configuration.

Safe mode (Mode 7) avoids any risk of electrical contention by configuring the pin as an input with no functional interface mapped to it. Safe mode is used mainly as the default mode for all pins containing no mandatory interface at the release of POR.

---

**NOTE:** When a pad is set into a mux mode that is not defined by pin multiplexing, the pad is actually set undriven (Hi-Z) with potential pullup/down.

---

For more information about the configurable mode on each pin, see [Table 18-10](#) and [Table 18-9](#).

---

**NOTE:** Pad names are signal names available in mode 0.

---

### 18.4.8.2 Pull Selection

There is no automatic gating control to ensure that internal weak pulldown/pullup resistors on a pad are disconnected whenever pad is configured as output. If a pad is always configured in output mode, it is recommended for user software to disable any internal pull resistor tied to it, to avoid unnecessary consumption.

**Table 18-8. Pull Selection**

PULL		Pin Behavior
PULLTYPESELECT	PULLUDENABLE	
0b0	0b0	Pulldown selected but not activated
0b0	0b1	Pulldown selected and activated
0b1	0b0	Pullup selected but not activated
0b1	0b1	Pullup selected and activated

For more information about the pull available on each pin, see [Table 18-10](#) and [Table 18-9](#).

---

**NOTE:** Software controls for internal active mode pullups and pulldowns on the lpddr21\_x and lpddr22\_x pads are available in the [CONTROL\\_LPDDR2IO1\\_0](#) through [CONTROL\\_LPDDR2IO1\\_2](#) and [CONTROL\\_LPDDR2IO2\\_0](#) through [CONTROL\\_LPDDR2IO2\\_2](#) registers, respectively.

Software controls for internal active mode pullups and pulldowns on the usbb1\_hsic\_x and usbb2\_hsic\_x pads are available in the [CONTROL\\_USBB\\_HSIC](#) register.

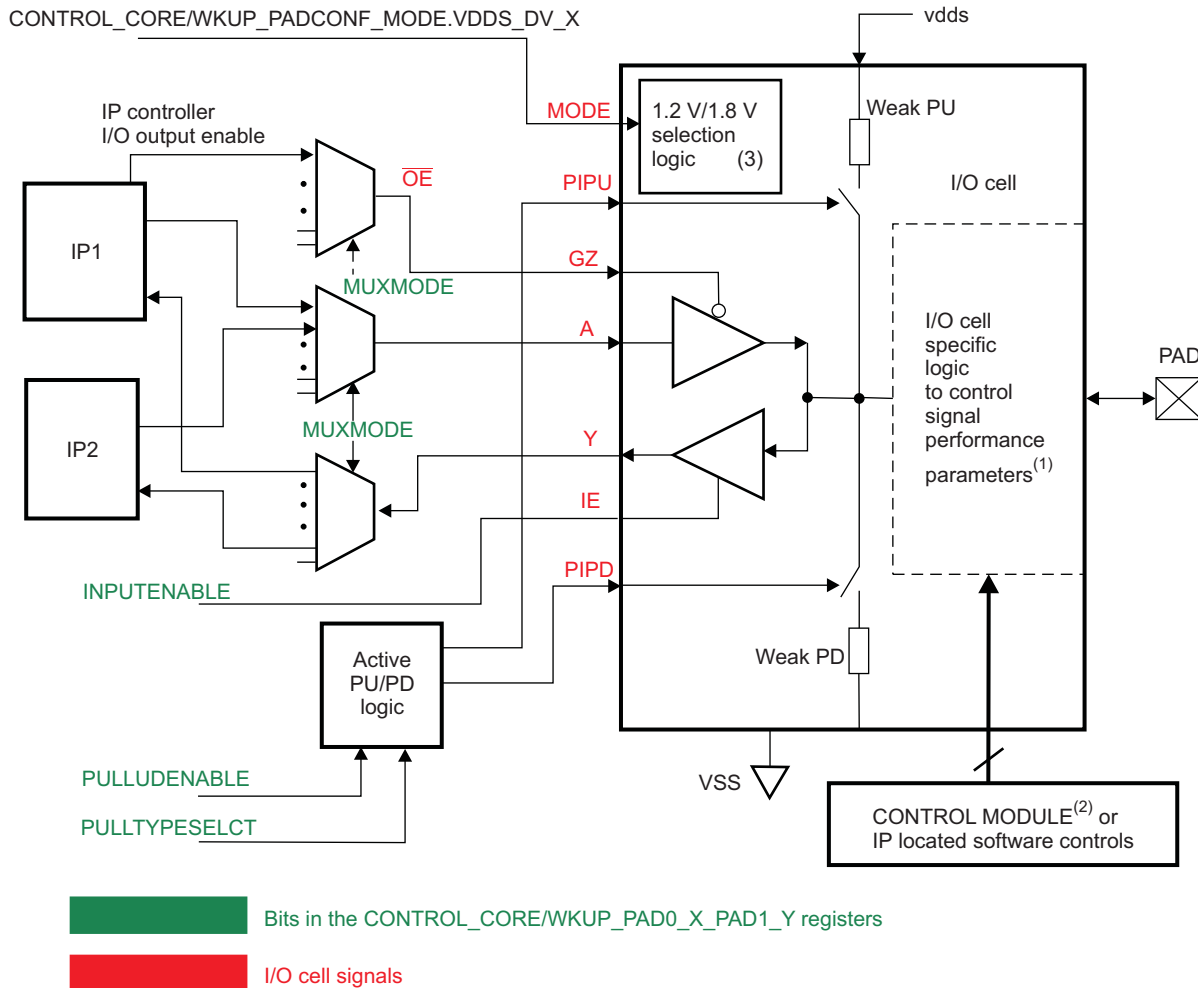

For more information, see [Section 18.4.12.9.2, High-Speed I/O Buffers With Impedance, Slew Rate, and Weak Driver Settings](#).

---

#### 18.4.8.2.1 Generic Pad Configuration Bit Fields vs I/O Cell Mapping

[Figure 18-8](#) provides a generic view of the relations between the pad configuration controls and I/O cell functions for a pad configured in active mode.

Figure 18-8. Active Mode Pad Configuration Bit Fields vs I/O Cell Mapping

sysctrl-028

- (1) [Section 18.4.12.9, Signal Integrity Parameter Control Registers With Pad Group Assignment](#), summarizes the I/O cell signal performance settings. For more information about the controlled I/O cell electrical parameters and interdependency considerations, see the device data manual.
- (2) For information about the mapping of software controls in the control module versus different device pads, see [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#). For more information about interface-specific signal parameter settings, see the device data manual.
- (3) The CONTROL\_CORE/WKUP\_PADCONF\_MODE.VDDS\_DV\_x bit is available for each I/O that is part of the dual-voltage domain group x. For more information about 1.2-V/1.8-V dual-voltage domain I/Os, see the device data manual. For more information about peripheral dual-voltage software controls versus pad group mapping, see [Section 18.4.12.10, Dual-Voltage-Supplied Peripheral Controls](#).

**NOTE:** Dynamic switching between 1.2-V and 1.8-V voltage modes on dual-voltage peripheral I/Os is not allowed.

### 18.4.8.3 Pad Multiplexing Register Fields

Table 18-10 and Table 18-9 provide for each pad configuration register field the address offset and associated signal name for each multiplexing mode (as set by the MUXMODE bit field). Mode 0 is always defined. Modes with no signal name are undefined for the given pad. For more information about default padconfiguration settings (POR values) for pads in the CORE power domain, see [Section 18.6.7, SYSCTRL\\_PADCONF\\_CORE Register Description](#); for pads in the WKUP power domain, see [Section 18.6.9, SYSCTRL\\_PADCONF\\_WKUP Register Description](#).

**NOTE:**

- [Table 18-9](#) lists the pad configuration registers instantiated in the WKUP power domain that drive the pads in the WKUP power domain. [Table 18-10](#) lists the pad configuration registers instantiated in the CORE power domain that drive the pads in the CORE power domain.
  - In [Table 18-10](#) and [Table 18-9](#), an empty cell indicates that the mode or pull is not available for this pin.
-

**Table 18-9. Device Wake-Up Control Module Pad Configuration Register Fields**

SYSCTRL_PADCONF_WKUP.[Register name]	Address Offset	Mode 0 <sup>(1)</sup>	Mode 1	Mode 2	Mode 3	Mode 4	Mode 5	Mode 6	Mode 7

<sup>(1)</sup> For the pad configuration registers in which the multiplexing set has only one signal (available in muxmode 0), the MUXMODE bit field is NOT implemented, and is described as RESERVED. Software must keep this bit field at its default (power-on reset) value.

<sup>(2)</sup> This pad is built on an I/O cell of the extended-drain type, which can be configured to operate within the 1.8-V (standard) or 3.0-V (high) I/O power supply voltage range. A PBIAS cell, which acts as a level shifter, is connected to the extended-drain I/O cell of this pad to appropriately bias its voltage according to the externally applied I/O power supply voltage. To ensure I/O safe operation at 1.8 V or 3.0 V and desired signal performance, the extended-drain I/O cell and its corresponding PBIAS cell must be appropriately configured by software prior to signal selection on the pad, regardless of the signal multiplexing mode. For more details on extended-drain I/O cell and PBIAS cell descriptions and settings, see [Section 18.4.9, Extended-Drain I/O and PBIAS Cell](#), and [Section 18.5.1.2.2, Extended-Drain I/Os and PBIAS Cells Programming Guide](#).

<sup>(2)</sup> This pad is built on an I/O cell of the extended-drain type, which can be configured to operate within the 1.8-V (standard) or 3.0-V (high) I/O power supply voltage range. A PBIAS cell, which acts as a level shifter, is connected to the extended-drain I/O cell of this pad to appropriately bias its voltage according to the externally applied I/O power supply voltage. To ensure I/O safe operation at 1.8 V or 3.0 V and desired signal performance, the extended-drain I/O cell and its corresponding PBIAS cell must be appropriately configured by software prior to signal selection on the pad, regardless of the signal multiplexing mode. For more details on extended-drain I/O cell and PBIAS cell descriptions and settings, see [Section 18.4.9, Extended-Drain I/O and PBIAS Cell](#), and [Section 18.5.1.2.2, Extended-Drain I/Os and PBIAS Cells Programming Guide](#).

### 18.4.8.4 Off Mode Pad Control Overview

When off mode is selected, which is true when `PRM_DEVICE_OFF_CTRL[0] DEVICE_OFF_ENABLE` from the PRCM module = 0b1 or `CONTROL_PADCONF_GLOBAL[31] FORCE_OFFMODE_ENABLE = 0b1` (force bit to test the value of off mode), the off mode values field `CONTROL_CORE_PAD0_X_PAD1_Y[27,11] OFFMODEOUTVALUE` overrides the pad state when the `CONTROL_CORE_PAD0_X_PAD1_Y[25,9] OFFMODEENABLE` bit is set.

The `CONTROL_CORE_PAD0_X_PAD1_Y[26,10] OFFMODEOUTENABLE` bit is active low.

Figure 18-9 shows the off mode pad control.

Figure 18-9. Off Mode Pad Control Overview

If off mode is active and the `OFFMODEENABLE` bit field is set to 0 (disable the off mode override feature), the pad keeps the AND value of the configuration (input/output, pullup/down) it had before going into off mode:

- For an input, the pad is isolated and the pull remains active.
- For an output, the value is latched before going into off mode, to drive the same value in off mode.

**NOTE:** Software controls for internal off-mode pullups and pulldowns on the `usbb1_hsic_x` and `usbb2_hsic_x` pads are available in the `CONTROL_USB_B_HSIC` register.

No internal off-mode pullups and pulldowns are available for the `lpddr21_x` and `lpddr22_x` pads of the device.

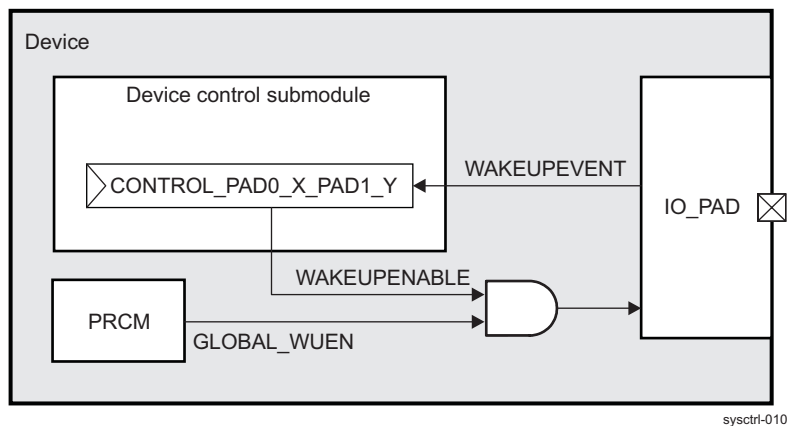

For more information, see [Section 18.4.12.9.2, High-Speed I/O Buffers With Impedance, Slew Rate, and Weak Driver Settings](#).

#### 18.4.8.4.1 Wake-Up Event Detection

In off mode, wake-up event detection can also be enabled on an input pad. The pad wake-up event is latched in the `CONTROL_CORE_PAD0_X_PAD1_Y[31,15]` and `CONTROL_WKUP_PAD0_X_PAD1_Y[31,15] WAKEUPEVENT` bits.

The off mode I/O pads wake-up scheme is enabled by setting the PRM\_IO\_PMCTRL[16] GLOBAL\_WUEN bit from the PRCM module. The wake-up scheme status is transmitted by the WKUP\_ENABLE signal. The wake-up event detection capability of each I/O pad of the device is individually enabled or disabled by writing the CONTROL\_CORE\_PAD0\_X\_PAD1\_Y[30,14] and CONTROL\_WKUP\_PAD0\_X\_PAD1\_Y[30,14] WAKEUPENABLE bits.

**Figure 18-10. Wake-Up Event Detection Overview**

**NOTE:** When wake-up detection is enabled for a pad, the pad must be configured as input to avoid contention between the device output buffer and an external driver. If this pin is already configured as an input in active mode, hardware automatically retains the same input state; no software action is required.

If this pin is configured as an output in active mode, the off override function must be enabled to set the pin as an input during off mode: in the CONTROL\_(CORE/WKUP)\_PAD0\_X\_PAD1\_Y register, set the OFFMODEENABLE bit to 0x1 to enable the off override function and set the OFFMODEOUTENABLE bit to 0x1 to switch this pin to input mode.

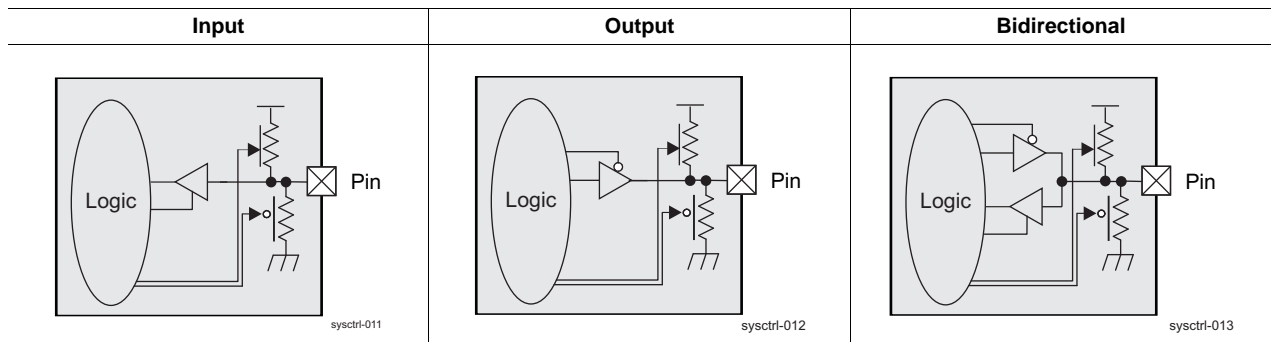

**NOTE:** Regardless of whether the INPUTENABLE bit is set high or low during active mode, to enable wake-up detection for a pad, user software must set the WAKEUPENABLE bit to 0x1. It is recommended to apply pullup/down resistors at the pad to avoid spurious wake-up detection. User software can optionally enable the pad off-mode internal pullup/down resistors through the appropriate setting of the OFFMODEPULLUDENABLE and OFFMODEPULLTYPESELECT bits in the corresponding pad configuration register.

The CONTROL\_PADCONF\_WAKEUPEVENT\_0 through CONTROL\_PADCONF\_WAKEUPEVENT\_6 registers are dedicated 32-bit registers for a separate capture of the WAKEUPEVENT from different pads. Duplication of the CONTROL\_CORE\_PAD0\_X\_PAD1\_Y[31,15] and CONTROL\_WKUP\_PAD0\_X\_PAD1\_Y[31,15] wake-up event bits inside these seven additional registers helps reduce the software latency in identifying which pad has triggered a wake-up event.

#### 18.4.8.4.2 I/O Power Optimization

To optimize I/O power, it is important to avoid unconnected or incorrectly pulled pins. According to the type of pins, the way to reduce power consumption can differ. [Table 18-11](#) shows the three available pin (or ball) types.

**Table 18-11. Pin Types**

The configuration differs according to the I/O cell types. The following advice can be useful to avoid extra current leakage:

- For input pins, use a pullup/down when possible.
- For output pins, check existing pulls to avoid conflicts.
- For bidirectional pins, reconfigure the pin as an output driving 0 when possible.

---

**NOTE:** If the pad is always configured in output mode, it is recommended for software to disable the internal pull by programming the I/O pad configuration register of the corresponding control module.

---

---

**NOTE:** If a device pad is left unconnected, but power is supplied to the I/O, or the pad is used only as an output during the lifetime of the application, it is recommended to keep its corresponding pad configuration bit `CONTROL_CORE /WKUP_PAD0_X_PAD1_Y.INPUTENABLE` set to 0b0. This keeps the input buffer disabled and reduces static current consumption.

---

Some I/O configurations involve modifications during the software setup of I/Os and sometimes require several hardware updates.

[Figure 18-11](#) shows how to optimize the power consumption of pads.

Figure 18-11. I/O Power Optimization Flow Chart

sysctrl-014

The following notes explain more about the pin configuration.

- To avoid unconnected pins, the configuration depends on its use:
  - If the pin is not driven externally, a pullup/down is required.
  - Otherwise, a pullup/down is not necessary.
- Pull conflicts occur when different pulls are on the same line. To configure the pin correctly, avoid having external and internal pulls together.
- Logic conflicts consist in different electrical levels at the same time on the same line. This can occur when several devices are connected to the same line. The two possible cases are:
  - If no external device drives the line, configure the pin to drive 0.
  - If another device drives the line, the same value must be driven or the pin must be disconnected (high-impedance state [Hi-Z]).

---

**NOTE:** It is advised to use Hi-Z logical state on the device or on the external component when the line is driven by both components.

---

For unconnected device pads, `safe_mode` pad configuration is recommended if available. [Table 18-12](#) summarizes recommendations for the configuration of unconnected pads (in terms of mux mode, input, and output buffer states) for all cases, including those where `safe_mode` configuration is not available.

**Table 18-12. Recommended Configuration For Unconnected Device Pads**

Pad MuxMode Set Features			Power-on reset default configuration		Recommended Unconnected Device Pad Configuration				
Safe Mode Available?	GPIO Function Available?	More Than One (Non-GPIO) Function Available?	Multiplexed Signal Direction at Pad	Pad State <sup>(1)</sup>	Multiplexed Signal Direction at Pad	Pad State	Input Buffer Disabled?	Output Buffer Disabled?	MUX Function Selected
Yes	N/A	N/A	Input	PU	Safe Mode	PU	Yes <sup>(2)</sup>	N/A	SAFE MODE <sup>(3)</sup>
Yes	N/A	N/A	Input	PD	Safe Mode	PD	Yes	N/A	SAFE MODE
Yes	N/A	N/A	Output	1	Safe Mode	PD	Yes	N/A	SAFE MODE
Yes	N/A	N/A	Output	0	Safe Mode	PD	Yes	N/A	SAFE MODE
Yes	N/A	N/A	-	Hi-Z	Safe Mode	PD	Yes	N/A	SAFE MODE
No	Yes	N/A	Input	PU	Input	PU	Yes	Yes <sup>(4)</sup>	GPIO_XX <sup>(5)</sup>
No	Yes	N/A	Input	PD	Input	PD	Yes	Yes	GPIO_XX
No	Yes	N/A	Output	1	Input	PD	Yes	Yes	GPIO_XX
No	Yes	N/A	Output	0	Input	PD	Yes	Yes	GPIO_XX
No	Yes	N/A	-	Hi-Z	Input	PD	Yes	Yes	GPIO_XX
No	No	Yes	Input	PU	Input	PU	Yes	N/A <sup>(4)</sup>	N/A (default)
No	No	Yes	Input	PD	Input	PD	Yes	N/A	N/A (default)
No	No	Yes	Output	1	Output	1	Yes	N/A	N/A (default) <sup>(6)</sup>
No	No	Yes	Output	0	Output	0	Yes	N/A	N/A (default) <sup>(6)</sup>
No	No	Yes	-	Hi-Z	Input	PD	Yes	N/A	N/A (default)
No	No	No	Input	PU	Input	PU	Yes	N/A <sup>(4)</sup>	N/A (default)
No	No	No	Input	PD	Input	PD	Yes	N/A	N/A (default)
No	No	No	Output	1	Output	1	Yes	N/A	N/A (default)
No	No	No	Output	0	Output	0	Yes	N/A	N/A (default)
No	No	No	-	Hi-Z	Input	PD	Yes	N/A	N/A (default)

<sup>(1)</sup> PU = Pullup; PD = Pulldown; Hi-Z = High impedance

<sup>(2)</sup> If a certain device pad is left unconnected, its associated padconfiguration register INPUTENABLE bit must be explicitly disabled in software (set to 0b0), regardless of pad MUXMODE bit field value.

<sup>(3)</sup> If a certain pad has a defined safe\_mode and is left unconnected in an application, it is recommended to keep its padconfiguration MuxMode value at 0x7 (that is, safe\_mode).

<sup>(4)</sup> There is no software control over the pad associated output buffer in the Control Module. In case of a GPIO function selection, the output buffer is hardware enabled once the user enables corresponding pin output direction in the GPIOx.GPIO\_OE control register.

<sup>(5)</sup> If a certain pad does not have a safe\_mode but has an associated GPIO function, it is recommended to set its padconfiguration register MuxMode to select the GPIO mode.

<sup>(6)</sup> If one of the other mux modes available is bidirectional or input-only, then the nondefault mux mode could be used and configured with input disabled.

### 18.4.9 Extended-Drain I/O and PBIAS Cell

The device primarily supports 1.8-V I/O voltage on its interfaces, with the exception of the MMC/SD/SDIO1 interface, which supports 1.8-V and 3.0-V voltages. The need for embedded extended-drain I/Os on the MMC/SD/SDIO1 interface imposes the use of embedded PBIAS cell MMC1\_PBIAS to provide a 1.8-V or 3.0-V reference.

A second PBIAS cell (PBIAS1) is integrated in the device. One of its associated extended-drain I/O cells operates the signals of the gpio\_wk0 through gpio\_wk2 I/Os.

A separate extended-drain I/O cell (USBC1\_ICUSB extended-drain I/O cell) is shared between usbc1\_icusb\_dp and usbc1\_icusb\_dm (MUXMODE = 0x0), and between the gpio\_98 and gpio\_99 (MUXMODE = 0x3) pads. The USBC1\_ICUSB I/O cell and extended-drain I/O cells gpio\_wk0 through gpio\_wk2 are biased by the same PBIAS1 output voltage.

---

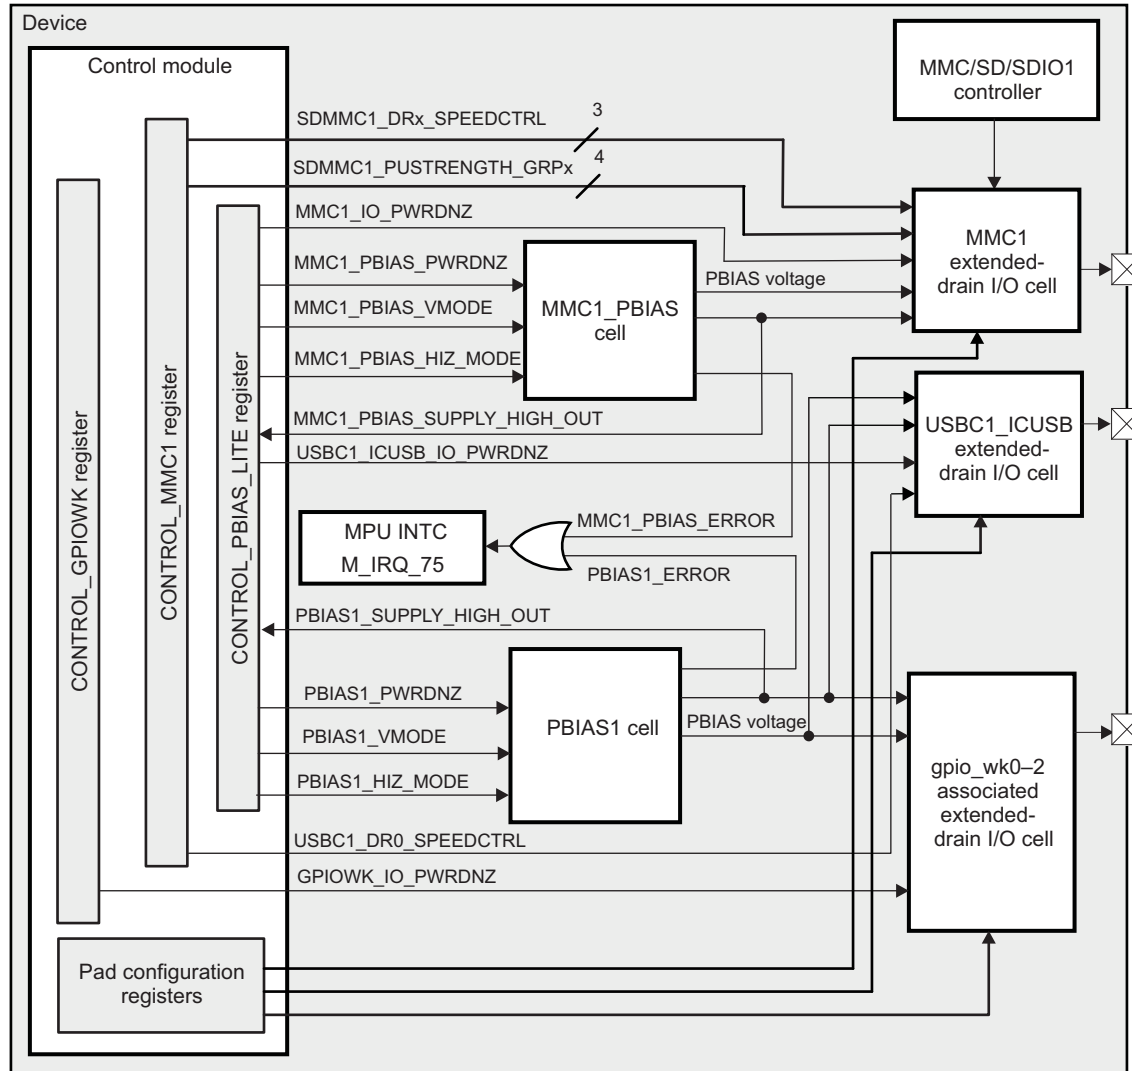

**NOTE:** With the appropriate PBIAS cell configuration, the different I/Os muxed on the sdmmc1, usbc1\_icusb, and gpio\_wk0 through gpio\_wk2 pads can operate at 1.8-V or 3.0-V power supply.

---

The MMC1\_PBIAS cell and its associated MMC1 extended-drain I/O is software-controlled by bits in the [CONTROL\\_PBIASLITE](#) and [CONTROL\\_MMC1](#) registers of the device core control module. PBIAS1 and associated GPIO\_WKx and USBC1\_ICUSB\_x I/Os are software-controlled by bits in the [CONTROL\\_PBIASLITE](#), [CONTROL\\_MMC1](#), and [CONTROL\\_GPIOWK](#) registers.

[Figure 18-12](#) shows the functional block diagram with the connections between the PBIAS cells and the extended-drain I/O cells.

Figure 18-12. Functional Block Diagram

sysctrl-015

**Table 18-13. PBIAS Cell and Extended-Drain I/O Pin CONTROL\_PBIAS\_LITE Bit Control**

Control Signals for Different PBIAS and Extended-Drain I/O Cells	Description
MMC1_PBIAS_PWRDNZ	Protects the MMC1_PBIAS cell when the SDMMC1_VDDS supply voltage is not stable. Software must keep this signal to 0b0 whenever this voltage ramps up/down or changes.  When this bit is set to 0, the PBIAS output voltage is equal to SDMMC1_VDDS voltage and the PBIAS supply detector is disabled.
MMC1_PBIAS_VMODE	Sets the SDMMC1_VDDS voltage level (MMC1_PBIAS side) according to which MMC1_PBIAS cell generates appropriate biasing levels for the MMC1 extended-drain I/O. The default state of this bit is HIGH, indicating that the voltage level SDMMC1_VDDS is 3.0 V.
MMC1_PBIAS_HIZ_MODE	When MMC1_PBIAS_HIZ_MODE is set to 1, the PBIAS output is in high impedance. MMC1_PBIAS_ERROR is automatically set to 1 when MMC1_PBIAS_HIZ_MODE = 1. When MMC1_PBIAS_HIZ_MODE = 0, MMC1_PBIAS cell is in normal operation mode.
MMC1_PBIAS_SUPPLY_HIGH_OUT	Output from the internal MMC1_PBIAS voltage supply detector, which indicates whether the SDMMC1_VDDS supply is 3.0 V or 1.8 V
MMC1_PBIAS_ERROR	Indicates whether the software-programmed MMC1_PBIAS_VMODE level matches the MMC1_PBIAS_SUPPLY_HI_OUT output signal during normal operation
MMC1_IO_PWRDNZ	Protects the MMC1 I/O extended-drain cell when the SDMMC1_VDDS voltage is not stable. Software must keep this signal to 0b0 whenever the SDMMC1_VDDS supply voltage ramps up/down or changes. When this bit is at 0, the pad is floating.
SDMMC1_DRx_SPEEDCTRL, x = (0...2)	Speed control signals for three different SDMMC1 pad groups identified within the MMC1 I/O cell
SDMMC1_PUSTRENGTH_GRPx, x = (0...3)	Pullup strength controls for four different SDMMC1 pad groups identified within the MMC1 I/O cell
PBIAS1_PWRDNZ	Protects the PBIAS1 cell when the SIM_VDDS supply voltage is not stable. Software must keep the PWRDNZ signal to 0b0 whenever this supply voltage ramps up/down or changes.  When this bit is at 0, the PBIAS1 output voltage is equal to SIM_VDDS voltage and the PBIAS supply detector is disabled.
PBIAS1_VMODE	Sets the SIM_VDDS voltage level (PBIAS1 side) according to which PBIAS1 cell generates appropriate biasing levels for the GPIOWK0GPIOWK2 and USBC1_ICUSB associated extended-drain I/Os. The default state of this bit is HIGH, indicating that the voltage level SIM_VDDS is 3.0 V.
PBIAS1_HIZ_MODE	When PBIAS1_HIZ_MODE is set to 1, the PBIAS1 output is in HIGH impedance. PBIAS1_ERROR is automatically set to 1 when PBIAS1_HIZ_MODE = 1.  When PBIAS1_HIZ_MODE = 0, PBIAS1 is in normal operation mode.
PBIAS1_SUPPLY_HIGH_OUT	Output from the internal PBIAS1 voltage supply detector, which indicates whether the SIM_VDDS supply is 3.0 V or 1.8 V
PBIAS1_ERROR	Indicates whether the software-programmed PBIAS1_VMODE level matches the PBIAS1_SUPPLY_HI_OUT output signal during normal operation
GPIOWK_IO_PWRDNZ	Protects the GPIOWK0GPIOWK2 associated extended-drain I/O cell when the SIM_VDDS voltage is not stable  Software must keep this signal to 0b0 whenever the SIM_VDDS supply voltage ramps up/down or changes. When this bit is set to 0, the pad is floating.
PAD_GPIO_WK1_LOW	This signal must be set to 0b0 to disable the strong pulldown available after reset on the gpio_wk1 pad. This is to ensure normal use of the gpio_wk1 pad.
0.22 PAD_GPIO_WK2_LOW	This signal must be set to 0b0 to disable the strong pulldown available after reset on the gpio_wk2 pad. This is to ensure normal use of the gpio_wk2 pad.
0.23 USBC1_ICUSB_IO_PWRDNZ	Protects the USBC1_ICUSB extended-drain I/O cell when the SIM_VDDS voltage is not stable. Software must keep this signal to 0b0 whenever the SIM_VDDS supply voltage ramps up/down or changes.  When this bit is at 0, the pad is floating.
0.24 USBC1_DR0_SPEEDCTRL	Speed controls for the ICUSB pads associated with the USBC1_ICUSB associated I/O cell

---

**NOTE:** When HIZ\_MODE = 1, the PBIAS output (the pbias\_mmc1 pin) must be tied to a defined external potential to avoid stress on transistors.

---

Table 18-14 lists the power supplies for PBIAS and the extended-drain I/O cells.

**Table 18-14. Power Supplies**

Name	Description
VDD2	Core voltage supply
SDMMC1_VDDS	MMC1 I/O cell supply voltage nominal 1.8 V/3.0 V
SIM_VDDS	USBC1_ICUSB and GPIOWK I/O cell supply voltage nominal 1.8 V/3.0 V
VDDS	1.8-V supply for the input buffer

#### 18.4.9.1 PBIAS Cell

The MMC1\_PBIAS cell provides a bias for the MMC/SD/SDIO1 extended-drain I/O cell used with high voltage for the MMC/SD/SDIO1 interface. This PBIAS cell provides a voltage reference (PBIAS voltage) for biasing extended-drain in the MMC/SD/SDIO1 cell. In addition to generating the bias voltage, the cell can detect the supply voltage (SDMMC1\_VDDS) value (1.8 V or 3.0 V) and update, with its status, the [CONTROL\\_PBIASLITE](#)[24] MMC1\_PBIASLITE\_SUPPLY\_HI\_OUT bit. However, this is possible when the voltage reaches its steady state (the internal PBIAS voltage detector is enabled only when the MMC1\_PBIAS\_PWRDNZ signal is set to 0b1).

The PBIAS1 cell provides a reference voltage for biasing the gpiowk0gpiowk2 associated extended-drain I/O cell and the USBC1\_ICUSB extended-drain I/O cell. In addition to generating the bias voltage, the cell can detect the supply voltage (SIM\_VDDS) value (1.8 V or 3.0 V) and update, with its status, the [CONTROL\\_PBIASLITE](#)[30] PBIASLITE1\_SUPPLY\_HI\_OUT bit. However, this is possible when voltage reaches its steady state (the internal PBIAS voltage detector is enabled only when the PBIAS1\_PWRDNZ signal is set to 0b1).

#### **CAUTION**

A PBIAS cell lets the peripheral associated with its corresponding extended-drain I/O cells support 1.8-V and 3.0-V voltages. A PBIAS cell is not part of a peripheral, but part of the device I/Os to which this peripheral is internally connected. These device I/Os are not exclusive to one peripheral; through I/O multiplexing they can be connected to other internal signals. It is necessary to configure the PBIAS to enable the I/Os, regardless of how I/O multiplexing is configured for these device I/Os. In other words, independently of which signal is internally connected to a device I/O powered by SDMMC1\_VDDS or SIM\_VDDS, the corresponding PBIAS must be configured.

#### 18.4.9.2 Extended-Drain I/O

The following MMC/SD/SDIO1 interface signals (selected when MuxMode = 0) use the device I/Os associated with the MMC1 extended-drain I/O cell:

- sdmmc1\_clk
- sdmmc1\_cmd
- sdmmc1\_dati (where i = 0 to 7)

The MMC1 I/O cell is powered externally through the vdds\_sdmmc1 pad.

---

**NOTE:** The MMC1 I/O cell-associated device I/Os are also shared with other signals. gpio100gpio109, etc. are available when MuxMode is different than 0x0. If signals other than sdmmc1\_x are selected, the MMC1 I/O cell must also be configured.

---

**NOTE:** For multiplexed gpio signals on the MMC1 I/O cell (gpio\_100 through gpio\_109), to function appropriately in standard 1.8-V mode, the [CONTROL\\_PBIASLITE\[21\]](#) MMC1\_PBIASLITE\_VMODE through [CONTROL\\_PBIASLITE\[26\]](#) MMC1\_PWRDNZ bits must be set to 0b0. When these bits are set, and the externally-applied I/O cell power supply voltage (1.8 V) is stabilized, gpio signals can be enabled on the pads by setting the [CONTROL\\_PBIASLITE\[22\]](#) MMC1\_PBIASLITE\_PWRDNZ bit to 0b1 (power-up MMC1\_PBIAS cell) and the [CONTROL\\_PBIASLITE\[26\]](#) MMC1\_PWRDNZ bit to 0b1 (power-up MMC1 extended-drain I/O cell).

---

For more information about signal multiplexing, see [Table 18-10](#).

For general-purpose (GP) device I/Os, which are part of the associated extended-drain cell of the GPIOWK pad, Muxmode = 3, Muxmode = 4 (gpio\_wk0 pad only), and Muxmode = 6 are functional.

With Muxmode set to 0x3, the following signals are present:

- gpio\_wk0
- gpio\_wk1
- gpio\_wk2

With Muxmode set to 0x6, the output signals (hw\_dbg1, hw\_dbg2, and hw\_dbg3) are present at the gpio\_wk0, gpio\_wk1, and gpio\_wk2 pads, respectively.

This PBIAS1 associated extended-drain I/O cell is externally powered through the vdds\_sim pad.

---

**NOTE:** The GPIOWK-associated I/O cell must be properly configured when the gpio\_wk0 through gpio\_wk2 pads are used. For more information about signal multiplexing, see [Table 18-10](#).

---

**NOTE:** For the gpio\_wk0 through gpio\_wk2 signals to function appropriately in standard 1.8-V mode, the [CONTROL\\_PBIASLITE\[27\]](#) PBIASLITE1\_VMODE through [CONTROL\\_PBIASLITE\[31\]](#) PBIASLITE1\_HIZ\_MODE bits and the [CONTROL\\_GPIOWK\[28\]](#) GPIOWK\_IO\_PWRDNZ bit must be set to 0b0. When these bits are set, and the externally-applied I/O cell power supply voltage (1.8 V) is stabilized, gpio signals can be enabled on the pads by setting the [CONTROL\\_PBIASLITE\[28\]](#) PBIASLITE1\_PWRDNZ bit to 0b1 (power-up PBIAS1 cell) and the [CONTROL\\_GPIOWK\[28\]](#) GPIOWK\_IO\_PWRDNZ bit to 0b1 (power-up extended-drain I/O cell).

---

The following USBC1\_ICUSB interface signals (selected through MuxMode = 0) use the device I/Os associated with the USBC1\_ICUSB extended-drain I/O cell:

- usbc1\_icusb\_dp
- usbc1\_icusb\_dm

The USBC1\_ICUSB I/O cell uses the same external power supply voltage as the GPIOWK cell (vdds\_sim pad).

---

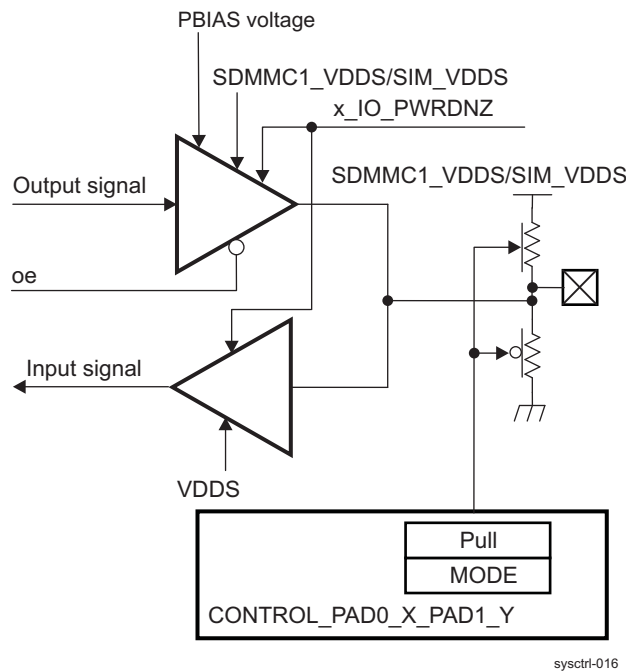

**NOTE:** The USBC1\_ICUSB I/O cell associated device I/Os are also shared with the gpio\_98 and gpio\_99 signals when MuxMode = 0x3. The USBC1IC\_ICUSB cell must be configured to allow for gpio\_98 and gpio\_99 operation. For more information about signal multiplexing, see [Table 18-10](#).

---

**NOTE:** For the gpio\_98 through gpio\_99 signals to function appropriately in standard 1.8-V mode, the [CONTROL\\_PBIASLITE\[27\]](#) PBIASLITE1\_VMODE through [CONTROL\\_PBIASLITE\[31\]](#) PBIASLITE1\_HIZ\_MODE bits and the [CONTROL\\_PBIASLITE \[20\]](#) USBC1\_ICUSB\_PWRDNZ bit must be set to 0b0. When these bits are set, and the externally-applied I/O cell power supply voltage (1.8 V) is stabilized, gpio signals can be enabled on the pads by setting the [CONTROL\\_PBIASLITE\[28\]](#) PBIASLITE1\_PWRDNZ bit to 0b1 (power-up PBIAS1 cell) and the [CONTROL\\_PBIASLITE\[20\]](#) USBC1\_ICUSB\_PWRDNZ bit to 0b1 (power-up extended-drain I/O cell).

Figure 18-13 shows the extended-drain I/O cells.

**Figure 18-13. Extended-Drain I/O**

The extended-drain I/O cells have the following I/O signals:

- The output signal, input signal, and oe, which comes from the selected I/O module with the correctly configured MUXMODE field within the corresponding CONTROL\_CORE\_PAD0\_X\_PAD1\_Y or CONTROL\_WKUP\_PAD0\_X\_PAD1\_Y register

**NOTE:** Extended-drain I/Os are muxed I/Os with mode and pullup/down configurations programmable in the control module.

- The PBIAS voltage is a voltage reference for biasing the extended-drain in the MMC1, USBC1\_ICSUB, and GPIOWK I/O cells.
- The PWRDNZ signals are used to protect the I/O cells when the SDMMC1\_VDDS/SIM\_VDDS voltage is not stable.

**CAUTION**

Software must keep the PWRDNZ-related signals to 0b0 whenever the SDMMC1\_VDDS or SIM\_VDDS signal ramps up/down or changes. When it is set to 0, the pad is floating (the pad may not reflect the state of the output signal, and the input signal may not reflect the state of the pad).

- [CONTROL\\_PBIASLITE\[24\]](#) MMC1\_PBIASLITE\_SUPPLY\_HI\_OUT is a status bit on the

SDMMC1\_VDDS value and is used to inform the MMC1 I/O cell about the value of the SDMMC1\_VDDS signal.

- **CONTROL\_PBIASLITE**[30] PBIASLITE1\_SUPPLY\_HI\_OUT is a status bit on the SIM\_VDDS value and is used to inform the gpiowk0 through gpiowk2 associated I/O cell and USBC1\_ICUSB I/O cell about the value of the SIM\_VDDS signal.

For more information about the software configurations of the extended drain I/Os and PBIAS cells, see [Section 18.5.1.2.2, Extended-Drain I/Os and PBIAS Cells Programming Guide](#).

---

**NOTE:** The device can be supplied by an external power IC. TI provides such a global solution to its customers with the TWL60xx power IC.

---

If the device is associated with the TWL60xx power IC, before using an extended-drain I/O interface, software must program the TWL60xx to enable VMMC1 (for the MMC/SD/SDIO1 or muxed I/O modules) or VSIM (for the GPIOWK0, GPIOWK2, USBC1\_ICUSB, or muxed I/Os) and the LDO to provide 1.8-V/3.0-V voltage. This is done by software through the inter-integrated circuit (I<sup>2</sup>C™) interface that links the device and the TWL60xx IC.

#### CAUTION

The power supply voltage generated from the companion power IC and applied on the vdds\_sdmmc1 or vdds\_sim device pins must be programmed according to the recommendations for the currently selected I/O module power supply range.

If the application does not want the I/O interface to run at 3.0 V, software users must then assert the VMODE signal to low for 1.8-V activity: in this case, the PBIAS is connected to ground.

[Table 18-15](#) lists the control signal with the corresponding control bits from the [CONTROL\\_PBIASLITE](#), [CONTROL\\_MMC1](#), and [CONTROL\\_GPIOWK](#) registers to configure the PBIAS and the extended-drain I/O cells. These signals can be controlled by software.

**Table 18-15. PBIAS/Extended-Drain I/O Cells Control Signals**

Control Signals for Different PBIAS and Extended-Drain I/O Cells	Bits Used for PBIAS Cell and I/O Cell Configurations for Different I/O Modules	Reset Value

The two PBIAS cells support two ranges of I/O SDMMC1\_VDDS/SIM\_VDDS: 1.8 V, typical for low-voltage applications, and 3.0 V, typical for high-voltage applications. For each supply voltage range, the cell generates suitable bias voltage (PBIAS) for extended-drain PMOS devices.

**CAUTION**

The PBIAS cell must be programmed according to peripheral power supply voltage. See [Table 18-16](#).

**Table 18-16. Voltage Configuration<sup>(1)</sup>**

PBIASLITEVMODE Configuration	SDMMC1_VDDS/SIM_VDDS Voltage	Type of Operation
1.8 V	1.8 V	Normal 1.8-V operation
1.8 V	3.0 V	Damaging configuration <sup>(2)</sup>
3.0 V	1.8 V	Degraded functionality <sup>(2)</sup>
3.0 V	3.0 V	Normal 3.0-V operation

<sup>(1)</sup> For damaging configuration, hardware system protection is provided to prevent deterioration of the associated extended-drain I/Os.

<sup>(2)</sup> These modes must not be used.

The PBIAS output voltage is the same as SDMMC1\_VDDS/SIM\_VDDS voltage when the corresponding PWRDNZ bit is low. Once the SDMMC1\_VDDS / SIM\_VDDS supply is stable, software can release the PWRNDZ (setting it high). This starts the PBIAS cell work to generate the PBIAS voltage. During the completion process the corresponding I/Os cannot be used to transmit data. If VMODE is set correctly (compared with supply detector output and found to be the same), then PBIAS output voltage is generated based on the value of VMODE.

---

**NOTE:** In the case of a damaging configuration, hardware system protection prevents deterioration of the associated extended-drain I/Os.

---

**CAUTION**

The following requirements are critical for an extended-drain I/O cell:

- The VMODE bit must be defined before the PWRNDZ bit is made high (cell is brought out of power-down mode).
- The default state of VMODE bit is high (indicates 3.0-V operation).
- The PWRNDZ bit must be kept low whenever the SDMMC1\_VDDS/SIM\_VDDS supply ramps up/down or changes. This can be damaging.
- Supply detector is disabled when PWRDNZ = 0, and in this case, supply detector output (SUPPLY\_HI\_OUT) is initialized to 0.

**18.4.9.3 PBIAS Error Generation**

If VMODE and supply detector outputs are unequal, it takes 4  $\mu$ s for the comparator to process the inputs and generate the VMODE\_ERROR flag.

Table 18-17 summarizes the generation of the PBIAS error signals (MMC1\_PBIAS\_ERROR of the MMC1\_PBIAS cell, and PBIAS1\_ERROR of the PBIAS1 cell), which depend on the various CONTROL\_PBIASLITE bit combinations. The shaded row in the table indicates a condition that could cause a reliability issue if not detected. To prevent this reliability issue, the PBIAS voltage is tied to SDMMC1\_VDDS/SIM\_VDDS when the PBIAS error signal is high. This disables the I/Os.

**CAUTION**

Although asserting VMODE\_ERROR to 1 ensures that PBIAS voltage is equal to SDMMC1\_VDDS/SIM\_VDDS, this does not completely protect the I/O cells. It is recommended that all the I/Os are powered down, setting the PWRDNZ mode bits of the corresponding I/O cells to 0b0 by software as soon as VMODE\_ERROR = 0b1.

**Table 18-17. PBIAS Error Signal Truth Table**

VMODE	PWRDNZ	HIZ_MODE	SUPPLY_HI_OUT	VMODE_ERROR
0	0	X	0	0
0	1	0	0	0
0	1	0	1	1
X	1	1	X	1
1	0	X	0	0
1	1	0	0	1
1	1	0	1	0

**NOTE:** VMODE\_ERROR = 0b1: VMODE level is not the same as SUPPLY\_HI\_OUT, or Hi-Z mode is selected.

VMODE\_ERROR = 0b0: VMODE level is the same as SUPPLY\_HI\_OUT, or VMODE is not considered (PWRDNZ = 0b0).

The MMC1\_PBIAS\_ERROR and PBIAS1\_ERROR signals are ORed and the outputs are mapped to the microprocessor unit (MPU) subsystem INTC. The interrupt line MA\_IRQ\_75 is activated upon error occurrence. For more information about the Cortex™-A9 MPU INTC registers and their description, see the *ARM Cortex-A9 MPCore Technical Reference Manual* (available at [infocenter.arm.com/help/index.jsp](http://infocenter.arm.com/help/index.jsp)).

The [CONTROL\\_PBIASLITE\[29\]](#) PBIASLITE1\_VMODE\_ERROR and [CONTROL\\_PBIASLITE\[23\]](#) MMC1\_PBIASLITE\_VMODE\_ERROR bits also indicate whether this kind of error occurs.

#### 18.4.9.4 Critical Timing Requirements

It is critical that the PBIAS and I/O cell-related PWRDNZ bits are deasserted (made 1 from 0) only after SDMMC1\_VDDS/SIM\_VDDS power supply voltage is stable in the device. The cells support only the case where the 1.8-V input buffer supply voltage VDDS ramps up before VDD2 (core voltage). This power-up sequence is automatically provided upon POR by hardware in the device. Take care to ensure that the externally provided SDMMC1\_VDDS/SIM\_VDDS voltage (1.8 V/ 3 V) is powered up only after VDD2 and VDDS reach their steady state.

[Figure 18-14](#) shows the only possible power-up sequence, as well as the expected behavior of PWRNDZ mode-related bits with regard to supplying voltage ramp up.

**Figure 18-14. VDDS Ramps Up Before VDD2**

#### 18.4.10 Band Gap Voltage and Temperature Sensor

The device supplies a voltage reference and a temperature sensor feature that are gathered in the band gap voltage and temperature sensor (VBGAPTS) module. The band gap provides current and voltage reference for its internal circuits and other analog IP blocks. The analog-to-digital converter (ADC) produces an output value that is proportional to the silicon temperature.

The main features of the VBGAPTS module are:

- A constant voltage reference output of 0.5 V
- Five constant current reference outputs of 1 $\mu$ A
- Analog supply is a nominal 1.8 V.
- Small ADC with 10-bit digital output
- Off mode compatible

A small finite state-machine (FSM) (band gap FSM) is instantiated inside the general core control module to help the VBGAPTS cell accomplish different measurement modes (see [Section 18.4.10.2, Temperature Sensor](#)). In addition, two programmable comparator blocks inside the general core control module post-process the converted data and provide the following outputs:

- Thermal alert programmable comparator output
- Thermal shutdown programmable comparator output

[Figure 18-15](#) shows the functional block diagram of the band gap and the temperature sensor module.

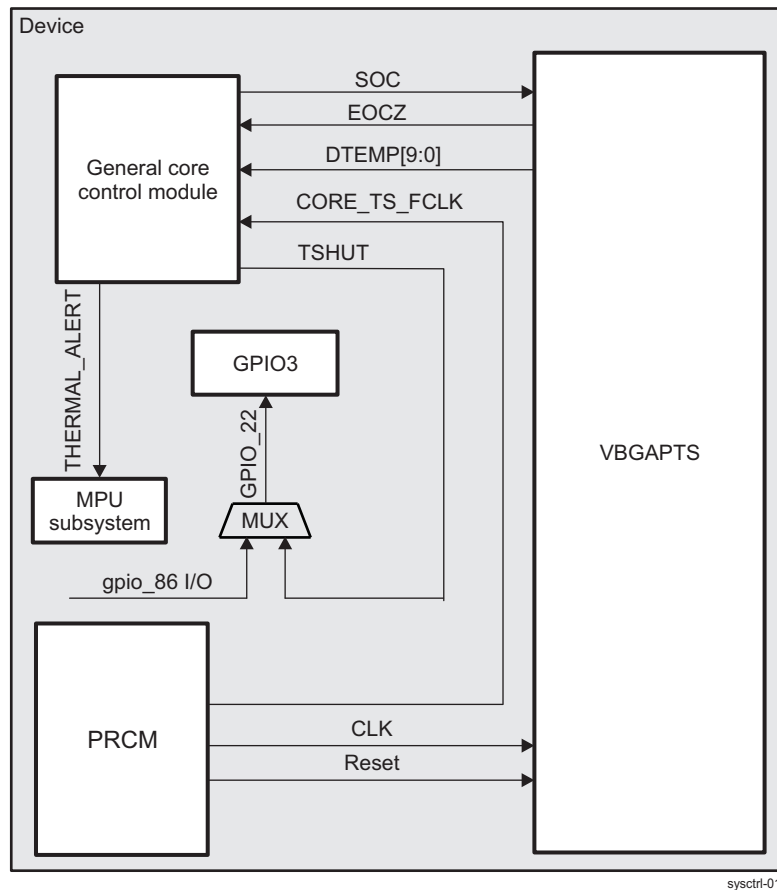

**Figure 18-15. Functional Block Diagram**

Table 18-18 describes the I/O signals, some of which (SOC, EOCZ, DTEMP[9:0]) build the interface between the VBGAPTS module and the bandgap state-machine of the general core control module.

**Table 18-18. Band Gap Voltage and Temperature Sensor Signal Description**

Pin	I/O <sup>(1)</sup>	Description
SOC	I	Start of Conversion signal. A transition to high starts a new ADC conversion cycle.
EOCZ	O	End of Conversion signal. When low, the signal indicates that the value of DTEMP[9:0] is valid.
DTEMP[9:0]	O	Temperature data from the temperature sensor. This value is valid when EOCZ is low.
CLRZ	I	When low, the temperature sensor is in reset mode. This signal must be low when OFFMODE is high.
CLK	I	Functional clock in the range (1–2 MHz) from the WKUP power domain used by the temperature sensor during temperature conversion

<sup>(1)</sup> I = Input, O = Output

All the configuration signals of the VBGAPTS temperature conversion logic are available through the [CONTROL\\_TEMP\\_SENSOR](#) register.

The bandgap state-machine of the general core control module is driven by a dedicated clock (CORE\_TS\_FCLK) that shares a common PRCM clock source with the VBGAPTS CLK. For more information about the thermal management clocks, see [Chapter 3, Power, Reset, and Clock Management](#).

**NOTE:** The VBGAPTS functional clock delivered on CLK input is used only for the temperature sensor. When ADC is not converting, this clock can be switched off (CLK = 0). In this case, DTEMP[9:0] retains the temperature code obtained at the previous conversion.

---

**NOTE:** User software must ensure that the `CONTROL_BANDGAP_STATUS[3]` `CLEAN_STOP` bit read-only flag is high before switching off the `VBGAPTS` cell (`CLK`) and the bandgap state (`CORE_TS_FCLK`) clocks by programming the `CONTROL_TEMP_SENSOR[13]` `BGAP_TEMPSONOFF` bit to 1. Status `CLEAN_STOP = 1` indicates that the band gap state-machine is in `IDLE` state, and clocks can be safely switched off.

---

Table 18-19 describes the functional outputs of the two post-processing comparator blocks integrated in the general core control module.

**Table 18-19. General Core Control Thermal Logic Outputs Description**

Functional Output	Description
THERMAL_ALERT	General core control module thermal alert output, mapped as an interrupt in the MPU subsystem. It is used by software to implement a thermal management policy of the device.
TSHUT	General core control module thermal shutdown comparator output, mapped on a GPIO input. This overheat protection signal is high during normal operation and goes low during a thermal shutdown event.

The configuration bits of the thermal post-processing logic are in several registers of the general core control module. For more information, see [Section 18.4.10.2.3, Thermal Data Post-Processing](#).

#### 18.4.10.1 Band Gap Voltage Reference

The band gap voltage reference feature provides several constant voltage and current references for its internal circuits and for other analog modules.

The voltage reference signal is a 0.5-V output. This output is used internally by the module and is exported for external modules or tests.

The current reference signals consist of five lines, each of which generates a 1- $\mu$ A current with a 1.8-V voltage. These lines can be used to bias other modules.

#### 18.4.10.2 Temperature Sensor

The temperature sensor feature is used to convert the temperature of the device into a decimal value coded on 10 bits. An internal ADC, which is part of the device embedded bandgap cell, is used for conversion.

For more information about the thermal sensor operating parameters (temperature range, accuracy, etc.), see the *Temperature Sensor* section in the device data manual.

For more information about the device operating junction temperature ranges under different conditions, see the *Recommended Operating Conditions* section in the device data manual.

---

**NOTE:** The temperature measured at the temperature sensor location is lower than the temperature of the hottest spot on the device die. This difference, defined also as the temperature offset between the on-die hottest spot temperature and the temperature registered by the on-die thermal sensor, depends on a number of factors, such as the current system power dissipation, device cooling conditions, etc.

---

#### **CAUTION**

User software must always take care to program thermal thresholds (thermal alert or TSHUT event points) at levels that do not exceed the device hottest spot maximal-allowed temperature minus the device temperature sensor offset estimated at current conditions.

The thermal alert interrupt events are described in [Section 18.4.10.2.4, Thermal Alert Functionality Comparators](#).

The TSHUT signal is connected internally to a GPIO controller pin. For more information, see [Chapter 25, General-Purpose Interface](#).

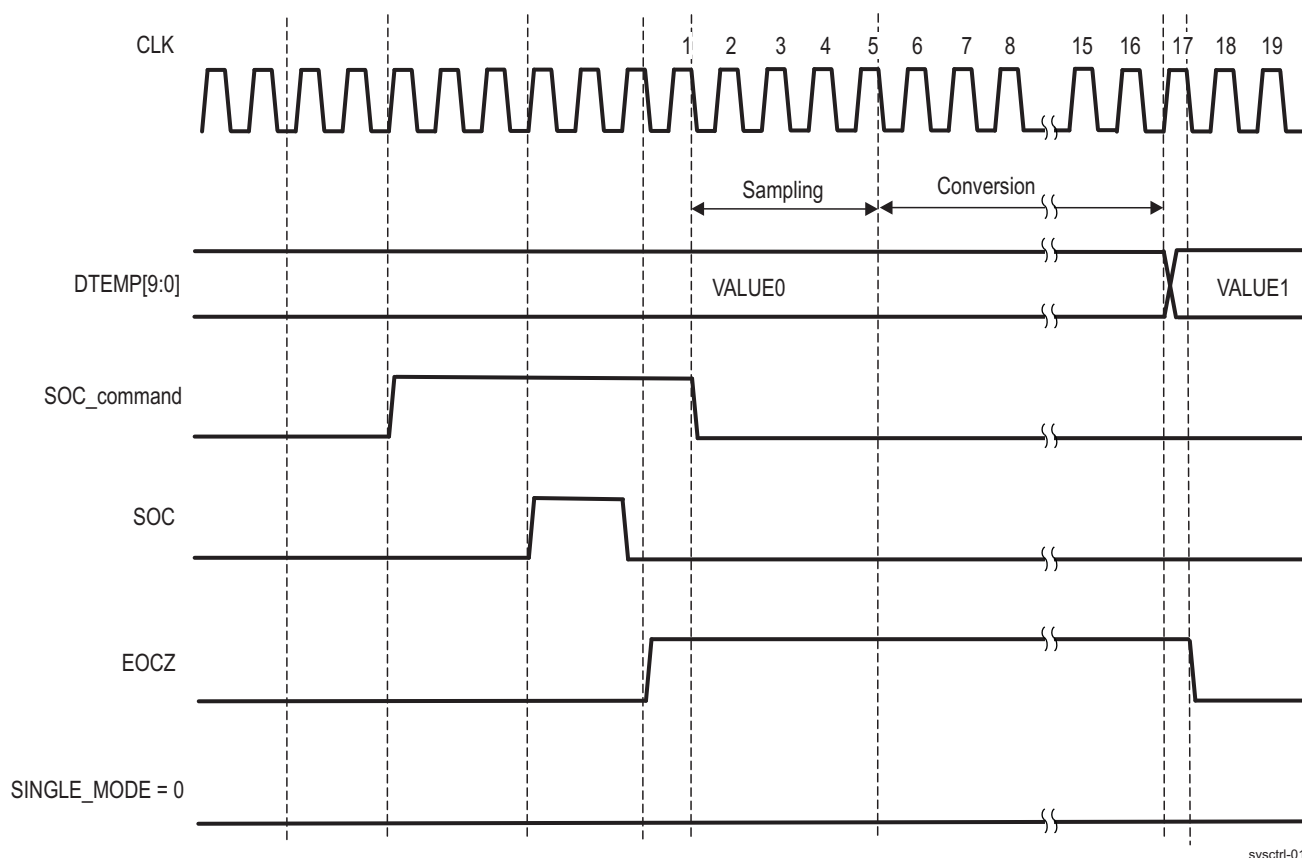

The bandgap state-machine offers two operating modes for the temperature sensor: single conversion mode and repeated single conversion mode.

#### 18.4.10.2.1 Single Conversion Mode

When the ADC is idle ([CONTROL\\_TEMP\\_SENSOR\[10\] BGAP\\_TEMP\\_SENSOR\\_EOCZ = 0](#)) and the [CONTROL\\_BANDGAP\\_CTRL\[31\] SINGLE\\_MODE](#) bit is set to 0, it is possible to ask for a single temperature conversion. To initiate a new conversion, the start of conversion bit ([CONTROL\\_TEMP\\_SENSOR\[11\] BGAP\\_TEMP\\_SENSOR\\_SOC](#)) must be asserted and maintained high until the end of conversion flag ([CONTROL\\_TEMP\\_SENSOR\[10\] BGAP\\_TEMP\\_SENSOR\\_EOCZ](#)) goes high, after which the SOC signal must be made low by setting the [CONTROL\\_TEMP\\_SENSOR\[11\] BGAP\\_TEMP\\_SENSOR\\_SOC](#) bit to 0. Conversion completion is indicated by a negative edge of EOCZ (the [CONTROL\\_TEMP\\_SENSOR\[10\] BGAP\\_TEMP\\_SENSOR\\_EOCZ](#) bit).

[Figure 18-16](#) shows the timing sequence of a single temperature conversion. As can be seen in the figure, a single temperature conversion is performed by ADC for 17 band gap clock cycles.

**Figure 18-16. Single Conversion Mode**

sysctrl-019

#### 18.4.10.2.2 Repeated Single Conversion Mode

A continuous temperature measurement on the device is performed as a sequence of single ADC conversions automatically initiated at regular intervals. A 24-bit counter inside the general core control module adds flexibility to program the delay between two consecutive SOC pulses generated from the band gap state-machine.

Two scenarios for ADC to work in a repeated single conversion mode are:

- Fixed-delay repeated single conversions
- Programmable-delay repeated single conversions

#### 18.4.10.2.2.1 Fixed-Delay Repeated Single Conversions

The fixed-delay repeated single conversions scenario follows the sequence:

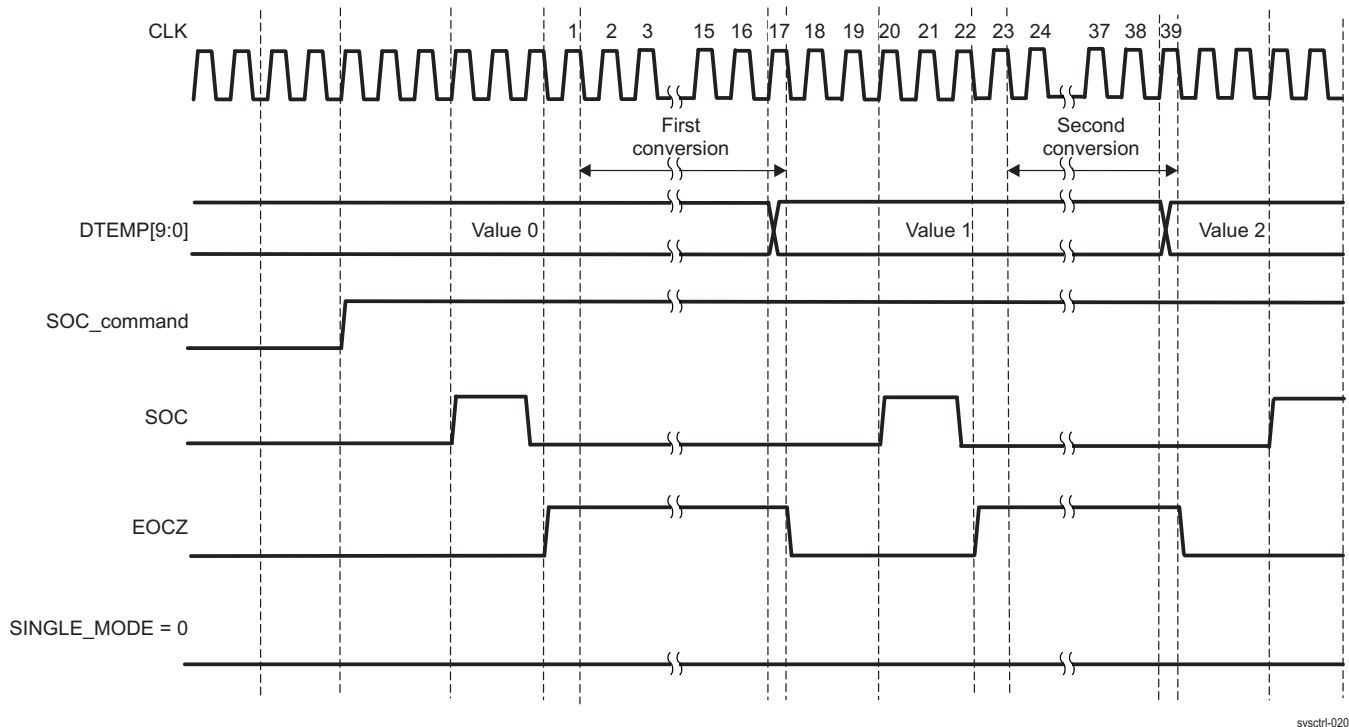

When the ADC is idle (`CONTROL_TEMP_SENSOR[10] BGAP_TEMP_SENSOR_EOCZ = 0`), and `CONTROL_BANDGAP_CTRL[31] SINGLE_MODE = 0`, the bandgap state-machine can be forced to generate a series of SOC pulses if the `CONTROL_TEMP_SENSOR[11] BGAP_TEMP_SENSOR_SOC` bit is asserted high and continuously maintained in this state during the required temperature monitoring period. The user software must deassert the `CONTROL_TEMP_SENSOR[11] BGAP_TEMP_SENSOR_SOC` bit to 0 when the `CONTROL_TEMP_SENSOR[10] BGAP_TEMP_SENSOR_EOCZ` status bit is set high for the last temperature measurement.

As described in [Section 18.4.10.2.1, Single Conversion Mode](#), valid data on the DTEMP[9:0] bus upon single conversion completion is indicated by a negative edge of the EOCZ signal. For the software, `CONTROL_TEMP_SENSOR[10] BGAP_TEMP_SENSOR_EOCZ = 0` signals that the temperature data `CONTROL_TEMP_SENSOR[7:0] BGAP_TEMP_SENSOR_DTEMP` bit field is updated.

Figure 18-17 shows the timing sequence for fixed-delay repeated single mode.

In this case, there is no flexibility to control delay between two consecutive SOC pulses, because with `CONTROL_BANDGAP_CTRL[31] SINGLE_MODE = 0` band gap counter logic is disabled. The delay is fixed to 22 bandgap functional clock cycles.

**Figure 18-17. Fixed-Delay Repeated Single Conversions**

sysctrl-020

#### 18.4.10.2.2.2 Programmable-Delay Repeated Single Conversions

In the programmable-delay repeated single conversions mode the bandgap state-machine uses a 24-bit incremental counter (part of the thermal post-processing logic of the general core control module) to generate a series of SOC pulses with a programmable delay between them.

The programmable-delay repeated single conversions scenario follows this sequence:

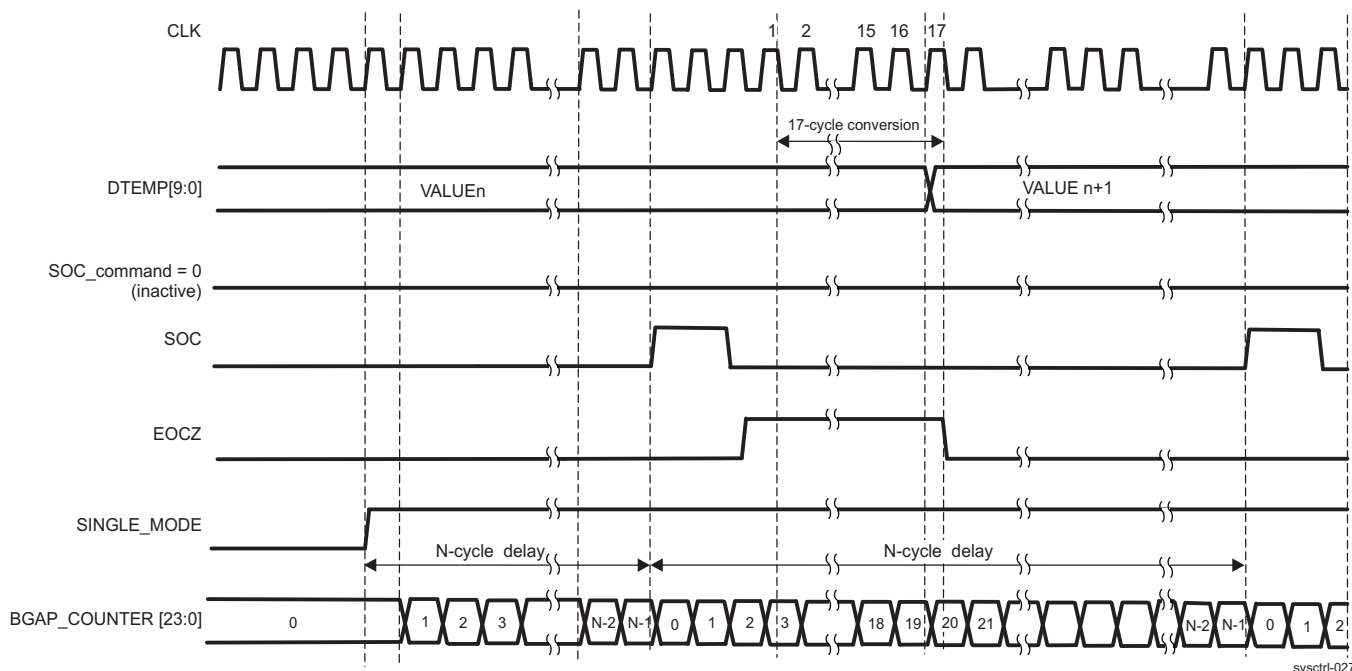

Before enabling this mode, the user must write the desired delay value as the number of bandgap CLK cycles in the CONTROL\_BGAP\_COUNTER[23:0] COUNTER bit field. When the ADC is idle (CONTROL\_TEMP\_SENSOR[10] BGAP\_TEMP\_SENSOR\_EOCZ = 0) and CONTROL\_TEMP\_SENSOR[11] BGAP\_TEMP\_SENSOR\_SOC = 0, the user must assert CONTROL\_BANDGAP\_CTRL[31] SINGLE\_MODE = 1 to enable programmable-delay repeated single conversions.

**NOTE:** The programmable-delay repeated single conversions require that software keeps CONTROL\_TEMP\_SENSOR[11] BGAP\_TEMP\_SENSOR\_SOC = 0 during the measurement sequence.

Figure 18-18 shows the timing sequence for a programmable-delay repeated single mode.

**Figure 18-18. Programmable-Delay Repeated Single Conversions**

As Figure 18-18 shows, the initial SOC pulse of a sequence is generated N-cycles after assertion of the SINGLE\_MODE bit, when BGAP\_COUNTER reaches N-1. The N-cycle period is repeated for consecutive SOC insertions until the sequence is stopped in software by deasserting the CONTROL\_BANDGAP\_CTRL[31] SINGLE\_MODE bit to 0.

The signal synchronization described in Section 18.4.10.2.1, *Single Conversion Mode*, applies to each single conversion in a measurement series. The general core control module sends the SOC pulses at regular programmable intervals defined through the value of the BGAP\_COUNTER bit field and registers the temperature when EOCZ is asserted low. Software must populate the correct value based on the band gap frequency and monitoring frequency, knowing that the band gap, regardless of the clock frequency, delivers its temperature after 17 clock cycles.

Table 18-20 provides examples for programming SOC pulse generation periods based on minimal (1 MHz) and maximal (2 MHz) band gap clock frequency.

**Table 18-20. Bandgap Counter Programming Examples**

Bandgap Clock	Monitoring Period				
	10 ms	20 ms	50 ms	100 ms	500 ms
1 MHz – 1000 ns	10,000 cycles	20,000 cycles	50,000 cycles	100,000 cycles	200,000 cycles

**Table 18-20. Bandgap Counter Programming Examples (continued)**

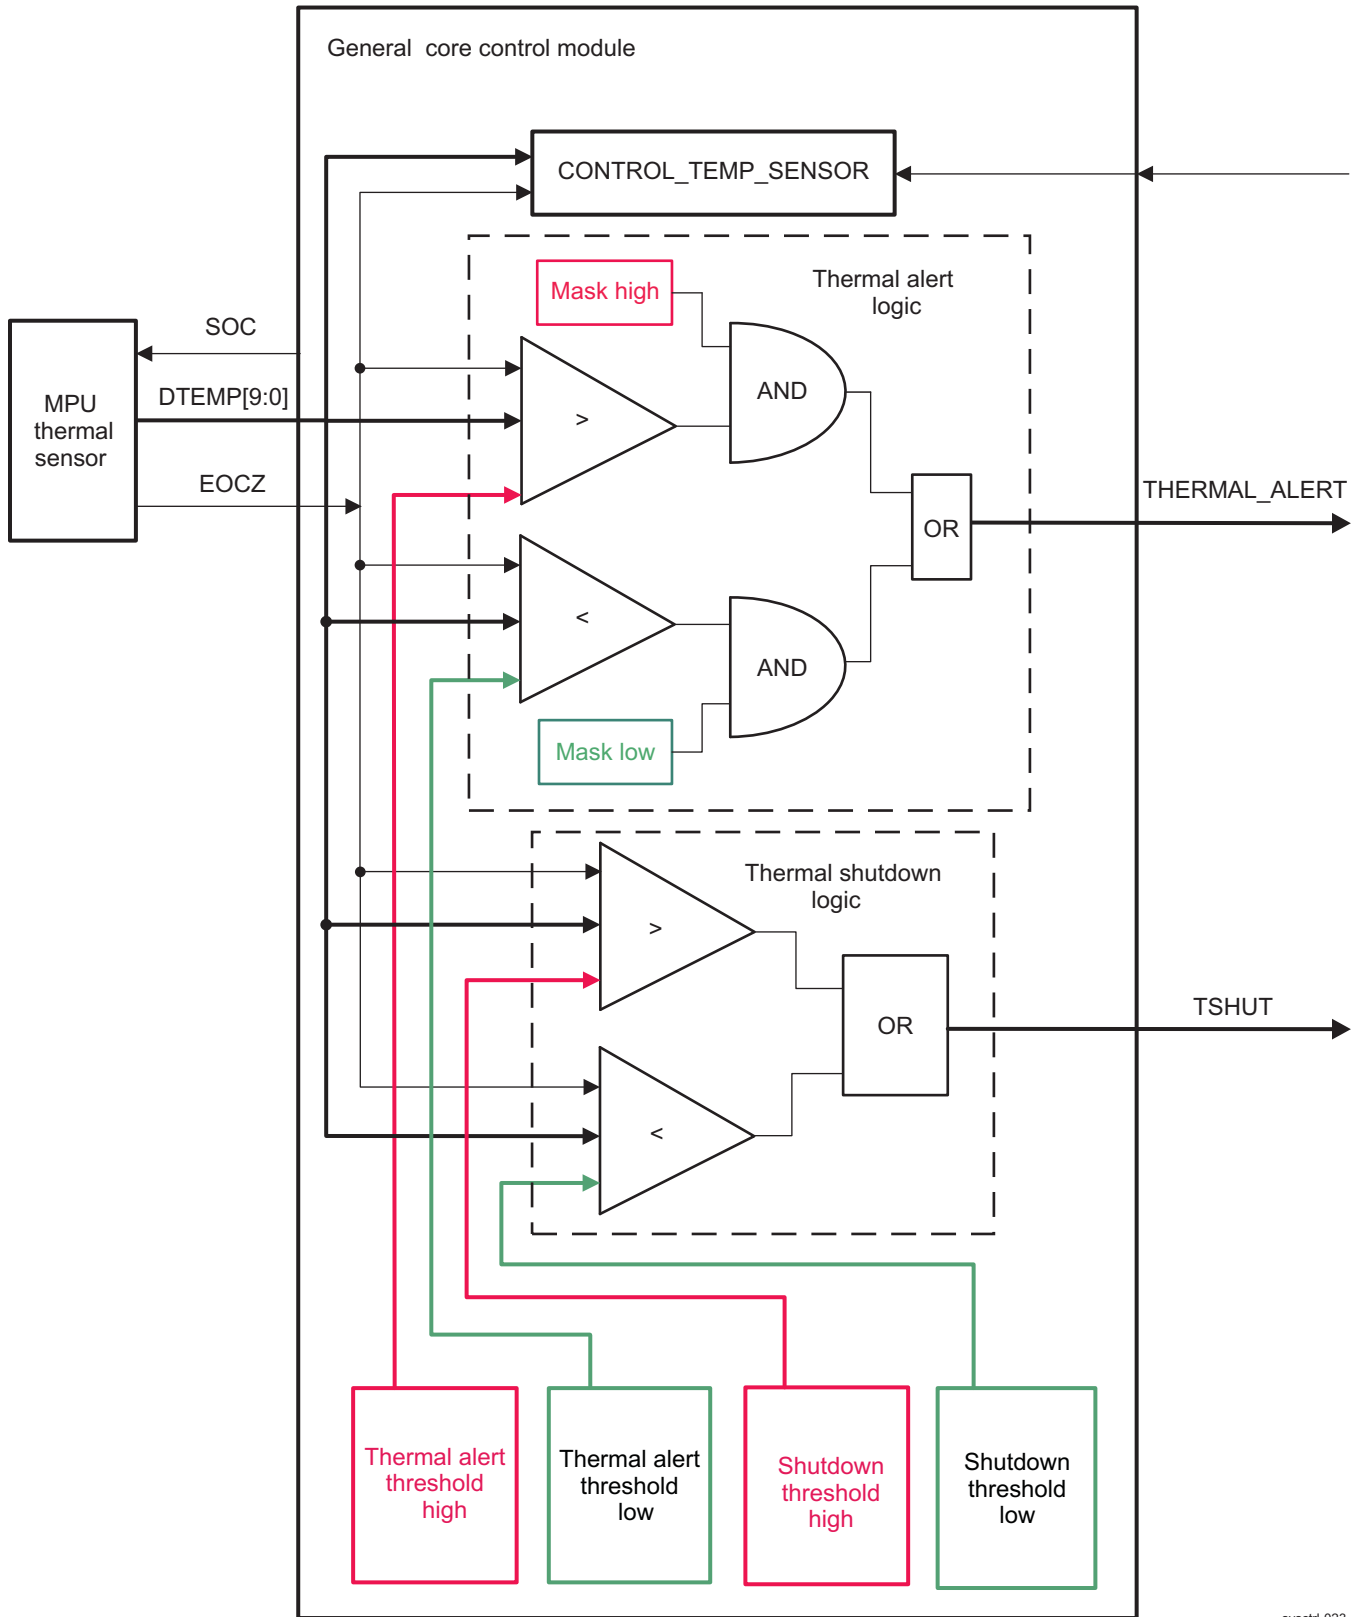

Bandgap Clock	Monitoring Period				
	10 ms	20 ms	50 ms	100 ms	500 ms
2 MHz – 500 ns	20,000 cycles	40,000 cycles	100,000 cycles	200,000 cycles	1,000,000 cycles

#### 18.4.10.2.3 Thermal Data Post-Processing Logic

A thermal data post-processing logic with dedicated registers is implemented in the general core control module. The registered ADC value is passed in parallel to the inputs of four comparators (two sets of two comparators). In each set, the temperature data is compared to high- and low-temperature thresholds defined in software, to handle the hysteresis effect when temperature decreases. The two comparator sets provide different thermal management functions.

[Figure 18-19](#) shows the thermal management schema in the device.

Figure 18-19. Thermal Management Schema

sysctrl-023

**NOTE:** The software settings of the comparator blocks must be applied before starting a single or repeated-single measurement sequence.

---

#### 18.4.10.2.4 Thermal Alert Functionality Comparators

The first set of comparators provides a thermal alert function output. The high- and low-temperature thresholds for this function are configurable through the 10-bit [CONTROL\\_BANDGAP\\_THRESHOLD\[25:16\]](#) T\_HOT and [CONTROL\\_BANDGAP\\_THRESHOLD\[9:0\]](#) T\_COLD bit fields, respectively. Thermal alert logic in the general core control module provides the capability to mask (active low) comparator outputs for hot and cold events through the [CONTROL\\_BANDGAP\\_CTRL\[1\]](#) MASK\_HOT and [CONTROL\\_BANDGAP\\_CTRL\[0\]](#) MASK\_COLD bits. [Figure 18-20](#) shows the functional logic of these 2 bits to mask comparator outputs for hot and cold thermal alert events. The masked HOT and COLD point monitoring signals are then ORed in the THERMAL\_ALERT signal, which delivers an interrupt to the MPU subsystem on the MA\_IRQ\_126 input (see [Section 18.3, Control Module Integration](#)). It can be used by software to implement a thermal management policy of the device. For more information about this interrupt, see [Section 17.3.2, Interrupt Requests to the Cortex-A9 MPU Interrupt Controller](#).

The nonmasked outputs of the thermal alert logic comparators are individually registered in the [CONTROL\\_BANDGAP\\_STATUS\[1\]](#) HOT\_FLAG and [CONTROL\\_BANDGAP\\_STATUS\[0\]](#) COLD\_FLAG read-only (RO) bits. The masked ORed event (that is, the THERMAL\_ALERT signal) is mapped to the [CONTROL\\_BANDGAP\\_STATUS\[2\]](#) BGAP\_ALERT RO bit. [Figure 18-20](#) shows the behavior of the thermal alert logic.

---

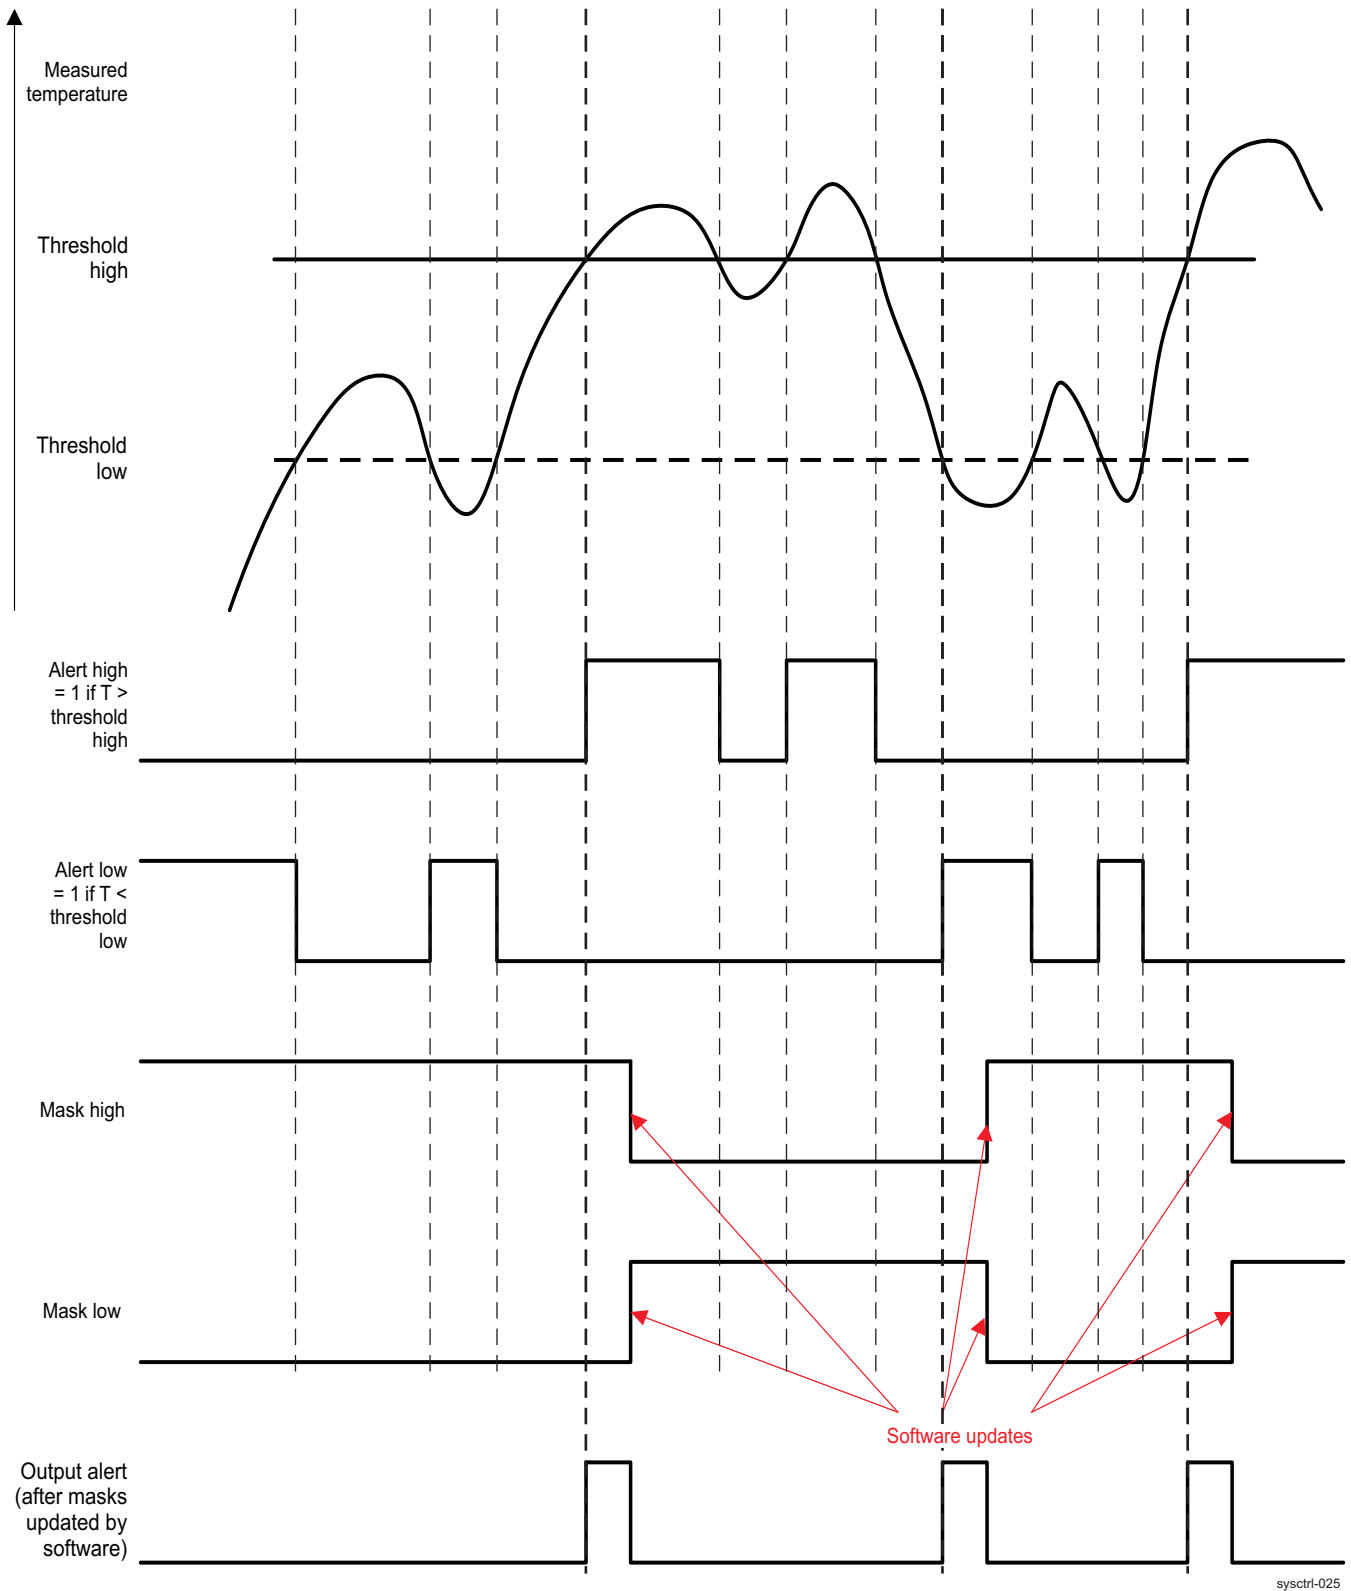

**NOTE:** The thermal processing logic of the general core control module generates an interrupt event to the MPU subsystem whenever the registered temperature of on-die thermal sensor crosses a software-configurable threshold.

---

#### CAUTION

Users must take care to program the value of the [CONTROL\\_BANDGAP\\_THRESHOLD\[25:16\]](#) T\_HOT bit field such that its corresponding temperature value does not exceed the maximal-allowed on-die temperature minus the temperature sensor offset estimated for the current conditions. For more information about the sensed temperature value constraints, see [Section 18.4.10.2, Temperature Sensor](#).

Figure 18-20. Thermal Alert Generation Signals

sysctrl-025

### 18.4.10.2.5 Thermal Shutdown Functionality Comparators

The second set of two comparators in the general core control module is responsible for the thermal shutdown protection of the device. Two 10-bit fields ([CONTROL\\_TSHUT\\_THRESHOLD\[25:16\]](#) TSHUT\_HOT and [CONTROL\\_TSHUT\\_THRESHOLD\[9:0\]](#) TSHUT\_COLD) define the high- and low-threshold code values, respectively. The default value of the TSHUT\_HOT bit field corresponds to the maximum allowed on the device die temperature. When the maximal temperature (TSHUT\_HOT) is reached, TSHUT output is activated. The TSHUT output of the general core control module is tied internally to a GPIO3 module input pin (see [Section 18.3, Control Module Integration](#)). Its main purpose is to indicate that the maximum junction temperature of the die is reached, which is true when the temperature measured by the on-die sensor (at sensor location), satisfies the condition:

$$T_{\text{sensor\_location\_max\_tshut}}, \text{ } ^\circ\text{C} = T_{\text{max\_allowed\_hottest\_spot}}, \text{ } ^\circ\text{C} - \Delta T_{\text{estimated\_temp\_offset}}, \text{ } ^\circ\text{C}$$

To prevent device malfunction or permanent damage to the device, software must take immediate action to reduce power dissipation by warm-resetting the device or freezing most internal activities.

#### CAUTION

User software must always provide that the temperature corresponding to the programmed value of the [CONTROL\\_TSHUT\\_THRESHOLD\[25:16\]](#) TSHUT\_HOT bit field does not exceed the described  $T_{\text{sensor\_location\_max\_tshut}}$  limit value. For more information about the sensed temperature value constraints, see [Section 18.4.10.2, Temperature Sensor](#).

For more information about thermal-related GPIO interrupts, see [Chapter 25, General-Purpose Interface](#).

To deactivate TSHUT output, the temperature ADC-encoded value must go below the value of TSHUT\_COLD threshold.

#### CAUTION

In case of a thermal shutdown event ( $T_{\text{shut\_hot}}, \text{ } ^\circ\text{C}$  value exceeded), users must take care to software-trigger a warm reset on the device upon a GPIO-generated TSHUT interrupt event. The device has no hardware mechanism to automatically generate a thermal-shutdown warm reset.

[Figure 18-21](#) shows the behavior of the TSHUT logic.

## 18.4.11 Hardware Observability

### 18.4.11.1 Device Internal Signals Observability Overview

The general control module provides observability features covering different module internal signals related to:

- Power and reset management protocol inside different power domains
- Power domain states/transition indication
- Interrupt requests by different modules
- DMA requests by different modules
- Clocks and clock management

The associated signal multiplexing function is controlled through the hardware observability I/O multiplexing registers (32-bit read/write registers). The selected observable signals are multiplexed between the general control module CORE and/or WKUP power domain and are output on the po\_hw\_dbg[31:0] observability bus at the boundaries of the general wake-up control module. The po\_hw\_dbg[31:0] observability outputs are then exported to the device control module logic to be further multiplexed as their corresponding hw\_dbg[31:0] signals on the different pads of the WKUP or CORE power domain of the device control module (see [Section 18.4.11.4, Observability Signals Multiplexing at Device Control Module Level](#)).

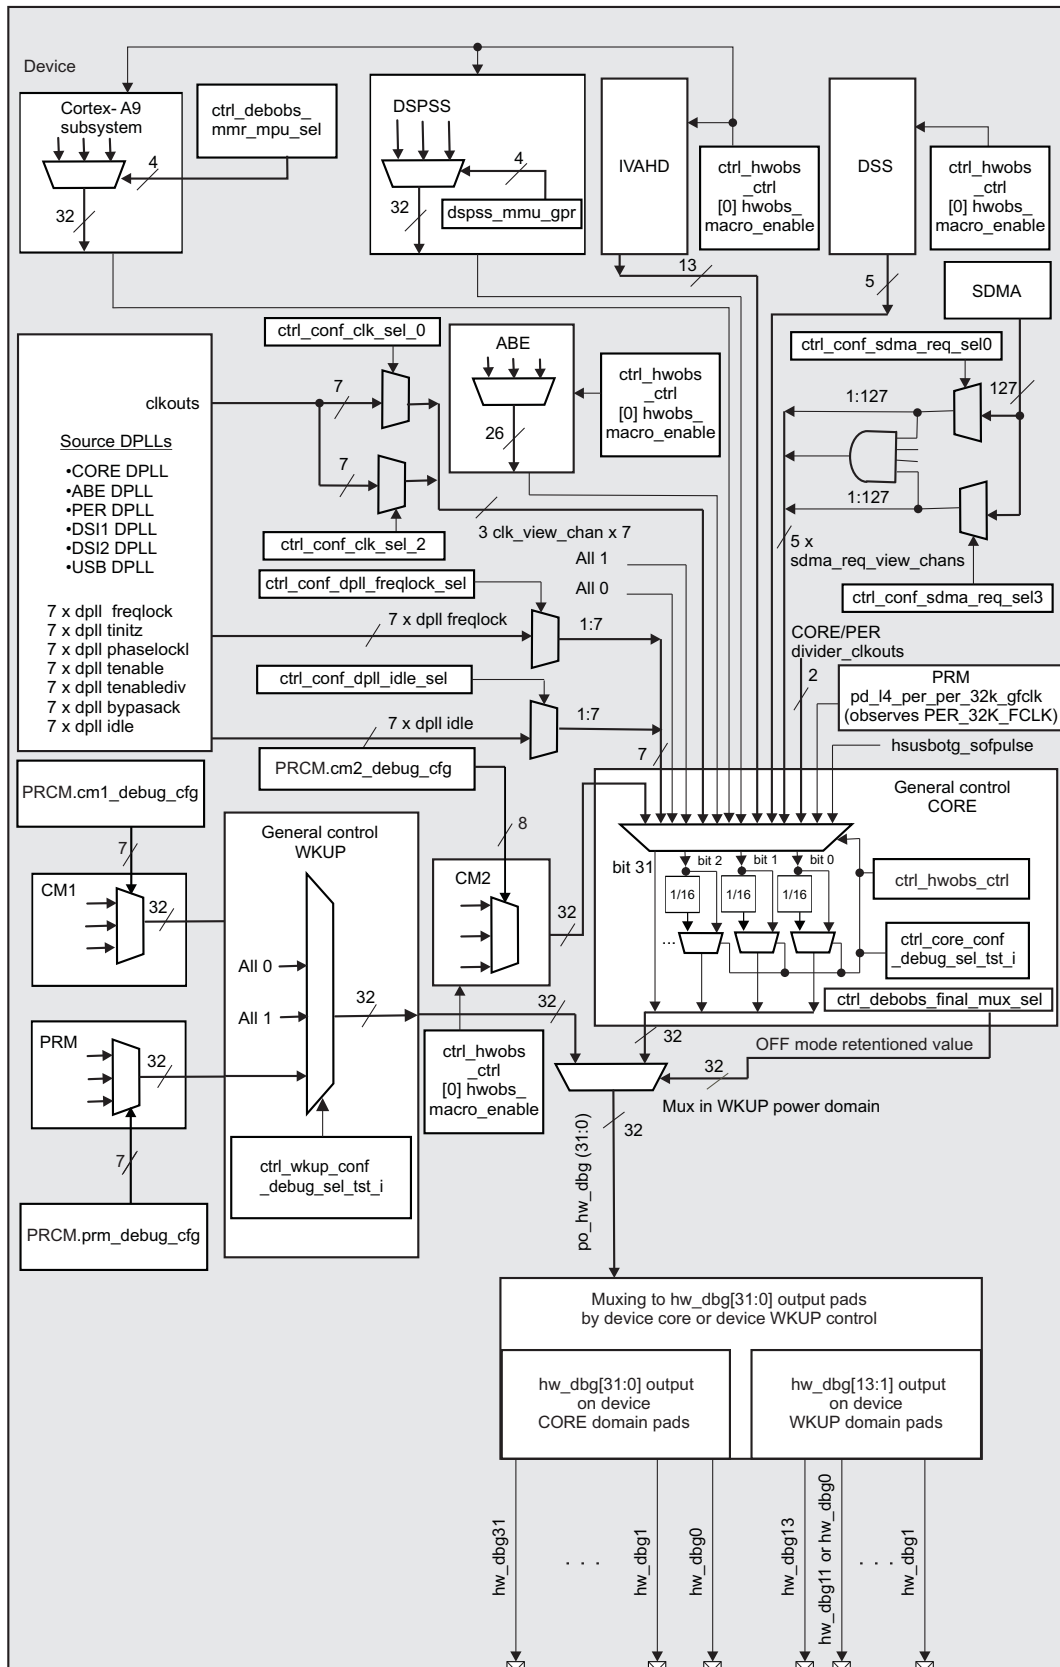

---

**NOTE:** Each signal po\_hw\_dbg\_i (where i = 0 to 31) of the general control wakeup po\_hw\_dbg[31:0] bus is propagated by device control module-level logic as its corresponding hw\_dbg<sub>i</sub> output signal at the device boundary (where i = 0 to 31) for the device CORE power domain pads and where i = 0 to 13 for the device WKUP power domain pads (with the constraint that hw\_dbg<sub>0</sub> and hw\_dbg<sub>11</sub> are multiplexed on the same WKUP power domain pad) described in [Section 18.4.11.4, Observability Signals Multiplexing at Device Control Module Level](#).

---

[Figure 18-22](#) is an overview of observability multiplexing, which minimizes the number of signals exchanged at the device boundary.

Figure 18-22. Overview of the Hardware Observability Functionality

sysctrl-006

### 18.4.11.2 Observability Gating Capabilities

The programmer has the option to gate all 32 signals of the observability bus simultaneously at the observability paths of the CORE and WKUP power domains, keeping them tied to 1 ([CONTROL\\_HWOBS\\_CONTROL\[1\]](#) HWOBS\_ALL\_ONE\_MODE = 0b1) or keeping them tied to 0 ([CONTROL\\_HWOBS\\_CONTROL\[2\]](#) HWOBS\_ALL\_ZERO\_MODE = 0b1). This can be useful to check the path from hardware observability to external pads. These two bits must be set to 0 to enable the observability feature for all observability pads.

Additionally, the [CONTROL\\_HWOBS\\_CONTROL\[0\]](#) HWOBS\_MACRO\_ENABLE bit provides the gating feature only to observability signals muxed in the CORE power domain that come from the following modules (identified in the so-called MACRO group):

- CORTEX-A9 MPU subsystem
- DSP subsystem
- IVA-HD
- Display subsystem
- CM2
- ABE

When [CONTROL\\_HWOBS\\_CONTROL\[0\]](#) HWOBS\_MACRO\_ENABLE = 0b0, the observability outputs associated with the MACRO group are gated and forced to 0b0.

---

**NOTE:** Do not set the observability gating bits [CONTROL\\_HWOBS\\_CONTROL\[1\]](#) HWOBS\_ALL\_ONE\_MODE and [CONTROL\\_HWOBS\\_CONTROL\[2\]](#) HWOBS\_ALL\_ZERO\_MODE simultaneously to 1 to avoid undefined states of the observability bus.

---

The clock frequency of the hw\_dbg0, hw\_dbg1, and hw\_dbg2 signals can be optionally divided by 1, 2, 4, 8, or 16 through programming dedicated bit fields in [CONTROL\\_HWOBS\\_CONTROL](#).

Assignment of dividers to the hw\_dbg0, hw\_dbg1, and hw\_dbg2 signals applies only in the CORE power domain, as follows:

- [7:3] HWOBS\_CLKDIV\_SEL for hw\_dbg0
- [13:9] HWOBS\_CLKDIV\_SEL\_1 for hw\_dbg1
- [18:14] HWOBS\_CLKDIV\_SEL\_2 for hw\_dbg2

---

**NOTE:** Only the CORE power domain signals hw\_dbg0, hw\_dbg1, and hw\_dbg2 pass through the [CONTROL\\_HWOBS\\_CONTROL](#) programmable dividers. These dividers are not available to the corresponding po\_hw\_dbg(0), po\_hw\_dbg(1), and po\_hw\_dbg(2) lines in the WKUP power domain.

---

---

**NOTE:** To enable observability over the po\_hw\_dbg(0), po\_hw\_dbg(1), and po\_hw\_dbg(2) bus lines, the HWOBS\_CLKDIV\_SEL, HWOBS\_CLKDIV\_SEL\_1, and HWOBS\_CLKDIV\_SEL\_2 bit fields in the [CONTROL\\_HWOBS\\_CONTROL](#) register must be set different than 0. The default value (0) is not sufficient to see the observability value at the hw\_dbg0, hw\_dbg1, and hw\_dbg2 pins.

---

**NOTE:** The hw\_dbg0, hw\_dbg1, and hw\_dbg2 frequency division and ability to gate the MACRO group observability signals (hw\_dbg i, configurable in the [CONTROL\\_HWBOBS\\_CONTROL](#) register) are limited to the hardware observability signals hw\_dbg i (where i = 0 to 31) multiplexed and propagated in the CORE power domain ([CONTROL\\_DEBOBS\\_FINAL\\_MUX\\_SEL\[i\] SELECT = 0b1](#)).

These options do not apply to the hardware observability signals, hw\_dbg i (where i = 0 to 31), which are muxed in the WKUP power domain ([CONTROL\\_DEBOBS\\_FINAL\\_MUX\\_SEL\[i\] SELECT = 0x0](#)).

### 18.4.11.3 Observability Signals Multiplexing at General Core/Wake-Up Control Level

Most of the observability multiplexers (MACRO group modules/DPLLs/sDMA associated) are configurable in the General Core Control Module, which is part of the switchable CORE power domain. Signal multiplexers are also instantiated in the general wakeup control module (CM1/PRM dedicated), which is part of the WKUP power domain. The [CONTROL\\_DEBOBS\\_FINAL\\_MUX\\_SEL\[31:0\] SELECT](#) bit field, instantiated in the CORE power domain, selects a signal to be observed between the outputs at the CORE and WKUP multiplexing levels. A bit from this register set to 1 selects to route a signal from the CORE power domain to a certain po\_hw\_dbg<sub>n</sub> (where n = 0...31) line, and when the bit is set to 0, selects to route a signal from the WKUP power domain to the same line. The output of this top-level multiplexing is further passed to the padconfiguration muxing I/O level within device control module boundaries.

**NOTE:** Although the [CONTROL\\_DEBOBS\\_FINAL\\_MUX\\_SEL](#) observability control register is in the CORE power domain, its value is retentioned before the device goes into off mode. Thus, the preserved value is used to control the final observability muxer in the WKUP power domain, even when the PD\_CORE supply in the device is switched off. Because the hw\_dbg i signals, which are propagated in the CORE power domain, are not available in off mode, the value of [CONTROL\\_DEBOBS\\_FINAL\\_MUX\\_SEL\[i\] SELECT = 0b1](#) (where i = 0 to 31) in this case means that the hw\_dbg i signal is not available at output.

The module and view-channel selection/reduction layer in the CORE domain is configured through the 4-bit field MODE in the 32 x 32-bit registers [CONTROL\\_CORE\\_CONF\\_DEBUG\\_SEL\\_TST\\_0](#) through [CONTROL\\_CORE\\_CONF\\_DEBUG\\_SEL\\_TST\\_31](#). The following modules can be selected as source of observability signals: Cortex-A9 MPU subsystem, DSP subsystem, IVA-HD, display subsystem, CM2, and ABE (MACRO signal sources).

Some of the [CONTROL\\_CORE\\_CONF\\_DEBUG\\_SEL\\_TST](#) registers are responsible for selection of sDMA view channels, different DPLL clock view channels, and other signal view channels.

- 3 x DPLL clockout signal view channels
- 7 x DPLL (other than clkout signal) view channels
- 5 x sDMA signal view channels
- 3 x additional clockout view channels monitoring the hwobs\_coredivider\_clkout3, hwobs\_perdivider\_clkout4, and hwobs\_pd\_l4\_per\_per32k\_gfclk signals.

[Table 18-22](#) summarizes the internal signals multiplexing schema for each of the 32 [CONTROL\\_CORE\\_CONF\\_DEBUG\\_SEL\\_TST](#) registers.

**Table 18-22. CORE Power Domain Observability Signals Multiplexing**

**Table 18-22. CORE Power Domain Observability Signals Multiplexing (continued)**

REG_NAME	REG_ID	REG_OFFSET	REG_RESET	INPUT0	INPUT1	INPUT2	INPUT3	INPUT4	INPUT5	INPUT6	INPUT7	INPUT8	INPUT9	INPUT10	INPUT11	INPUT12
<a href="#">CONTROL_CORE_CONF_DEBUG_SEL_TST_29</a>	29	0x04F4	0x0	hwobs_int_mpu(29)	Reserved	0	Reserved	0	hwobs_int_cm2(29)	hwobs_int_ivahd(29)	Reserved	hwobs_int_abe(29)	hwobs_int_dspss(29)	Reserved	0	sdma_req_view_2
<a href="#">CONTROL_CORE_CONF_DEBUG_SEL_TST_30</a>	30	0x04F8	0x0	hwobs_int_mpu(30)	Reserved	0	Reserved	0	hwobs_int_cm2(30)	hwobs_int_ivahd(30)	Reserved	hwobs_int_abe(30)	hwobs_int_dspss(30)	Reserved	0	sdma_req_view_3
<a href="#">CONTROL_CORE_CONF_DEBUG_SEL_TST_31</a>	31	0x04FC	0x0	hwobs_int_mpu(31)	Reserved	0	Reserved	0	hwobs_int_cm2(31)	hwobs_int_ivahd(31)	Reserved	hwobs_int_abe(31)	hwobs_int_dspss(31)	Reserved	0	sdma_req_view_all

A third 1:N selection layer is applied over several signals to route them one-at-a-time to a certain view channel output:

- The [CONTROL\\_CONF\\_CLK\\_SEL0\[2:0\]](#) MULT through [CONTROL\\_CONF\\_CLK\\_SEL2\[2:0\]](#) MULT bit fields control the multiplexing of DPLL CLKOUT signals over three parallel DPLL clockout view channels. The signal source of a certain view channel can be selected to be one of six DPLLs in the device:
  - CORE DPLL
  - ABE DPLL
  - PER DPLL
  - DSI1 DPLL
  - DSI2 DPLL
  - USB DPLL
- The register bit fields associated with the seven different DPLL signal view channels are summarized in [Table 18-23](#). Again, the 3-bit MULT bit field in each of the seven registers makes it possible to choose the source of the DPLL signal to be one of the following device DPLLs:
  - CORE DPLL
  - ABE DPLL
  - PER DPLL
  - DSI1 DPLL
  - DSI2 DPLL
  - USB DPLL
- There are four independent sDMA request view channels, each of which has a dedicated register ([CONTROL\\_CONF\\_SDMA\\_REQ\\_SEL0](#) through [CONTROL\\_CONF\\_SDMA\\_REQ\\_SEL3](#)) with a 7-bit MULT bit field to select one from 127 possible sDMA request signals for observation purposes. For more information, see [Chapter 16, sDMA Controller](#). The fifth channel, `sdma_req_view_all`, is acquired by applying logical AND reduction over the four currently selected sDMA view channel output signals.

- The General Core observability logic input (hwobs\_pd\_l4\_per\_per32k\_gfclk) is tied to the PRM output observability signal (pd\_l4\_per\_per\_32k\_gfclk). The pd\_l4\_per\_per\_32k\_gfclk signal corresponds to the hardware gated in the L4\_PER clock domain clock (PER\_32K\_FCLK), which is directly sourced by the SCRM clock (32K\_FCLK). For more information, see [Section 3.6.3.1, PRM Clock Source](#), in [Chapter 3, Power, Reset, and Clock Management](#). The PER\_32K\_FCLK and 32K\_FCLK clocks are also multiplexed for observability in the WKUP domain when the PRCM.PRM\_DEBUG\_CFG[6:0] bit field is set to 0x6C. The observable signals are devfsm\_I0.clk and gat\_per\_32k\_gfclk\_I0.clkGated, respectively. For more information, see [Table 18-49, PRM Observable Signals](#).
- The General Core observability logic input, hwobs\_coredivider\_clkout3, is tied to the Core DPLL observability output, CLK\_FUNC\_1\_0\_3, which is a direct (nongated, nondivided) version of the CORE DPLL clock output, CLKOUTX2\_M3. For more information, see [Section 3.6.3.5, DPLL\\_CORE Description](#), in [Chapter 3, Power, Reset, and Clock Management](#).
- The General Core observability logic input, hwobs\_perdivider\_clkout4, is tied to the Core DPLL observability output, CLK\_FUNC\_1\_0\_4, which is a direct (nongated, nondivided) version of the PER DPLL clock output, CLKOUTX2\_M4. For more information, see [Section 3.6.3.4, DPLL\\_PER Description](#), in [Chapter 3, Power, Reset, and Clock Management](#).

[Table 18-23](#) lists the DPLL signal observability controls.

**Table 18-23. DPLL Signal Observability Controls**

Feature	Type	Register/Bit Field/Observability Control	Description
Different domain DPLL freqlock observability	Control	<a href="#">CONTROL_CONF_DPLL_FREQLOCK_SEL</a> [2:0] MULT	Selects DPLL freqlock view channel (1:8)
Different domain DPLL phaselock observability	Control	<a href="#">CONTROL_CONF_DPLL_PHASELOCK_SEL</a> [2:0] MULT	Selects DPLL phaselock view channel (1:8)
Different domain DPLL tinitz observability	Control	<a href="#">CONTROL_CONF_DPLL_TINITZ_SEL</a> [2:0] MULT	Selects to observe DPLL tinitzview channel (1:8)
Different domain DPLL tenable observability	Control	<a href="#">CONTROL_CONF_DPLL_TENABLE_SEL</a> [2:0] MULT	Selects to observe DPLL tenableview channel (1:8)
Different domain DPLL tenablediv observability	Control	<a href="#">CONTROL_CONF_DPLL_TENABLEDIV_SEL</a> [2:0] MULT	Selects to observe DPLL tenabledivview channel (1:8)
Different domain DPLL bypassack observability	Control	<a href="#">CONTROL_CONF_DPLL_BYPASSACK_SEL</a> [2:0] MULT	Selects to observe DPLL bypassackview channel (1:8)
Different domain DPLL idle observability	Control	<a href="#">CONTROL_CONF_DPLL_IDLE_SEL</a> [2:0] MULT	Selects to observe DPLL idleview channel (1:8)

**NOTE:** Features configured in the following registers are limited to hardware observability signals, hw\_dbg i (where i = 0 to 31), multiplexed and propagated in the CORE power domain ([CONTROL\\_DEBOBS\\_FINAL\\_MUX\\_SEL\[i\] SELECT = 0b1](#)):

- [CONTROL\\_CORE\\_CONF\\_DEBUG\\_SEL\\_TST\\_0](#) through [CONTROL\\_CORE\\_CONF\\_DEBUG\\_SEL\\_TST\\_31](#)
- [CONTROL\\_CONF\\_CLK\\_SEL0\[2:0\] MULT](#) through [CONTROL\\_CONF\\_CLK\\_SEL2\[2:0\] MULT](#)
- [CONTROL\\_CONF\\_SDMA\\_REQ\\_SEL0](#) through [CONTROL\\_CONF\\_SDMA\\_REQ\\_SEL3](#)
- [CONTROL\\_CONF\\_DPLL\\_FREQLOCK\\_SEL](#)
- [CONTROL\\_CONF\\_DPLL\\_TINITZ\\_SEL](#)
- [CONTROL\\_CONF\\_DPLL\\_PHASELOCK\\_SEL](#)
- [CONTROL\\_CONF\\_DPLL\\_TENABLE\\_SEL](#)
- [CONTROL\\_CONF\\_DPLL\\_TENABLEDIV\\_SEL](#)
- [CONTROL\\_CONF\\_DPLL\\_BYPASSACK\\_SEL](#)
- [CONTROL\\_CONF\\_DPLL\\_IDLE\\_SEL](#)

These options are not applicable to hardware observability signals, hw\_dbg i (where i = 0 to 31), which at the general control module level are muxed in the WKUP power domain ([CONTROL\\_DEBOBS\\_FINAL\\_MUX\\_SEL\[i\] SELECT = 0b0](#)).

The [CONTROL\\_WKUP\\_CONF\\_DEBUG\\_SEL\\_TST\\_i\[0\] MODE](#) bit (where i = 0...31) provides the option to choose between observation of power and reset manager signals in the device or observation of signals related to CM1. If [CONTROL\\_WKUP\\_CONF\\_DEBUG\\_SEL\\_TST\\_i\[0\] = 0b1](#), the hwobs\_int\_prm\_i signal is selected. Otherwise, the hwobs\_int\_cm1\_i signal is output.

**NOTE:** The CM1 and PRM observable signals are multiplexed in the WKUP power domain.

#### 18.4.11.4 Observability Signals Multiplexing at Device Control Module Level

The pads used for the hardware debug must be properly configured by selecting the hardware debug function (hw\_dbgn) of the pad.

##### 18.4.11.4.1 Observability Signals Muxed on Pads in Core Power Domain

To map the hw\_dbg0 through hw\_dbg19 signals to their associated external device pads in the CORE power domain, set the related MUXMODE bit fields within the [CONTROL\\_CORE\\_PAD0\\_SYS\\_BOOT5\\_PAD1\\_DPM\\_EMU0](#) through [CONTROL\\_CORE\\_PAD0\\_DPM\\_EMU19\\_PAD1\\_CSI22\\_DX2](#) padconfiguration registers to 0b110 (Mode 6). To make the remaining signals (hw\_dbg20 through the hw\_dbg31) available at their corresponding device pads in the CORE power domain, set the MUXMODE bit fields within the [CONTROL\\_CORE\\_PAD0\\_CAM\\_GLOBALRESET\\_PAD1\\_USBB1\\_ULPITLL\\_CLK](#) through [CONTROL\\_CORE\\_PAD0\\_USBB1\\_ULPITLL\\_DAT7\\_PAD1\\_USBB1\\_HSIC\\_DATA](#) padconfiguration registers to 0b110 (Mode 6).

For more information, see [Table 18-10](#), *Device Core Control Module Pad Configuration Register Fields*.

For more information about hardware observability configuration, see [Table 18-121](#), *ACTIVE PADS Configuration Points*.

---

**NOTE:** The hw\_dbg i signals (where i = 0 to 31), which are multiplexed and propagated in the CORE power domain, are not visible when the device is set in off mode (PD\_CORE supply switched off).

---

##### 18.4.11.4.2 Observability Signals Muxed on Pads in WKUP Power Domain

To have hw\_dbg1 through hw\_dbg13 signals multiplexed on the WKUP power domain pads, set MuxMode = 0x6 in the following SYSCTRL\_PADCONF\_WKUP registers:

- [CONTROL\\_WKUP\\_PAD0\\_GPIO\\_WK0\\_PAD1\\_GPIO\\_WK1](#) through [CONTROL\\_WKUP\\_PAD0\\_GPIO\\_WK2\\_PAD1\\_GPIO\\_WK3](#)[31:16] to have the hw\_dbg1–hw\_dbg4 signals output on the gpio\_wk0–gpio\_wk3 device pads, respectively
- [CONTROL\\_WKUP\\_PAD0\\_GPIO\\_WK4\\_PAD1\\_SR\\_SCL](#)[15:0] to have the hw\_dbg5 signal output on the gpio\_wk4 device pad
- [CONTROL\\_WKUP\\_PAD0\\_FREF\\_CLK0\\_OUT\\_PAD1\\_FREF\\_CLK3\\_REQ](#) through [CONTROL\\_WKUP\\_PAD0\\_FREF\\_CLK3\\_OUT\\_PAD1\\_FREF\\_CLK4\\_REQ](#) to have the hw\_dbg6–hw\_dbg9 signal output on the freq\_clk0\_out, freq\_clk3\_req, freq\_clk3\_out, and freq\_clk4\_req device pads, respectively
- [CONTROL\\_WKUP\\_PAD0\\_FREF\\_CLK4\\_OUT\\_PAD1\\_SYS\\_32K](#)[15:0] to have the hw\_dbg10 signal output on the freq\_clk4\_out device pad
- [CONTROL\\_WKUP\\_PAD0\\_SYS\\_PWR\\_REQ\\_PAD1\\_SYS\\_PWRON\\_RESET\\_OUT](#)[31:16] to have the hw\_dbg11 signal output on the sys\_pwron\_reset\_out device pad
- [CONTROL\\_WKUP\\_PAD0\\_SYS\\_BOOT6\\_PAD1\\_SYS\\_BOOT7](#) to have the hw\_dbg12 and hw\_dbg13 signals output on the sys\_boot6 and sys\_boot7 device pads, respectively

The hw\_dbg0 signal is available on the sys\_pwron\_reset\_out pad in WKUP domain, through setting MuxMode=0x5 in

the [CONTROL\\_WKUP\\_PAD0\\_SYS\\_PWR\\_REQ\\_PAD1\\_SYS\\_PWRON\\_RESET\\_OUT](#)[31:16] register. Because hw\_dbg11 (MuxMode=0x6) and hw\_dbg0 (MuxMode=0x5) are muxed on the same pad - sys\_pwron\_reset\_out, user should make choice between the two observable signals in WKUP domain

See [Table 18-9](#), *Device Wakeup Control Module Pad Configuration Register Fields* for more information.

See [Table 18-121](#), *ACTIVE PADS Configuration Points*, for more details on hardware observability configuration.

**NOTE:** If multiplexed on corresponding device pads in the WKUP power domain, the hw\_dbg i signals (where i = 0 to 31), which are multiplexed and propagated in the WKUP power domain, can be observed even if the device goes into off mode.

### 18.4.11.5 Observability Signals Sourced at Module Level

Observable signals coming from within different device subsystems are mapped to general core control and general wakeup control observability inputs. Additional multiplexing is also implemented inside some of the observable modules (see [Figure 18-22, Overview of the Hardware Observability Functionality](#)).

#### 18.4.11.5.1 Dual Cortex-A9 Subsystem Observable Signals

[Table 18-24](#) through [Table 18-32](#) list the Cortex-A9 MPU subsystem observable signals available in 12 functional multiplexing modes. The mode is selected at the general core control module level by programming the [CONTROL\\_DEBOBS\\_MMR\\_MPU\[3:0\] SELECT](#) bit field. The SELECT values in range (0xC–0xF) are reserved for future use.

**Table 18-24. Observability Signals Multiplexing at Cortex-A9 MPU Subsystem Level – Mode 0**

hwobs_int_mpu[0]			

The POPROFILING\_EVENT2PRM bus signals, observable in modes 0, 1, 2, and 3, monitor the power states of the CPU. There are 6 status bits per Cortex-A9 CPU0 and CPU1, respectively. [Table 18-28](#) describes the encoding of the status bits.

POPROFILING\_EVENT2PRM[5:0] are the status bits for CPU0, and POPROFILING\_EVENT2PRM[11:6] are the status bits for CPU1.

**Table 18-28. CPU0/CPU1 PM Profiling Bus Observable Signals Description**

hwobs_dssdacpwrdbgz	DSS_DAC_PWR_DNBGZ	Display subsystem DAC pwrdbgz – Band gap power down for DAC	0: DAC Bandgap put in power-down mode 1: DAC Bandgap put in ACTIVE state

**NOTE:** The (VDAC) function is not supported.

#### 18.4.11.5.4 DSP Subsystem Observable Signals

Table 18-39 through Table 18-45 show Cortex-A9 MPU subsystem observable signals available in eight multiplexing modes. The mode is selected at the general control module level through writing in the bit field DSPSS\_MMU\_GPR[3:0] HWDEBUG\_MUX.

The DSPSS.DSPSS\_MMU\_GPR register provides mux control for hardware observability signals exported at the DSPSS boundary to the general control module. Interrupts, DMA requests, and other events can be seen on the PO\_HW\_DBG\_OUT bus. The DSPSS.DSPSS\_MMU\_GPR register provides mux controls for selecting the appropriate 32-bit value to be output on the PO\_HW\_DBG\_OUT signal bus. The mux values and associated signals that can be observed on the PO\_HW\_DBG\_OUT bus are described in Chapter 20, *Memory Management Units*. Setting the DSPSS.DSPSS\_MMU\_GPR[15] FORCE\_IDLE\_REQ bit initiates IDLE request/acknowledgment protocol with various blocks; the acknowledge information can be observed when HWDEBUG\_MUX = 4'b1110.

All interrupts into DSPSS can be observed by setting the DSPSS.DSPSS\_MMU\_GPR[3:0] HWDEBUG\_MUX bit field to 0x6, 0x7, 0x8, and 0x9. All interrupts to the INTC, which includes external and internal interrupts, can be seen by setting the HWDEBUG\_MUX values to 0x2, 0x3, 0x4, and 0x5. DMA requests can be seen when the HWDEBUG\_MUX values are set to 0xA and 0xB.

DPLL\_IVA and the associated HSDIVIDER values can be seen by values of 0x0, the default reset value. DSPSS raw CD0 clock is sent out without any division. Other clocks are divided by 32.

The DSPSS.DSPSS\_MMU\_GPR[15] FORCE\_IDLE\_REQ bit must be used only for observability purposes, not in functional mode. When set, the FORCE\_IDLE\_REQ bit causes IDLE requests to be sent to various components inside the DSPSS, and idle acknowledgment is displayed when the value of the HWDEBUG\_MUX[3:0] bit field is 4'b1110; the signals listed can then be checked to determine which component is not idle.

**NOTE:** Once this feature is used, FORCE\_IDLE\_REQ must be set to 0 before continuing the observability process.

hwobs_int_abe[18]	AESS_DMAREQ_PER	(Logical OR with all DMA requests coming from the peripheral)	High when incoming DMA requests from audio engine are still to be served
hwobs_int_abe[17]	AESS_IDLEPO	PO_IDLE AESS output	High when the audio engine executes a wait until an activation of the PI_WAKEUP pin is done
hwobs_int_abe[16:0]	RESERVED	–	–

#### 18.4.11.5.6 USBOTGHS Subsystem Observable Signals

One of the General Wakeup Control observability inputs can be mapped to the USBOTGHS start-of-frame signal (hsusbogt\_sofpulse) by setting [CONTROL\\_CORE\\_CONF\\_DEBUG\\_SEL\\_TST\\_11\[3:0\] MODE = 0x1](#).

#### 18.4.11.5.7 CM2 Subsystem Observable Signals

The SYSCTRL\_GENERAL\_CORE observability inputs hwobs\_int\_cm2(i), (where i = 0...31) are mapped to the signals debugcm2(i), (where i = 0...31) coming out of the PRCM submodule, clock manager 2 (CM2).

Local multiplexing controls at the CM2 level are in the CM2\_DEBUG\_CFG register. The CM2 observability output signals are driven on the debugcm2(0) through debugcm2(7) lines. A certain mux set is selected by programming the CM2\_DEBUG\_CFG[7:0] SEL0 bit field. The remaining debugcm2(8) through debugcm2(31) lines are reserved for future use. For more information about the CM2 observability source select field, see [Section 3.11.30.1, INTRCONN\\_SOCKET\\_CM2 Register Summary](#), in [Chapter 3, Power, Reset, and Clock Management](#).

[Table 18-47](#) provides different details about the signals inside the CM 2 that can be monitored on device hw\_dbg pins.

**18.4.11.5.8 CM1 Subsystem Observable Signals**

The General Wakeup Control observability inputs `hwobs_int_cm1(i)`, (where  $i = 0 \dots 31$ ) are mapped to the signals `debugcm1(i)`, (where  $i = 0 \dots 31$ ) coming out of the PRCM submodule clock manager 1 (CM1).

Local multiplexing controls at the CM1 level are in the `CM1_DEBUG_CFG` register. The CM1 observability output signals are driven on the `debugcm1(0)` through `debugcm1(7)` lines. A certain mux set is selected by programming the `CM1_DEBUG_CFG[6:0] SEL0` bit field. The remaining `debugcm1(8)` through `debugcm1(31)` lines are reserved for future use. For more information about the CM1 observability source select field, see [Section 3.11.22.1](#), *INTRCONN\_SOCKET\_CM1 Register Summary* in [Chapter 3](#), *Power, Reset, and Clock Management*.

[Table 18-48](#) provides different details about the signals inside CM1 that can be monitored on device `hw_dbg` pins.

#### 18.4.11.5.9 PRM Subsystem Observable Signals

The General Wakeup Control observability inputs hwobs\_int\_prm(i), (where i = 0...31) are mapped to the signals debugprm(i), (where i = 0...31) coming out from the power reset manager (PRM) submodule.

Local multiplexing controls at the PRM level are in the PRM\_DEBUG\_CFG register. The PRM observability output signals are driven on the debugprm(0) through debugprm(7) lines. A certain mux set is selected by programming the PRM\_DEBUG\_CFG[6:0] SEL0 bit field. The remaining debugprm(8) through debugprm(31) lines are reserved for future use. For more information about the PRM observability source select field, see [Section 3.11.2.1, INTRCONN\\_SOCKET\\_PRM Register Summary](#) in [Chapter 3, Power, Reset, and Clock Management](#).

[Table 18-49](#) provides different details about the signals inside the PRM that can be monitored on device hw\_dbg pins.

**18.4.11.5.10 PRCM FSM State Observable Signals Description**

Some of the observable signals encode the different PRCM finite state-machine (FSM) states. Each state corresponds to a combination of FSM output signal values. The states of the different FSMs associated with the SAR RAM, DPLLs, EMIF, I/O controller, power manager, global reset manager warm reset generator, and clock managers, along with their corresponding output signal values (except for DPLL Ctrl outputs) are described in [Table 18-50](#) through [Table 18-56](#).

**Table 18-50. SAR FSM State Description**

device_sar fsm_10. fsm_state	FSM State		Output Values

### 18.4.11.5.12 Other CORE DPLL Observable Signals

Table 18-58 describes the mapping of CORE DPLL observability signals (other than CLKOUT) to the SYSCTRL\_GENERAL\_CORE DPLL observing inputs. The selection of CORE DPLL as the source of the additional DPLL signals is done at the SYSCTRL\_GENERAL\_CORE level by setting bit field MULT = 0x0 inside each of the eight registers (CONTROL\_CONF\_DPLL\_FREQLOCK\_SEL through CONTROL\_CONF\_DPLL\_IDLE\_SEL).

**Table 18-58. Other CORE DPLL Observability Signals**

SYSCTRL_GENERAL_CORE Observability Inputs Tied to CORE DPLL Observable Signals	Other CORE DPLL Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability Inputs	Signal Description	Logical Value Meaning

hwobs_coredpll_bypassack	COREdpll_bypassack	CORE DPLL bypass status signal	–
hwobs_coredpll_idle	COREdpll_idle	CORE DPLL idle mode input	–

### 18.4.11.5.13 Other ABE DPLL Observable Signals

Table 18-59 describes the mapping of CORE DPLL observability signals (other than CLKOUT) to the SYSCTRL\_GENERAL\_CORE DPLL observing inputs. The selection of ABE DPLL as the source of the additional DPLL signals is done at the SYSCTRL\_GENERAL\_CORE level by setting bit field MULT = 0x1 inside each of the eight registers (CONTROL\_CONF\_DPLL\_FREQLOCK\_SEL through CONTROL\_CONF\_DPLL\_IDLE\_SEL).

**Table 18-59. Other ABE DPLL Observability Signals**

hwobs_dsi1dpll_idle	dspDpllPhaseLock	dspDPLL phase lock check	–

#### 18.4.11.5.16 Other DSI2 DPLL Observable Signals

Table 18-62 describes the mapping of CORE DPLL observability signals (other than CLKOUT) to the SYSCTRL\_GENERAL\_CORE DPLL observing inputs. The selection of DSI2 DPLL as the source of the additional DPLL signals is done at the SYSCTRL\_GENERAL\_CORE level by setting bit field MULT = 0x4 inside each of the eight registers ([CONTROL\\_CONF\\_DPLL\\_FREQLOCK\\_SEL](#) through [CONTROL\\_CONF\\_DPLL\\_IDLE\\_SEL](#)).

**Table 18-62. Other DSI2 DPLL Observability Signals**

<b>SYSCTRL_GENERAL_CORE Observability Inputs Tied to DSI2 DPLL Observable Signals</b>	<b>Other DSI2 DPLL Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability Inputs</b>	<b>Signal Description</b>	<b>Logical Value Meaning</b>

hwobs_dsi2dpll_bypassack	dspDpllPhaseLock	dspDPLL phase lock check	–
hwobs_dsi2dpll_idle	PERIPHDpllPhaseLock	PERIPH DPLL phase lock check	–

#### 18.4.11.5.17 Other USB DPLL Observable Signals

Table 18-63 shows mapping of (other than CLKOUT) CORE dpll observability signals to the SYSCTRL\_GENERAL\_CORE dpll observing inputs. The selection of USB DPLL as the source of the additional DPLL signals is done at SYSCTRL\_GENERAL\_CORE level through setting bit field MULT=0x6 inside all of the eight registers - [CONTROL\\_CONF\\_DPLL\\_FREQLOCK\\_SEL](#) through [CONTROL\\_CONF\\_DPLL\\_IDLE\\_SEL](#).

**Table 18-63. Other USB DPLL Observability Signals**

## 18.4.12 Functional Register Description

### 18.4.12.1 DSP Boot Register

Table 18-64 describes the DSP boot address register.

**Table 18-64. DSP Boot Address Register**

Physical Address	Register Name	Description	Access
0x4A00 2304	<a href="#">CONTROL_DSP_BOOTADDR</a>	DSP boot loader address register	R/W

The [CONTROL\\_DSP\\_BOOTADDR](#) register defines the physical address for the DSP boot loader and drives the DSP\_BOOTADDR[31:10] signals out from the control block to the DSP subsystem.

#### 18.4.12.1.1 PBIASLITE Control Register

Table 18-65 describes the [CONTROL\\_PBIASLITE](#) register, which controls some settings of PBIASLITE cells for the MMC I/O interface.

**Table 18-65. PBIAS Control Register**

Physical Address	Register Name	Description	Access
0x4A10 0600	<a href="#">CONTROL_PBIASLITE</a>	Control settings for PBIAS cell	RW

### 18.4.12.2 Temperature Sensor Control Registers

Table 18-66 describes the [CONTROL\\_TEMP\\_SENSOR](#) registers of the general core control module, which control the temperature sensor, band gap state-machine, and thermal post-processing logic.

**Table 18-66. Temperature Sensor Register**

Physical Address	Register Name	Description	Access
0x4A00 232C	<a href="#">CONTROL_TEMP_SENSOR</a>	Temperature sensor control register	R/W
0x4A00 2378	<a href="#">CONTROL_BANDGAP_CTRL</a>	Mode selection and mask hot/cold event register	R/W
0x4A00 237C	<a href="#">CONTROL_BANDGAP_COUNTER</a>	Band gap delay counter register	R/W
0x4A00 2380	<a href="#">CONTROL_BANDGAP_THRESHOLD</a>	Band gap thermal alert threshold register	R/W
0x4A00 2384	<a href="#">CONTROL_TSHUT_THRESHOLD</a>	Tshut threshold register	R/W
0x4A00 2388	<a href="#">CONTROL_BANDGAP_STATUS</a>	Thermal alert and band gap idle events status register	RO

#### 18.4.12.2.1 CSI Receiver Control Register

To enable the physical layer of the camera receiver, the programmer manipulates the bits within the [CONTROL\\_CAMERA\\_RX](#) register.

**Table 18-67. CSI Receiver Control Register**

Physical Address	Register Name	Description	Access
0x4A10 0608	<a href="#">CONTROL_CAMERA_RX</a>	Module dedicated configurations	RW

### 18.4.12.3 Protection Status Registers

[Table 18-68](#) lists the status registers.

**Table 18-68. Protection Status Registers**

Physical Address	Register Name	Description	Access
0x4A00 22D0	<a href="#">CONTROL_SEC_ERR_STATUS_FUNC</a>	Protection firewall error status register	Public (R)
0x4A00 22D4	<a href="#">CONTROL_SEC_ERR_STATUS_DEBUG</a>	Protection firewall error status register debug	Public (RW Write 1 to Clear)

These registers do not depend on the device type.

The [CONTROL\\_SEC\\_ERR\\_STATUS\\_FUNC](#) can be read in public mode, but cannot be written.

The [CONTROL\\_SEC\\_ERR\\_STATUS\\_DEBUG](#) register is both read and write accessible in GP devices.

These bits are cleared when the L3 and L4 firewall embedded-error log registers are cleared. All bits in these registers reflect internal events in the device related to the device protection.

On a specific event (signal rising edge), the corresponding bit is set. On a rising edge, the input signal must stay high for at least two interface clock periods to be recognized. Software must clear each bit after reviewing the events.

When a protection violation occurs, the following bits are set:

- In application mode
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_FUNC](#)[01] = L3RAM protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_FUNC](#)[02] = GPMC protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_FUNC](#)[03] = EMIF protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_FUNC](#)[04] = IVA-HD protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_FUNC](#)[05] = Dual Cortex™-M3 protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_FUNC](#)[06] = SL2 protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_FUNC](#)[13] = SGX protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_FUNC](#)[14] = DSS protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_FUNC](#)[15] = ISS protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_FUNC](#)[16] = L4\_PER protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_FUNC](#)[17] = L4\_CFG protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_FUNC](#)[18] = DEBUGSS protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_FUNC](#)[19] = L4 AudioBE protection violation
- In debug mode:
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_DEBUG](#)[01] = L3RAM protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_DEBUG](#)[02] = GPMC protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_DEBUG](#)[03] = EMIF protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_DEBUG](#)[04] = IVA-HD protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_DEBUG](#)[05] = Dual Cortex-M3 protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_DEBUG](#)[06] = SL2 protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_DEBUG](#)[13] = SGX protection violation
  - [CONTROL\\_SEC\\_ERR\\_STATUS\\_DEBUG](#)[14] = DSS protection violation

- [CONTROL\\_SEC\\_ERR\\_STATUS\\_DEBUG\[15\]](#) = ISS protection violation
- [CONTROL\\_SEC\\_ERR\\_STATUS\\_DEBUG\[16\]](#) = L4\_PER protection violation
- [CONTROL\\_SEC\\_ERR\\_STATUS\\_DEBUG\[17\]](#) = L4\_CFG protection violation
- [CONTROL\\_SEC\\_ERR\\_STATUS\\_DEBUG\[18\]](#) = DEBUGSS protection violation
- [CONTROL\\_SEC\\_ERR\\_STATUS\\_DEBUG\[19\]](#) = L4 AudioBE protection violation

For more information about L4 firewall protection-violation report mechanisms, see [Section 13.3.3.4.5, Firewall Error Logging in the Control Module](#), in [Chapter 13, Interconnect](#). For more information about L3 firewall protection-violation report mechanisms, see [Section 13.2.4.2.1, L3 Interconnect Error Analysis](#), in [Chapter 13, Interconnect](#).

#### 18.4.12.4 Protection SDRAM Configuration Registers

[Table 18-69, Protection SDRAM Configuration Registers for EMIF1 and EMIF2](#), lists the protection SDRAM configuration registers for EMIF1 and EMIF2 that are part of the general wakeup control module. Upon POR, their values are exported as reset values of the EMIF1 and EMIF2 registers (EMIF\_SDRAM\_CONFIG and EMIF\_SDRAM\_CONFIG\_2, respectively).

**Table 18-69. Protection SDRAM Configuration Registers for EMIF1 and EMIF2**

Physical Address	Register Name	Description	Access
0x4A30C110	<a href="#">CONTROL_WKUP_PROT_EMIF1_SDRAM_CONFIG_REG</a>	Protection SDRAM configuration register 1, defining bit field reset values of the EMIF1.EMIF_SDRAM_CONFIG register	RW
0x4A30C114	<a href="#">CONTROL_WKUP_PROT_EMIF1_SDRAM_CONFIG2_REG</a>	Protection SDRAM configuration register 2, defining bit field reset values of the EMIF1.EMIF_SDRAM_CONFIG_2 register	RW
0x4A30C118	<a href="#">CONTROL_WKUP_PROT_EMIF2_SDRAM_CONFIG_REG</a>	Protection SDRAM configuration register 1, defining bit field reset values of the EMIF2.EMIF_SDRAM_CONFIG register	RW
0x4A30C11C	<a href="#">CONTROL_WKUP_PROT_EMIF2_SDRAM_CONFIG2_REG</a>	Protection SDRAM configuration register 2, defining bit field reset values of the EMIF2.EMIF_SDRAM_CONFIG_2 register	RW

#### 18.4.12.5 Register Controls for the LPDDR2IO1 and LPDDR2IO2 I/O Buffer Modes

There are global controls related to LPDDR2IO1 and LPDDR2IO2 (EMIF1 and EMIF2 associated) CA I/O receivers (loopback mode only) and DQ I/O receivers. These controls reside in the SYCTRL\_GENERAL\_CORE.CONTROL\_GEN\_CORE\_OCPREG\_SPARE register.

[Figure 18-23](#) in [Section 18.4.12.6, Reference Voltage for OMAP LPDDR2IO1 and LPDDR2IO2 I/O Buffers and LPDDR2 Memory](#), shows how these controls are related to mode selection and powerdown controls for LPDDR2IO receivers.

Their functionality is as follows:

- Setting the OCPREG\_SPARE[3] bit to 0b1 simultaneously disables (powers-down) all receivers associated with DQ groups of the LPDDR22 I/Os.
- Setting the OCPREG\_SPARE[1] bit to 0b1, simultaneously disables (power-downs) all receivers associated with DQ groups of the LPDDR21 I/Os.
- Only the four DQ I/O groups receivers are impacted by the OCPREG\_SPARE[1] and OCPREG\_SPARE[3] bits as follows:
  - lpddr2x\_dm0, lpddr2x\_dqs0, lpddr2x\_ndqs0, lpddr2x\_dq [7:0]
  - lpddr2x\_dm1,dqs1,ndqs1,dq [15:8]
  - lpddr2x\_dm2,dqs2,ndqs2,dq [23:16]
  - lpddr2x\_dm3,dqs3,ndqs3,dq [31:24]
- Programming the OCPREG\_SPARE[2] and OCPREG\_SPARE[0] bits to 0b1 configures all the LPDDR2 DQ and CA (CA receivers enabled in a loopback mode only) I/O groups receivers to use low-

voltage CMOS (LVCMOS) buffer logic, for the LPDDR22 and LPDDR21 I/Os, respectively.

- There is one CA I/O group ( lpddr2x\_ca[0:9], lpddr2x\_ncs0/1, lpddr2x\_cke0/1, lpddr2x\_ck, lpddr2x\_nck) for the LPDDR21 and LPDDR22 command I/O lines. Programming the OCPREG\_SPARE[2] and OCPREG\_SPARE[0] bits to 0b0 configures all the LPDDR2 DQ and CA (loopback mode only) I/O groups receivers to use a true differential comparator logic (so called Vref-based receivers). For more details on the configuration of a Vref-based receiver, see [Section 18.4.12.6 Reference Voltage for OMAP LPDDR2IO1 and LPDDR2IO2 I/O Buffers and LPDDR2 Memory](#).

[Table 18-70](#) lists the register used to control the described EMIF1 and EMIF2 features.

**Table 18-70. LPDDR2IO Buffer Control Register**

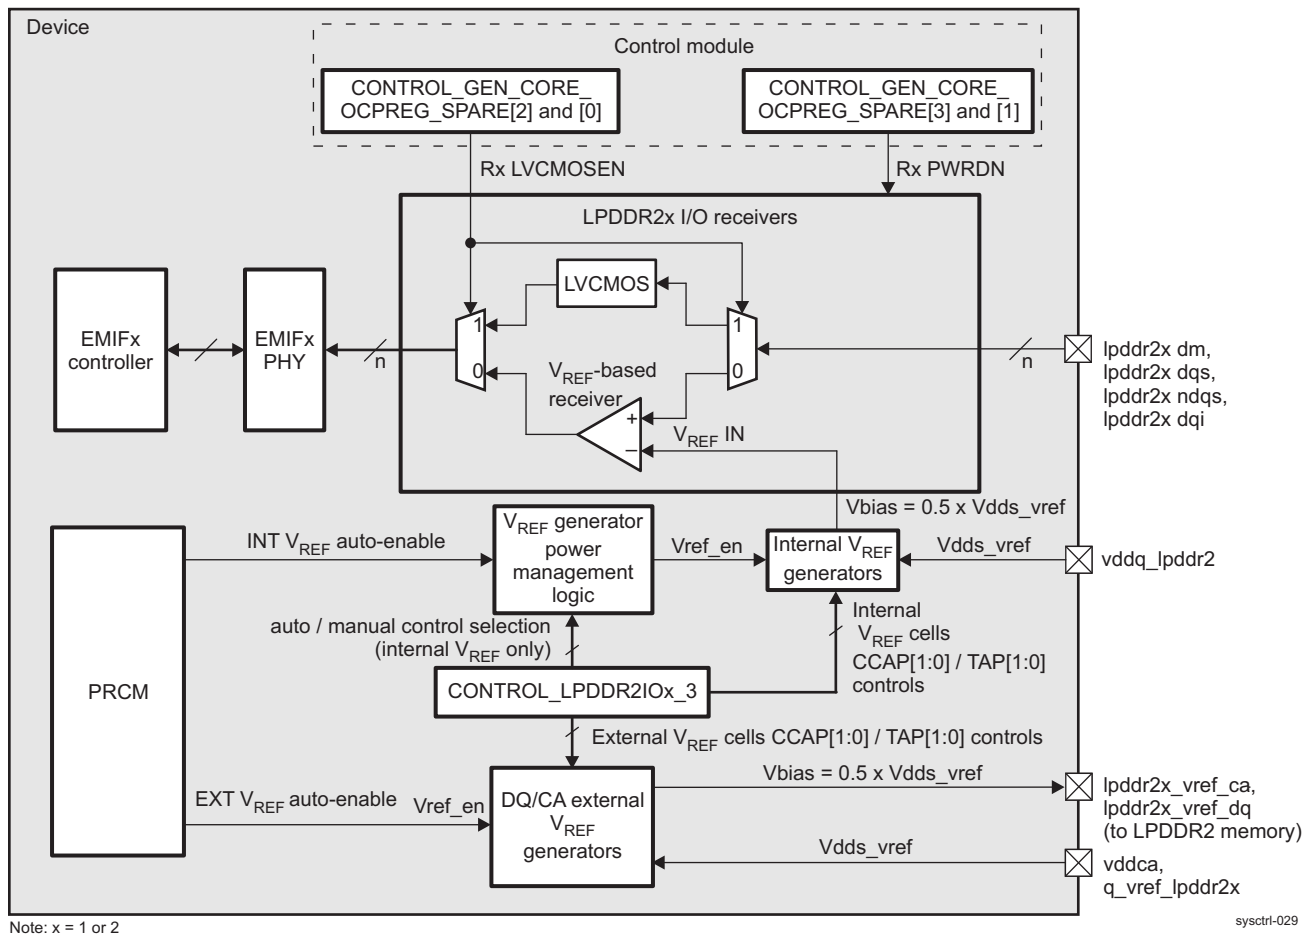

Physical Address	Register Name	Description	Access
0x4A0023FC	<a href="#">CONTROL_GEN_CORE_OCPREG_SPARE</a>	The lower 4 bits of this register are assigned to control the power-down mode for LPDDR2 DQ lines and select either a LVCMOS buffer or Vref-based receiver configuration for the LPDDR2 DQ/CA receivers.	RW

#### 18.4.12.6 Reference Voltage for OMAP LPDDR2IO1 and LPDDR2IO2 I/O Buffers and LPDDR2 Memory

When device LPDDR2IO1 or LPDDR2IO2 I/O buffers are used in differential comparator mode (so called Vref based receivers), a reference voltage must be provided to the buffers. Several Vref-generation cells are integrated in the device to supply this internal reference voltage. [Figure 18-23](#) provides the details about different controls related to the external and internal Vref generation cells for the differential comparator receivers.

When the Vref generator is turned on, it supplies voltage reference to the Vref-based receivers associated with the LPDDR2IO DQ and CA interface lines. In Vref-based receiver mode, the LPDDR2 I/O cell receiver is a true differential comparator with positive terminal connected to the device pad on which signal from LPDDR2 memory is received, and negative terminal tied to the VREF voltage generated on the Vbias output of the receiver corresponding Vref cell (see [Figure 18-23](#)).

The Vbias equals  $0.5 \times V_{dds\_vref}$ , where  $V_{dds\_vref}$  is power supply voltage of the Vref cell. The Vref-based receiver allows the improvement of speed performance at  $V_{DDS} = 1.2\text{-V}$  I/O voltage supply. A reference voltage is also provided to externally attached LPDDR2 memory through the device lpddr2x\_vref\_ca and lpddr2x\_vref\_dq output pads. The same type of Vref-generation cells are used for these external reference voltages.

**Figure 18-23. LPDDR2 Vref Cell and Receiver Type Controls**

The voltage drive selection bit fields of these internal / external voltage reference cells are in the [CONTROL\\_LPDDR2IO1\\_3](#) and [CONTROL\\_LPDDR2IO2\\_3](#) registers. Individual `VREF_TAP[1:0]` control bits set the output drive capability for each reference voltage.

[Table 18-71](#) lists the possible options for internal reference voltage drive selection.

**Table 18-71. LPDDR2 Internal Reference Configuration**

VREF_TAP1	VREF_TAP0	Description
0	0	Pad/bias2 Connected to reference $V_{dds\_vref} / 2$ , for 2- $\mu$ A current load
0	1	Pad/bias2 Connected to reference $V_{dds\_vref} / 2$ , for 4- $\mu$ A current load
1	0	Pad/bias2 Connected to reference $V_{dds\_vref} / 2$ , for 6- $\mu$ A current load
1	1	Pad/bias2 Connected to reference $V_{dds\_vref} / 2$ , for 8- $\mu$ A current load

According to the noise environment, the user can choose to filter the reference voltage which is supplied.

Two coupling capacitors, internal to a Vref-generation cell, are available and are configurable as specified in [Table 18-72](#).

**Table 18-72. LPDDR2 Vref Cell Decoupling Cap Selection**

VREF_CCAP0	VREF_CCAP1	Capacitor
0	0	Capacitor between internal reference node (Vbias) and Vss (ground)
0	1	Capacitor between internal reference node (Vbias) and Vdds_vref as well as internal reference node (Vbias) and Vss
1	0	No capacitor connected
1	1	Capacitor between internal reference node (Vbias) and Vdds_vref

Individual VREF\_CCAP0 and VREF\_CCAP1 control bits in the [CONTROL\\_LPDDR2IO1\\_3](#) and [CONTROL\\_LPDDR2IO2\\_3](#) registers set the coupling capacitor connection on VREF nodes.

For leakage improvement the Vref-generation cells can be enabled and disabled.

The Vref-generation cells used for the device internal Vref voltage are controlled by software. Setting bit CONTROL\_LPDDR2IOx\_3[0] LPDDR2x\_INT\_VREF\_AUTO\_EN\_DQ = 0b1 or CONTROL\_LPDDR2IOx\_3[1] LPDDR2x\_INT\_VREF\_AUTO\_EN\_CA = 0b1 (where x = 1, 2) enables the device PRCM automatic shut off or switch-on of the internal Vref cell generators associated with the LPDDR2x interface, DQ and CA lines, respectively.

If user software sets the manual control bit CONTROL\_LPDDR2IOx\_3[2] LPDDR2x\_INT\_VREF\_EN\_DQ=0b1 or CONTROL\_LPDDR2IOx\_3[2] LPDDR2x\_INT\_VREF\_EN\_CA =0b1, internal Vref cell generators are enabled, regardless of the state of the LPDDR2x\_INT\_VREF\_AUTO\_EN\_DQ / LPDDR2x\_INT\_VREF\_AUTO\_EN\_CA bits. Thus, PRCM automatic control over the internal Vref cell generators can always be overridden in the context of enabling the Vref generator.

In contrast to the internal Vref source generator cells, which enable/disable-control can be selected in software between PRCM and manual software control, the Vref-generation cells used for the external Vref output generation are controlled only by the PRCM.

[Table 18-73](#) provides different combinations of Vref cell control types and the state of the Vref cell.

**Table 18-73. LPDDR2 Vref Cells State Description**

LPDDR2x_INT_VREF_EN_DQ /CA (Manual Control Bits)	LPDDR2x_INT_VREF_AUTO_EN_DQ/CA (AUTO Control Bits)	Type of Control	Vref Cell State
1	x	Manual	Enabled
0	1	AUTO	Automatically enabled/disabled
0	0	–	Disable

There are four internal VREF cells (k = 0 to 3) associated with DQ line receivers and a single internal VREF cell associated with CA line receivers (loopback mode only) for each of the device LPDDR21 and LPDDR22 set of I/Os. The group assignment of a VREF cell Vbias output to different I/Os associated Vref-based receivers is covered in [Table 18-74](#).

**Table 18-74. Internal VREF Generators CCAP and TAP Controls versus LPDDR2IO Receiver Pads**

Control Module Register	LPDDR21 Pads	Internal Vref cell TAP / CCAP controls associated to device LPDDR21 pad corresponding Vref-based receivers
<a href="#">CONTROL_LPDDR2IO1_3</a>	lpddr21_dm0, lpddr21_dqs0, lpddr21_ndqs0, lpddr21_dq[7:0]	LPDDR21_VREF_DQ_INT0_TAP/CCAP
	lpddr21_dm1, lpddr21_dqs1, lpddr21_ndqs1, lpddr21_dq[15:8]	LPDDR21_VREF_DQ_INT1_TAP/CCAP
	lpddr21_dm2, lpddr21_dqs2, lpddr21_ndqs2, lpddr21_dq[23:16]	LPDDR21_VREF_DQ_INT2_TAP/CCAP
	lpddr21_dm3, lpddr21_dqs3, lpddr21_ndqs3, lpddr21_dq[31:24]	LPDDR21_VREF_DQ_INT3_TAP/CCAP
	lpddr21_ca[9:0], lpddr21_ncs0, lpddr21_ncs1, lpddr21_cke0, lpddr21_cke1, lpddr21_ck, lpddr21_nck	LPDDR21_VREF_CA_INT_TAP/CCAP
Control Module Register	LPDDR22 Pads	Internal Vref cell TAP / CCAP controls associated to device LPDDR21 pad corresponding Vref-based receivers
<a href="#">CONTROL_LPDDR2IO2_3</a>	lpddr22_dm0, lpddr22_dqs0, lpddr22_ndqs0, lpddr22_dq[7:0]	LPDDR22_VREF_DQ_INT0_TAP/CCAP
	lpddr22_dm1, lpddr22_dqs1, lpddr22_ndqs1, lpddr22_dq[15:8]	LPDDR22_VREF_DQ_INT1_TAP/CCAP
	lpddr22_dm2, lpddr22_dqs2, lpddr22_ndqs2, lpddr22_dq[23:16]	LPDDR22_VREF_DQ_INT2_TAP/CCAP
	lpddr22_dm3, lpddr22_dqs3, lpddr22_ndqs3, lpddr22_dq[31:24]	LPDDR22_VREF_DQ_INT3_TAP/CCAP
	lpddr22_ca[9:0], lpddr22_ncs0, lpddr22_ncs1, lpddr22_cke0, lpddr22_cke1, lpddr22_ck, lpddr22_nck	LPDDR22_VREF_CA_INT_TAP/CCAP

Different LPDDR2x\_VREF\_DQ / CA\_INTk\_TAP[1:0], LPDDR2x\_VREF\_DQ / CA\_INTk\_CCAP[1:0] bitfields from the [CONTROL\\_LPDDR2IO1\\_3](#) (for LPDDR2IO1 Vref cells) and [CONTROL\\_LPDDR2IO2\\_3](#) (for LPDDR2IO2 Vref cells) registers, apply to k=4 different DQ groups and a single group of CA I/Os per LPDDR2 I/O set, as specified in [Table 18-74](#).

The LPDDR2x\_VREF\_DQ[1:0] or CA\_TAP[1:0] bit fields, and LPDDR2x\_VREF\_DQ[1:0] or CA\_CCAP[1:0] bit fields are used to set the output drive capability and coupling capacitors at the Vbias node of the DQ/CA external Vref generation cells.

In contrast to VREF\_TAP and VREF\_CCAP (which are individual per LPDDR2x I/O group), the LPDDR2x\_INT\_VREF\_EN\_DQ, LPDDR2x\_INT\_VREF\_EN\_CA, LPDDR2x\_INT\_VREF\_AUTO\_EN\_DQ, and LPDDR2x\_INT\_VREF\_AUTO\_EN\_CA bit fields act as common controls to all internal Vref generator cells.

---

**NOTE:** The CA and DQ Vref-generation cells used as external Vref output generators are controlled only by the PRCM.

---

### 18.4.12.7 EMIF DLL Master/Slave Specific Registers

#### 18.4.12.7.1 EMIF DLL Slaves Individual Offset Compensation

Delays used to time the DQS signals of the LPDDR2 interface vary for the different DDR PHY DLL slaves associated with an EMIF controller instance. An individual offset compensation is provided for each of the four DLL slaves to achieve symmetrical timings.

Two 32-bit registers ( [CONTROL\\_EMIF1\\_OFFSET](#) and [CONTROL\\_EMIF2\\_OFFSET](#)) in the general core control module are dedicated to hold four signed-offset programmable values for the EMIF1 and EMIF2 PHY DLL slaves, respectively. The following programming points apply to these registers:

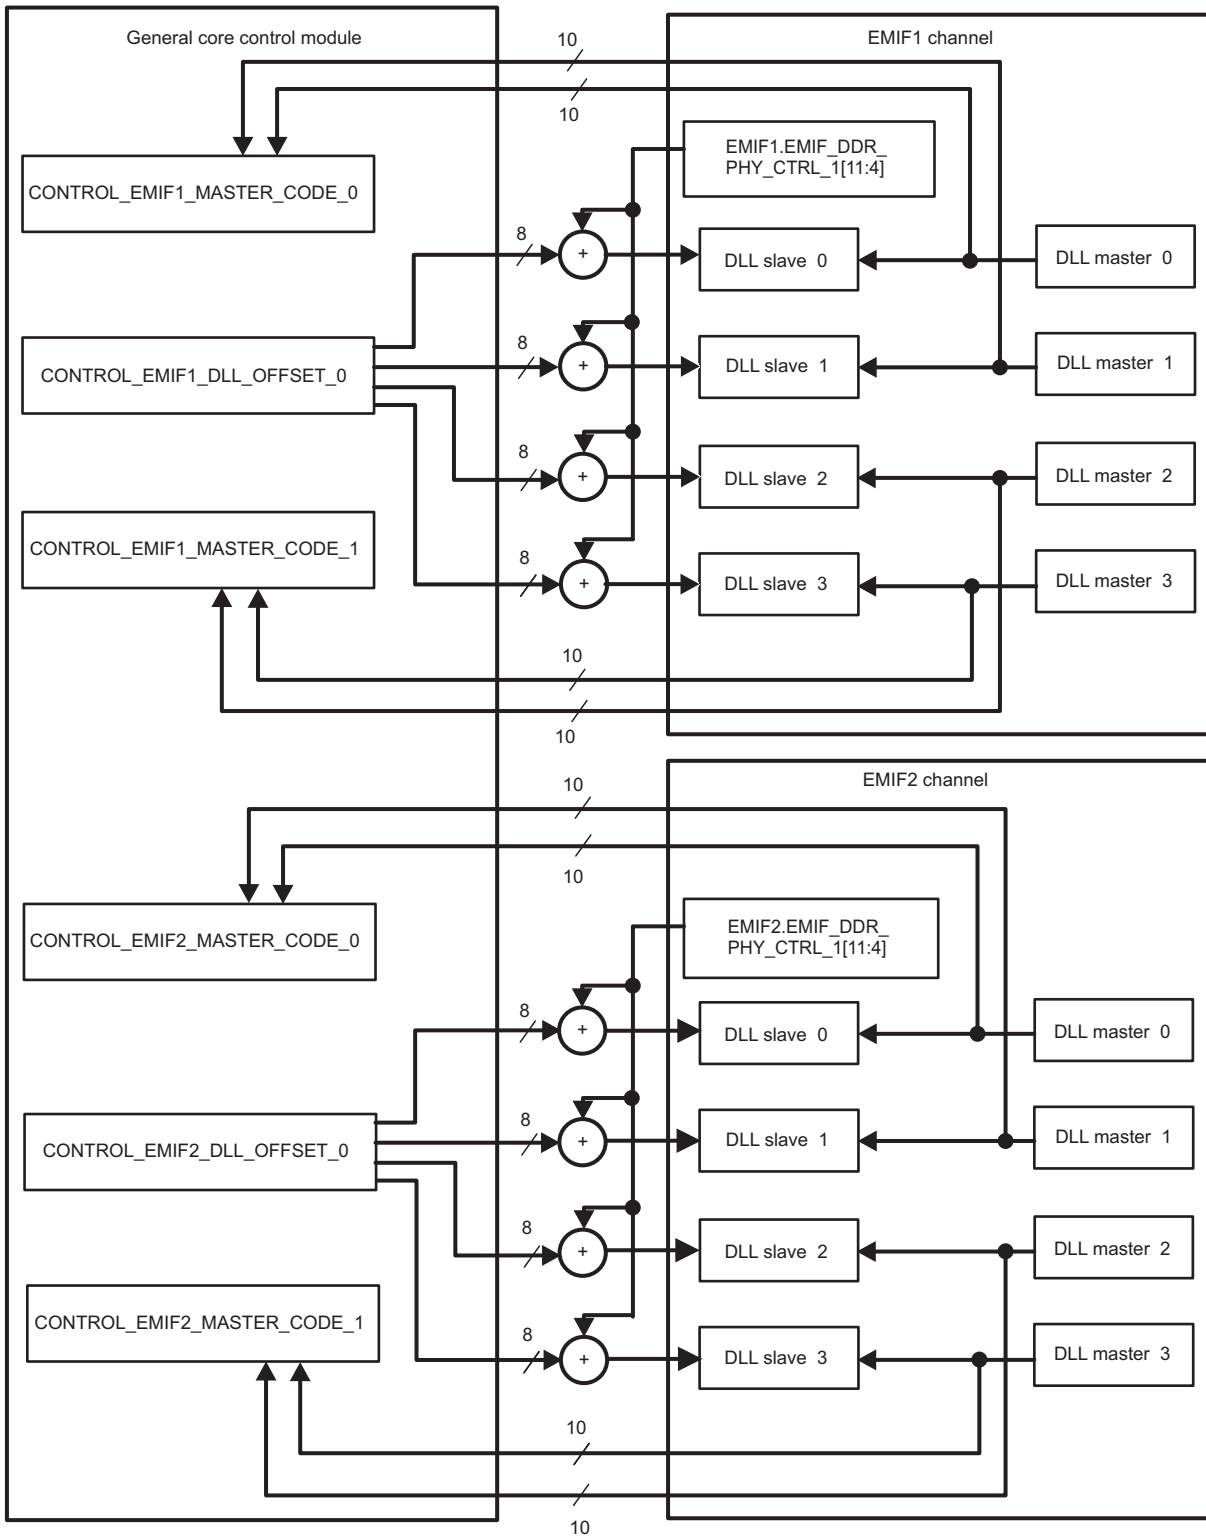

- Offset is stored as 2s complement 8-bit value, ranging from -128 to +127.

- Reset value is 0 (that is, by default, no offset is applied).
- The programmed values are saved and restored during an off mode transition.

The slave delay ratio value also has a single software control for all DLLs associated with an EMIF instance (the EMIF1.EMIF\_DDR\_PHY\_CTRL\_1[11:4] REG\_DLL\_SLAVE\_DLY\_CTRL bit field in the EMIF1 address space and EMIF2.EMIF\_DDR\_PHY\_CTRL\_1[11:4] REG\_DLL\_SLAVE\_DLY\_CTRL bit field in the EMIF2 address space). For more information, see [Chapter 15, Memory Subsystem](#).

The control sent to each DLL slave is the EMIF1/EMIF2 control (REG\_DLL\_SLAVE\_DLY\_CTRL) and the local signed offset, which is stored in the DLL slave corresponding bit field in the [CONTROL\\_EMIF1\\_OFFSET](#)/[CONTROL\\_EMIF2\\_OFFSET](#) registers. [DLL Slave Delay Control Schema](#) shows the DLL slave delay control schema.

Figure 18-24. DLL Slave Delay Control Schema

sysctrl-022

Because the adders work in saturation mode, there is no wrap-around on either end of the spectrum:

- Any value higher than 0xFF saturates to 0xFF.
- Any value lower than 0x00 saturates to 0x00.

Table 18-75 describes the control registers in general core control module dedicated to store delay offsets individually for the four DDR PHY DLL slaves.

**Table 18-75. EMIF DLL Slave Offset Compensation Registers**

Physical Address	Register Name	Description	Access
0x4A00 2360	<a href="#">CONTROL_EMIF1_OFFSET</a>	EMIF1 slaves individual DLL offset controls	R/W
0x4A00 2364	<a href="#">CONTROL_EMIF2_OFFSET</a>	EMIF2 slaves individual DLL offset controls	R/W

#### 18.4.12.7.2 EMIF DLL Master Code Monitoring Registers

As can be seen in Figure 18-24, two read-only (RO) registers are provided in the general core control module to monitor DLL master codes for each of the EMIF1 and EMIF2 instances.

The 40 EMIF1 DLL master code monitoring signals are distributed as 20 read-only bits in the [CONTROL\\_EMIF1\\_MASTER\\_CODE\\_0](#) register and 20 read-only bits in the [CONTROL\\_EMIF1\\_MASTER\\_CODE\\_1](#) register, respectively.

Similarly, the 40 EMIF2 DLL master code monitoring signals are distributed as 20 read-only bits in the [CONTROL\\_EMIF2\\_MASTER\\_CODE\\_0](#) register and 20 read-only bits in the [CONTROL\\_EMIF2\\_MASTER\\_CODE\\_1](#) register, respectively.

Table 18-76 lists the control registers in general core control module dedicated to monitor the master code for the four DDR PHY DLLs.

**Table 18-76. EMIF DLL Master Code-Monitoring Registers**

Physical Address	Register Name	Description	Access
0x4A00 2368	<a href="#">CONTROL_EMIF1_MASTER_CODE_0</a>	EMIF1 Master 0, 1 code	RO
0x4A00 236C	<a href="#">CONTROL_EMIF1_MASTER_CODE_1</a>	EMIF1 Master 2, 3 code	RO
0x4A00 2370	<a href="#">CONTROL_EMIF2_MASTER_CODE_0</a>	EMIF2 Master 0, 1 code	RO
0x4A00 2374	<a href="#">CONTROL_EMIF2_MASTER_CODE_1</a>	EMIF2 Master 2, 3 code	RO

#### 18.4.12.8 Force MPU Write Nonposted Transactions Control Register

At the top level, software can force all writes from the MPU subsystem to the L3 interconnect to be nonposted, regardless of the attributes of the transactions coming from the Cortex-A9 CPU. When active-high bit FORCEWRNP = 1, only nonposted write commands are sent to the L3 interconnect. This bit must remain stable for the entire transfer and must not change in between the transfer.

Table 18-77 describes the general core control module register with FORCEWRNP control.

**Table 18-77. Force MPU Write Nonposted Transactions Control Register**

Physical Address	Register Name	Description	Access
0x4A00 03C0	<a href="#">CONTROL_FORCEWRNP</a>	Forces only nonposted write commands from the MPU subsystem to the L3 interconnect	R/W

#### 18.4.12.9 Signal Integrity Parameter Control Registers With Pad Group Assignment

##### 18.4.12.9.1 Signal Integrity Parameter Controls Overview

Most of the I/O cells associated with the device pads can be configured to deliver their carried signals to the targeted sink with maximum signal integrity. Configuration of these I/Os is done by pad group assignment and not individually per pad.

The different I/O-specific requirements determine the use of different types of I/O cells for the device I/Os. Software controls associated with the signal integrity parameters are implemented at the SYSCTRL\_PADCONF\_CORE and SYSCTRL\_PADCONF\_WKUP level.

The following types of I/O cells associated with pad groups can be identified:

- LPDDR2 high-speed I/O cells with impedance(I), slew rate(SR), and weak driver (WD) settings
- High-speed I/O cells with far-end load (LB) settings
- Low -speed I/O cells with combined slew rate (SC) and load versus transmission line (TL) length (LB) settings
- Two types of I/O cells with mode (MB) controls and load compensation (LB) settings
- I/O cells with control (DS0) of the impedance mode
- SDMMC2 or GPMC I/O cells with LB0 control adjustable according to interface requirement/voltage mode
- I/O cells with pullup strength (PUSTRENGTH) and speed controls
- I2Cx I/O cells with pullup resistance vers capacitance load settings
- JTAG I/O cells with bus-holder enable control

---

**NOTE:** I/Os are non-failsafe, which means that voltage must never be applied at a pad before the internal I/O supply voltage VDDS is powered.

---

The pad group-assigned signal integrity controls are provided through the registers described in [Table 18-78](#).

**Table 18-78. Signal Integrity Parameter Control Registers**

Physical Address	Register Name	Description	Access
0x4A10 05A8	<a href="#">CONTROL_SMART1IO_PADCONF_0</a>	Signal integrity pad group assignment control register	R/W

#### 18.4.12.9.2 High-Speed I/O Buffers With Impedance, Slew Rate, and Weak Driver Settings

The LPDDR2IO (EMIF) buffers are based on high-speed unterminated logic and require excellent driver impedance control to achieve optimal timing–EMI trade-offs. A specific type of device I/O cell with programmable features is used to meet this requirement. These I/O cells also support the high-speed interchip (HSIC) interface.

Two types of software-configurable I/O cells are integrated to support high-speed unterminated logic:

- Single-ended I/O cells
- Two-pad differential I/O cells

Two-pad differential I/O cells are provided with a differential receiver and complementary transmitter. They are used to support the LPDDR2 clock pads (lpddr21\_ck, lpddr21\_nck, lpddr22\_ck, lpddr22\_nck) and LPDDR2 strobe pads (lpddr21\_dqsi, lpddr21\_ndqsi, lpddr22\_dqsi, and lpddr22\_ndqsi ,where i = 0 to 3).

A LPDDR2 bidirectional-I/O cell receiver (Rx) can be configured to operate as a LVCMOS buffer and as a true differential comparator with a reference voltage (Vref input [a so called Vref-based receiver]). For more information on LPDDR2 I/O receiver-buffer type selection and power management controls, see [Section 18.4.12.5, Register Controls for the LPDDR2IO1/LPDDR2IO2 I/O Buffer Modes](#).

In addition, several Vref-generation cells are integrated in the device to supply reference voltage (Vref) to receiver buffers (when configured to operate as Vref-based receivers), and to provide Vref to externally-attached LPDDR2 memory. For more details on the functionality and controls of device Vref generation cells, see [Section 18.4.12.6, Reference Voltage for OMAP LPDDR2IO1 and LPDDR2IO2 I/O Buffers and LPDDR2 Memory](#).

The LPDDR2x I/O cells are integrated with the following controls in the SYSCTRL\_PADCONF\_CORE module:

- Driver output impedance (I) controls
- SR controls
- WD controls to support LPDDR2/HSIC interface and avoid floating pad
- Process-only impedance compensation using 5-bit binary coded schema separately for pullup p<1:5> and pulldown n<1:5> impedance

Programmable bits for impedance and SR control are provided when the I/Os are set to operate in driver mode (outputs).

The bits I[2:0] are used to program the desired impedance value of the driver.

The drive strengths corresponding to the I[2:0] value are aliased as Drv i (where i = 5 to 12) in the CONTROL\_LPDDR2IO1\_x and CONTROL\_LPDDR2IO2\_x, (where x = 0 to 2) register tables in [Section 18.6.7, SYSCTRL\\_PADCONF\\_CORE Register Description](#).

#### CAUTION

To ensure the best performance of the LPDDR2 I/Os, it is strongly recommended for user software to always set the impedance controlling bits (I) in the CONTROL\_LPDDR2IO1\_x and CONTROL\_LPDDR2IO2\_x registers (where x = 0 to 2) to 0x7, which corresponds to Drv12 mode.

For more information about LPDDR2 I/O-specific driver output impedance (respectively, corresponding drive strength) parameter, see the *Electrical Characteristics/DC Electrical Characteristics/LPDDR2 DC Electrical Characteristics* section in the device data manual.

User software can program the slew rate (turn-on time) of the output signal using the control bits SR[1:0] in the CONTROL\_LPDDR2IO1\_x and CONTROL\_LPDDR2IO2\_x (where x = 0 to 2) registers.

For more information about the LPDDR2 I/O slew rate parameter control, SR[1:0], see the *Electrical Characteristics/DC Electrical Characteristics/LPDDR2 DC Electrical Characteristics* section in the device data manual.

Weak pullup/down or a keeper on pad is enabled through the wd0 and wd1 bits. The weak pullup/down option is used to define the pad state (high or low) when no signal is driving the pad. The weak keeper option is used to maintain the previous output value when nothing is driving the pad. [Table 18-79](#) describes the WD controls.

---

**NOTE:** The WD[1:0] bit field controls play the role of the PULLTYPESELECT and PULLUDENABLE bits within the standard pad configuration registers, and provides the keeper function to the I/Os with the state WD = 0b11. For LPDDR2 I/Os, the WD controls do not apply during off mode.

---

#### CAUTION

To ensure the best performance of the LPDDR2 I/Os, it is strongly recommended for user software to always set the slew rate (SR) control bit field in the CONTROL\_LPDDR2IO1\_x and CONTROL\_LPDDR2IO2\_x registers (where x = 0 to 2) to 0b01.

It is also recommended to set the weak driver (WD) in the CONTROL\_LPDDR2IO1\_x and CONTROL\_LPDDR2IO2\_x registers to 0b10 (weak pull-down).

Similar to the lpddr1\_x and lpddr2\_x pads, the usbb1\_hsic\_data/strobe and usbb2\_hsic\_data/strobe pads also have weak driver software controls for active-mode internal weak pullups and pulldowns. They are in the [CONTROL\\_USBB\\_HSIC](#) register.

In contrast to the LPDDR2 I/Os, the usbb1\_hsic and usbb2\_hsic pads are also provided with bits in the same register to select weak pullup/down and keeper function during off mode. For a given usbbx\_hsic\_data/strobe pad (where x = 1, 2) the associated bit to allow an off mode-specific pullup/pulldown/keeper setting is OFFMODE\_WD\_ENABLE. The off mode option is defined through the OFFMODE\_WD[1:0] bit field in the [CONTROL\\_USBB\\_HSIC](#) register..

**Table 18-79. Weak Driver PUPD/Latch Mode**

WD1	WD0	Operation
0	0	Pull logic disabled
0	1	Weak pullup enabled
1	0	Weak pulldown enabled
1	1	Weak keeper enabled

The following sequence is required to program the off-mode pullup/pulldown /latch (keeper) feature of the usbb1\_hsic\_data/usbb2\_hsic\_data and usbb1\_hsic\_strobe/usbb2\_hsic\_strobe pads:

1. Program the desired values for USBB1\_HSIC\_DATA\_OFFMODE\_WD/USBB2\_HSIC\_DATA\_OFFMODE\_WD and USBB1\_HSIC\_STROBE\_OFFMODE\_WD/USBB2\_HSIC\_STROBE\_OFFMODE\_WD in the [CONTROL\\_USBB\\_HSIC](#) register.
2. For an off-mode pullup/pulldown configuration different than the active-mode pullup/pulldown configuration, set the USBB1\_HSIC\_DATA\_OFFMODE\_WD\_ENABLE/USBB2\_HSIC\_DATA\_OFFMODE\_WD\_ENABLE and USBB1\_HSIC\_STROBE\_OFFMODE\_WD\_ENABLE/USBB2\_HSIC\_STROBE\_OFFMODE\_WD\_ENABLE bits to 1.

If USBB1\_HSIC\_DATA\_OFFMODE\_WD\_ENABLE/USBB2\_HSIC\_DATA\_OFFMODE\_WD\_ENABLE is set to 0, the applied value of the pullup/pulldown after the device goes to off mode will be same as the value of the active pullup/pulldown (that is, in this case, the value of the OFFMODE PU/PD bit field is disregarded).

If, for example, USBB1\_HSIC\_DATA\_OFFMODE\_WD\_ENABLE/USBB2\_HSIC\_DATA\_OFFMODE\_WD\_ENABLE is programmed with the same setting as USBB1\_HSIC\_DATA\_WD\_ENABLE/USBB2\_HSIC\_DATA\_WD\_ENABLE, then the value of USBB1\_HSIC\_DATA\_OFFMODE\_WD\_ENABLE/USBB2\_HSIC\_DATA\_OFFMODE\_WD\_ENABLE does not matter.

Therefore,

USBB1\_HSIC\_DATA\_OFFMODE\_WD\_ENABLE/USBB2\_HSIC\_DATA\_OFFMODE\_WD\_ENABLE and USBB1\_HSIC\_STROBE\_OFFMODE\_WD\_ENABLE/USBB2\_HSIC\_STROBE\_OFFMODE\_WD\_ENABLE apply only to off-mode pullup/pulldown selection.

The eFuse impedance compensation settings are exported upon POR to 10 bits in the [CONTROL\\_EFUSE\\_2](#) register of the device control module as follows:

[CONTROL\\_EFUSE\\_2](#)[23] LPDDR2\_PTV\_N1 through [CONTROL\\_EFUSE\\_2](#)[19] LPDDR2\_PTV\_N5 (pulldown impedance trimming)

[CONTROL\\_EFUSE\\_2](#)[18] LPDDR2\_PTV\_P1 through [CONTROL\\_EFUSE\\_2](#)[14] LPDDR2\_PTV\_P5 (pullup impedance trimming)

#### CAUTION

Do not override the eFuse impedance compensation settings in the [CONTROL\\_EFUSE\\_2](#) register.

**NOTE:** There is no software control (INPUTENABLE) for the input buffer of the high-speed unterminated logic I/Os associated with the lpddr21\_x, lpddr22\_x, usbb1\_hsic\_data/strobe, and usbb2\_hsic\_data/strobe pads. If the CMOS buffer is enabled, it is always bidirectional (that is, the input buffer is always enabled).

### 18.4.12.9.3 Low-Speed I/Os Combined Slew Rate Versus TL Length and Load Settings

The low-speed I/O cells slew modes are selectable through the slew mode control SC[1:0] bit field. These settings act like coarse settings for the signal performance behavior of the low-speed I/Os. The slew rate settings determine three target maximal frequencies of I/O operation at maximum load (see [Table 18-80](#))

The low-speed I/O cells far-end capacitance load can be selected according to the transmission line (TL) length settings by modifying load bits LB[1] and LB[0] appropriately. The four possible load bit settings described in [Table 18-81](#) are fully applicable and have maximum effect only when slew control mode 0 is selected. These settings fine-tune the signal performance.

The pads featuring low-speed I/O cells require different SC[1:0] and LB[1:0] bit field settings to achieve optimal electrical performance for the multiplexed interface. This behavior may depend on various factors:

- [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#), describes the different interfaces that have SC[1:0] and LB[1:0] controls and their pad corresponding software control registers.
- The *Electrical Characteristics/DC Electrical Characteristics* section of the device data manual provides more information about the specific SC[1:0] and LB[1:0] bit field settings applicable to these interfaces multiplexed to low-speed I/O pads.
- The *Timing Parameters* section of the device data manual provides the exact system conditions (far end load, trace length, etc.) at which pad-multiplexed interface I/O timing parameters reach their boundary values.

**Table 18-80. Slew Control Mode (Coarse) Settings**

SC[1] bit	SC[0] bit	Slew Rate Control Mode	Maximum Frequency Achieved at Maximum Load
0	0	0	20 MHz
0	1	1	60 MHz
1	0	2	40 MHz

**Table 18-81. Load Bit (Fine) Settings**

LB[1] (CLoad Capacitance Control)	LB[0] (TL-Length Control)	Effective TL Length (cm)	CLoad Capacitance (pF) (per TL)
0	0	2–20	1–10
0	1	20–40 (dual TL)	1–10
1	0	2–20	10–20
1	1	20–40 (dual TL)	10–20

**NOTE:** The load bit modes in [Table 18-81](#) are fully applicable and have maximum effect only in the case of slew control mode 0 (SC[1:0] = 00). For slew control modes 1 and 2, LB[1:0] = 0b11 is recommended.

### 18.4.12.9.4 I/Os With Combined Mode and Load Settings

There are two subtypes (conditionally described as type 1 and type 2 throughout this chapter) of device I/Os, with combined mode and load settings, that differ primarily in typical output impedance and mode-specific performance. Type 1 I/Os feature a lower typical output impedance than type 2.

Both I/Os have an output buffer with an internal pad voltage SR control mechanism. Each of the type 1 and type 2 corresponding I/O cells is controlled from two mode bits (MB0 and MB1) and a dedicated bit (LB0) for load compensation. LB0 programs the  $C_{\text{far-end load}}$  for the I/O cell associated pads. [Table 18-82](#) describes the mode bit settings for each mode and lists the load bit settings.

**Table 18-82. Software Controls for I/Os With Combined Mode and Load Settings**

Mode	MB1	MB0	LB0
Mode 1 – SDMMC/SPI	0	1	0
Mode 2 - DMIC/GPIO	1	0	0: ( $C_{far\ end\ load}^{(1)} < 15pf$ ) 1: ( $C_{far\ end\ load} \geq 15pf$ )
Mode 3 – HSI	1	1	0: ( $C_{far\ end\ load} < 5pf$ ) 1: ( $C_{far\ end\ load} \geq 5pf$ )
Mode 4 - ULPI	1	1	0: ( $C_{far\ end\ load} < 4pf$ ) 1: ( $C_{far\ end\ load} \geq 4pf$ )

<sup>(1)</sup> The  $C_{far\ end\ load}$  is the external capacitance load applied at the far end of the pad signal transmission line.

The *Electrical Characteristics / DC Electrical Characteristics* section of the device data manual provides more information on the specific MB[1:0] and LB[1:0] bit field settings applicable to different interfaces multiplexed to I/O pads with combined mode and load settings. The *Timing Parameters* section of the device data manual provides the exact system conditions (far end load, trace length, etc.) at which pad-multiplexed interface I/O timing parameters reach their boundary values.

The pads featuring type 1 and type 2 I/O cells with combined mode and load settings require different MB[1:0] and LB0 bit field settings to achieve optimal electrical performance for the multiplexed interface. This behavior may depend on various factors:

- [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#), describes the different interfaces that have type 1 and type 2 MB and LB0 controls and the type 1 and type 2 I/O cell pad corresponding software control registers.
- The *Electrical Characteristics/DC Electrical Characteristics* section the device data manual provides more information about the specific MB[1:0] and LB0 bit field settings applicable to these interfaces multiplexed to type 1 and type 2 I/O pads with combined mode and load controls.

A process-only compensation using a 4-bit binary-coded schema is used separately for pullup/down output parameter variations.

For type 1 I/Os, only mode 2 does not use such compensation.

For type 2 I/Os, only mode 1 and mode 2 use eFuse process-only compensation to reduce the spread in timing parameters.

The I/Os with combined mode and load controls share the same compensation settings with the I/Os with driver output impedance (DS) settings and with the SDMMC2 or GPMC I/O buffers. They are exported from eFuse upon POR to the following bits in the [CONTROL\\_EFUSE\\_2](#) register:

[CONTROL\\_EFUSE\\_2\[31\]](#) EFUSE\_SMART2TEST\_P0 through [CONTROL\\_EFUSE\\_2\[28\]](#) EFUSE\_SMART2TEST\_P3 (pullup output parameters trimming)

[CONTROL\\_EFUSE\\_2\[27\]](#) EFUSE\_SMART2TEST\_N0 through [CONTROL\\_EFUSE\\_2\[24\]](#) EFUSE\_SMART2TEST\_N3 (pulldown output parameters trimming)

#### CAUTION

Do not override the SMART2TEST\_P/SMART2TEST\_N eFuse compensation settings in the [CONTROL\\_EFUSE\\_2](#) register.

#### 18.4.12.9.5 I/O Cells With Configurable Impedance Mode

The impedance mode at which this type of I/O cell operates is selected by setting a single bit drive strength control, DS0, as follows:

- DS0 = 1 selects mode 1, corresponding to 25-Ω impedance mode
- DS0 = 0 selects mode 2, corresponding to 50-Ω impedance mode

The pads featuring I/O cell with configurable impedance mode require different DS0 bit settings to achieve optimal electrical performance for the multiplexed interface. This behavior may depend on various factors:

- [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#), describes the different

interfaces that have DS0 impedance mode control and the pad corresponding software control registers.

- The *Electrical Characteristics/DC Electrical Characteristics* section of the device data manual provides more information about the specific DS0 bit settings applicable to these interfaces multiplexed to I/O pads with configurable impedance mode.

A process-only compensation using 4-bit binary coded schema is used separately for pullup/down output parameter variations. Only MODE1 and MODE2 use eFuse process-only compensation to reduce spread in timing parameters. The I/Os with DS0 impedance mode control share the same compensation settings with the I/Os with combined mode and load controls (both type 1 and type 2) and with the SDMMC2 or GPMC I/O buffers. They are exported from eFuse upon POR to the following bits in the [CONTROL\\_EFUSE\\_2](#) register:

[CONTROL\\_EFUSE\\_2](#)[31] EFUSE\_SMART2TEST\_P0 through [CONTROL\\_EFUSE\\_2](#)[28] EFUSE\_SMART2TEST\_P3 (pullup output parameters trimming)

[CONTROL\\_EFUSE\\_2](#)[27] EFUSE\_SMART2TEST\_N0 through [CONTROL\\_EFUSE\\_2](#)[24] EFUSE\_SMART2TEST\_N3 (pulldown output parameters trimming)

#### 18.4.12.9.6 SDMMC2 or GPMC I/O Cells With Load Setting Adjustable According to Interface Requirement Voltage Mode

To configure this type of I/O cell for different interfaces multiplexed on it, the user must manipulate in software a single bit, LB0, depending on type of multiplexed interface (GPMC and SDMMC2) of the pad and the selected I/O voltage supply mode. Like LPDDR2IO, this I/O cell is provided with selectable LVCMOS and Vref-based receiver option. A vref pad is provided to supply reference voltage to the receiver in the 1.2-V mode. To save power at lower frequency operation, the LVCMOS receiver can be selected, and 2 bits, for each of the two SDMMC2 or GPMC pad groups, are used to enable/disable the LVCMOS receiver (CMOSEN\_C2C\_FRM\_CTRL) manually in the [CONTROL\\_C2CIO\\_PADCONF\\_0](#) register.

The pads featuring SDMMC2 or GPMC I/O cells with load setting adjustable according to interface requirement/voltage mode require different LB0 bit settings to achieve optimal electrical performance for the multiplexed interface. This behavior may depend on various factors:

- [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#), describes the different interfaces that have the interface type versus voltage mode control (LB0) and the pad corresponding software control registers.
- The *Electrical Characteristics/DC Electrical Characteristics* section of the device data manual provides more information about the specific LB0 bit settings applicable to these interfaces multiplexed to I/O pads with configurable impedance mode.

---

**NOTE:** No bits are assigned to control the output drive capability of the internal SDMMC2 or GPMC Vref generator (at the c2c\_vref pad). It is fixed to a 2- $\mu$ A current load.

---

If 1.2-V voltage mode is selected, the user can choose to have the LVCMOS receiver or Vref-based receiver on the SDMMC2 or GPMC I/O cell pads. For the description of the dual-voltage mode settings of the SDMMC2 or GPMC I/O cell pads, see [Section 18.4.12.10, Dual Voltage-Supplied Peripheral Controls](#).

In Vref-based receiver mode, the SDMMC2 or GPMC I/O cell receiver is a true differential comparator with pad connected to the positive terminal and VREF tied to the negative terminal. The Vref-based receiver allows the improvement of speed performance at VDDS = 1.2-V I/O voltage supply.

---

**NOTE:** The Vref-based receiver is not supported in 1.8-V mode. In this mode, the LVCMOS receiver is the only option.

---

---

**NOTE:** While at VDDS = 1.2 V, the LVCMOS receiver is supported for all SDMMC2 or GPMC I/O cell pads. The Vref-based receiver is supported on only some of these pads.

---

The [CONTROL\\_C2CIO\\_PADCONF\\_0\[12\]](#) CMOSEN\_C2C\_0\_FRM\_CTRL and [CONTROL\\_C2CIO\\_PADCONF\\_0\[11\]](#) CMOSEN\_C2C\_1\_FRM\_CTRL bits, each related to a separate group of pads, are dedicated to select Vref-based receiver mode or LVCMOS receiver mode when VDD5 = 1.2 V is selected in the [CONTROL\\_CORE\\_PADCONF\\_MODE](#) register.

CMOSEN\_C2C\_0\_FRM\_CTRL = 1 enables the 1.2-V mode LVCMOS receiver, and CMOSEN\_C2C\_0\_FRM\_CTRL = 0 enables the 1.2-V Vref-based receiver for the following pads:

- gpmc\_ad8–gpmc\_ad15
- gpmc\_ncs4
- gpmc\_ncs5

CMOSEN\_C2C\_1\_FRM\_CTRL = 1 enables the 1.2-V mode LVCMOS receiver and CMOSEN\_C2C\_1\_FRM\_CTRL = 0 enables the 1.2-V Vref-based receiver for the following pads:

- gpmc\_a16–gpmc\_a23

---

**NOTE:** The Vref-based receiver in 1.2-V mode is not supported for the following SDMMC2 or GPMC I/O cell pads:

- gpmc\_ad0–gpmc\_ad7
  - gpmc\_a24
  - gpmc\_a25
  - gpmc\_ncs0–gpmc\_ncs3
  - gpmc\_clk
  - gpmc\_nadv\_ale
  - gpmc\_noe
  - gpmc\_nwe
  - gpmc\_nbe0\_cle
  - gpmc\_nbe1
  - gpmc\_wait1
  - gpmc\_wait2
  - gpmc\_ncs6
  - gpmc\_ncs7
- 

When the internal Vref generator is turned on, it supplies voltage reference to the Vref-based receivers supported for some SDMMC2 or GPMC I/O cell pads and can also be used to drive external modules with 1.2-V reference. In this case, the c2c\_vref device pad outputs voltage of the internal SDMMC2 or GPMC Vref cell.

Setting bit [CONTROL\\_C2CIO\\_PADCONF\\_0\[7\]](#) C2C\_INT\_VREF\_AUTO\_EN = 0b1 enables the automatic shut off or switch-on of the internal Vref cell generator.

If user software sets the manual control bit [CONTROL\\_C2CIO\\_PADCONF\\_0\[8\]](#) C2C\_INT\_VREF\_EN = 0b1, the internal Vref cell generator is enabled, regardless of the state of the [CONTROL\\_C2CIO\\_PADCONF\\_0\[7\]](#) C2C\_INT\_VREF\_AUTO\_EN bit. Thus, automatic control over the SDMMC2 or GPMC Vref cell generator can always be overridden in the context of enabling the Vref generator.

If the Vref cell generator is enabled, the c2c\_vref pad acts as output and can be used to supply reference voltage to external devices.

---

**NOTE:** At VDD5 = 1.8-V voltage mode, the internal reference generator is shut off and the internal Vref cell reference node is connected to 0.

---

For the description of the dual-voltage mode settings of the SDMMC2 or GPMC I/O cell pads, see [Section 18.4.12.10, Dual Voltage-Supplied Peripheral Controls](#).

**CAUTION**

While using the Vref cell in internal reference mode, nothing else must drive the pad externally, although the pad can be connected to supply the Vref signal to other devices.

When the internal Vref cell generator is disabled and bypassed, which is provided when bits [CONTROL\\_C2CIO\\_PADCONF\\_0\[8\]](#) C2C\_INT\_VREF\_EN = 0b0 and [CONTROL\\_C2CIO\\_PADCONF\\_0\[7\]](#) C2C\_INT\_VREF\_AUTO\_EN = 0b0, the c2c\_vref pad acts as input that can supply voltage reference to the Vref-based receivers from external sources.

[Table 18-83](#) provides different combinations of Vref cell control types, the state of the Vref cell, and the associated voltage reference pad direction.

**Table 18-83. SDMMC2 or GPMC Vref Cell State Description**

C2C_INT_VREF_EN (Manual Control Bits)	C2C_INT_VREF_AUTO_EN (AUTO Control Bits)	Type of Control	Vref Cell State	Voltage Reference Pad Direction
1	x	Manual	Enabled	O
0	1	AUTO	Automatically enabled/disabled	O
0	0	–	Disabled and bypassed	I

**CAUTION**

The c2c\_vref pad must be externally driven only in 1.2-V voltage mode.

According to the noise environment, the user can select to filter the reference voltage, which is supplied at the internal VREF node (receiver comparators Vref input) by the Vref cell generator or by an external source. Two coupling capacitors, internal to the SDMMC2 or GPMC Vref cell, are available at the internal VREF node, which is configurable as specified in [Table 18-84](#).

**Table 18-84. SDMMC2 or GPMC Vref Cell Decoupling Cap Selection**

VREF_CCAP0	VREF_CCAP1	Capacitor
0	0	No capacitor connected
0	1	Capacitor between internal reference node and VDD5
1	0	Capacitor between internal reference node and VSS
1	1	Capacitor between internal reference node and VDD5 as well as internal reference node and VSS

A process-only compensation using a 4-bit binary-coded schema is used separately for pullup/down output parameter variations. The SDMMC2 or GPMC I/O buffers share the same compensation settings with the I/Os with combined mode and load controls (both with 25- and 50-Ω output) and I/Os with driver output impedance (DS) settings. They are exported from eFuse upon POR to the following bits in the [CONTROL\\_EFUSE\\_2](#) register:

[CONTROL\\_EFUSE\\_2\[31\]](#) EFUSE\_SMART2TEST\_P0 through [CONTROL\\_EFUSE\\_2\[28\]](#) EFUSE\_SMART2TEST\_P3 (pullup output parameters trimming)

[CONTROL\\_EFUSE\\_2\[27\]](#) EFUSE\_SMART2TEST\_N0 through [CONTROL\\_EFUSE\\_2\[24\]](#) EFUSE\_SMART2TEST\_N3 (pulldown output parameters trimming)

### 18.4.12.9.7 SDMMC1 Pullup Strength Control

The SDMMC1\_PUSTRENGTH\_GRP<sub>i</sub> (where  $i = 1$  to 3) control bits are added in the [CONTROL\\_MMC1](#) register to program the pullup strength for the MMC/SD/SDIO1 I/Os group.

- [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#), describes the different interfaces that have the pullup strength control and the pad corresponding software control registers.
- The *Electrical Characteristics/DC Electrical Characteristics* section of the device data manual provides more information about the specific pullup strength settings applicable to these interfaces multiplexed to I/O pads with configurable pullup strength.

### 18.4.12.9.8 I2Cx I/Os Group Pullupresx Controls and Load Range Settings

The I2Cx buffer contains internal pullup resistors for F/S and HS modes. LB[1:0] bits are used to select an appropriate pullup resistor for a given load range.

The active high GLFENB[0] bit is implemented for I<sup>2</sup>C receivers to enable glitch-free operation.

---

**NOTE:** The pullup versus load settings applicable to I2Cx FS mode also apply to I2Cx standard speed mode.

---

The type of the pullup resistor (external or internal) for a certain I2Cx I/O group (where  $x = 1$  to 4) is selected through the I2Cx\_SCL\_PULLUPRESX and I2Cx\_SDA\_PULLUPRESX bits which reside in the [CONTROL\\_I2C\\_0](#) register. The SR\_SCL\_PULLUPRESX and SR\_SDA\_PULLUPRESX bits reside in the [CONTROL\\_I2C\\_2](#) register, which is part of the wakeup voltage domain.

Internal pullups are activated when I2Cx\_SCL\_PULLUPRESX / I2Cx\_SDA\_PULLUPRESX = 0b0 or SR\_SCL\_PULLUPRESX/SR\_SDA\_PULLUPRESX = 0b0.

I<sup>2</sup>C functionality is not ensured if the weak internal pullup or pulldown is activated on any of the I/Os connected to the bus.

---

**NOTE:** The user must set PULLUDENABLE = 0b0 in the I2Cx padconf registers (disable internal weak pullup resistors on i2cx pads) to ensure the full I/O cell performance capabilities of the I<sup>2</sup>C.

---

The I<sup>2</sup>C pads require different LB[1:0] and GLFENB[0] bit field settings to achieve optimal electrical performance for the multiplexed (in MuxMode = 0x0) I<sup>2</sup>C signals. This behavior may depend on various factors:

- [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#), describes the I<sup>2</sup>C pads and their corresponding software control registers.
- The *Electrical Characteristics/DC Electrical Characteristics/I<sup>2</sup>C DC Electrical Characteristics* section of the device data manual provides more information about the specific LB[1:0] and GLFENB[0] bit settings applicable to I<sup>2</sup>C I/O pads.

### 18.4.12.9.9 Device Interfaces Signal Group Controls Mapping

[Table 18-85](#) through [Table 18-112](#) describe the mapping of the signal integrity control bit fields in the different signal integrity control registers described in [Table 18-78](#).

---

**NOTE:** The same I/O cell and I/O cell controls assigned to a pad signal available when Muxmode = 0 are shared between signals available on the same pad when Muxmode is selected different than 0. For more information, see [Section 18.4.8.3, Pad Multiplexing Register Fields](#).

---

#### 18.4.12.10 Dual Voltage-Supplied Peripheral Controls

Some of the peripheral I/Os have the option to be supplied with a 1.2-V or 1.8-V power supply (VDD5 through device external pads). The power supply level to the dual-voltage I/Os of different peripherals is configurable through bit fields in the [CONTROL\\_CORE\\_PADCONF\\_MODE](#) register in the CORE domain (EMIF, GPMC, CAMERA, and SDMMC2 I/Os) and the [CONTROL\\_WKUP\\_PADCONF\\_MODE](#) register in the WKUP domain (EMIF and FREF generator). One control bit in these registers is dedicated to set dual-voltage per group of pads.

**NOTE:** Dynamic switching between 1.2-V and 1.8-V voltage modes on dual-voltage peripheral I/Os is not allowed.

[Table 18-113](#) describes dual-voltage controls versus the mapping of different pads.

**Table 18-113. Dual-Voltage Peripheral Control Bits vs Pad Mapping**

## 18.5 Control Module Programming Guide

### 18.5.1 Control Module Low-Level Programming Models

This section describes the low-level programming sequences for the configuration and use of the control module.

#### 18.5.1.1 Global Initialization

##### 18.5.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the control module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the environment and integration of the control module. For more information, see [Section 18.2, Control Module Environment](#), and [Section 18.3, Control Module Integration](#).

**Table 18-114. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	The three clocks coming from the PRCM module (CFG_L4_ICLK , WKUP_L4_ICLK2 , and CORE_TS_FCLK) are not software-controlled by PRCM. For more information about the three clocks, see <a href="#">Section 3.6.3.2.4, CM2 Clock Generator</a> , and <a href="#">Section 3.6.3.1, PRM Clock Source</a> , in <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
L4 interconnect	For information about the L4-CFG interconnect configuration, see <a href="#">Section 13.3, L4 Interconnects</a> , in <a href="#">Chapter 13, Interconnects</a> .

##### 18.5.1.1.2 Control Module Global Initialization

###### 18.5.1.1.2.1 Software Reset

The control module is not sensitive to a software reset.

###### 18.5.1.1.2.2 Clock Gating Configuration

As described in [Section 18.4.2, Control Module Clock Configuration](#), the programmer can choose a clock-gating strategy individually for each of the four control module instances. [Table 18-115](#) explains the necessary steps.

**Table 18-115. Configure Clock Gating for Different Control Module Instances**

Step	Register/Bit Field/Programming Model	Value
Set clock gating for SYSCTRL_PADCONF_CORE.	CONTROL_PADCONF_CORE_SYSCONFIG[3:2]	0x-
Set clock gating for SYSCTRL_PADCONF_WKUP.	CONTROL_PADCONF_WKUP_SYSCONFIG[3:2]	0x-
Set clock gating for SYSCTRL_GENERAL_CORE.	CONTROL_GEN_CORE_SYSCONFIG[3:2] CONTROL_TEMP_SENSOR[13]	0x-
Set clock gating for SYSCTRL_GENERAL_WKUP.	CONTROL_GEN_WKUP_SYSCONFIG[3:2]	0x-

#### 18.5.1.2 Operational Modes Configuration

##### 18.5.1.2.1 Video Driver Configuration

This section provides information about all modules and features in the high-tier device.

For more information about the VDAC, see [Section 10.6, Video Encoder](#).

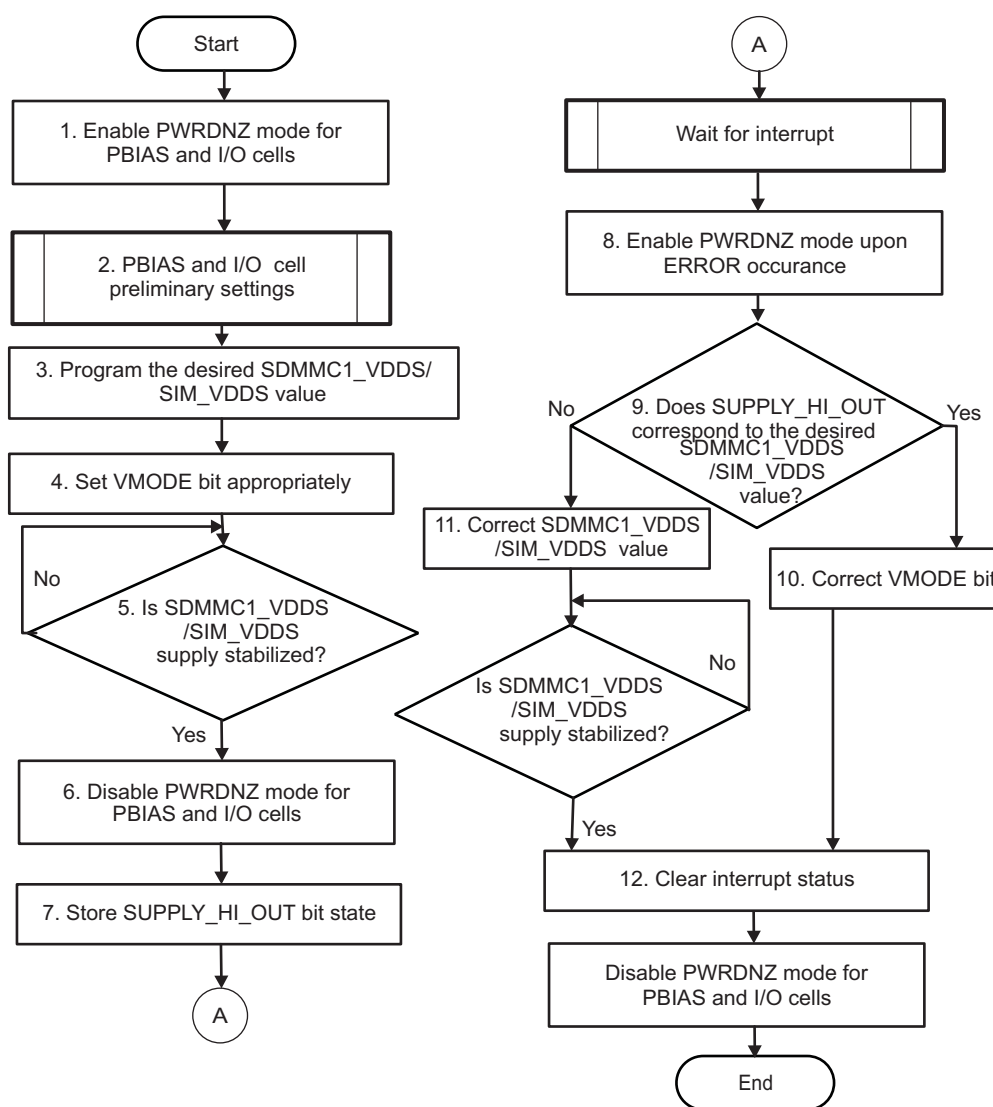

**Table 18-116. Control Module AVDAC Configuration**

Step	Register/Bit Field/Programming Model	Value
Video buffer is bypassed or not bypassed.	CONTROL_AVDAC[30] AVDAC_TVOUTBYPASS	0b-
Enable or disable ac coupling for TV output.	CONTROL_AVDAC[31] AVDAC_ACEN	0b-

**NOTE:** The (VDAC) function is not supported.

### 18.5.1.2.2 Extended-Drain I/Os and PBIAS Cells Programming Guide

This section describes the programming flow from 3.0 V to 1.8 V, and vice versa, when operating with the extended-drain I/Os and PBIAS cells.

**Figure 18-25. Configuring PBIAS Cell to Operate in Different Modes, Interrupt Method**

sysctrl-021

**Table 18-117. Register Settings for Configuring the MMC1\_PBIAS and MMC1 I/O Cells**

Procedure Name	Description	Register Settings
1. Enable PWRDNZ mode for MMC1_PBIAS cell and MMC/SD/SDIO1 I/O cell.	Software must keep MMC1_PBIAS cell and MMC1_IO cell PWRDNZ signals low whenever SDMMC1_VDDS ramps up/down or changes. This is for cell protection purposes.	1. Set <a href="#">CONTROL_PBIASLITE</a> [22] MMC1_PBIASLITE_PWRDNZ = 0b0. 2. Set <a href="#">CONTROL_PBIASLITE</a> [26] MMC1_PWRDNZ = 0b0.
2. Preliminary MMC1_PBIAS and MMC1 IO cell settings	Enable MMC1_PBIAS cell output and MMC1_PBIAS error associated interrupt. Select desired I/Os within the MMC1 I/O cell and set the corresponding pad configuration fields appropriately. Set the group speed and pullup strength controls for the MMC/SD/SDIO1 pads.	1. Set <a href="#">CONTROL_PBIASLITE</a> [25]MMC1_PBIASLITE_HIZ_MODE = 0b0. 2. For information about setting the MA_IRQ_75 line associated interrupt request PBIAS_IRQ, see <a href="#">Chapter 17, Interrupt Controller</a> . 3. For I/O multiplexing and pad configuration settings, see <a href="#">Section 18.5.1.2.5, Pad Configuration Programming Points</a> . 4. Set the speed control bits for the MMC1 I/O cell pads: <ul style="list-style-type: none"> <li>• <a href="#">CONTROL_MMC1</a>[27] SDMMC1_DR0_SPEEDCTRL = 0b-</li> <li>• <a href="#">CONTROL_MMC1</a>[26] SDMMC1_DR1_SPEEDCTRL = 0b-</li> <li>• <a href="#">CONTROL_MMC1</a>[28] SDMMC1_DR2_SPEEDCTRL = 0b-</li> </ul> 5. Set the pullup strength control bits for the MMC1 I/O cell pad groups: <ul style="list-style-type: none"> <li>• <a href="#">CONTROL_MMC1</a>[31] SDMMC1_PUSTRENGTH_GRP0=0b-</li> <li>• <a href="#">CONTROL_MMC1</a>[30] SDMMC1_PUSTRENGTH_GRP1=0b-</li> <li>• <a href="#">CONTROL_MMC1</a>[29] SDMMC1_PUSTRENGTH_GRP2=0b-</li> <li>• <a href="#">CONTROL_MMC1</a>[28] SDMMC1_PUSTRENGTH_GRP3=0b-</li> </ul>
3. Program the desired SDMMC1_VDDS voltage for MMC/SD/SDIO1 I/Os.	Program external power supply IC to generate appropriate SDMMC1_VDDS voltage:(3.0 V/ 1.8 V).	For more information about I <sup>2</sup> C interface operation, see <a href="#">Section 23.1, Multimaster High-Speed I<sup>2</sup>C</a> .
4. Set VMODE bit appropriately.	PBIAS voltage generation is based on the value of VMODE, set according to externally applied SDMMC1_VDDS voltage.	Set <a href="#">CONTROL_PBIASLITE</a> [21] MMC1_PBIASLITE_VMODE = 0b- <sup>(1)</sup> .
5. Check whether the SDMMC1_VDDS supply is stabilized.	Check the state of the externally generated SDMMC1_VDDS voltage, which is provided through communication between the device and external power supply device over the I <sup>2</sup> C interface.	For more information about I <sup>2</sup> C interface settings, see <a href="#">Section 23.1, Multimaster High-Speed I<sup>2</sup>C</a> .
6. Disable PWRDNZ mode for MMC1_PBIAS and associated extended-drain MMC1 I/O cell.	This starts the MMC1_PBIAS cell work to generate the PBIAS voltage.	1. Set <a href="#">CONTROL_PBIASLITE</a> [22] MMC1_PBIASLITE_PWRDNZ = 0b1. 2. Set <a href="#">CONTROL_PBIASLITE</a> [26] MMC1_PWRDNZ = 0b1.
7. Store the state of the SUPPLY_HI_OUT bit.	Done as a preliminary step for error handling analysis. (Whenever PWRDNZ = 0b0 , SUPPLY_HI_OUT is unconditionally set to 0b0.)	Store <a href="#">CONTROL_PBIASLITE</a> [24] MMC1_PBIASLITE_SUPPLY_HI_OUT bit in memory.
8.Enable PWRDNZ mode upon error occurrence.	It is recommended that all the I/Os are powered down (PWRDNZ = 0) as soon as VMODE_ERROR is high.	1. Set <a href="#">CONTROL_PBIASLITE</a> [26] MMC1_PWRDNZ = 0b0 . 2. Set <a href="#">CONTROL_PBIASLITE</a> [22]MMC1_PBIASLITE_PWRDNZ = 0b0.
9. Does SUPPLY_HI_OUT correspond to the desired SDMMC1_VDDS?	Test whether the error comes from incorrectly set value of SDMMC1_VDDS or incorrectly set VMODE bit.	Check the SUPPLY_HI_OUT bit stored in memory.
10. Correct VMODE bit.	If the level of SUPPLY_HI_OUT corresponds to the desired value of SDMMC1_VDDS, the correct the value of the VMODE bit	Modify the value of the <a href="#">CONTROL_PBIASLITE</a> [21] MMC1_PBIASLITE_VMODE bit.
11. Correct SDMMC1_VDDS value.	If SUPPLY_HI_OUT is different from expected, correct and set SDMMC1_VDDS value over I <sup>2</sup> C again.	For more information about I <sup>2</sup> C interface settings, see <a href="#">Section 23.1, Multimaster High-Speed I<sup>2</sup>C</a> ,
12. Clear Interrupt status.	Clear the IRQ_MA_75 interrupt status flag.	For more information about setting the MA_IRQ_75 line associated interrupt request PBIAS_IRQ, see <a href="#">Chapter 17, Interrupt Controller</a> .

<sup>(1)</sup> Must be set high when external SDMMC1\_VDDS source is programmed to be 3.0 V, or low when the external SDMMC1\_VDDS source is programmed to be 1.8 V. The reset default value corresponds to 3.0 V.

**Table 18-118. Register Settings for Configuring the PBIAS1 Cell, USBC1\_ICUSB and gpio\_wk0gpio\_wk2 Associated I/O Cells**

Procedure Name	Description	Register Settings
1. Enable PWRDNZ mode for PBIAS1 cell ,USBC1_ICUSB I/O cel,l and gpiowk0–gpiowk2 associated I/O cell.	Software must keep the PBIAS1 cell and the USBC1_ICUSB and gpiowk0 - gpiowk2 I/O cells associated with the PWRDNZ signals low whenever SIM_VDDS ramps up/down or changes. This is for cell protection purposes.	1. Set <a href="#">CONTROL_PBIASLITE</a> [28] PBIASLITE1_PWRDNZ = 0b0. 2. Set <a href="#">CONTROL_PBIASLITE</a> [20] USBC1_ICUSB_PWRDNZ = 0b0. 3. Set <a href="#">CONTROL_GPIOWK</a> [28] GPIOWK_IO_PWRDNZ = 0b0.
2. PBIAS1 cell, USBC1_ICUSB, and gpio_wk0-gpio_wk2 I/O cell settings	Enable PBIAS1 cell output and USBC1_ICUSB, gpio_wk0-gpio_wk2 error associated interrupt. Select desired I/Os within the USBC1_ICUSB and GPIOWK I/O cells and set appropriately their corresponding pad configuration fields Set the speed and pulldown controls for the pads (if applicable).	1. Set <a href="#">CONTROL_PBIASLITE</a> [31] PBIASLITE1_HIZ_MODE = 0b0. 2. For more information about setting MA_IRQ_75 line associated interrupt request PBIAS_IRQ, see <a href="#">Chapter 17, Interrupt Controller</a> . 3. For the I/O multiplexing and pad configuration settings, see <a href="#">Section 18.5.1.2.5, Pad Configuration Programming Points</a> . 4. Set the speed control bits for USBC1_ICUSB I/O cell pads <a href="#">CONTROL_MMC1</a> [24] USBC1_DR0_SPEEDCTRL = 0b- (No speed ctrl available for GPIOWK associated I/O cell). 5. Disable strong pulldowns on the gpio_wk1 and gpio_wk2 pads available by default after reset: <ul style="list-style-type: none"> <li><a href="#">CONTROL_GPIOWK</a>[31] PAD_GPIO_WK1_LOW = 0b0</li> <li><a href="#">CONTROL_GPIOWK</a>[29] PAD_GPIO_WK2_LOW = 0b0</li> </ul>
3. Program the desired voltage for SIM_VDDS for the USBC1_ICUSB/gpiowk0–gpiowk2 or (hw_dbg1–hw_dbg3 in WKUP domain) I/Os.	Program external power supply IC to generate appropriate SIM_VDDS voltage:(3.0 V/1.8 V)	For more information about I <sup>2</sup> C interface operation, see <a href="#">Section 23.1, Multimaster High-Speed I<sup>2</sup>C</a> .
4. Set VMODE bit appropriately.	PBIAS voltage generation is based on the value of VMODE, set according to externally applied SIM_VDDS voltage.	Set <a href="#">CONTROL_PBIASLITE</a> [27] PBIASLITE1_VMODE = 0b-. <sup>(1)</sup>
5. Check whether SIM_VDDS supply is stabilized.	Check the state of the externally generated SIM_VDDS voltage.This is provided through communication between the device and the companion power supply device over the I <sup>2</sup> C interface.	For more information about I <sup>2</sup> C interface setting, see <a href="#">Section 23.1, Multimaster High-Speed I<sup>2</sup>C</a> .
6. Disable PWRDNZ mode for PBIAS1 cell and its associated extended-drain USBC1_ICUSB and gpiowk0–gpiowk2 I/O cells.	This starts the PBIAS1 cell work to generate the PBIAS voltage.	1. Set <a href="#">CONTROL_PBIASLITE</a> [28] PBIASLITE1_PWRDNZ = 0b1. 2. Set <a href="#">CONTROL_PBIASLITE</a> [20 ] USBC1_ICUSB_PWRDNZ = 0b1. 3. Set <a href="#">CONTROL_GPIOWK</a> [28] GPIOWK_IO_PWRDNZ = 0b1.
7. Store the state of the SUPPLY_HI_OUT bit.	Done as a preliminary step for error handling analysis. (Whenever PWRDNZ = 0b0 , SUPPLY_HI_OUT is unconditionally set to 0b0.)	Store the <a href="#">CONTROL_PBIASLITE</a> [30] PBIASLITE1_SUPPLY_HI_OUT bit in memory.
8.Enable PWRDNZ mode upon error occurrence.	It is recommended that all the I/Os are powered down (PWRDNZ = 0) as soon as VMODE_ERROR is high.	1. Set <a href="#">CONTROL_PBIASLITE</a> [28] PBIASLITE1_PWRDNZ = 0b0. 2. Set <a href="#">CONTROL_PBIASLITE</a> [20] USBC1_ICUSB_PWRDNZ = 0b0. 3. Set <a href="#">CONTROL_GPIOWK</a> [28] GPIOWK_IO_PWRDNZ = 0b0.
9. Does SUPPLY_HI_OUT correspond to the desired SIM_VDDS level?	Test whether the error comes from incorrectly set value of SIM_VDDS or incorrectly set VMODE bit.	Check the stored in memory SUPPLY_HI_OUT bit.
10. Correct VMODE bit.	If the level of SUPPLY_HI_OUT corresponds to the desired value for SIM_VDDS, the correct value of the VMODE bit.	Modify value of <a href="#">CONTROL_PBIASLITE</a> [27] PBIASLITE1_VMODE.
11. Correct SIM_VDDS value.	If SUPPLY_HI_OUT is different than expected, correct and set SIM_VDDS value over I <sup>2</sup> C again.	For more information about I <sup>2</sup> C interface setting, see <a href="#">Section 23.1, Multimaster High-Speed I<sup>2</sup>C</a> .
12. Clear Interrupt status.	Clear the IRQ_MA_75 interrupt status flag.	For more information about setting MA_IRQ_75 line associated interrupt request PBIAS_IRQ, see <a href="#">Chapter 17, Interrupt Controller</a> .

<sup>(1)</sup> Must be set high when the external SIM\_VDDS source is programmed to be 3.0 V, or low when the external SIM\_VDDS source is programmed to be 1.8 V. The reset default value corresponds to 3.0 V .

### 18.5.1.2.3 Hardware Observability Settings

This section describes the procedures to control the hardware observability features of the device. To configure these features, the programmer must perform the steps listed in [Table 18-119](#).

**Table 18-119. Configure Hardware Observability Features**

Step	Register/Bit Field/Programming Model	Value
1. Select the hwobs(0)/hwobs(1)/hwobs(2) signal frequency divider value (applies only to po_hw_dbg0, po_hw_dbg1, and po_hw_dbg2 bus signals propagated in the CORE power domain).	<a href="#">CONTROL_HWOBS_CONTROL</a> [7:3] HWOBS_CLKDIV_SEL <a href="#">CONTROL_HWOBS_CONTROL</a> [13:9] HWOBS_CLKDIV_SEL_1 <a href="#">CONTROL_HWOBS_CONTROL</a> [18:14] HWOBS_CLKDIV_SEL_2	0x- <sup>(1)</sup>
2. Enable/disable gating of hwobs and alternatively set all hwobs ports to 0 or 1.	<a href="#">.CONTROL_HWOBS_CONTROL</a> [2] HWOBS_ALL_ZERO_MODE <a href="#">CONTROL_HWOBS_CONTROL</a> [1] HWOBS_ALL_ONE_MODE	0x- <sup>(2)</sup>
3. Enable/disable hwobs port gating only for signals coming from IPs identified in the MACRO group (applies only to po_hw_dbg bus signals propagated in the CORE power domain).	<a href="#">CONTROL_HWOBS_CONTROL</a> [0] HWOBS_MACRO_ENABLE	0x- <sup>(3)</sup>
4. Associate a certain hwobs channel to the CORE or WKUP power domain.	Configure each bit from the <a href="#">CONTROL_DEBOBS_FINAL_MUX_SEL</a> [31:0] SELECT bit field appropriately for its corresponding hw_dbg channel.	0x-
5. Choose the source of a signal or signal view channel in the CORE power domain.	Configure each <a href="#">CONTROL_CORE_CONF_DEBUG_SEL_TST_0</a> [3:0] MODE through <a href="#">CONTROL_CORE_CONF_DEBUG_SEL_TST_31</a> [3:0] MODE bit field appropriately for its corresponding hw_dbg channel.	0x-
6. Choose the source of a signal within the WKUP power domain.	Configure each <a href="#">CONTROL_WKUP_CONF_DEBUG_SEL_TST_i</a> [0] MODE bit, (where i = 0 to 31) appropriately for its corresponding hw_dbg channel i (where i = 0 to 31).	0x-
7. Choose to associate a certain DPLL signal to a given DPLL signal view channel (applies only to po_hw_dbg bus signals propagated in the CORE power domain).	<a href="#">CONTROL_CONF_DPLL_FREQLOCK_SEL</a> [2:0] MULT <a href="#">.CONTROL_CONF_DPLL_TINITZ_SEL</a> [2:0] MULT <a href="#">CONTROL_CONF_DPLL_PHASELOCK_SEL</a> [2:0] MULT <a href="#">CONTROL_CONF_DPLL_TENABLE_SEL</a> [2:0] MULT <a href="#">CONTROL_CONF_DPLL_TENABLEDIV_SEL</a> [2:0] MULT <a href="#">CONTROL_CONF_DPLL_BYPASSACK_SEL</a> [2:0] MULT <a href="#">CONTROL_CONF_DPLL_IDLE_SEL</a> [2:0] MULT	0x-
8. Choose to associate a certain clockout signal to a given clockview channel (applies only to po_hw_dbg bus signals propagated in the CORE power domain).	<a href="#">CONTROL_CONF_CLK_SEL0</a> [2:0] MULT through <a href="#">CONTROL_CONF_CLK_SEL2</a> [2:0] MULT	0x-
9. Choose to associate an sDMA signal to a given sDMA view channel (applies only to po_hw_dbg bus signals propagated in the CORE power domain).	<a href="#">CONTROL_CONF_SDMA_REQ_SEL0</a> [6:0] MULT through <a href="#">CONTROL_CONF_SDMA_REQ_SEL3</a> [6:0] MULT	0x-
10. Set the appropriate pad configuration bit fields to associate the hw_dbg pad function to output pins and configure additional output pad features.	For more information, see <a href="#">Section 18.4.11, Hardware Observability</a> , and <a href="#">Section 18.4.8, Pad Functional Multiplexing and Configuration</a> .	For more information, see <a href="#">Section 18.4.8, PAD Functional Multiplexing and Configuration</a> .

<sup>(1)</sup> To configure the hwobs(0) channel to operate normally, the value of the HWOBS\_CLKDIV\_SEL, HWOBS\_CLKDIV\_SEL\_1, or HWOBS\_CLKDIV\_SEL\_2 bit must be set different than 0.

<sup>(2)</sup> Set both bits to 0 to enable hardware observability. Set only one bit to 1 to gate hwobs ports according to the output state required.

<sup>(3)</sup> The modules that belong to this group are: Cortex-A9 MPU subsystem, DSP subsystem, IVA-HD, display subsystem, CM2, and ABE.

For more information about the different functions and registers associated with the hardware observability features, see [Section 18.4.11, Hardware Observability](#).

### 18.5.1.2.4 Off Mode Preliminary Settings

This section describes configurations of pads to work in off mode. The following actions must be performed once, and remain valid for all device off <-> on transitions.

**Table 18-120. Setting Pad Off Mode Through Padconfiguration Registers**

Step	Register/Bit Field/Programming Model	Value
Set OFFMODEPULLTYPESELECT bit.	CONTROL_CORE_PAD0_X_PAD1_Y[29,13] – Select pullup/down type when pad in off mode.	0b-
Set OFFMODEPULLUDENABLE bit.	CONTROL_CORE_PAD0_X_PAD1_Y[28,12] – Enable/disable pullup/down feature when pad in off mode.	0b-
Set OFFMODEOUTVALUE bit.	CONTROL_CORE_PAD0_X_PAD1_Y[27,11] – Set off mode pad override value.	0b-
Set OFFMODEENABLE bit (enable/disable pad overriding capability in off mode).	CONTROL_CORE_PAD0_X_PAD1_Y[25,9] – Set pad to keep its previous state (it had before going to off mode) or force pad output to a certain override value (OFFMODEOUTVALUE) when pad in off mode.	0b-
Set OFFMODEOUTENABLE bit.	CONTROL_CORE_PAD0_X_PAD1_Y[26,10] – Enable/disable output in off mode.	0b-
Program a valid device ACTIVE pad configuration.	For more information about ACTIVE pad configuration, see <a href="#">Table 18-121</a> .	
Set clock gating strategy.	. CONTROL_PADCONF_CORE_SYSCONFIG[3:2] IP_SYSCONFIG CONTROL_PADCONF_WKUP_SYSCONFIG[3:2] IP_SYSCONFIG	0x2,0x3
Enable/disable the wake-up detection capability <sup>(1)</sup> .	CONTROL_CORE_PAD0_X_PAD1_Y[30,14]	0b-

<sup>(1)</sup> When the wake-up detection is enabled for a pad, this pad is configured as input. Therefore, be sure to write 0b1 in the OFFOUTENABLE bit to disable the output capability.

### 18.5.1.2.5 Pad Configuration Programming Points

This section describes through an example the configurations of pads necessary for working in active mode.

To configure the pad, ensure that the following steps are done:

1. Identify signals required on the interface based on the target application.

Example: To configure the UART2 interface on balls, the required signals are `uart2_tx`, `uart2_rts`, `uart2_cts`, and `uart2_rx`.

2. Choose the pads used for those signals. Some signals may be available on several pads and/or may be multiplexed with other signals needed for another application. See [Section 18.4.8.3, Pad Multiplexing Register Fields](#).

Example: Unlike the UART2 interface signals, `uart2_rx` and `uart2_tx`, each of which is available on two pads, the `uart2_cts` and `uart2_rts` signals are available only on one pad each (MUXMODE = 0b000). The `uart2_cts` signal, however, is multiplexed with the MMC I/O signal `sdmmc3_clk`, and the `uart2_rts` signal is multiplexed with the MMC I/O signal `sdmmc3_cmd` on the same pad. Assume that the MMC I/O 3 interface is also required in the system. Therefore, for the MMC I/O interface signals, pads must be used where those signals are not multiplexed with a UART2 signal, if possible. In this case, the solution is to use `sdmmc3_clk` and `sdmmc3_cmd` on another two pads of the device (`usbb2_ulpitll_dat7` and `usbb2_ulpitll_dat6`) configuring (MUXMODE = 0b010).

3. Identify the signal integrity parameter settings (drive strength, impedance, slew rate, pullup/pulldown strength, etc.) necessary for the pads associated I/O cells, listed in [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#).

For the register settings of the signal integrity parameters for the `uart2_rx`, `uart2_tx`, `uart2_cts`, and `uart2_rts` pads (this is the variant when the desired `uart2` signals appear in MuxMode = 0x0), see [Table 18-101](#).

For the `uart2_cts`, `uart2_rts`, and `uart2_rx` pads, the following bit fields (Mode and Load bit group settings) must be set:

- [CONTROL\\_SMART3IO\\_PADCONF\\_1\[27:26\]](#) UART2\_DR0\_MB
- [CONTROL\\_SMART3IO\\_PADCONF\\_2\[13\]](#) UART2\_DR0\_LB

For the `uart2_tx` pad, the following bit fields (Mode and Load bit group settings) must be set:

- [CONTROL\\_SMART3IO\\_PADCONF\\_1\[25:24\]](#) UART2\_DR1\_MB
- [CONTROL\\_SMART3IO\\_PADCONF\\_2\[12\]](#) UART2\_DR1\_LB

For recommendations about the signal integrity parameter settings of the mentioned pad group, see the device data manual.

---

**NOTE:** To identify the signal-associated I/O cell signal parameter settings in [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#), the user must search for the device pad name on which the desired signal is muxed, because the I/O cell settings are designated and listed on a per pad basis. This means that a signal name does not appear (unless MuxMode = 0x0) in [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#), but only the pad on which the signal is muxed.

Pads that do not have software I/O cell signal integrity parameter controls are not listed in [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#).

---

Assume the user application configures the `sdmmc3_clk` and `sdmmc3_cmd` signals on the `usbb2_ulpitll_dat7` and `usbb2_ulpitll_dat6` pads (MuxMode = 0x2). The I/O cell setting (single-bit group control – SPI3\_DR0\_DS of driver output impedance) listed in [Table 18-89](#) also applies to the `sdmmc3_clk` and `sdmmc3_cmd` signals, which appear on the same pads, when MuxMode = 0x2.

In this case, the [CONTROL\\_SMART2IO\\_PADCONF\\_2\[21\]](#) SPI3\_DR0\_DS bit must be set to configure the I/O cell performance of `sdmmc3_clk` and `sdmmc3_clk`.

For recommendations about the mentioned pad group signal integrity parameter settings, see the device data manual.

4. Identify and program the peripheral dual-voltage settings, if they apply to the chosen pads:

[Table 18-113](#) lists the corresponding control bits of the pads in the [CONTROL\\_CORE\\_PADCONF\\_MODE](#) and [CONTROL\\_WKUP\\_PADCONF\\_MODE](#) registers. The identification of the I/O dual voltage domains/control bits for a signal must be made on a per-pad basis.

All pads (`uart2_cts`, `uart2_rts`, `uart2_rx`, and `uart2_tx`) fall within the same dual-voltage domain (VDDS\_DV\_BANK1) and the I/O supply voltage (1.2 V/1.8 V) is configured by setting the [CONTROL\\_CORE\\_PADCONF\\_MODE\[30\]](#) VDDS\_DV\_BANK1 bit.

As previously explained, the `sdmmc3_clk` and `sdmmc3_cmd` signals are muxed on the `usbb2_ulpitll_dat7` and `usbb2_ulpitll_dat6` pads. The dual-voltage control bit corresponding to these two pads is [CONTROL\\_CORE\\_PADCONF\\_MODE\[26\]](#) VDDS\_DV\_BANK6 (see [Table 18-113](#)).

For more information about pad performance dependencies from I/O dual-voltage supply settings, see the device data manual.

5. Identify the pad configuration registers associated with the pads to be used in the application. See [Section 18.4.8.3, Pad Multiplexing Register Fields](#).

Example: Under the previous hypothesis, the pad configuration registers to program are:

- `uart2_rts`: [CONTROL\\_CORE\\_PAD0\\_UART2\\_CTS\\_PAD1\\_UART2\\_RTS\[31:16\]](#)
- `uart2_cts`: [CONTROL\\_CORE\\_PAD0\\_UART2\\_CTS\\_PAD1\\_UART2\\_RTS\[15:0\]](#)
- `uart2_tx`: [CONTROL\\_CORE\\_PAD0\\_UART2\\_RX\\_PAD1\\_UART2\\_TX\[31:16\]](#)
- `uart2_rx`: [CONTROL\\_CORE\\_PAD0\\_UART2\\_RX\\_PAD1\\_UART2\\_TX\[15:0\]](#)
- `sdmmc3_clk` (MuxMode = 0x2): [CONTROL\\_CORE\\_PAD0\\_USBB2\\_ULPITLL\\_DAT6\\_PAD1\\_USBB2\\_ULPITLL\\_DAT7\[31:16\]](#)
- `sdmmc3_cmd` (MuxMode = 0x2): [CONTROL\\_CORE\\_PAD0\\_USBB2\\_ULPITLL\\_DAT6\\_PAD1\\_USBB2\\_ULPITLL\\_DAT7\[15:0\]](#)

**Table 18-121. ACTIVE PADS Configuration Points**

Step	Register/Bit Field/Programming Model	Value
1. Identify the interface signals and map them to the appropriate pads according to the application requirements and the device-specific pad I/O muxing capabilities. See <a href="#">Section 18.4.8.3, Pad Multiplexing Register Fields</a> .	Define the list of I/O signal names: uart2_cts, uart2_rts, uart2_rx, uart2_tx, sdmmc3_clk, and sdmmc3_cmd Define the list of corresponding pads: uart2_cts, uart2_rts, uart2_rx, uart2_tx, usbb2_ulpitll_dat7, and usbb2_ulpitll_dat6	–
2. Identify the corresponding I/O cell signal integrity parameter controls for the pad (on a per-pad basis). See <a href="#">Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping</a> .	(uart2_cts, uart2_rts, uart2_rx pads) <a href="#">CONTROL_SMART3IO_PADCONF_1</a> [27:26] UART2_DR0_MB <a href="#">CONTROL_SMART3IO_PADCONF_2</a> [13] UART2_DR0_LB (uart2_tx pad) <a href="#">CONTROL_SMART3IO_PADCONF_1</a> [25:24] UART2_DR1_MB <a href="#">CONTROL_SMART3IO_PADCONF_2</a> [12] UART2_DR1_LB (usbb2_ulpitll_dat7, usbb2_ulpitll_dat6) <a href="#">CONTROL_SMART2IO_PADCONF_2</a> [21] SPI3_DR0_DS	For more information about the recommended I/O settings, see the device data manual
3. Determine whether the pad is associated with a peripheral dual-voltage domain (see the device data manual). Identify its corresponding 1.2-V/1.8-V dual-voltage control bit in the <a href="#">CONTROL_CORE_PADCONF_MO</a> DE or <a href="#">CONTROL_WKUP_PADCONF_MO</a> DE register. See <a href="#">Table 18-113</a> .	(uart2_cts, uart2_rts, uart2_rx, uart2_tx) <a href="#">CONTROL_CORE_PADCONF_MODE</a> [30] VDDS_DV_BANK1 (usbb2_ulpitll_dat7, usbb2_ulpitll_dat6) <a href="#">CONTROL_CORE_PADCONF_MODE</a> [26] VDDS_DV_BANK6	For more information about the I/O performance dependency on dual-voltage settings, see the device data manual.
4. Configure MUXMODE field in pad configuration registers associated with the pads used.	<a href="#">CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS</a> [18:16] UART2_RTS_MUXMODE <a href="#">CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS</a> [2:0] UART2_CTS_MUXMODE <a href="#">CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX</a> [18:16] UART2_TX_MUXMODE <a href="#">CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX</a> [2:0] UART2_RX_MUXMODE <a href="#">CONTROL_CORE_PAD0_USBB2_ULPITLL_DAT6_PAD1_USBB2_ULPITLL_DAT7</a> [18:16] USBB2_ULPITLL_DAT7_MUXMODE <a href="#">CONTROL_CORE_PAD0_USBB2_ULPITLL_DAT6_PAD1_USBB2_ULPITLL_DAT7</a> [2:0] USBB2_ULPITLL_DAT6_MUXMODE	0b000 0b000 0b000 0b000 0b010 0b010
5. Select the type of the internal pullup/down resistor <sup>(1)</sup> .	<a href="#">CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX</a> [4] UART2_RX_PULLTYPESELECT <a href="#">CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS</a> [2:0] UART2_CTS_PULLTYPESELECT	0b1 (pullup selected) 0b1 (pullup selected)
6. Enable/disable pullup/down feature of the pad <sup>(2)</sup> .	<a href="#">CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX</a> [3] UART2_RX_PULLUDENABLE <a href="#">CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS</a> [3] UART2_CTS_PULLUDENABLE	0b1 (pull feature enabled) 0b1 (pull feature enabled)
7. Set the direction of the pin signal. <sup>(2)</sup>	<a href="#">CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX</a> [8] UART2_RX_INPUTENABLE <a href="#">CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS</a> [8] UART2_CTS_INPUTENABLE <a href="#">CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX</a> [24] UART2_TX_INPUTENABLE <a href="#">CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS</a> [24] UART2_RTS_INPUTENABLE <a href="#">CONTROL_CORE_PAD0_USBB2_ULPITLL_DAT6_PAD1_USBB2_ULPITLL_DAT7</a> [24] USBB2_ULPITLL_DAT7_INPUTENABLE (sdmmc3_clk) <a href="#">CONTROL_CORE_PAD0_USBB2_ULPITLL_DAT6_PAD1_USBB2_ULPITLL_DAT7</a> [8] USBB2_ULPITLL_DAT6_INPUTENABLE (sdmmc3_cmd)	0b1 (input pin) 0b1 (input pin) 0b0 (output pin) 0b0 (output pin) 0b1 (input pin) 0b1 (input pin)

<sup>(1)</sup> It is recommended to use internal pullup/down resistor if pad is used as input and external pullup/down is not used.<sup>(2)</sup> If the pad is configured in output mode, it is recommended for software to disable the internal pullup/pulldown associated with it.

---

**NOTE:** The order for setting the previous pad configuration bits is not important.

---

**NOTE:** If a device pad is left unconnected, but power is supplied to the I/O, or the pad is used only as an output during the lifetime of the application, it is recommended to keep its corresponding pad configuration bit `CONTROL_CORE /WKUP_PAD0_X_PAD1_Y.INPUTENABLE` set to 0b0. This keeps the input buffer disabled and reduces static current consumption.

---

**NOTE:** I/Os are non-failsafe, which means that voltage must never be applied at a pad before the internal I/O supply voltage `VDDS` is powered.

---

## 18.6 Control Module Register Manual

### 18.6.1 Control Module Instance Summary

Table 18-122 lists the base address and address space for the control module instances.

**Table 18-122. Control Module Instance Summary**

Module instance	Base Address	Size	Description
SYSCTRL_GENERAL_C ORE	0x4A00 2000	4KB	Module
SYSCTRL_GENERAL_W KUP	0x4A30 C000	4KB	Module
SYSCTRL_PADCONF_C ORE	0x4A10 0000	4KB	Module
SYSCTRL_PADCONF_W KUP	0x4A31 E000	4KB	Module

**NOTE:** All module registers are 8-, 16-, or 32-bit accessible through the L4 interconnect (little-endian encoding).

### 18.6.2 SYSCTRL\_GENERAL\_CORE Register Summary
