#### 8.3.4.5.4 ISS ISP RSZ Programming Constraints

The RSZ module contains shadowed and nonshadowed registers. Shadowed registers can be updated anytime during the resizing operation, but the new setting does not take effect until the next `rsz_int_reg` event. Shadowed registers can be updated for the next frame after the `rsz_int_reg` event triggers.

Nonshadowed registers must be programmed before enabling the RSZ module or between frames (that is, after the `rsz_int_dma` and the entire frame have come on the VPORT IF, and before the VD of the next frame). [Table 8-384](#) list the nonshadowed registers.

**Table 8-384. ISS ISP RSZ Nonshadowed Registers**

#### 8.3.4.6 ISS ISP H3A Programming Model

This section discusses issues related to the software control of the H3A module. It lists which registers are required to be programmed in different modes, how to enable and disable the H3A, how to check the status of the H3A, discusses the different register access types, and enumerates several programming constraints.

##### 8.3.4.6.1 ISS ISP H3A Hardware Setup/Initialization

This section discusses the configuration of the H3A required before image processing can begin.

###### 8.3.4.6.1.1 ISS ISP H3A Reset Behavior

Upon hardware reset of the ISP, all the registers in the H3A are reset to their reset values.

###### 8.3.4.6.1.2 ISS ISP H3A Register Setup

For register configuration purposes, the AF and AEW engines of the H3A can be configured independently. Because there are separate enable bits for each engine, this section is divided into the AF engine and the AEW engine.

###### 8.3.4.6.1.2.1 ISS ISP H3A AF Engine

Before enabling the AF engine, the hardware must be properly configured through register writes. [Table 8-385](#) lists the register parameters that must be programmed before enabling the AF engine of the H3A.

**Table 8-385. ISS ISP H3A AF Engine Required Configuration Parameters**

Step	Configuration Required	Value
AF optional preprocessing settings		
<b>Note:</b> A suggestion is to use the averaging filter in the IPIPEIF to reduce noise before generating AF statistics.		
Enable or disable the median filter.	H3A_PCR[2] AF_MED_EN	
Set the median filter threshold, if the filter is enabled.	H3A_PCR[10:3] MED_TH	
Enable or disable A-Law compression.	H3A_PCR[1] AF_ALAW_EN

### 8.3.4.6.2 ISS ISP H3A Enable/Disable Hardware

Setting the [H3A\\_PCR\[0\] AF\\_EN](#) bit enables the AF engine, and setting the [H3A\\_PCR\[16\] AEW\\_EN](#) bit enables the AEW engine. This is done after all of the required registers discussed in the previous section are programmed.

The H3A operates in continuous mode. Processing of the frame is dependent on the timing of the IPIPEIF. To ensure that data from the IPIPEIF is not missed, the H3A must be enabled before the IPIPEIF. In this way, the H3A waits for data from the IPIPEIF. The AF engine or the AEW engine can be disabled by clearing the [H3A\\_PCR\[0\] AF\\_EN](#) or [H3A\\_PCR\[16\] AEW\\_EN](#) bit, respectively, during the processing of the last frame. The disable is latched in at the end of the frame in which it was written.

### 8.3.4.6.3 ISS ISP H3A Register Accessibility During Frame Processing

There are two types of register access in the H3A module:

- Shadow registers

These registers/fields can be read and written (if the field is writable) at any time. However, the written values take effect only at the start of a frame. Reads still return the most recent write even though the settings are not used until the next start of frame.

The only shadowed registers in the H3A module are:

- [H3A\\_AFPAX1](#)
- [H3A\\_AFPAX2](#)
- [H3A\\_AFPAXSTART](#)
- [H3A\\_AFIIRSH](#)
- [H3A\\_AEWWIN1](#)
- [H3A\\_AEWINSTART](#)
- [H3A\\_AEWINBLK](#)
- [H3A\\_AEWSUBWIN](#)
- [H3A\\_AEWCFG](#)
- [H3A\\_AEWBUFST](#)

- Busy-lock registers

All other registers, except those described previously, belong to this category.

Busy-lock registers cannot be written when the module is busy ([H3A\\_PCR\[15\] BUSYAF == 1](#) OR [H3A\\_PCR\[18\] BUSYAEAWB == 1](#)). Writes are allowed to occur, but no change occurs in the registers (blocked writes from the hardware perspective, but allowed write from the software perspective). Once the busy bit in the [H3A\\_PCR](#) register ([H3A\\_PCR\[15\] BUSYAF](#) or [H3A\\_PCR\[18\] BUSYAEAWB](#) bit) is reset to 0, the busy-lock registers can be written.

The ideal procedure for changing the H3A registers if ([H3A\\_PCR\[15\] BUSYAF == 0](#) or [H3A\\_PCR\[18\] BUSYAEAWB == 0](#)) or if (EOF interrupt occurs) is:

1. Disable AF or AE/AWB.
2. Change registers.
3. Enable AF or AE/AWB.

### 8.3.4.6.4 ISS ISP H3A Interframe Operations

Between frames, it may be necessary to modify the memory pointers before processing the next frame. Because the [H3A\\_PCR](#) register and memory pointer registers are shadowed, these modifications can take place any time before the end of the frame, and the data will be latched in for the next frame. The host controller can perform these changes upon receiving an interrupt.

### 8.3.4.6.5 ISS ISP H3A Summary of Constraints

The following is a list of register configuration constraints to adhere to when programming the H3A. It can be used as a quick checklist. More detailed register setting constraints can be found in the individual register descriptions.

- The output addresses ([H3A\\_AFBUFST](#)[31:5] AFBUFST and ) must be on 64-byte boundaries.
- Each horizontal row of paxels () or windows () starts on a 32-byte boundary.
- If the pixel clock frequency < ISP\_FCLK/2 and vertical focus is enabled, the constraints listed in [Table 8-387](#) apply.

**Table 8-387. ISS ISP H3A Constraints When PCLK < ISP\_FCLK/2 and Vertical Focus Enabled**

Field	Constraint
<a href="#">H3A_AEWWIN1</a> [20:13] WINW	>7
<a href="#">H3A_AFPAX1</a> [23:16] PAXW	>7
<a href="#">H3A_AFIIRSH</a> [11:0] IIRSH	None
<a href="#">H3A_AFPAXSTART</a> [27:16] PAXSH	>= <a href="#">H3A_AFIIRSH</a> [11:0] IIRSH + 2
<a href="#">H3A_AFPAX2</a> [20:17] AFINCH	None
<a href="#">H3A_AFPAX2</a> [5:0] PAXHC	<=11

- If the pixel clock frequency < ISP\_FCLK/2 and vertical focus is disabled, the constraints listed in [Table 8-388](#) apply.

**Table 8-388. ISS ISP H3A Constraints When PCLK < ISP\_FCLK/2 and Vertical Focus Disabled**

Field	Constraint
<a href="#">H3A_AEWWIN1</a> [20:13] WINW	>7
<a href="#">H3A_AFPAX1</a> [23:16] PAXW	>7
<a href="#">H3A_AFIIRSH</a> [11:0] IIRSH	Must be even
<a href="#">H3A_AFPAXSTART</a> [27:16] PAXSH	>= <a href="#">H3A_AFIIRSH</a> [11:0] IIRSH + 2 and must be even
<a href="#">H3A_AFPAX2</a> [20:17] AFINCH	(1+ <a href="#">H3A_AFPAX1</a> [23:16] PAXW / <a href="#">H3A_AFPAX2</a> [20:17] AFINCH) * <a href="#">H3A_AFPAX2</a> [5:0] PAXHC must be between 4 and 384
<a href="#">H3A_AFPAX2</a> [5:0] PAXHC	<=35

- If the pixel clock frequency >= ISP\_FCLK/2 and vertical focus is enabled, the constraints listed in [Table 8-389](#) apply.

**Table 8-389. ISS ISP H3A Constraints When PCLK >= ISP\_FCLK/2 and Vertical Focus Enabled**

Field	Constraint
<a href="#">H3A_AEWWIN1</a> [20:13] WINW	>15
<a href="#">H3A_AFPAX1</a> [23:16] PAXW	>15
<a href="#">H3A_AFIIRSH</a> [11:0] IIRSH	None
<a href="#">H3A_AFPAXSTART</a> [27:16] PAXSH	>= <a href="#">H3A_AFIIRSH</a> [11:0] IIRSH + 2
<a href="#">H3A_AFPAX2</a> [20:17] AFINCH	None
<a href="#">H3A_AFPAX2</a> [5:0] PAXHC	<=11

- If the pixel clock frequency >= ISP\_FCLK/2 and vertical focus is disabled, the constraints in [Table 8-390](#) apply.

**Table 8-390. ISS ISP H3A Constraints When PCLK >= ISP\_FCLK/2 and Vertical Focus Disabled**

Field	Constraint
<a href="#">H3A_AEWWIN1</a> [20:13] WINW	>15
<a href="#">H3A_AFPAX1</a> [23:16] PAXW	>15
<a href="#">H3A_AFIIRSH</a> [11:0] IIRSH	Must be even
<a href="#">H3A_AFPAXSTART</a> [27:16] PAXSH	>= <a href="#">H3A_AFIIRSH</a> [11:0] IIRSH + 2 and must be even

**Table 8-390. ISS ISP H3A Constraints When PCLK >= ISP\_FCLK/2 and Vertical Focus Disabled (continued)**

Field	Constraint
H3A_AFPAX2[20:17] AFINCH	(1+ H3A_AFPAX1[23:16] PAXW / H3A_AFPAX2[20:17] AFINCH) * H3A_AFPAX2[5:0] PAXHC must be between 4 and 384 and H3A_AFPAX2[20:17] AFINCH modulo H3A_AFPAX1[23:16] PAXW !=1
H3A_AFPAX2[5:0] PAXHC	<=35

### AF engine

- The paxel horizontal start value must be greater than or equal to the IIR horizontal start position.
- The paxel start/end and IIR filter start positions must not be set within the first 2 and the last 2 pixels (to check).
- The width (H3A\_AFPAX1[23:16] PAXW) and height (H3A\_AFPAX1[7:0] PAXH) of the paxels must be an even number.
- The minimum width of the paxel (H3A\_AFPAX1[23:16] PAXW) must be 16 pixels, if the pixel clock is half or less of the ISP\_FCLK clock. If the pixel clock is equal to ISP\_FCLK, then the minimum width is 32 pixels.
- The number of columns to increment in a paxel (H3A\_AFPAX2[20:17] AFINCH) must be even and is restricted to 2 to 32.
- The number of lines to increment in a paxel (H3A\_AFPAX2[16:13] AFINCV) must be even and is restricted to 0 to 30.
- The maximum number of vertical paxels in a frame (H3A\_AFPAX2[12:6] PAXVC) must not exceed 128.
- The number of paxels in the horizontal direction (H3A\_AFPAX2[5:0] PAXHC) has a valid range from 1 to 35.
- If vertical mode is enabled:
  - The paxel horizontal start position (H3A\_AFPAXSTART[27:16] PAXSH) must be even.
  - The lower bit of the H3A\_AFPAXSTART[27:16] PAXSH bit field and the lower bit of the H3A\_AFIIRSH[11:0] IIRSH] bit field must be equal.
  - The H3A\_AFPAXSTART[11:0] PAXSV bit field must be >= 8.
- If vertical mode is not enabled, the H3A\_AFIIRSH[11:0] IIRSH bit field must be even.
- Paxels cannot overlap the last pixel in a line.
- Paxels must be adjacent to one another.

### AEW engine

- The width (H3A\_AEWWIN1[20:13] WINW) and height (H3A\_AEWWIN1[31:24] WINH) of the windows must be an even number.
- The minimum width of the window (H3A\_AEWWIN1[20:13] WINW) must be 16 pixels, if the pixel clock is half or less of the ISP\_FCLK clock. If the pixel clock is equal to ISP\_FCLK, then the minimum width is 32 pixels.
- The window height (H3A\_AEWWIN1[31:24] WINH) has a valid range from 2 to 512.
- The maximum number of vertical windows in a frame (H3A\_AEWWIN1[12:6] WINVC) must not exceed 128.
- The number of horizontal windows (H3A\_AEWWIN1[5:0] WINHC) has a valid range from 1 to 35.
- The vertical and horizontal window start position (H3A\_AEWWINSTART) has a valid range from 0 to 4095.
- The vertical window start position for single black lines (H3A\_AEWINBLK[27:16] WINSV) has a valid range from 0 to 4095.
- The horizontal window start position for single black lines (H3A\_AEWINBLK[6:0] WINH) must be even and has a valid range from 2 to 256

- The subsampling windows can start only on even numbers.
- The vertical and horizontal sampling point increment ([H3A\\_AEWSUBWIN](#)) has a valid range from 2 to 32.

### 8.3.4.7 ISS ISP BL Programming Model

The procedure listed in [Table 8-391](#) initializes the buffer logic.

**Table 8-391. ISS ISP BL Settings**

Step	Register/Bit Field/Programming Model	Value
Sets the memory access priority registers	<a href="#">ISP5_MPSR</a>	
Sets the minimum interval between two memory requests for ISIF read port	<a href="#">ISP5_BL_MTC_1</a> [31:16] ISIF_R	
Sets the minimum interval between two memory requests for IPIPEIF read port	<a href="#">ISP5_BL_MTC_1</a> [15:0] IPIPEIF_R	
Sets the minimum interval between two memory requests for H3A write port	<a href="#">ISP5_BL_MTC_1</a> [31:16] H3A_W	
Set the maximum number of CIDs/tags that the BL can use.	<a href="#">ISP5_CTRL</a> [7:4] VBUSM_CIDS	
Set the BL VBUSM priority setting.	<a href="#">ISP5_CTRL</a> [3:1] VBUSM_CPRIORITY	
Set write posted/nonposted.	<a href="#">ISP5_CTRL</a> [0] OCP_WRNP	
Enable the BL clock.	<a href="#">ISP5_CTRL</a> [15] BL_CLK_ENABLE	0x1

<b>Physical Address</b>	<a href="#">0x5201 0010</a>		
<b>Description</b>	Clock management configuration		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																STANDBYMODE	RESERVED	SOFTRESET	AUTO_IDLE												

Bits	Field Name	Description	Type	Reset
31:6	RESERVED		R	0x00000000
5:4	STANDBYMODE	Configuration of the local initiator state management mode. By definition, initiator may generate read/write transaction as long as it is out of STANDBY state.  0x0: Force-standby mode: local initiator is unconditionally placed in standby state. Backup mode, for debug only.  0x1: No-standby mode: local initiator is unconditionally placed out of standby state. Backup mode, for debug only.  0x3: Reserved  0x2: Smart-standby mode: local initiator standby status depends on local conditions, that is, the module's functional requirement from the initiator. IP module must not generate (initiator-related) wake-up events. Generation of the MStandby signal must be initiated by the firmware by writing <code>ISP5_CTRL.MSTANDBY = 1</code> .	RW	0x2
3:2	RESERVED		R	0x0

Bits	Field Name	Description	Type	Reset
1	SOFTRESET	<p>Software reset.</p> <p>The soft reset will cause the MStandby to be asserted as the reset value of the <code>ISP5_CTRL.MSTANDBY</code> bit is 1. After a soft reset, the software must ensure not to perform any access for 16 clock cycles (OCP-slave port frequency) after writing this bit. The OCP slave port is running at half the frequency of the functional clock. Before issuing a soft reset, the software must ensure that no more traffic is being generated by the ISP. Basically, it means that the camera module must be stopped from sending data and/or that the ISP modules are disabled. The last interrupt triggered by the ISP design upon completion of the frame processing is <code>rsz_int_dma</code>. This <code>rsz_int_dma</code> event must be used to enable clean termination of the processing. The software must wait a few hundred cycles to trigger the soft reset after upon assertion of the <code>rsz_int_dma</code>, this is to ensure that the BL is completely drained.</p> <p>Software must set the ISP in standby mode before issuing the soft reset:</p> <p>Set <code>ISP5_SYSCONFIG.STANDBYMODE = 2</code> (smart standby).</p> <p>Set <code>ISP5_CTRL.MSTANDBY</code> to 1.</p> <p>Poll for <code>ISP5_CTRL.MSTANDBY_WAIT = 1</code>.</p> <p>Then, the soft reset can be applied (<code>ISP5_SYSCONFIG.SOFTRESET = 1</code>).</p> <p>Write 0x0: No action</p> <p>Write 0x1: Initiate software reset</p> <p>Read 0x1: Reset (software or other) ongoing</p> <p>Read 0x0: Reset done, no pending action</p>	RW	0
0	AUTO_IDLE	Auto clock gating. Always enabled.	R	1

**Table 8-404. ISP5\_IRQSTATUS\_i**

<b>Address Offset</b>	0x0000 0028 + (0x10 * i)	<b>Index</b>	i = 0 to 3
<b>Physical Address</b>	0x5201 0028 + (0x10 * i)	<b>Instance</b>	ISS_ISP5_SYS1
<b>Description</b>	Per-event "enabled" interrupt status vector. Enabled status is not set unless event is enabled. Write 1 to clear the status after interrupt has been serviced (raw status gets cleared, that is, even if not enabled). The ISP outputs four interrupt lines, ISP_IRQ0 to ISP_IRQ3. Any internal ISP event can be merged on the four lines. A same event must be enabled on only one interrupt line.

**Table 8-405. Register Call Summary for Register ISP5\_IRQSTATUS\_i**

## ISS ISP

- [ISS ISP RSZ Reset Behavior: \[0\] \[1\]](#)
- [ISS ISP5 SYS1 Register Summary: \[2\]](#)

**NOTE:** ISP submodule interrupts are mapped to ISP top-level lines. Moreover, ISP top-level lines are mapped to the ISS top interrupt merger level. For information about how IRQ lines are handled at the ISP level, see [Table 8-311](#). For information about how IRQs are handled at the ISS top-level before the signals leave ISS boundaries, see [Section 8.1.2.1.1, ISS Interrupt Merger](#).

**Table 8-406. ISP5\_IRQENABLE\_SET\_i**

<b>Address Offset</b>	0x0000 002C + (0x10 * i)	<b>Index</b>	i = 0 to 3
<b>Physical Address</b>	0x5201 002C + (0x10 * i)	<b>Instance</b>	ISS_ISP5_SYS1
<b>Description</b>	Per-event interrupt enable bit vector. Write 1 to set (enable interrupt). Readout equal to corresponding _CLR register. The ISP outputs four interrupt lines, ISP_IRQ0 to ISP_IRQ3. Any internal ISP event can be merged on the four lines. A same event must be enabled on only one interrupt line.

Bits	Field Name	Description	Type	Reset
31:30	DMA3_CFG	<p>This bit field selects the DMA transfer configuration which is used with the ISS_DMA3 DMA request signal. This DMA request is generated from IPIPE_INT_LAST_PIXEL event. One can choose to use this DMA request to transfer the DPC initialization data, the gamma table, or both.</p> <p>0x0: No DMA request associated with ISS_DMA3.</p> <p>0x1: DPC DMA request associated with ISS_DMA3. Expected DMA transfer size is 2KB in the range 0x8000-0x87FF. DPC_EVT_INI must be set to 0.</p> <p>0x3: DPC + GAMMA DMA request associated with ISS_DMA3. Expected DMA transfer size is 8KB in the range 0x8000-0x87FF and 0xA800-0xBFFF. DPC_EVT_INI must be set to 0.</p> <p>0x2: GAMMA DMA request associated with ISS_DMA3. Expected DMA transfer size is 6KB in the range 0xA800-0xBFFF.</p>	RW	0x0
29:28	RESERVED		R	0x0
27	RESERVED		R	0x0
26	HST_RD_CHK	<p>When the HISTOGRAM computation is enabled and the HST DMA request is not used to read out the data, this register ensures that the data is read fast enough, else an interrupt <a href="#">ISP5_IRQSTATUS2_i[5]</a> IPIPE_HST_ERR is triggered.</p> <p>The hardware sets automatically this bit to 1 when software can start reading the memory.</p>	RW	0
<div style="border: 1px solid black; padding: 10px; width: fit-content; margin: 0 auto;"> <p><b>CAUTION</b></p> <p>It is the software responsibility to set this bit to 0 after reading the data. Once the MPU has read the histogram data, it must clear this register, else the <a href="#">ISP5_IRQSTATUS2_i[5]</a> IPIPE_HST_ERR will occur.</p> </div>				
<p>Write 0x0: Clears the signal to avoid error generation. The software must write this bit to 0 after the last data read.</p> <p>Write 0x1: Reserved</p> <p>Read 0x1: The MPU can read the data from the memory. Needs to complete fast enough to avoid the interrupt generation.</p> <p>Read 0x0: No interrupt generation can happen</p>				
25	DPC_EVT_INI	<p>Select the IPIPE module event to be used to generate the DMA requests for the DPC submodule.</p> <p>0x0: IPIPE_INT_LAST_PIX event is selected.</p> <p>0x1: IPIPE_INT_DPC_INI event is selected.</p>	RW	0

Bits	Field Name	Description	Type	Reset
24	MSTANDBY	<p>MStandby signal assertion and de-assertion control for power management transitions.</p> <p>After software reset, this bit is asserted.</p> <p>Write "1" to transition from normal mode to idle mode. The firmware needs to ensure that no more ISP processing is ongoing before setting up this bit.</p> <p>Write "0" to transition from idle mode to normal mode. The software should poll <code>ISP5_CTRL.MSTANDBY_WAIT = 0</code> after writing <code>ISP5_CTRL.MSTANDBY = 0</code> in a transition from idle to normal mode.</p> <p>0x0: De-assert MStandby signal. May not be immediate due to power management handshaking btw the MStandby and Wait signals.</p> <p>0x1: Assert MStandby signal</p>	RW	1
23	VD_PULSE_EXT	<p>VD pulse extension enable</p> <p>This bit enables or disables the VD extension bridge. By default, the bridge is enabled. At ISS level, it is expected that <code>ISP5_CTRL.VD_PULSE_EXT = 1</code> when the VPORT gets data from the CSI2 RX module and <code>ISP5_CTRL.VD_PULSE_EXT = 0</code> when the VPORT gets data from the parallel interface or the CCP2 RX module. There must be at least three clock cycles between the time this bit is modified and the HD/VD pulse for start of frame comes.</p> <p>0x0: Disabled</p> <p>0x1: Enabled</p>	RW	1
22	PCLK_INV	<p>Pixel clock inversion</p> <p>This bit enables or disables pixel clock inversion. The ISP always samples the data on the rising edge of the pixel clock. Enabling the inversion shifts the resampling period by 1/2 a pixel clock period.</p> <p>0x0: Normal</p> <p>0x1: Inversed</p>	RW	0
21	MFLAG	<p>MFlag signal generation control</p> <p>This bit controls how the OCP MFlag signal is generated on the ISS NOC.</p> <p>0x0: The MFlag value is dynamic.</p> <p>0x1: The MFlag value is static. The value is set with the <code>ISP5_CTRL[3:1] VBUSM_CPRIORITY</code>.</p>	RW	0
20	MSTANDBY_WAIT	<p>MStandby / Wait power management status bit.</p> <p>The power management framework of the ISP is based on the handshaking of the MStandby and Wait signals. The software is not supposed to write inside the ISP slave port and initiate traffic when <code>ISP5_CTRL.MSTANDBY</code> bit is written. The software can poll this bit to know when Wait signal is deasserted.</p> <p>Read 0x1: MStandby signal is asserted.</p> <p>Read 0x0: MStandby signal is deasserted.</p>	R	-

24	IPIPE_GAMMA_RGB_COPY	GAMMA table RGB Copy This bit must be enable when one wants to use the same Gamma table for the R, G and B color components. When the CPU writes the R table, it is automatically copied to the G and B tables if this bit is set.  0x0: Copy disable Independent RGB gamma table  0x1: Copy enable Common RGB Gamma table	RW	0
23:21	RESERVED		R	0x0
20	IPIPE_BSC_TB1	IPIPE BSC TB1 memory access priority This memory is expected to be read by the CPU or the DMA to get BSC information during vertical blanking period.  0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0
19	IPIPE_BSC_TB0	IPIPE BSC TB0 memory access priority This memory is expected to be read by the CPU or the DMA to get BSC information during vertical blanking period.  0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0
18	IPIPE_HST_TB3	IPIPE histogram memory #3 access priority This memory is expected to be read by the CPU or the DMA to get HST information during vertical blanking period.  0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0
17	IPIPE_HST_TB2	IPIPE histogram memory #2 access priority This memory is expected to be read by the CPU or the DMA to get HST information during vertical blanking period.  0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0

Bits	Field Name	Description	Type	Reset
16	IPIPE_HST_TB1	IPIPE histogram memory #1 access priority This memory is expected to be read by the CPU or the DMA to get HST information during vertical blanking period. 0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0
15	IPIPE_HST_TB0	IPIPE histogram memory #0 access priority This memory is expected to be read by the CPU or the DMA to get HST information during vertical blanking period. 0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0
14	IPIPE_D3L_TB3	D3L TB3 memory access priority This memory is expected to be written during ISP initialization and potentially updated during vertical blanking periods. 0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0
13	IPIPE_D3L_TB2	D3L TB2 memory access priority This memory is expected to be written during ISP initialization and potentially updated during vertical blanking periods. 0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0
12	IPIPE_D3L_TB1	D3L TB1 memory access priority This memory is expected to be written during ISP initialization and potentially updated during vertical blanking periods. 0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0
11	IPIPE_D3L_TB0	D3L TB0 memory access priority This memory is expected to be written during ISP initialization and potentially updated during vertical blanking periods. 0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0
10	IPIPE_GBC_TB	IPIPE GBC TB memory access priority This memory is expected to be written during ISP initialization and potentially updated during vertical blanking periods. 0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0
9	IPIPE_YEE_TB	YEE TB memory access priority This memory is expected to be written during ISP initialization and potentially updated during vertical blanking periods. 0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0
8	IPIPE_GMM_TBR	IPIPE Gamma LUT R memory arbitration This memory is expected to be written during ISP initialization and potentially updated during vertical blanking periods. 0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0

Bits	Field Name	Description	Type	Reset
7	IPIPE_GMM_TBG	IPIPE Gamma LUT G memory arbitration This memory is expected to be written during ISP initialization and potentially updated during vertical blanking periods. 0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0
6	IPIPE_GMM_TBB	IPIPE Gamma LUT B memory arbitration This memory is expected to be written during ISP initialization and potentially updated during vertical blanking periods. 0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0
5	IPIPE_DPC_TB	IPIPE defect pixel memory arbitration This memory is expected to be written during ISP initialization and potentially updated during vertical blanking periods. 0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0
4	ISIF_DCLAMP	ISIF DC accumulation memory arbitration This memory is expected to be written during ISP initialization and potentially updated during vertical blanking periods. 0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0
3	ISIF_LSC_TB1	ISIF LSC memory 1 access This memory is expected to be written during ISP initialization and potentially updated during vertical blanking periods. 0x0: MODULE has memory access When the module has memory access, the potential concurrent CPU accesses (on the ISP memory map) to read the memory are stalled. The CPU will eventually get back the data during the horizontal or vertical blanking periods when the module is not making access anymore. 0x1: CPU has memory access When the CPU has memory access (read or write), it will cause data corruption if the module tries to perform concurrent memory accesses. The module cannot know that the read or write access has not taken place because of CPU accesses.	RW	0
2	ISIF_LSC_TB0	ISIF LSC memory 0 access This memory is expected to be written during ISP initialization and potentially updated during vertical blanking periods. 0x0: MODULE has memory access. When the module has memory access, the potential concurrent CPU accesses (on the ISP memory map) to read the memory are stalled. The CPU will eventually get back the data during the horizontal or vertical blanking periods when the module is not making access anymore. 0x1: CPU has memory access When the CPU has memory access (read or write), it will cause data corruption if the module tries to perform concurrent memory accesses. The module cannot know that the read or write access has not taken place because of CPU accesses.	RW	0
1	ISIF_LIN_TB	ISIF linearity compensation memory arbitration This memory is expected to be written during ISP initialization and potentially updated during vertical blanking periods. 0x0: MODULE access has higher priority 0x1: CPU access has higher priority.	RW	0

<b>Description</b>	<p>Per-event interrupt enable bit vector.  Write 1 to clear (disable interrupt).  Readout equal to corresponding _SET register.  Overflow / underflow errors are not recoverable at ISP level, a software reset is required at ISS level.  The ISP outputs 4 interrupt lines ISP5_IRQ0 to ISP5_IRQ3. Any internal ISP event can be merged on the 4 lines. A same event must be enabled on only one interrupt line.</p>

<b>Description</b>	This register is not shadowed	
<b>Type</b>	RW	

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																WRT	OST														

Bits	Field Name	Description	Type	Reset
31:2	RESERVED		R	0x0000 0000
1	WRT	Video port WEN signal selection This bit selects whether the WEN signal which is present on the IPIPE and IPIPEIF video port is used or not to select the input data. If WRT is 0, the RESIZER module ignores the WEN signal and processes all image frame while RESIZER is enabled. If WRT is 1, the RESIZER module only processes the lines that arrived while the WEN is high. HD is used to sample the WEN signal.  0x0: Disable 0x1: Enable	RW	0
0	OST	The processing mode selection of the RESIZER module. Value 0 indicates the mode of free run, value 1 indicates the mode of one shot.  0x0: Free running 0x1: One shot	RW	0

RESERVED																HPS															

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0000
15:0	HPS	Horizontal Start Position The <b>RSZ_SRC_HPS</b> register has two functions: The first function is to compensate for possible delay between the HD pulse and the first valid data. It is possible for this delay to be different than 0 when the RESIZER module gets its input data from the VP connected to the IPIPEIF module (the offset value can be odd or even). When data are coming from the IPIPE module, it is not required to resynchronize HD and the first valid data. The second function is to crop the data in the horizontal direction. When used for cropping, only <b>RSZ_SRC_HPS</b> must be even or null.	RW	0x0000

<b>Address Offset</b>	0x0000 0188	<b>Instance</b>	ISS_RESIZER
<b>Physical Address</b>	0x5201 0588		
<b>Description</b>	RESIZER B - OUTPUT MEMORY START ADDRESS REGISTER FOR CHROMA DATA (YUV4:2:0) This register is used if the output data format is YUV4:2:0. U and V data are written into this buffer.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																C_SAD_L															

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0000
15:0	C_SAD_L	<p>Memory Base Address Sets the 16 lower bits of the 32-bit start address in memory. It is a byte address. For every frame, the first line of data will be written to this address (C_SAD_H/C_SAD_L). We have: SAD = BAD + (PTR_S x OFT) and PTR_S &lt; PTR_E If the first line must be written at the beginning of the circular buffer memory then SAD = BAD and PTR_S = 0. YUV4:2:0 format (output data on 8 bits): The two least significant bits must be set to 00 when horizontal reversal mode is off. The two least significant bits must be set to 11 when horizontal reversal mode is on.</p>	RW	0x0000

<b>Description</b>	RESIZER B - OUTPUT MEMORY OFFSET REGISTER FOR CHROMA DATA (YUV4:2:0) This register is used if the output data format is YUV4:2:0		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																C_OFT															

Bits	Field Name	Description	Type	Reset
31:17	RESERVED		R	0x0000
16:0	C_OFT	<p>Memory Line Offset Sets the size of each line in the circular buffer. It is expressed in bytes and unsigned. Note that OFT does not necessary corresponds to the size of a line in a frame, it can be much bigger. The line offset must be a multiple of 128 bytes (bits [6:0] of RZX_SDR_Y_OFT and RZX_SDR_C_OFT must be set to 0). Example: line 0 address = SAD line 1 address = SAD + 1 x OFT line 2 address = SAD + 2 x OFT</p>	RW	0x00000

**Table 8-809. IPIPE\_YUV\_PHS**

<b>Address Offset</b>	0x0000 02C8	<b>Instance</b>	ISS_IPIPE
<b>Physical Address</b>	<a href="#">0x5201 0AC8</a>		
<b>Description</b>	YUV4:2:2 down sampling register. This register controls the YUV4:4:4 to YUV4:2:2 chroma downsampling. This register is valid if <a href="#">IPIPE_SRC_FMT.FMT</a> = 0 (RAW input and YUV output). <a href="#">IPIPE_YUV_PHS</a> = 0 leads to pure subsampling, no filtering, cosited chroma output. <a href="#">IPIPE_YUV_PHS</a> = 1 leads to (1, 1) >> 1 filtering, centered chroma output. <a href="#">IPIPE_YUV_PHS</a> = 2 leads to (1, 2, 1) >> 1 filtering, cosited chroma output. <a href="#">IPIPE_YUV_PHS</a> = 3 leads to (1, 3, 3, 1) >> 3 filtering, centered chroma output. When the chroma output is cosited, and that downsampling is enabled in the RESIZER module, one need to take care that the averager disrupts the relative phase for luma and chroma color components. The <a href="#">RZA_H_PHS_ADJ</a> and <a href="#">RZB_H_PHS_ADJ</a> registers need to be used to fix the disruption.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

1	LPF	121-LPF enable for chrominance samples. This register is valid if <a href="#">IPIPE_SRC_FMT.FMT</a> = 0 (RAW input and YUV output).  0x0: off 0x1: on	RW	0

Bits	Field Name	Description	Type	Reset
0	POS	<p>This bit sets the output position of the chrominance sample with regards to the luma sample positions. One can choose between centered and cosited.</p> <p>This register is valid if <code>IPIPE_SRC_FMT.FMT = 0</code> (RAW input and YUV output).</p> <p>The RESIZER module does not change the relative position of the chroma samples vs. the luma samples between the input and output and the chroma position at the output of the IPIPE module and at the output of the RESIZER module must be identical. In other words, we must have <code>RSZ_YUV_PHS.POS = IPIPE_YUV_PHS.POS</code>.</p> <p>0x0: Cosited = same position with luminance 0x1: Centered = middle of the luminance</p>	RW	0

RESERVED																RESERVED												CLR	SEL		

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0000
15:2	RESERVED		R	0x0000
1	CLR	Histogram memory clear. The histogram can be cleared before the start of operations. However, the clear takes 512 cycles and therefore: + if line size > 512, the first line must not be used for histogram computation. + if line size < 512, ceil (512/line size) lines must not be used for histogram computation. It's the programmer's responsibility to set the histogram computation area outside the "clear" area.  0x0: Disable 0x1: Enable	RW	0
0	SEL	This bit must be used to select which memory is used to store the histogram data. By selecting alternatively one or the other bit, one can double buffer the histogram output buffer. The 4 KB memory can either be read by the CPU or a DMA request.  0x0: Use Table 0 and 1 = 4KB in the memory ISP map. 0x1: Use Table 2 and 3 = 4KB in the memory ISP map.	RW	0

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0000
15:2	RESERVED		R	0x0000
1	DWEN	Controls the storage of image sensor RAW data in memory. This bit is loaded with the timing of the internal VD signal: it becomes active starting at the lead of the VD signal that comes after 1 is written in this bit.  0x0: Disable 0x1: Enable	RW	0
0	SYEN	Controls ON/OFF of VD/HD output. Internal timing generator becomes active and VD/HD output starts when 1 is written in this bit. In case of input, VD/HD loading begins.  0: Disable 1: Enable	RW	0

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0000
15	VLDC	On/off control of CPU registers resynchronize function by VSYNC. All the others are shadowed registers, where register values are updated at V-sync timing by default. If VDLC=1, ISIF register values are updated immediately after register write just like non-shadowed registers. 0x0: Enable 0x1: Disable	RW	0
14	RESERVED	Reserved. must always be set to 0.	RW	0

Bits	Field Name	Description	Type	Reset
13	MSBINVI	MSB inverse of CIN port when the data are captured to SDRAM. The <a href="#">ISIF_MODESET.CCDW</a> , <a href="#">ISIF_HSIZE.ADCR</a> , <a href="#">ISIF_HSIZE.HSIZE</a> , <a href="#">ISIF_CCDCFG.BSWD</a> , <a href="#">ISIF_CCDCFG.MSBINV</a> , <a href="#">ISIF_CCDCFG.SDRPACK</a> bit fields control how pixel data are stored to SDRAM.  0x0: Disable 0x1: Enable	RW	0
12	BSWD	On/off control of Byte SWAP function when SDRAM capturing. The <a href="#">ISIF_MODESET.CCDW</a> , <a href="#">ISIF_HSIZE.ADCR</a> , <a href="#">ISIF_HSIZE.HSIZE</a> , <a href="#">ISIF_CCDCFG.BSWD</a> , <a href="#">ISIF_CCDCFG.MSBINV</a> , <a href="#">ISIF_CCDCFG.SDRPACK</a> bit fields control how pixel data are stored to SDRAM.  0x0: Disable 0x1: Enable (swap)	RW	0
11	Y8POS	Selects Y signal position when in 8bit input mode  0x0: even pixel 0x1: odd pixel	RW	0
10	EXTRG	Setting 1 to this register, the SDRAM address is initialized at the rising edge of FID input signal or DWEN register.	RW	0
9	TRGSEL	Select trigger source signal of SDRAM address initializing in case EXTRG=1.  0x0: DWEN register 0x1: FID input port	RW	0
8	WENLOG	Specifies the CCD valid area.  0x0: internal valid signal and WEN signal is ANDed logically. 0x1: internal valid signal and WEN signal is ORed logically.	RW	0
7:6	FIDMD	Specifies FID detection mode  0x0: latch the FID at the VSYNC timing 0x1: no latch the FID 0x3: Reserved 0x2: Reserved	RW	0x0
5	BT656	Selects bit width of CCIR656. This bit applies only if <a href="#">ISIF_REC656IF.R656ON</a> = 1.  0x0: 8 bits 0x1: 10 bits	RW	0
4	YCINSWP	The ISIF module has a 16-bit interface. When 16-bit YUV data are input, the luma data (YIN7-0) are expected to be on the 8 MS bits and the chroma (CIN7-0) data are expected to be on the LS bits. This bit enables to swap the 8 MS bits with the 8 LS bits of the interface in case the luma and chroma do not come in the correct order. See the top-level ISIF block diagram.  0x0: YIN7-0 = Y signal / CIN7-0 = C signal 0x1: YIN7-0 = C signal / CIN7-0 = Y signal	RW	0
3	RESERVED	Reserved. must always be set to 0.	RW	0
2	RESERVED	Reserved. must always be set to 0.	RW	0

Bits	Field Name	Description	Type	Reset
1:0	SDRPACK	<p>This bit field selects how the data are stored to SDRAM. There can be 8, 12 or 16 bits per pixel. The <a href="#">ISIF_MODESET.CCDW</a>, <a href="#">ISIF_HSIZE.ADCR</a>, <a href="#">ISIF_HSIZE.HSIZE</a>, <a href="#">ISIF_CCDCFG.BSWD</a>, <a href="#">ISIF_CCDCFG.MSBINV</a>, <a href="#">ISIF_CCDCFG.SDRPACK</a> bit fields control how pixel data are stored to SDRAM.</p> <p>0x0: 16 bits / pixel 0x1: 12 bits / pixel 0x3: Reserved 0x2: 8 bits / pixel</p>	RW	0x0

RESERVED																SYNCOFF	ENABLE																																																																

Bits	Field Name	Description	Type	Reset
31:2	RESERVED		R	0x0000 0000
1	SYNCOFF	VD output mask This register masks the VD output to the IPIPE module. This can be useful when one wants to read data from SDRAM which are stored in a double buffer. If the VD is not masked each time we start the module an new VD will be generated to the IPIPEIF module. Let's consider two buffers A and B of N lines each. *This bit field is latched by VD.  0x0: VD output mask is disabled. 0x1: VD output mask is enabled.	RW	0
0	ENABLE	IPIPE I/F Enable This register is used to start the operation of SDRAM buffer memory read and generates SYNC signals. This register is available when INPSRC1 or INPSCR2 = 1, 2 or 3.  0x0: disable 0x1: enable	RW	0

Bits	Field Name	Description	Type	Reset
31:22	AVE2LMT	AE/AWB Saturation Limit This is the value that all sub sampled pixels in the AE/AWB engine are compared to. If the data is greater or equal to this data then the block is considered saturated.	RW	0x3FF
21	OVF	H3A module overflow status bit. If the H3A module overflows it will keep sending data. The software can read this status bit during vertical blanking period to ensure that no overflow happened while writing out the data to SDRAM. There is also an interrupt at ISP level (H3A_OVF) which can be used to monitor this.  0x0: Read 0: No overflow pending Write 0: Status bit unchanged  0x1: Read 1: Overflow happened while writing out the data. Output data likely to be corrupted. Write 1: Clear the status bit.	RW	0
20	AF_VF_EN	AF Vertical Focus Enable  0x0: 4 Color Horizontal FV only 0x1: 1 Color Horizontal FV and 1 Color Vertical FV	RW	0
19	AEW_MED_EN	AE/AWB Median filter Enable If the median filter is enabled, then the 1st 2 and last 2 pixels in the frame are not filtered.  0x0: Disable Auto Focus median filter 0x1: Enable Auto Focus median filter	RW	0
18	BUSYAEAWB	Busy bit for AE/AWB	R	0

Bits	Field Name	Description	Type	Reset
17	AEW_ALAW_EN	AE/AWB A-law Enable 0x0: Disable Auto exposure/white balance A-law table 0x1: Enable Auto exposure/white balance A-law table.	RW	0
16	AEW_EN	AE/AWB enable 0x0: Disable Auto exposure/white balance 0x1: Enable Auto exposure/white balance	RW	0
15	BUSYAF	Busy bit for AF.	R	0
14	FVMODE	Focus Value Accumulation Mode 0x0: Sum mode. 0x1: Peak mode.	RW	0
13:11	RGBPOS	Red, Green, and blue pixel location in the AF windows RGBPOS(0): GR and GB as Bayer pattern RGBPOS(1): RG and GB as Bayer pattern RGBPOS(2): GR and BG as Bayer pattern RGBPOS(3): RG and BG as Bayer pattern RGBPOS(4): GG and RB as custom pattern RGBPOS(5): RB and GG as custom pattern 6 and 7 are reserved This Value is only used if VF is disabled	RW	0x0
10:3	MED_TH	Median filter threshold.	RW	0xFF
2	AF_MED_EN	Auto Focus Median filter Enable If the median filter is enabled, then the 1st 2 and last 2 pixels in the frame are not in the valid region. Therefore the pixel start/end and IIR filter start positions should not be set within the 1st and last 2 pixels. 0x0: Disable AF median filter. 0x1: Enable AF median filter.	RW	0
1	AF_ALAW_EN	AF A-law table enable 0x0: Disable Auto Focus A-law table 0x1: Enable Auto Focus A-law table	RW	0
0	AF_EN	AF enable 0x0: Disable Auto Focus Engine 0x1: Enable Auto Focus Engine	RW	0

RESERVED								AFINCH				AFINCV				PAXVC				PAXHC											

Bits	Field Name	Description	Type	Reset
31:21	RESERVED		R	0x000
20:17	AFINCH	AF Engine Column Increments Number of columns to increment in a poxel plus 1 multiplied by 2. Thus, the number of columns that can be skipped between two processed line pairs is 2-32 (even). The starting two columns in a poxel are first processed before this field is applied. This must be set so that there are at least 4 samples on a line when combined with the number of horizontal poxels. * This value is shadowed and latched on the rising edge of VSYNC.	RW	0x0

Bits	Field Name	Description	Type	Reset
16:13	AFINCV	AF Engine Line Increments Number of lines to increment in a Poxel plus 1 multiplied by 2. Incrementing the line in a paxel is always done on a line pair due to the fact that the RGB pattern falls in two lines. If all the lines are to be processed, this field should be set to zero, and thus line count is incremented by 2 following a line pair. Thus, the number of lines that can be skipped between two processed line pairs is 0-30 (even). The starting two lines in a paxel are first processed before this field is applied. * This value is shadowed and latched on the rising edge of VSYNC.	RW	0x0
12:6	PAXVC	AF Engine Vertical Poxel Count The number of paxels in the vertical direction plus 1. The maximum number of vertical paxels in a frame should not exceed 128. The value should be set to ensure that the bandwidth requirements and buffer size are not exceeded. * This value is shadowed and latched on the rising edge of VSYNC.	RW	0x00
5:0	PAXHC	AF Engine Horizontal Poxel Count The number of paxels in the horizontal direction plus 1. It is illegal to set a number that is greater than 35 (total of 36 paxels in the horizontal direction). The minimum number of paxels should be 2 (valid range for the field is 1-35). * This value is shadowed and latched on the rising edge of VSYNC.	RW	0x00

## 8.4 ISS Still Image Coprocessor

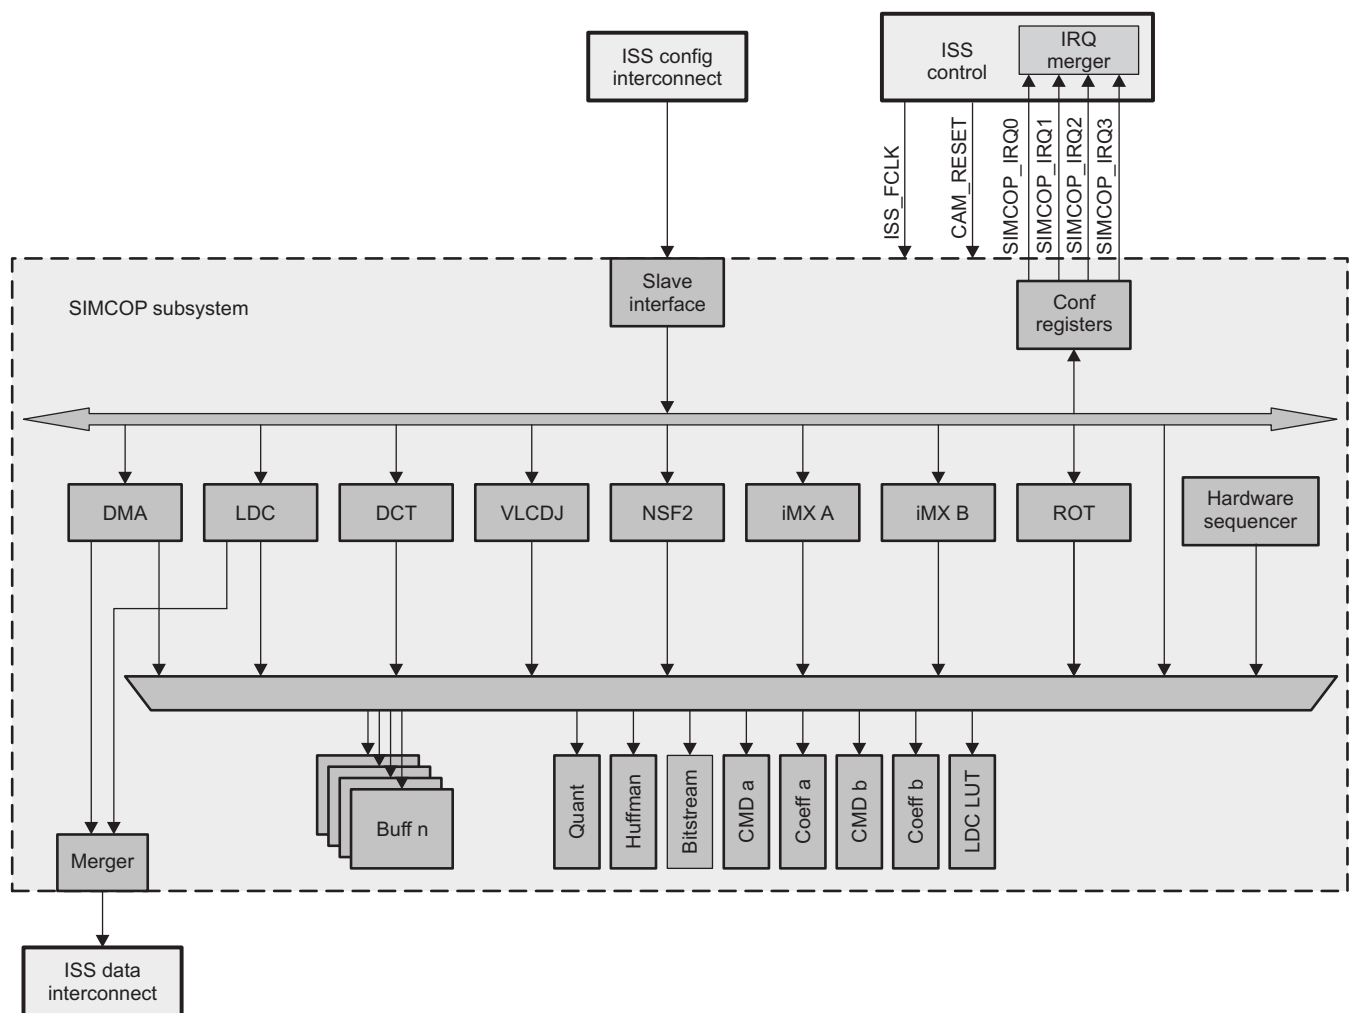

This section gives a high-level description of the ISS still iMage coprocessor (SIMCOP) in the device. For a high-level description of ISS level, see [Section 8.1, ISS: Overview](#).

### 8.4.1 ISS SIMCOP Overview

The SIMCOP subsystem is designed to encode, decode, and process image data. The SIMCOP is a macroblock-based memory-to-memory processing engine. It fetches macroblocks from system memory and stores them into local memories. Different accelerators take the fetched data, perform processing, and send the processing outcome back to local memories. From there the data could be further processed by other accelerators or be sent back to system memory. The SIMCOP needs an external central processing unit (CPU) to perform high-level control tasks and configurations. The SIMCOP is closely coupled to a CPU for that purpose.

Figure 8-243 shows a block diagram of the SIMCOP subsystem.

Figure 8-243. SIMCOP Subsystem Overview

simcop-002

The ISS SIMCOP subsystem consists of:

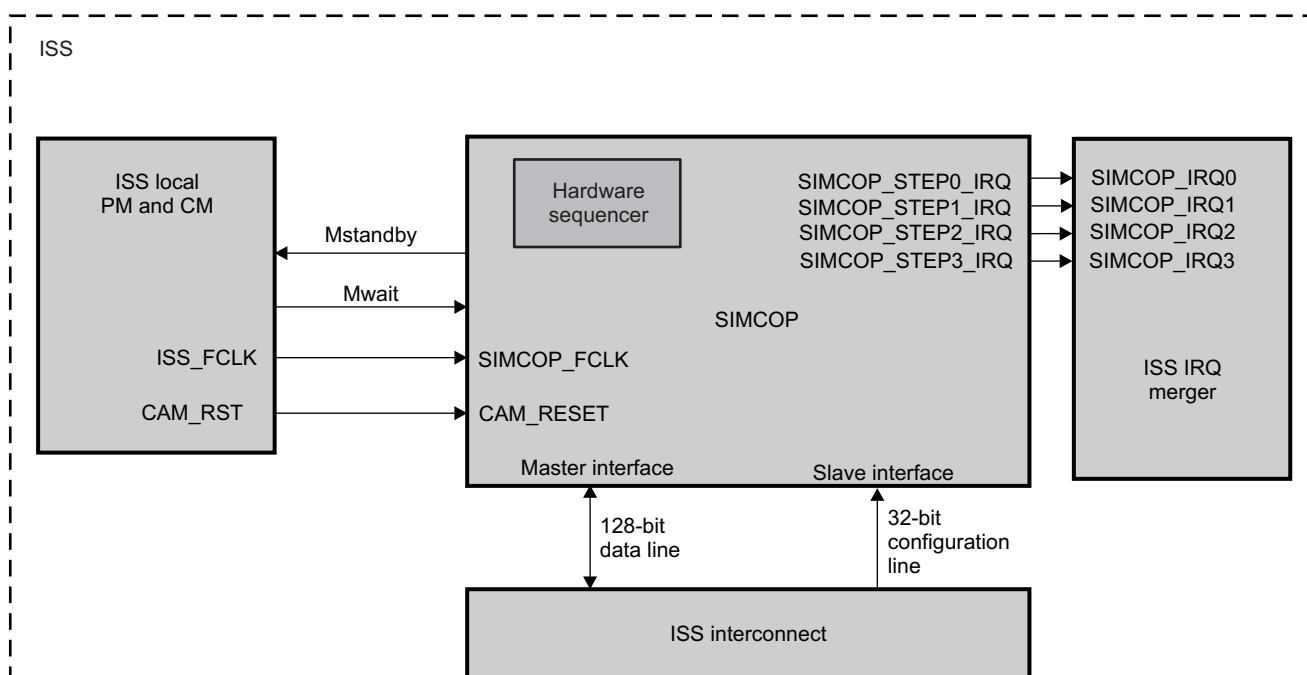

- Noise filter (NSF2) for advanced noise filtering and an edge-enhancement
- Two image and video processing engines (iMXs) supplement various fixed-function processing blocks
- Variable-length coder/decoder for JPEG (VLCDJ) module handles quantization and variable length coding, decoding and inverse quantization
- Discrete cosine transform (DCT) module implements method in the compression flow to transform blocks of image

- Lens distortion correction (LDC) module deals with lens geometric distortion issues in the camera subsystem
- Rotation accelerator (ROT) engine blocks data rotation and shifting from a SIMCOP local memory to another SIMCOP local memory
- Hardware sequencer and buffers control SIMCOP modules/buffers to offload an external processor to perform low-level sequencing tasks
- Direct memory access (DMA) controller data transfers from SIMCOP memories to system memory or from system memory to SIMCOP memories

### 8.4.1.1 ISS SIMCOP Integration

The SIMCOP subsystem is connected to the rest of the system through the ISS local interconnect. Figure 8-244 shows the integration of the SIMCOP subsystem in the ISS.

Figure 8-244. SIMCOP Integration

simcop-001

**NOTE:** For more information about the IDLE hardware handshake and the wake-up request, see Section 3.1.1.1, *Clock Management*, in Chapter 3, *Power, Reset, and Clock Management*.

This section gives an overview of typical uses of the module. See Chapter 3, *Power, Reset, and Clock Management*, for more information and settings of the PRCM relationship to ISS clocks and resets.

Table 8-1242 lists the integration attributes.

Table 8-1242. Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
SIMCOP	PD_CAM	

Table 8-1243 lists the clocks and resets values.

**Table 8-1243. Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
SIMCOP	SIMCOP_FCLK	ISS_FCLK	PRCM	Functional clock provided by ISS_CLK from the PRCM module. It is used by all ISS submodules and ISS top-level resources.
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
SIMCOP	CAM_RESET	CAM_RST	PRCM	ISS and SIMCOP global reset

Table 8-1244 lists the hardware resets.

**Table 8-1244. Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
SIMCOP	SIMCOP_STEP_0_IRQ	SIMCOP_IRQ0	SIMCOP IRQ merger	Event triggered when a SIMCOP context is activated by the hardware sequencer
SIMCOP	SIMCOP_STEP_1_IRQ	SIMCOP_IRQ1	SIMCOP IRQ merger	Event triggered when a SIMCOP context is activated by the hardware sequencer
SIMCOP	SIMCOP_STEP_2_IRQ	SIMCOP_IRQ2	SIMCOP IRQ merger	Event triggered when a SIMCOP context is activated by the hardware sequencer
SIMCOP	SIMCOP_STEP_3_IRQ	SIMCOP_IRQ3	SIMCOP IRQ merger	Event triggered when a SIMCOP context is activated by the hardware sequencer

For more information about interrupt requests, see [Section 8.4.1.2.3, Interrupt Merger](#).

## 8.4.1.2 ISS SIMCOP Functional Description

### 8.4.1.2.1 ISS SIMCOP Local Power and Clock Management

#### 8.4.1.2.1.1 ISS SIMCOP Local Clock Management

ISS has five asynchronous clock domains. The SIMCOP belongs to the ISS\_FCLK clock domain.

An externally provided clock-enable signal is used. Multiple subdomains exist internally to reduce dynamic power consumption. This feature does not require intervention by the PRCM module. For high-level description of the SIMCOP clock domain and configuration inside ISS, see [Section 8.1.2.2, ISS Clocks](#).

Moreover, at high level the functional clock of ISS SIMCOP submodules can be cut by software to reduce power consumption by cutting off or turning on the modules from the [SIMCOP\\_CLKCTRL](#) register (see [Table 8-1245](#)).

When software wants to enable a submodule:

- Software sets the adequate bit in the [SIMCOP\\_CLKCTRL](#) register.
- Hardware enables the submodule functional and interface clocks.
- Hardware connects the configuration port of the submodule to the coprocessor bus.
- Hardware sets the appropriate bit in the [SIMCOP\\_CLKCTRL](#) register. Software must check if this bit is set before accessing the submodule.

[Table 8-1245](#) lists the ISS SIMCOP clock control register settings.

**Table 8-1245. ISS SIMCOP Clock Control Register Settings**

Module Name	Bit Field Name	Description
ROT	<a href="#">SIMCOP_CLKCTRL[7]</a> ROT_A	Writing 0x1 enables the module
iMX B	<a href="#">SIMCOP_CLKCTRL[6]</a> IMX_B	Writing 0x1 enables the module
iMX A	<a href="#">SIMCOP_CLKCTRL[5]</a> IMX_A	Writing 0x1 enables the module
NSF2	<a href="#">SIMCOP_CLKCTRL[4]</a> NSF2	Writing 0x1 enables the module
VLCDJ	<a href="#">SIMCOP_CLKCTRL[3]</a> VLCDJ	Writing 0x1 enables the module
DCT	<a href="#">SIMCOP_CLKCTRL[2]</a> DCT	Writing 0x1 enables the module
LDC	<a href="#">SIMCOP_CLKCTRL[1]</a> LDC	Writing 0x1 enables the module
DMA	<a href="#">SIMCOP_CLKCTRL[0]</a> DMA	Writing 0x1 enables the module

When software wants to shutdown a submodule:

- Software ensures that the submodule is idle. Mainly:
  - The submodule must not generate new events.
  - The submodule must not have any pending events.
  - For initiators: the submodule must stop interconnect transaction generation.
- Software clears the appropriate bit in the [SIMCOP\\_CLKCTRL](#) register.
- Hardware disconnects the configuration port of the module from the coprocessor bus: no more accesses are routed to the submodule. Ongoing transactions are finished (hardware stays in this state as long as required).
- For initiators: hardware waits until there are no more outstanding transactions:
  - SIMCOP DMA provides an MStandBy signal for that purpose.
  - The LDC does not provide this information. Software must ensure that the LDC is idle. SIMCOP hardware ensures that the internal MTC2OCP bridges have no outstanding transactions.
- Hardware cuts the submodules clock.
- Hardware clears the appropriate [SIMCOP\\_CLKCTRL](#) registers.

SIMCOP submodules support autogating. They can gate their functional and interface clock internally based on functional requirements. This feature could be disabled for debug or power consumption measurement purposes.

#### 8.4.1.2.1.2 Local Clock Autogating

The SIMCOP subsystem modules support autogating. They can gate their functional and interface clock internally based on functional requirements. This feature can be disabled. [Table 8-1246](#) summarizes which modules support autogating control and which control bit is used.

**Table 8-1246. Autoclock Gating Bit Control**

SIMCOP Resource	Autogating Override
SIMCOP top-level resources	N/A
SIMCOP DMA	N/A
LDC	N/A
DCT	<a href="#">DCT_CFG[5]</a> AUTOGATING
VLCDJ	<a href="#">VLCDJ_CTRL[3]</a> AUTOGATING
NSF2	N/A
iMX A	<a href="#">iMXa.IMX_CLKCNTRL[0]</a> CLKCNTRL
iMX B	<a href="#">iMXb.IMX_CLKCNTRL[0]</a> CLKCNTRL
ROT	<a href="#">ROT_CFG[9]</a> AUTOGATING

#### 8.4.1.2.1.3 ISS SIMCOP Power Management

The SIMCOP supports the STANDBY power-management protocol. It is used by the SIMCOP to indicate when it has no more interconnect transactions to perform. This information is used at ISS level to control the SIMCOP and ISS shut-down sequence. The SIMCOP does not have any internal wake-up events. DISCONNECT and IDLE protocols are not supported.

The typical SIMCOP shut-down sequence is:

1. Software disables all SIMCOP submodules. This ensures the SIMCOP does not:
  - (a) Generate any traffic on its master port: SIMCOP asserts the MStandby signal.
  - (b) Generate new events (IRQs).
2. Software clears all pending events at SIMCOP level: All interrupt lines become inactive.
3. Software initiates the SIMCOP shut-down sequence by writing the appropriate bit at ISS level.
4. ISS hardware:
  - (a) Disconnects the SIMCOP configuration port. Any access attempts to SIMCOP are blocked at ISS level. The DISCONNECT protocol is handled at ISS level: SIMCOP does not provide any handshake signals to support it.
  - (b) Waits until MStandby from SIMCOP is asserted (always true in a normal case because SIMCOP submodules are inactive)
  - (c) Asserts the SWait input of SIMCOP
  - (d) Cuts the SIMCOP clock

The typical SIMCOP enable sequence is:

1. Software initiates the SIMCOP enable sequence by writing the appropriate bit at ISS level.
2. ISS hardware:
  - (a) Enables the SIMCOP clock
  - (b) Deasserts the SWait input of the SIMCOP
  - (c) Connects the SIMCOP configuration port

Three modes for MStandBy control are supported. The mode is selected using the [SIMCOP\\_HL\\_SYSCONFIG\[5:4\]](#) STANDBYMODE bit field.

- Smart-standby: This is the normal mode to be used. When in this mode, the SIMCOP asserts the MStandBy signal when the MStandBy output of SIMCOP DMA is asserted, the LDC is effectively disabled ([SIMCOP\\_CLKCTRL\[1\]](#) LDC =0), and the MTCR2OCP bridge and the merger have no more outstanding transactions.
- Force-standby: This is a backup mode intended to be used only if smart-idle mode is bugged. When in this mode, the SIMCOP asserts MStandBy unconditionally. Software must ensure that the SIMCOP is in a correct quiet state before programming this mode.
- No-standby: This is a backup mode intended to be used only if smart-idle mode is bugged. When in this mode, the SIMCOP never asserts the MStandBy signal.

#### 8.4.1.2.2 Software Reset

Software reset is intended to return the SIMCOP into a known state without requiring a complete device reset. A software reset at SIMCOP level is seen as a hardware reset for SIMCOP submodules. To perform a software reset, sets the [SIMCOP\\_HL\\_SYSCONFIG\[0\]](#) SOFTRESET bit to 1. The [SIMCOP\\_HL\\_SYSCONFIG\[0\]](#) SOFTRESET bit indicates that the software reset is ongoing when its value is 1. When the software reset completes, the [SIMCOP\\_HL\\_SYSCONFIG\[1\]](#) SOFTRESET bit is automatically reset. Software must ensure that the software reset completes before configuring the hardware sequencer or buffers.

#### 8.4.1.2.3 Interrupt Merger

SIMCOP interrupts are merged at the SIMCOP subsystem level into four interrupts, as shown in [Figure 8-245](#).

**Figure 8-245. SIMCOP Interrupt Merger Overview**

These four outputs interrupts can be configured through [SIMCOP\\_HL\\_IRQENABLE\\_SET\\_i](#) and [SIMCOP\\_HL\\_IRQENABLE\\_CLR\\_i](#) (where  $i = 0$  to 3, corresponding to output interrupt) to enable or disable interrupt mask for each interrupt output. Software can poll the value of interrupt before masking ([SIMCOP\\_HL\\_IRQSTATUS\\_RAW\\_i](#)) and after masking ([SIMCOP\\_HL\\_IRQSTATUS\\_i](#)).

Software can configure how outputs interrupts are generated through [SIMCOP\\_CTRL\[i\] IRQi\\_MODE](#) (where  $i = 0$  to 3):

- 0x0: OR, the interrupt is asserted when one of the selected events has occurred
- 0x1: AND, the interrupt is asserted when all selected events have occurred

[Table 8-1247](#) shows how interrupts are mapped on the [SIMCOP\\_HL\\_IRQSTATUS\\_RAW\\_i](#), [SIMCOP\\_HL\\_IRQSTATUS\\_i](#), [SIMCOP\\_HL\\_IRQENABLE\\_SET\\_i](#), and [SIMCOP\\_HL\\_IRQENABLE\\_CLR\\_i](#) registers.

**Table 8-1247. SIMCOP Interrupts**

Bit	Name	Description
0	SIMCOP_DMA_IRQ0	Interrupt triggered by SIMCOP DMA
1	LDC_FRAME_IRQ	A full frame has been processed by LDC2
2	DCT_IRQ	DCT operation has been completed (configured number of MCUs for YUV4:2:0/4:2:2 mode, or number of blocks for sequential block mode).
3	VLCDJ_BLOCK_IRQ	A macroblock has been processed (encode/decode).
4	NSF_IRQ	Event triggered by the NSF2 imaging accelerator when processing of a block is done
5	IMX_A_IRQ	Event triggered when iMX has executed a SLEEP instruction
6	IMX_B_IRQ	
7	ROT_A_IRQ	Event triggered by the ROT engine
8	RESERVED	Reserved
9	LDC_BLOCK_IRQ	A macroblock has been processed by LDC2.
10	SIMCOP_STEP0_IRQ	Event triggered when a SIMCOP context is activated by the hardware sequencer
11	SIMCOP_STEP1_IRQ	
12	SIMCOP_STEP2_IRQ	
13	SIMCOP_STEP3_IRQ	
14	DONE_IRQ	Event triggered when the hardware sequencer finishes the sequence: - the sequence step counter has reached the limit - All accelerator and DMA events for the last sequence step have been received.
15	VLCDJ_DECODE_ERR_IRQ	A decode error has been signaled by the VLCDJ
16	ICNT_ERR_IRQ	An error has been received on the SIMCOP master port on the L3 interconnect.
17	LDC2BRIDGE_ERR_IRQ	The LDC2 bridge has generated an error. This event must not trigger in a normal use case.
18	SIMCOP_DMA_IRQ1	Interrupt triggered by SIMCOP DMA
19	CPU_PROC_START_IRQ	This interrupt is used when CPU data processing is used in a macroblock processing pipeline. When the CPU receives this IRQ, data is ready to be processed. When CPU is done with processing it acknowledges by setting the SIMCOP_HWSEQ_CTRL.CPU_PROC_DONE bit. The interrupt is cleared as usual.

#### 8.4.1.2.4 ISS SIMCOP Modules Description

This section gives links to each subsection for each submodule in the ISS SIMCOP module.

The ISS module provides unique ISS\_FCLK for all the submodules inside the SIMCOP (see [Section 8.4.1.2.1.1, ISS SIMCOP Local Clock Management](#)).

For information about hardware and software resets for each module see [Table 8-1247](#).

For interrupt request information for each module, see [Section 8.4.1.2.3, Interrupt Merger](#).

ISS SIMCOP consists of the following submodules:

- Hardware sequencer and buffers, for more information see [Section 8.4.2, ISS SIMCOP Hardware Sequencer and Buffers](#).
- DMA, for more information, see [Section 8.4.3, ISS SIMCOP DMA Module](#).
- ROT, for more information, see [Section 8.4.7, ISS SIMCOP Rotation Accelerator \(ROT\) Module](#).
- iMX
- NSF2
- VLCDJ, for more information, see [Section 8.4.6, ISS SIMCOP Variable Length Coder/Decoder for JPEG \(VLCDJ\) Module](#).
- DCT, for more information, see [Section 8.4.5, ISS SIMCOP Discrete Cosine Transform \(DCT\) Module](#).
- LDC, for more information, see [Section 8.4.4, ISS SIMCOP LDC Module](#).

#### 8.4.1.3 ISS SIMCOP Programming Models

##### 8.4.1.3.1 Global Initialization

###### 8.4.1.3.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the ISS SIMCOP module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration of the ISS SIMCOP.

**Table 8-1248. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
ISS local PM and CM	Module interface and functional clocks must be enabled. For more information, see <a href="#">Section 8.4.1.2.1, ISS SIMCOP Local Power and Clock Management</a> .

###### 8.4.1.3.1.2 ISS SIMCOP Module Global Initialization

This procedure initializes the ISS SIMCOP module after a power on or software reset.

**Table 8-1249. ISS SIMCOP Global Initialization**

Step	Register/Bit Field/Programming Model	Value
Execute software reset.	<a href="#">SIMCOP_HL_SYSCONFIG[0]</a> SOFTRESET	0x1
Wait until reset completed?	<a href="#">SIMCOP_HL_SYSCONFIG[0]</a> SOFTRESET	0x0
Configure STANDBYMODE.	<a href="#">SIMCOP_HL_SYSCONFIG[5:4]</a> STANDBYMODE	0x2
Configure submodules interface and functional clock.	<a href="#">SIMCOP_CLKCTRL[7:0]</a>	xxx
<b>Interrupt configuration</b>		
Set interrupt enable bit for the submodules.	<a href="#">SIMCOP_HL_IRQENABLE_SET_i[7:0]</a>	xxx

### 8.4.1.3.2 ISS SIMCOP Operational Modes Configuration

#### 8.4.1.3.2.1 Interrupts

To unmask an interrupt for generation of SIMCOP\_IRQ<sub>i</sub> output interrupts, software must set the corresponding bit of `SIMCOP_HL_IRQENABLE_SET_i` (where  $i = 0$  to 3) to 1.

Example 1, SIMCOP\_IRQ1 is generated when DCT\_IRQ or VLCDJ\_BLOCK\_IRQ are generated:

- `SIMCOP_HL_IRQENABLE_SET_i[2]` DCT\_IRQ = 0x1 (where  $i = 1$ )
- `SIMCOP_HL_IRQENABLE_SET_i[3]` VLCDJ\_BLOCK\_IRQ = 0x1 (where  $i = 1$ )
- `SIMCOP_CTRL[1]` IRQ1\_MODE = 0x0

Example 2, SIMCOP\_IRQ3 is generated when IMX\_A\_IRQ and LDC\_BLOCK\_IRQ are generated:

- `SIMCOP_HL_IRQENABLE_SET_i[5]` IMX\_A\_IRQ = 0x1 (where  $i = 3$ )
- `SIMCOP_HL_IRQENABLE_SET_i[9]` LDC\_BLOCK\_IRQ = 0x1 (where  $i = 3$ )
- `SIMCOP_CTRL[3]` IRQ3\_MODE = 0x1

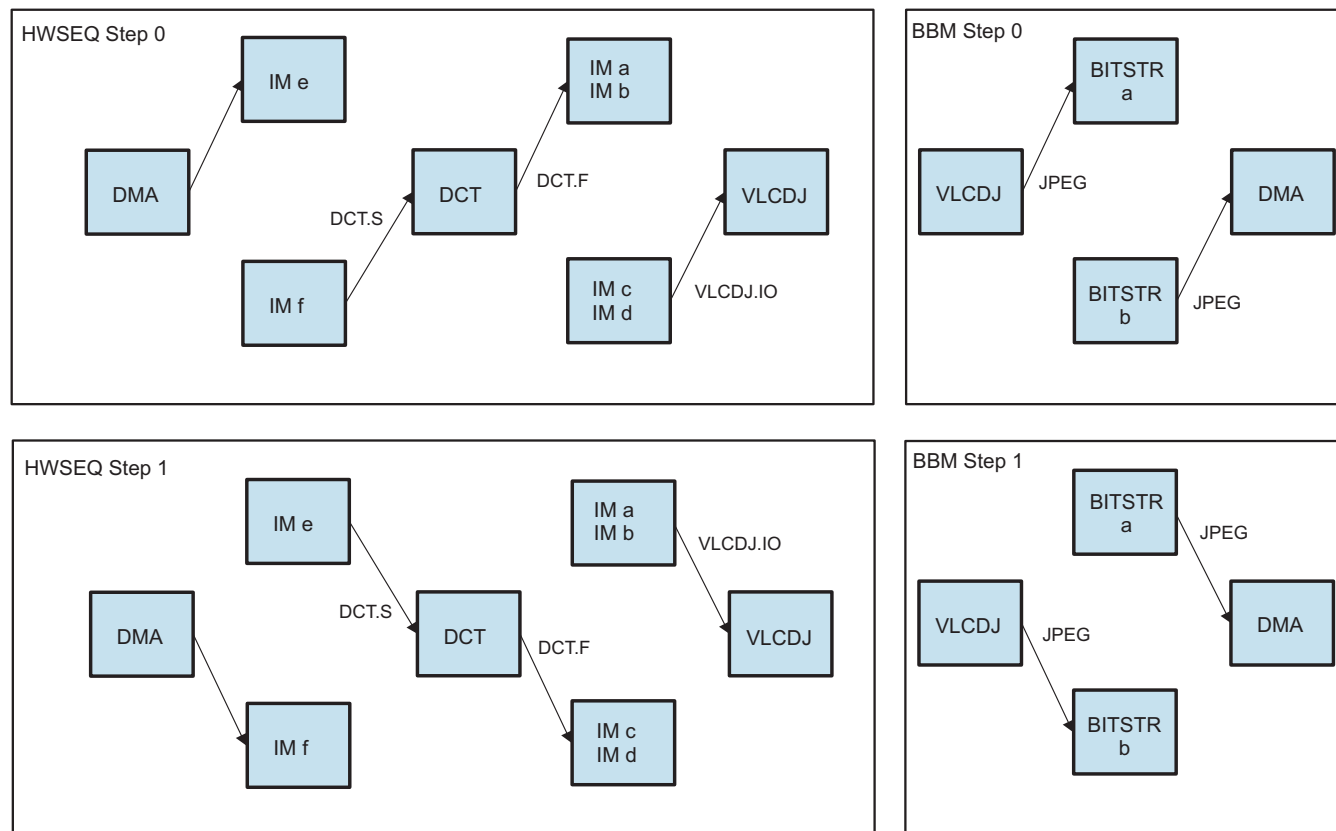

To mask an interrupt for generation of SIMCOP\_IRQ<sub>i</sub> output interrupts, software must clear the corresponding bit of `SIMCOP_HL_IRQENABLE_CLEAR_i` (where  $i = 0$  to 3) to 0.

When an event occurs, the corresponding bit in the `SIMCOP_HL_IRQSTATUS_RAW_i` (where  $i = 0$  to 3) register is set regardless if the event has been enabled or not. Bits in the `SIMCOP_HL_IRQSTATUS_i` (where  $i = 0$  to 3) registers are only set when an enabled event occurs. Software can clear a pending event by setting the adequate bit in the `SIMCOP_HL_IRQSTATUS_i` (where  $i = 0$  to 3) register.

#### 8.4.1.3.2.2 JPEG Encode Operational Mode Configuration

Figure 8-246 shows a typical JPEG encode macroblock pipeline.

**Figure 8-246. JPEG Encode Pipeline**

simcop-012

**Table 8-1250. JPEG Encode Pipeline**

<b>Step</b>	<b>Register/Bit Field/Programming Model</b>	<b>Value</b>
Set SIMCOP DMA to fetch data from SDRAM and stored into an image buffer (IM e or IM f).	See DMA programming model <a href="#">Section 8.4.3.4</a>	xxx
Set DCT to reads data from an image buffer (IM e or IM f).	DCT_SPTR[12:5] ADDR	xxx
Set DCT to store data into sets of two image buffers (IM a + IM b or IM c + IM d).	DCT_FPTR[12:4] ADDR	xxx
Set VLCDJ to read data from image buffers.	See VLCDJ programming model <a href="#">Section 8.4.6.4</a>	xxx
Set VLCDJ to write the data to the bitstream buffer.	See VLCDJ programming model <a href="#">Section 8.4.6.4</a>	xxx
Set the SIMCOP DMA to send the data to SDRAM.	See DMA programming model <a href="#">Section 8.4.3.4</a>	xxx

## 8.4.1.4 ISS SIMCOP Register Manual

### 8.4.1.4.1 SIMCOP Instance Summary

Table 8-1251 is the SIMCOP top level instance summary.

**Table 8-1251. SIMCOP Instance Summary**

Module Name	Base Address L3 Interconnect	Base Address Cortex-M3 Private Access	Size
SIMCOP_CONTROL	0x5202 0000	0x5506 0000	256 bytes

**NOTE:** Private Access is an access that does not use the L3/L4 interconnects.

### 8.4.1.4.2 SIMCOP Registers

#### 8.4.1.4.2.1 SIMCOP Register Summary

Table 8-1252 is the SIMCOP\_CONTROL register mapping summary.

**Table 8-1252. SIMCOP\_CONTROL Register Mapping Summary**

Register Name	Type	Register Width (Bits)	Address Offset	Physical Address L3 Interconnect	Physical Address Cortex-M3 Private Access

**Table 8-1255. SIMCOP\_HL\_HWINFO**

<b>Address Offset</b>	0x0000 0004	<b>Instance</b>	SIMCOP_CONTROL_L3 SIMCOP_CONTROL_CORTEX-M3
<b>Physical Address</b>	0x5202 0004 0x5506 0004		
<b>Description</b>	Information about the IP module's hardware configuration. It provides information about the generic parameters.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																LDCIMXNSF_BOOST	RY22_LDCMEM	LDCR_RESP_FIFO	IMAGE_BUFFERS	RESERVED	ROT_A_ENABLE	IMX_B_ENABLE	IMX_A_ENABLE	NSF_ENABLE	VLCDJ_ENABLE	DCT_ENABLE	LDC_ENABLE				

Bits	Field Name	Description	Type	Reset
31:15	RESERVED	Read returns 0.	R	0x00000
14	LDCIMXNSF_BOOST	Read 0x1: SIMCOP receives a 400 MHz clock. Some modules receive the 400 Mhz clock and others receive 400 /2 = 200 Mhz  Read 0x0: SIMCOP receives a 200 MHz clock driving all sub-modules	R	1

Bits	Field Name	Description	Type	Reset
13	RY22_LDCMEM	<p>Chooses the LDC working memory configuration</p> <p>Read 0x1: Working memory only populated for YUV420 operation</p> <p>A: 1024x32 B: 1024x32 C: 1024x16 D: 1024x16</p> <p>Read 0x0: Working memory fully populated. Supports YUV422 operation.</p> <p>A: 512x32 B: 512x32 C: 1024x16 D: 1024x16 E: 512x32 F: 512x32 G: 1024x16 H: 1024x16</p>	R	0x0
12:10	LDCR_RESP_FIFO	<p>Defines the size of the LDC read master response FIFO in words of 128-bits.</p> <p>Read 0x2: 8x128 bits Read 0x3: 16x128 bits Read 0x4: 32x128 bits Read 0x5: 64x128 bits Read 0x6: 128x128 bits Read 0x7: 256x256 bits</p>	R	0x4
9:8	IMAGE_BUFFERS	<p>This parameter defines the image buffer count.</p> <p>Read 0x0: 4 Image buffers (e, f, g, h) Read 0x1: 8 Image buffers</p>	R	0x1
7	RESERVED	Read returns 0.	R	0
6	ROT_A_ENABLE	<p>The ROT a is present when this parameter is set.</p> <p>Read 0x0: Disabled at design time Read 0x1: Enabled at design time</p>	R	1
5	IMX_B_ENABLE	<p>The iMX B module and the CMD b, COEFF b memories are present when this parameter is set.</p> <p>Read 0x0: Disabled at design time Read 0x1: Enabled at design time</p>	R	1
4	IMX_A_ENABLE	<p>The iMX A module and the CMD a, COEFF a memories are present when this parameter is set.</p> <p>Read 0x0: Disabled at design time Read 0x1: Enabled at design time</p>	R	1
3	NSF_ENABLE	<p>The NSF2 is present when this parameter is set.</p> <p>Read 0x0: Disabled at design time Read 0x1: Enabled at design time</p>	R	1
2	VLCDJ_ENABLE	<p>The VLCD module and the QUANT, HUFFMAN, BITSTREAM memories are present when this parameter is set.</p> <p>Read 0x0: Disabled at design time Read 0x1: Enabled at design time</p>	R	1
1	DCT_ENABLE	<p>The DCT module is present when this parameter is set.</p> <p>Read 0x0: Disabled at design time Read 0x1: Enabled at design time</p>	R	1

Bits	Field Name	Description	Type	Reset
0	LDC_ENABLE	The LDC module and the LDC LUT are present when this parameter is set. Read 0x0: Disabled at design time Read 0x1: Enabled at design time	R	1

<b>Address Offset</b>	0x0000 0010	<b>Instance</b>	SIMCOP_CONTROL_L3 SIMCOP_CONTROL_CORTEX-M3
<b>Physical Address</b>	0x5202 0010 0x5506 0010		
<b>Description</b>	This register controls the various parameters of the OCP interface		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																STANDBYMODE		RESERVED		SOFTRESET											

Bits	Field Name	Description	Type	Reset
31:6	RESERVED	Read returns 0.	R	0x0000000
5:4	STANDBYMODE	Configuration of the local initiator state management mode. By definition, initiator may generate read/write transaction as long as it is out of STANDBY state. 0x0: Force-standby mode: local initiator is unconditionally placed in standby state. Backup mode, for debug only. 0x1: No-standby mode: local initiator is unconditionally placed out of standby state. Backup mode, for debug only. 0x2: Smart-standby mode: local initiator standby status depends on local conditions, that is, the module's functional requirement from the initiator.	RW	0x0
3:1	RESERVED	Read returns 0.	R	0x0
0	SOFTRESET	Software reset Read 0x0: Reset done, no pending action Write 0x0: No action Write 0x1: Initiate software reset Read 0x1: Reset (software or other) ongoing	RW	0

**Table 8-1259. SIMCOP\_HL\_IRQSTATUS\_RAW\_i**

<b>Address Offset</b>	0x0000 0020 + (0x10 * i)	<b>Instance</b>	SIMCOP_CONTROL_L3 SIMCOP_CONTROL_CORTEX-M3
<b>Physical Address</b>	0x5202 0020 + (0x10 * i) 0x5506 0020 + (0x10 * i)		
<b>Description</b>	Per-event raw interrupt status vector Raw status is set even if event is not enabled. Write 1 to set the (raw) status, mostly for debug.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								CPU_PROC_START_IRQ	SIMCOP_DMA_IRQ1	LDC2BRIDGE_ERR_IRQ	ICNT_ERR_IRQ	VLCDJ_DECODE_ERR_IRQ	DONE_IRQ	STEP3_IRQ	STEP2_IRQ	STEP1_IRQ	STEP0_IRQ	LDC_BLOCK_IRQ	RESERVED	ROT_A	IMX_B_IRQ	IMX_A_IRQ	NSF_IRQ_IRQ	VLCDJ_BLOC_IRQ	DCT_IRQ	LDC_FRAME_IRQ	SIMCOP_DMA_IRQ0				

Bits	Field Name	Description	Type	Reset
31:20	RESERVED	Read returns 0.	R	0x000
19	CPU_PROC_START_IRQ	Event triggered by the hardware sequencer to instruct the CPU to process a macroblock  Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug)	RW W1toSet	0
18	SIMCOP_DMA_IRQ1	Event triggered by the SIMCOP DMA. This event is automatically cleared at SIMCOP level when it is cleared at SIMCOP DMA level. Check SIMCOP DMA IRQ registers.  Read 0x0: No event pending Read 0x1: Event pending	R	0
17	LDC2BRIDGE_ERR_IRQ	The LDC2 bridge has generated an error.  Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug)	RW W1toSet	0
16	ICNT_ERR_IRQ	An error has been received on the SIMCOP master port.  Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug)	RW W1toSet	0
15	VLCDJ_DECODE_ERR_IRQ	A decode error has been signaled by the VLCDJ module  Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug)	RW W1toSet	0

Bits	Field Name	Description	Type	Reset
14	DONE_IRQ	Event triggered when the hardware sequencer finishes the sequence: - the sequence step counter has reached the limit - all accelerator and DMA events for the last sequence step have been received. Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug)	RW W1toSet	0
13	STEP3_IRQ	Event triggered when Step 3 is activated by the hardware sequencer Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug)	RW W1toSet	0
12	STEP2_IRQ	Event triggered when Step 2 is activated by the hardware sequencer Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug)	RW W1toSet	0
11	STEP1_IRQ	Event triggered when Step 1 is activated by the hardware sequencer Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug)	RW W1toSet	0
10	STEP0_IRQ	Event triggered when Step 0 is activated by the hardware sequencer Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug)	RW W1toSet	0
9	LDC_BLOCK_IRQ	This event is triggered by LDC when a macroblock has been processed Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug)	RW W1toSet	0
8	RESERVED	Read returns 0.	R	0
7	ROT_A	Event triggered by the ROT a engine Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug)	RW W1toSet	0
6	IMX_B_IRQ	Event triggered when iMX has executed a SLEEP instruction. Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug)	RW W1toSet	0

Bits	Field Name	Description	Type	Reset
5	IMX_A_IRQ	Event triggered when iMX has executed a SLEEP instruction. Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug)	RW W1toSet	0
4	NSF_IRQ_IRQ	Event triggered by the NSF2 imaging accelerator when processing of a block is done. Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug)	RW W1toSet	0
3	VLCDJ_BLOC_IRQ	This event is triggered by VLCDJ when a macroblock has been processed (encode/decode) Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug)	RW W1toSet	0
2	DCT_IRQ	Event triggered when a block has been processed by the DCT module and the filter outcome has been stored to an image buffer. Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug)	RW W1toSet	0
1	LDC_FRAME_IRQ	This event is triggered by LDC when a full frame has been processed Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug)	RW W1toSet	0
0	SIMCOP_DMA_IRQ0	Event triggered by the SIMCOP DMA. This event is automatically cleared at SIMCOP level when it is cleared at SIMCOP DMA level. Check SIMCOP DMA IRQ registers. Read 0x0: No event pending Read 0x1: Event pending	R	0

Bits	Field Name	Description	Type	Reset
31:29	RESERVED	Read returns 0.	R	0x0
28	LDC_R_BURST_BREAK	Controls if bursts issued by the LDC2 bridge could cross burst length boundaries. When this register is set, the LDC2 bridge only issues aligned bursts. Register can only be used when LDC_R_MAX_BURST_LENGTH is 32, 64, or 128 bytes.  0x0: Yes. 0x1: No. OCP transactions must be split	RW	0
27:26	LDC_R_MAX_BURST_LENGTH	Limits the maximum burst length that could be used by the LDC2 bridge  0x0: 8 x 128 0x1: 6 x 128 0x2: 4 x 128 0x3: 2 x 128	RW	0x0
25	RESERVED	Read returns 0.	R	0
24:21	LDC_R_TAG_CNT	Limits the maximum number of outstanding requests to LDC_R_TAG_CNT+1	RW	0x3
20	RESERVED	Read returns 0.	R	0
19:16	LDC_R_TAG_OFST	First OCP tag ID that can be used by LDC reads. Software must prevent overlap with tags generated by the SIMCOP DMA. Typically this value should be equal to SIMCOP_DMA_CTRL.TAG_CNT+1.	RW	0xC
15	RESERVED	Read returns 0.	R	0
14	IMX_B_CMD	Switch for iMX # command memory  0x0: Coprocessor bus 0x1: iMX B instruction read / write	RW	0
13:12	IMX_A_CMD	Switch for iMX A command memory  0x0: Coprocessor bus 0x1: iMX A instruction read/write 0x2: iMX B instruction read/write	RW	0x0

Bits	Field Name	Description	Type	Reset
11	HUFF	Switch for Huffman table 0x0: Coprocessor 0x1: VLCDJ Huffman table read	RW	0
10	QUANT	Switch for quantization table 0x0: Coprocessor bus 0x1: VLCDJ quantization table read	RW	0
9	RESERVED	Read returns 0.	R	0
8	LDC_LUT	Switch for LDC LUT 0x0: Coprocessor bus 0x1: The LDC module could access the LDC LUT.	RW	0
7:6	LDC_INPUT	Selects input data buffer for LDC. Memories attached to LDC as working memories cannot be used by any other accelerators. HWSEQ or HWSEQ software override settings are ignored for those memories. 0x0: No input memory attached 0x1: Use image buffers a and b 0x2: Use image buffers a, b, c, and d 0x3: Use LDC private input memory.	RW	0x0
5:4	NSF_WMEM	Selects working memory for NSF. Memories attached to NSF as working memories cannot be used by any other accelerators. HWSEQ or HWSEQ software override settings are ignored for those memories. 0x0: No working memory attached to NSF2. NSF2 cannot be used. 0x1: iMX A coefficient memory used. 0x2: Image buffers a and b used. Those image buffers cannot be used for other purposes. This setting has higher priority than the context configuration. 0x3: Image buffers a, b, c, and d used. Those image buffers cannot be used for other purposes. This setting has higher priority than the context configuration.	RW	0x0
3	IRQ3_MODE	Interrupt generation method 0x0: The interrupt line is asserted when one of the events enabled in SIMCOP_IRQENABLE_3 is pending. 0x1: The interrupt line is asserted when all events enabled in SIMCOP_IRQENABLE_3 are pending.	RW	0
2	IRQ2_MODE	Interrupt generation method 0x0: The interrupt line is asserted when one of the events enabled in SIMCOP_IRQENABLE_2 is pending. 0x1: The interrupt line is asserted when all events enabled in SIMCOP_IRQENABLE_2 are pending.	RW	0
1	IRQ1_MODE	Interrupt generation method 0x0: The interrupt line is asserted when one of the events enabled in SIMCOP_IRQENABLE_1 is pending. 0x1: The interrupt line is asserted when all events enabled in SIMCOP_IRQENABLE_1 are pending.	RW	0
0	IRQ0_MODE	Interrupt generation method 0x0: The interrupt line is asserted when one of the events enabled in SIMCOP_IRQENABLE_0 is pending. 0x1: The interrupt line is asserted when all events enabled in SIMCOP_IRQENABLE_0 are pending.	RW	0

## 8.4.2 ISS SIMCOP Hardware Sequencer and Buffers

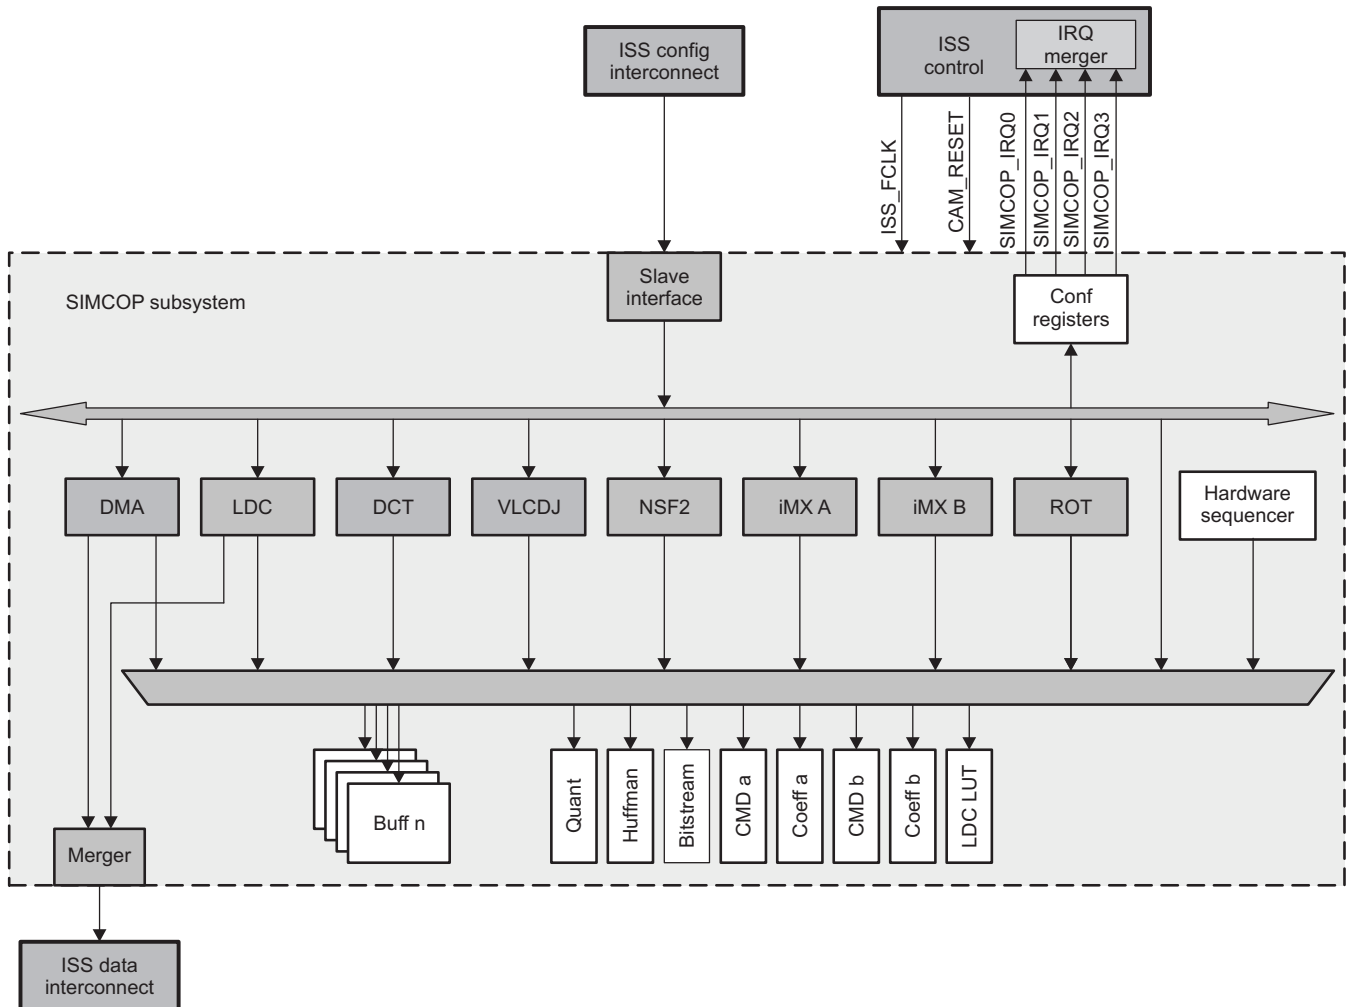

This section describes the hardware sequencer and buffers in the still image coprocessor (SIMCOP) subsystem.

### 8.4.2.1 ISS SIMCOP Hardware Sequencer and Buffers Overview

The SIMCOP hardware sequencer control all the modules included in the SIMCOP subsystem with their memories.

Figure 8-247 shows an overview of the hardware sequencer and buffers in the SIMCOP subsystem.

Figure 8-247. Hardware Sequencer and Buffers in the SIMCOP Subsystem

hwseq-001

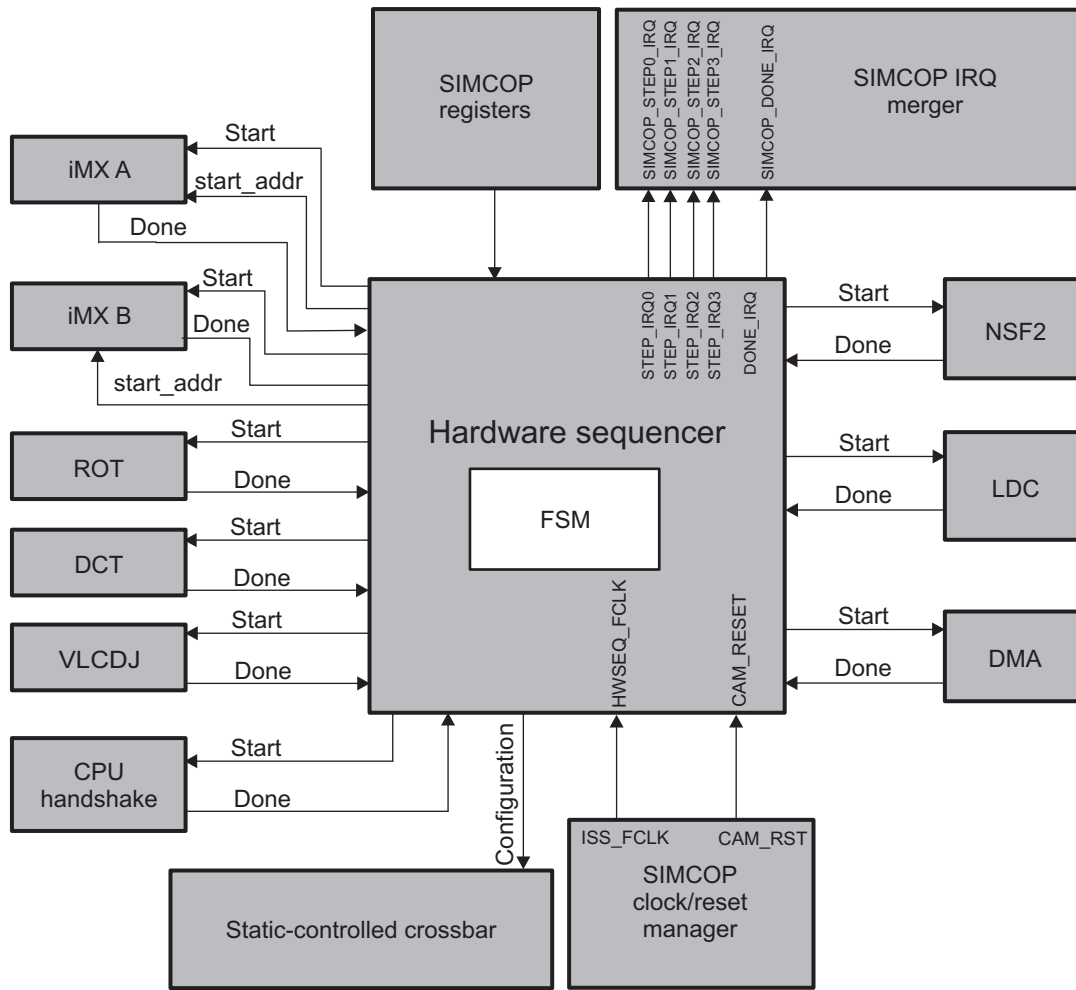

- Hardware acceleration for low-level sequencing tasks:
  - Synchronizes with DMA, DCT, VLCDJ, ROT, NSF2, LDC, and iMX
  - Supports 4 memory crossbar contexts
- On-chip memories (RAM):
  - Eight image buffers, 4KB each
  - Quantization table storage: 512 bytes
  - Huffman table storage: 4KB
  - Bitstream buffer: 4KB
  - Two iMX coefficient memories: 16KB each
  - Two iMX program memories: 4KB for iMX A and 8KB for iMX B
  - LDC look-up table (LUT) storage: 256 entries
- Power-management support

#### 8.4.2.2 ISS SIMCOP Hardware Sequencer and Buffer Integration

The hardware sequencer and buffers module is part of the SIMCOP subsystem in the imaging subsystem (ISS).

Figure 8-248 shows the integration of the hardware sequencer and buffers in the SIMCOP subsystem.

**Figure 8-248. Hardware Sequencer and Buffer Integration**

hwseq-011

Table 8-1272 lists the integration attributes, Table 8-1273 lists the clocks and resets, and Table 8-1274 lists the hardware requests.

**Table 8-1272. Integration Attributes**

Module Instance	Attributes	
	Power Domain	Interconnect
Hardware sequencer and buffers	PD_CAM	

**Table 8-1273. Clocks and Resets**

Clocks					
Module Instance	Destination Signal Name	Source Signal Name	Source	Description	
Hardware sequencer and buffers	HWSEQ_FCLK	ISS_FCLK	PRCM	Functional clock provided by ISS_CLK from PRCM . It is used by all ISS submodules and ISS top-level resources.	
Resets					
Hardware sequencer and buffers	CAM_RESET	CAM_RST	PRCM	ISS and SIMCOP global reset	

For information about clock and reset management, see [Section 8.4.1.2.1](#), *ISS SIMCOP Local Power and Clock Management*.

**Table 8-1274. Hardware Requests**

Interrupt Requests					
Module Instance		Source Signal Name	Destination Signal Name	Destination	Description
Hardware and buffers	sequencer	STEP_IRQ0	SIMCOP_STEP0_IRQ	SIMCOP IRQ merger	Event triggered when a SIMCOP context is activated by the hardware sequencer
Hardware and buffers	sequencer	STEP_IRQ1	SIMCOP_STEP1_IRQ	SIMCOP IRQ merger	Event triggered when a SIMCOP context is activated by the hardware sequencer
Hardware and buffers	sequencer	STEP_IRQ2	SIMCOP_STEP2_IRQ	SIMCOP IRQ merger	Event triggered when a SIMCOP context is activated by the hardware sequencer
Hardware and buffers	sequencer	STEP_IRQ3	SIMCOP_STEP3_IRQ	SIMCOP IRQ merger	Event triggered when a SIMCOP context is activated by the hardware sequencer
Hardware and buffers	sequencer	DONE_IRQ	SIMCOP_DONE_IRQ	SIMCOP IRQ merger	Event triggered when the hardware sequencer finishes the sequence

For more information about interrupt requests, see [Section 8.4.1.2.3](#), *Interrupt Merger*.

### 8.4.2.3 ISS SIMCOP Hardware Sequencer and Buffers Functional Description

#### 8.4.2.3.1 ISS SIMCOP Hardware Sequencer and Buffers Software Reset

For information about how to perform a software reset, see [Section 8.4.1.2.2, Software Reset](#).

#### 8.4.2.3.2 ISS SIMCOP Hardware Sequencer and Buffers Power Management

For more information about power management, see [Section 8.4.1.2.1.3, ISS SIMCOP Power Management](#).

#### 8.4.2.3.3 ISS SIMCOP Hardware Sequencer and Buffer Interrupt Requests

This module sends four interrupts to the ISS top level. For more information about interrupt management, see [Section 8.4.1.2.3, Interrupt Merger](#).

#### 8.4.2.3.4 ISS SIMCOP Hardware Sequencer Buffer Description

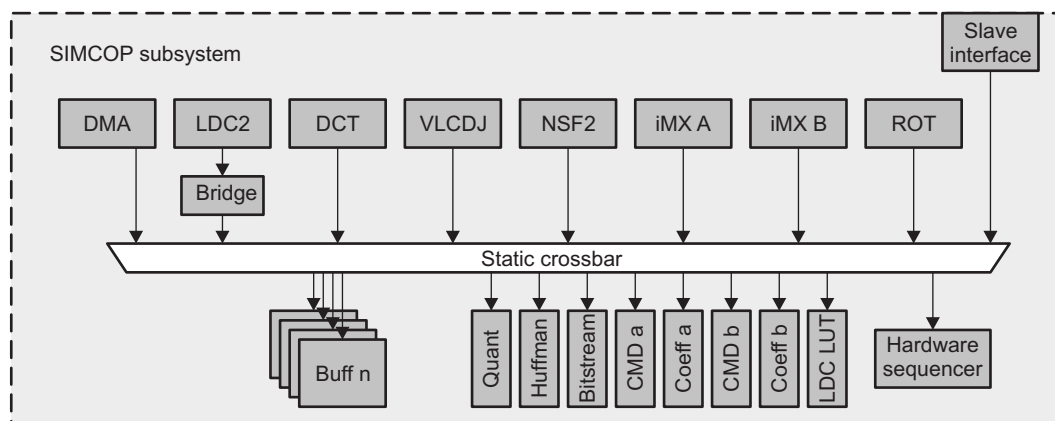

The SIMCOP subsystem includes the following memories:

- Eight image buffers, 4KB each
- Quantization table storage: 512 bytes
- Huffman table storage: 4KB
- Bitstream buffer: 4KB
- Two iMX coefficient memories: 16KB each
- Two iMX program memories: 4KB for iMX A and 8KB for iMX B
- LDC LUT storage: 256 entries
- LDC private working memory

##### 8.4.2.3.4.1 Static Crossbar

The static crossbar connects SIMCOP modules to the SIMCOP memories as shown in [Figure 8-249](#).

**Figure 8-249. SIMCOP Static Crossbar Overview**

hwseq-002

The buses for QUANT, HUFF, LDC LUT, CMD a, and CMD b are controlled by an external initiator. Typically, those memories are initialized before SIMCOP starts processing, and the content remains unchanged until the full frame is processed. The amount of data transferred to those memories is low and transfer is not timing critical. [Table 8-1275](#) shows how to connect these memories to SIMCOP modules.

**NOTE:** The transfer can only be done through the slave interface (for example, CPU or system DMA [sDMA]). The SIMCOP DMA cannot access those memories.

**Table 8-1275. Static Crossbar Control Summary**

Memory	Register SIMCOP_CTRL	Value						
		Bus	iMX A inst	iMX B inst	VLCDJ HUFF	VLCDJ QUANT	LDC LUT	LDC INPUT
Quantization	[10] QUANT	0				1		
Huffman	[11] HUFF	0			1			
CMD a	[13:12] IMX_A_CMD	0	1	2				
CMD b	[14] IMX_B_CMD	0		1				
LDC LUT	[8] LDC_LUT	0					1	
LDC Priv	[7:6] LDC_INPUT							3

Image buffers and coefficient memories are used to store the data to be processed and processing results. Those memories can be accessed by the SIMCOP DMA, SIMCOP bus, and SIMCOP modules. [Table 8-1276](#) shows possible connections in the SIMCOP static crossbar: for example DCT Freq port can access image buffer A when SIMCOP\_HWSEQ\_SWITCH\_i[2:0] IMBUFF\_A = 5 (where i = 0, 1, 2, or 3 corresponds to the active context).

SIMCOP supports multiple contexts for the configuration of those memories. Software or the hardware sequencer can activate different contexts.

The BITSTREAM data flow is asynchronous from the macroblock pipeline. Therefore it supports dynamic buffer switching logic.

**Table 8-1276. Static Crossbar Control Summary (2/2)**

Memory	Register (SIMCOP_HWSEQ_S TEP_SWITCH_i and SIMCOP_HWSEQ_S TEP_CTRL2_i)	Value													
		Bus	DMA	iMX data A	iMX data B	VLC DJ IO	VLC DJ BS	DCT Spati al	DCT Freq	NSF2 IO	NSF2 WME M	LDC 0	LDC WME M	ROT In	ROT Out

#### 8.4.2.3.4.2 Image Buffers

Image buffers are four banks × 256 × 32 bits (4KB) working memories used by the SIMCOP modules to perform image processing operations. Image buffers are shared between the iMX, NSF2, DCT, LDC, VLCDJ, ROT, DMA, and SIMCOP bus accesses. Not all initiators can access the image buffers simultaneously.

Switches are controlled by the hardware sequencer or an external initiator through register configuration. Data is always organized in little-endian format.

One or multiple image buffers can be attached to a given accelerator port by configuring the adequate bits in the [SIMCOP\\_HWSEQ\\_STEP\\_SWITCH\\_i](#) registers.

The image buffer address mapping to different buses listed in [Table 8-1277](#) is controlled using the adequate [SIMCOP\\_HWSEQ\\_STEP\\_CTRL\\_i](#) register bit fields.

**Table 8-1277. Image Buffer Address Map**

Figure 8-250 shows how width conversion and bank interleaving is performed. Each color corresponds to a different physical bank.

**Figure 8-250. Image Buffer Width Translation**

hwseq-003

**8.4.2.3.4.3 Coefficient Memories**

The IMX\_COEF\_A memory is used by the NSF2 to store temporary data. The IMX\_x also uses COEFF\_A and COEFF\_B to store coefficients used during certain operations. IMX\_COEF\_A and IMX\_COEFF\_B are shared between the iMX, DMA, DCT, VLCDJ, and SIMCOP bus accesses. Only one initiator can access a coefficient memory at given time.

Switches are controlled by the hardware sequencer or an external initiator through register configuration. Data is always organized in little-endian format.

The initiators access types to the IMX\_COEF\_x memory are summarized in Table 8-1278. Coefficient memory configuration depends on the initiators. Data is always organized little endian.

**Table 8-1278. Coefficient Buffer Organization**

Figure 8-251 shows how width conversion and bank interleaving is performed. Each color corresponds to a different physical bank.

**Figure 8-251. Coefficient Memory Width Translation**

hwseq-004

**8.4.2.3.4.4 Quantization Memories**

The QUANT memory is used to store the quantization and dequantization tables for the VLCDJ module.

Coefficients are coded as 16-bit values. Every color component requires 8 x 8 quantization entries, therefore the QUANT memory of SIMCOP can hold up to four tables as shown in Table 8-1279.

**Table 8-1279. Quantization Table Storage in QUANT Memory**

Table	0	1	2	3
ADDR	0x000	0x0080	0x0100	0x0180

Table	0	1	2	3
Decode only	Unused	Unused	Y dequantization	UV dequantization
Encode and decode	Y quantization	UV quantization	Y dequantization	UV dequantization

QUANT is shared between the VLCDJ and SIMCOP bus accesses. All initiators cannot access QUANT simultaneously.

The initiators access types to the QUANT memory are summarized in [Table 8-1280](#). QUANT memory configuration depends on the initiators.

**Table 8-1280. QUANT Memory Organization**

VLCDJ	Coprocessor Bus
128 words × 32 bits	128 words × 32 bits

#### 8.4.2.3.4.5 Huffman Tables

The HUFF memory is used to store the Huffman table for the VLCDJ module. Details about the Huffman table organization can be found in the VLCDJ module description (see [Section 8.4.6](#), *VLCDJ*).

HUFF memory is shared between the VLCDJ and SIMCOP bus accesses. All initiators cannot access HUFF simultaneously.

The initiators access types to the HUFF memory are summarized in [Table 8-1281](#). HUFF memory configuration depends on the initiators.

**Table 8-1281. HUFF Memory Organization**

VLCDJ	Coprocessor Bus
1024 words × 32 bits	1024 words × 32 bits

#### 8.4.2.3.4.6 Bitstream Buffer

##### 8.4.2.3.4.6.1 Overview

The bitstream buffer is used to store the VLCDJ bitstream. The bitstream buffer is shared between the VLCDJ, DMA, and SIMCOP bus accesses.

The bitstream buffer can be used in manual or automatic mode.

In manual mode, software selects if SIMCOP DMA, VLCDJ bitstream port, or SIMCOP bus can access the bitstream buffer. Manual mode is typically used to interleave JPEG encode and decode, for example, to support JPEG transcoding.

In automatic mode (`SIMCOP_HWSEQ_CTRL[6:4] BITSTREAM = ENCODE` or `DECODE`) the bitstream buffer is handled as two banks to prevent access collision between VLCDJ and SIMCOP DMA. A dedicated hardware engine (BBM) is used to ensure that VLCDJ and SIMCOP DMA access separate banks.

Automatic mode is disabled by writing `SIMCOP_HWSEQ_CTRL[6:4] BITSTREAM = COPR`.

The bitstream buffer mapping into the SIMCOP DMA address map depends on the `SIMCOP_HWSEQ_CTRL[6:4] BITSTREAM` and `SIMCOP_HWSEQ_CTRL[3:2] BITSTR_XFER_SIZE` bit fields and the internal state of the BBM. [Table 8-1282](#) lists the mapping of the bitstream buffer for SIMCOP DMA.

**Table 8-1282. Bitstream Buffer Mapping to SIMCOP DMA**

SIMCOP_HWSEQ_CTRL		Address Map		BBM count	Bitstream buffer		
BITSTREAM	XFER_SIZE						
0: COPRO	N/A	0x1000	0x1FFF	N/A	0x000	0xFF	
5: ENCODE or 6: DECODE	2048 bytes	0x1000	0x17FF	N/A	0x000	0x7FF	
				N/A	0x800	0xFF	
		0x1800	0x1FFF	N/A	N/A	N/A	
	1024 bytes	0x1000	0x13FF	0	0x000	0x3FF	
				1	0x400	0x7FF	
		0x1400	0x1FFF	N/A	N/A	N/A

2				0x200	0x2FF		
3				0x300	0x3FF		
4				0x400	0x4FF		
5				0x500	0x5FF		
6				0x600	0x6FF		
7				0x700	0x7FF		
		0x1100	0x1FFF	N/A	N/A	N/A	

#### 8.4.2.3.4.6.2 Automatic Bitstream Buffer Management

To enter automatic mode software must write the following values into the BITSTREAM configuration register:

- SIMCOP\_HWSEQ\_CTRL[6:4] BITSTREAM=COPRO (required to reset BBM)
- SIMCOP\_HWSEQ\_CTRL[6:4] BITSTREAM=JPEG\_ENCODE or JPEG\_DECODE

#### 8.4.2.3.4.7 LDC Lookup Table

The LDC\_LUT memory is used to store LUTs for the LDC module. LDC\_LUT is shared between the LDC and SIMCOP bus accesses. All initiators cannot access LDC\_LUT simultaneously.

The initiators access types to the QUANT memory are summarized in [Table 8-1283](#). QUANT memory configuration depends on the initiators.

**Table 8-1283. LDC\_LUT Memory Organization**

LDC	Coprocessor Bus

### 8.4.2.3.4.8 LDC Private Input Memory

The LDC has a private input memory that can be used when LDC operates in YUV 4:2:0 mode. For YUV 4:2:2 and RAW operation, LDC must use image buffers as input memories.

The LDC input memory is dedicated for LDC operation. It cannot be accessed from the SIMCOP bus or by any other SIMCOP module.

### 8.4.2.3.5 ISS SIMCOP Hardware Sequencer

SIMCOP typically processes a full frame on a macroblock by macroblock basis. SIMCOP modules and the DMA controller trigger an interrupt when they have completed a macroblock. This event can trigger an interrupt to an external initiator (manual mode) or trigger a context switch and resume DMA/SIMCOP module processing. Typically, initiator intervention is needed to fill the macroblock pipeline (called pipe-up. For example, first n macroblocks of an image) and to flush the macroblock pipeline (called pipe-down. For example, last n macroblocks of an image). Automatic sequencing mode is typically used for the rest of the image.

The hardware sequencer is particularly useful to offload the initiator during JPEG encode/decode, ROT, LDC, NSF2, or iMX processing.

Figure 8-252 shows the SIMCOP hardware sequencer overview.

Figure 8-252. SIMCOP Hardware Sequencer Overview

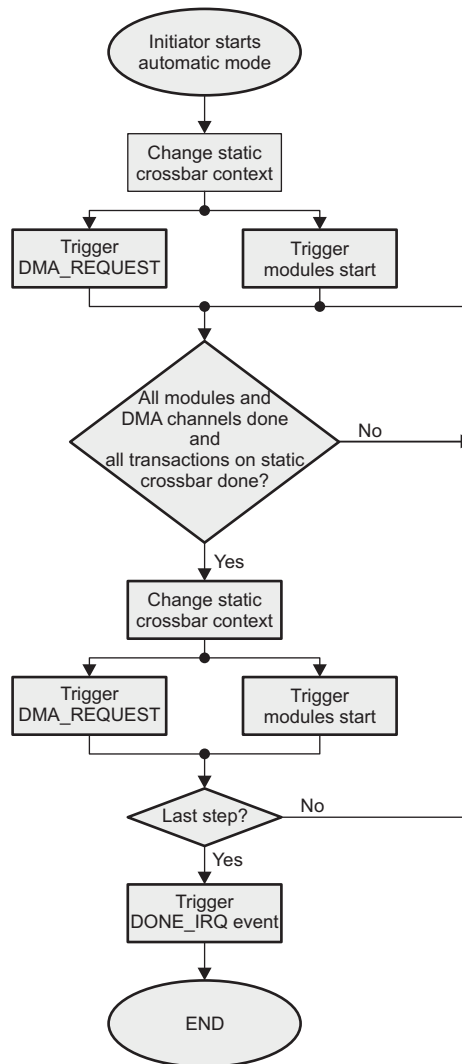

hwseq-008

The hardware sequencer can automatically execute a predefined number of sequencing steps without software intervention. That is called automatic operation. Automatic operation can also be used to pipeline filling and flushing with some limited software intervention. During automatic operation, the hardware sequencer controls generation of START/DONE pulses and the connections in the static-controlled crossbar. Software can take control over some resources while the hardware sequencer is running. That is called hardware sequencer override.

#### 8.4.2.3.5.1 Automatic Operation

Figure 8-253 shows the flow diagram executed by the hardware sequencer.

**Figure 8-253. Hardware Sequencing Example**

hwseq-009

The external initiator configures the different SIMCOP modules and DMA channels. When this is done, the initiator enables the hardware sequencer. This resets the internal state of the hardware sequencer (pending events, context switch counter).

It starts by running sequence step [SIMCOP\\_HWSEQ\\_CTRL\[12:11\] STEP](#):

- Clear all pending completion events that have been selected for step 0 in the hardware sequencer. This does not affect the SIMCOP\_IRQSTATUS register.
- Apply step [SIMCOP\\_HWSEQ\\_CTRL\[12:11\] STEP](#) configuration to the static crossbar.
- Start DMA transfers. Multiple channels can be enabled sequentially (for example, YUV 4:2:0 data transfers or SIMCOP→SDRAM followed by SDRAM→SIMCOP) by using the SIMCOP DMA linking

feature.

- Start hardware accelerators. The list of accelerators to start can be selected by software using the `SIMCOP_HWSEQ_STEP_CTRL_i[7:0] *_SYNC` register.

The hardware sequencer then waits for completion of events from selected SIMCOP modules and SIMCOP DMA channels.

The hardware sequencer also ensures that all SIMCOP memory accesses requested by accelerators and DMA channels enabled for the synchronization step are complete. This condition prevents data corruption due to early switching.

Steps can be chained to define the sequence to execute. Steps are started until the step counter reaches the limit defined by software. When the last step has completed, a `DONE_IRQ` event is triggered.

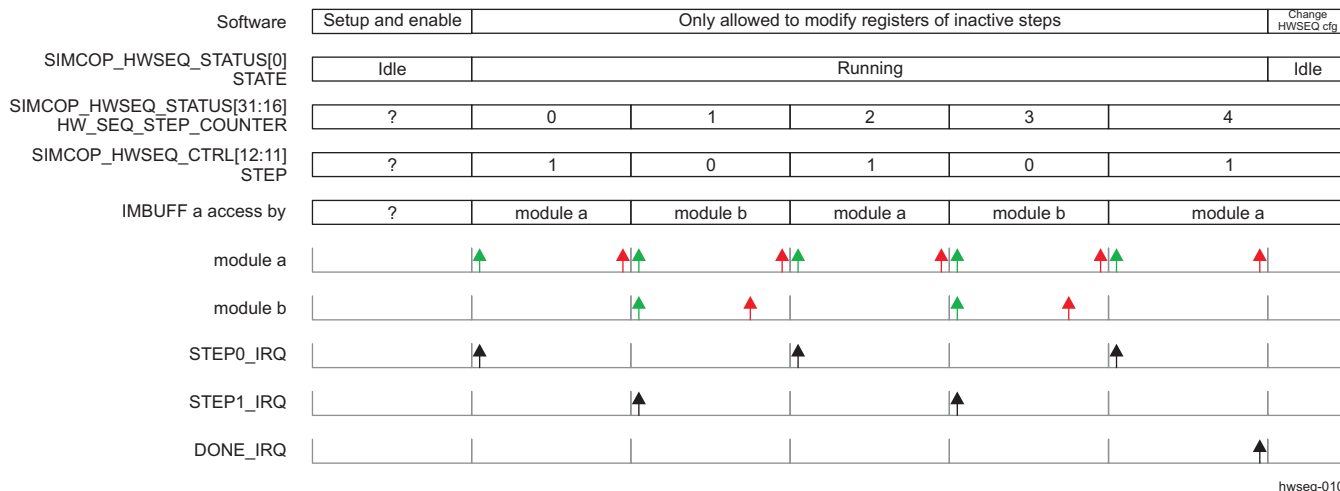

SIMCOP can execute one hardware sequence at a time. However, software can be used to execute multiple independent sequences in parallel (for example, two unrelated macroblock pipelines) using the override feature.

The hardware sequencer has no specific support for macroblock pipeline filling (pipe-up) or flushing (pipe-down). It needs some software intervention.

The hardware sequencer supports sequences composed of up to four steps. Longer sequences require software intervention.

Figure 8-253 shows hardware sequencer operation.

**Figure 8-254. Hardware Sequencer Operation Example**

The example involves use of two SIMCOP modules (or DMA channels) that are synchronized using the hardware sequencer. A total of five sequencing steps are executed (`SIMCOP_HWSEQ_CTRL[31:6] HW_SEQ_STEP_COUNTER = 5`). The sequence is two steps long and starts with step 1. These two steps are configured using the `SIMCOP_HWSEQ_STEP_*_i` registers (where  $i = 0$  and  $1$ ).

SIMCOP modules processing is started using `START` pulses (green). When SIMCOP modules are done they return a `DONE` pulse (red). Software can choose which accelerators to run for a given step using the `SIMCOP_HWSEQ_STEP_CTRL_i[7:0] *_SYNC` registers. They do not need to finish at the same time because the hardware sequencer waits for reception of all `DONE` pulses of used accelerators before moving to the next step.

The hardware sequencer also triggers a series of interrupts that can be used by software. For example, it is possible for software to change the configuration of inactive sequencing steps. This can be particularly useful to run longer sequences than what is supported by hardware.

For example, software can set up a 4-step looping sequence:  $Step\ 0 \rightarrow 1 \rightarrow 2 \rightarrow 3 \rightarrow 0 \rightarrow 1 \rightarrow \dots$ . When the `STEP1_IRQ` event is triggered, software can load the configuration into the `SIMCOP_HWSEQ_STEP_*_i` registers, to be used the next time step 0 becomes active.

#### 8.4.2.3.5.2 Hardware Sequencer Override

By default, the hardware sequencer controls START/DONE pulses of all SIMCOP modules as well as the static-controlled crossbar. Software can take control over some resources by setting the adequate bits in the [SIMCOP\\_HWSEQ\\_OVERRIDE](#) register. Sequencing resources under software control are managed using the [SIMCOP\\_HWSEQ\\_STEP\\_CTRL\\_OVERRIDE](#) and [SIMCOP\\_HWSEQ\\_STEP\\_SWITCH\\_OVERRIDE](#) registers.

Changes to the [SIMCOP\\_HWSEQ\\_STEP\\_CTRL\\_OVERRIDE](#)[27:11] \*\_OFST and [SIMCOP\\_HWSEQ\\_STEP\\_SWITCH\\_OVERRIDE](#) registers have immediate effect. Software must ensure there is no active traffic on the affected connection in the static-controlled crossbar.

For example, when software wants to alternatively attach image buffers a and b to SIMCOP\_DMA while preserving the buffer start address in the SIMCOP DMA address map constant, it sets the following for the full application duration:

- [SIMCOP\\_HWSEQ\\_STEP\\_SWITCH\\_OVERRIDE](#)[2:0] IMBUFF\_A = 1
- [SIMCOP\\_HWSEQ\\_STEP\\_SWITCH\\_OVERRIDE](#)[6:4] IMBUFF\_B = 1

It then changes the [SIMCOP\\_HWSEQ\\_STEP\\_SWITCH\\_OVERRIDE](#)[2:0] IMBUFF\_A and [SIMCOP\\_HWSEQ\\_STEP\\_SWITCH\\_OVERRIDE](#)[6:4] IMBUFF\_B registers to attach the image buffers to the correct SIMCOP submodule.

The settings in the [SIMCOP\\_HWSEQ\\_STEP\\_CTRL\\_OVERRIDE](#) and [SIMCOP\\_HWSEQ\\_STEP\\_SWITCH\\_OVERRIDE](#) registers for resources controlled by the hardware sequencer have no effect.

Synchronization with SIMCOP modules is controlled using the [SIMCOP\\_HWSEQ\\_STEP\\_CTRL\\_OVERRIDE](#)[7:0] \*\_TRIGGER bit fields. For ROT, NSF, VLCDJ, DCT, and LDC, a START pulse is sent to the module when 1 is written into the adequate bit field. Software can trigger one or multiple start pulses at the time. The \*\_TRIGGER bit field is cleared by writing 1. It is automatically set by hardware when a DONE pulse is received from the relevant SIMCOP module.

Software can poll the status of the [SIMCOP\\_HWSEQ\\_STEP\\_CTRL\\_OVERRIDE](#)[7:0] \*\_TRIGGER bit field to detect when a SIMCOP module has completed its processing task. Alternatively, software can also use an interrupt. SIMCOP can merge one or multiple internal events into SIMCOP outgoing interrupts.

Software can choose between two modes for each interrupt output (SIMCOP\_CTRL[3:0] IRQx\_MODE):

- 0x0: OR, the interrupt is asserted when one of the selected events has occurred.
- 0x1: AND, the interrupt is asserted when all selected events have occurred.

The AND mode leads to lower initiator load. In fact, the initiator is only interrupted once per sequencing step, even when events from multiple SIMCOP submodules are expected. Also, it does not need to poll the SIMCOP\_HL\_IRQSTATUS\_i register to detect which events have occurred: it simply must write 0xFFFF into the SIMCOP\_HL\_IRQSTATUS\_i register to clear all pending events.

The SIMCOP DMA START/DONE control is slightly different. Software can trigger one or multiple DMA channels by writing into the [SIMCOP\\_HWSEQ\\_STEP\\_CTRL\\_OVERRIDE](#)[7:5] DMA\_TRIGGER bit field. The DMA\_TRIGGER bit field returns the written value when all expected DONE pulses are received from SIMCOP DMA.

Alternatively, SIMCOP modules (except LDC) may be triggered by direct writes into their configuration registers. However, this approach leads to higher initiator load because multiple writes must be done.

### 8.4.2.4 ISS SIMCOP Hardware Sequencer and Buffers Basic Programming Model

#### 8.4.2.4.1 ISS SIMCOP Application Programming Principle

Software must first configure SIMCOP access tag handling (SIMCOP\_CTRL[24:21] LDC\_R\_TAG\_CNT, SIMCOP\_CTRL[19:16] LDC\_R\_TAG\_OFST, and SIMCOP\_DMA\_CTRL[7:4] TAG\_CNT). Software must ensure there is no active traffic on the SIMCOP master port before changing those registers.

Then it initializes Huffman, Quantization, and LDC LUT if they are used. Those memories must first be attached to the SIMCOP bus so they can be accessed from the slave port (SIMCOP\_CTRL[11] HUFF, SIMCOP\_CTRL[10] QUANT, and SIMCOP\_CTRL[7:6] LDC\_LUT). Then they can be preloaded using an external CPU or an external DMA engine. SIMCOP DMA cannot preload these tables.

Similarly, software can also preload data (such as filter coefficients) into iMX coefficient memories or image buffers. This can be handled by SIMCOP DMA:

- The buffers must first be attached to the SIMCOP DMA using the [SIMCOP\\_HWSEQ\\_OVERRIDE](#) and [SIMCOP\\_HWSEQ\\_STEP\\_SWITCH\\_OVERRIDE](#) registers.
- Alternatively, software can use the SIMCOP\_HWSEQ\_STEP\_\*\_i registers (where i = 0) instead of the override feature. The hardware sequencer ensures that the configuration of step 0 is applied when the hardware sequencer is disabled.
- Software then configures and starts one or multiple data transfers using the SIMCOP DMA.
- Software monitors SIMCOP DMA events to know when DMA transfers are complete. Other configuration tasks may happen concurrently, but software must ensure that transfers complete before attaching the memories to another module.

Software must then enable the modules to be used.

Typically, the first steps and last steps of the macroblock pipeline are different from the ones in the middle of the pipeline. The hardware sequencer has no specific support for pipe-up and pipe-down. However, software can cut the sequence into smaller sequences to benefit from the hardware sequencing and to avoid software sequencing.

[Figure 8-255](#) shows an example of a 10-step sequence involving two DMA transfers and three modules.

**Figure 8-255. Typical Hardware Sequencer-Controlled Sequencer With Pipe-Up and Pipe-Down**

The macroblock pipeline is composed of a chain of three modules. Data between the modules is exchanged using ping-pong buffering.

Pipe-up and pipe-down require four sequencing steps each. The main processing can be done with two steps.

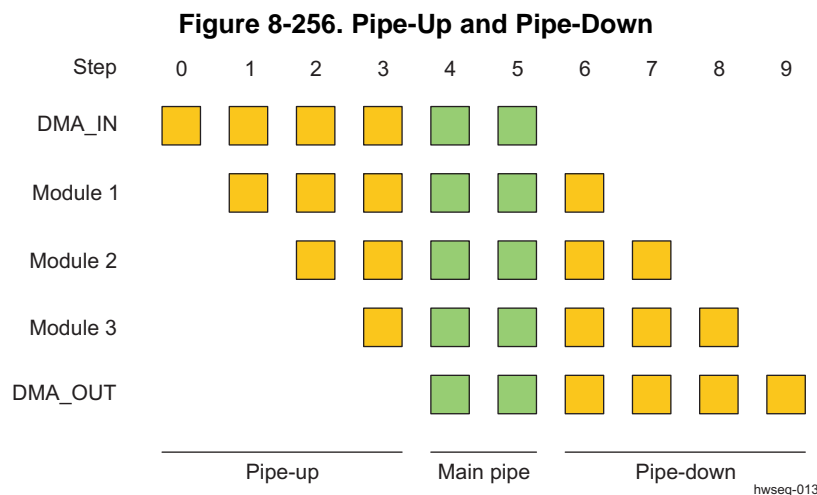

Software configures the hardware sequencer with the 4-step pipe-up sequence. Each step is executed once. When pipe-up is done, SIMCOP triggers the DONE\_IRQ event.

Software then reconfigures the hardware sequencer for the 2-step main sequence. The number of steps is defined by the amount of data to process. When the main pipe is done, SIMCOP triggers the DONE\_IRQ event.

Software finally reconfigures the hardware sequencer with the 4-step pipe-down sequence. Each step is executed once. When pipe-down is done, SIMCOP triggers the DONE\_IRQ event.

[Figure 8-256](#) shows an example of pipe-up and pipe-down.

The hardware sequencer configuration determines which module can access a given SIMCOP memory for a sequence step.

#### 8.4.2.4.2 External CPU Use for Data Processing

An external CPU can be used to perform some data processing, as SIMCOP hardware accelerators do. A similar mechanism to the START/DONE pulse interaction with SIMCOP hardware accelerators is implemented.

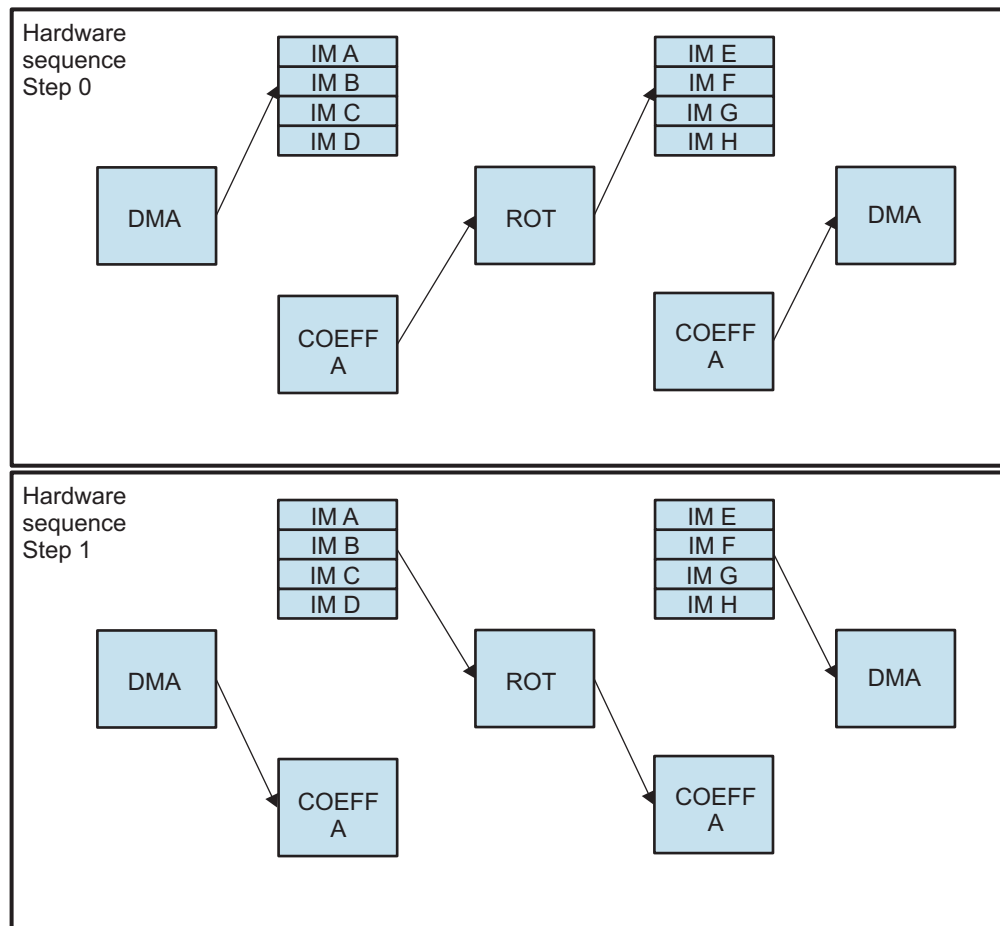

The external CPU receives the request to start processing by the CPU\_PROC\_START\_IRQ interrupt merged at SIMCOP subsystem level. This interrupt is enabled and acknowledged as usual.

When processing completes, the CPU generates the DONE pulse to the hardware sequencer by setting the [SIMCOP\\_HWSEQ\\_CTRL\[10\]](#) CPU\_PROC\_DONE bit to 1.

#### 8.4.2.4.3 Rotation Operational Mode Configuration

The macroblock pipeline is controlled by a 2-step hardware sequence:

Figure 8-257. Rotation Macroblock Pipeline

hwseq-014

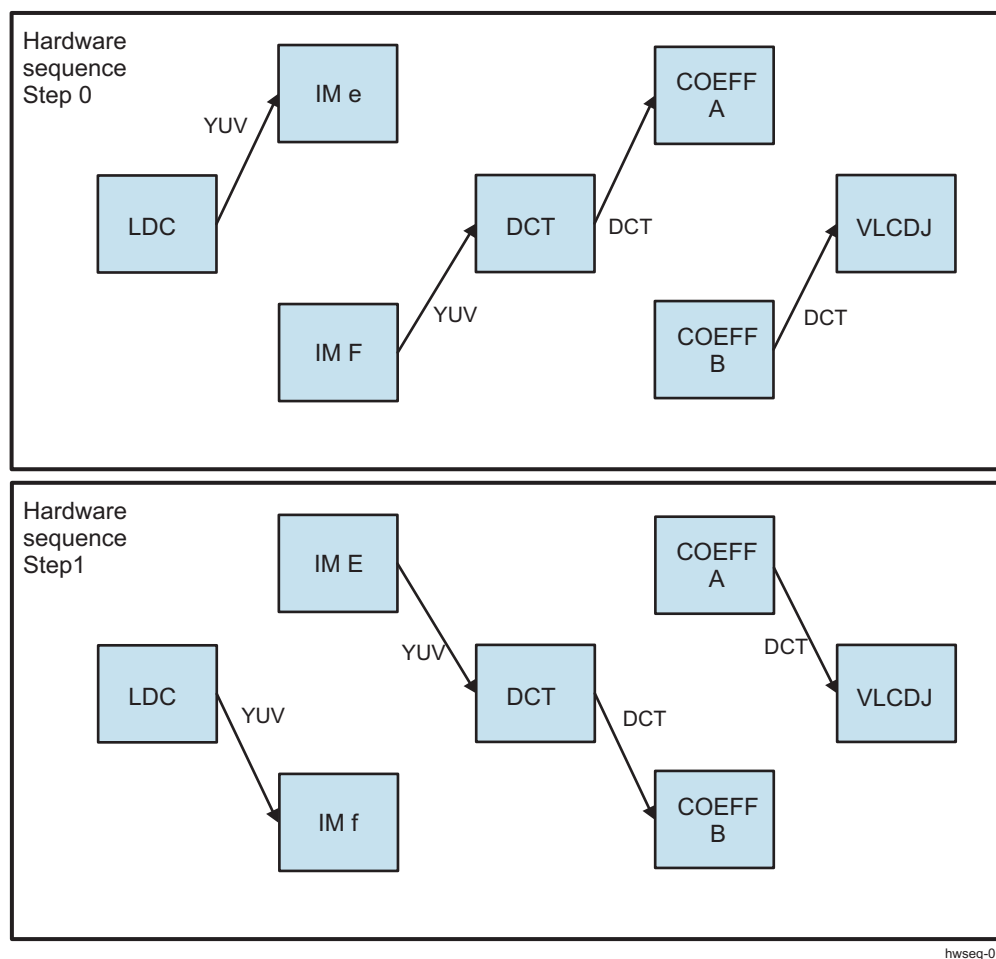

Table 8-1285. Rotation Macroblock Pipeline

Step	Register/Bit Field/Programming Model	Value
Set DMA to access IMBUFF_A.	<a href="#">SIMCOP_HWSEQ_STEP_SWITCH_i[2:0]</a> IMBUFF_A (i = 0)	0x1
Set ROT_A_O to access IMBUFF_E.	<a href="#">SIMCOP_HWSEQ_STEP_SWITCH_i[18:16]</a> IMBUFF_E (i = 0)	0x7
Set ROT_A_I to access COEFF_A.	<a href="#">SIMCOP_HWSEQ_STEP_CTRL2_j[2:0]</a> = COEFF_A (i = 0)	0x6
Set DMA to access COEFF_B.	<a href="#">SIMCOP_HWSEQ_STEP_CTRL2_i[6:4]</a> COEFF_B (i = 0)	0x1
Set ROT_A_I to access IMBUFF_A.	<a href="#">SIMCOP_HWSEQ_STEP_SWITCH_i[2:0]</a> IMBUFF_A (i = 1)	0x6
Set DMA to access IMBUFF_E.	<a href="#">SIMCOP_HWSEQ_STEP_SWITCH_i[18:16]</a> IMBUFF_E (i = 1)	0x1
Set DMA to access COEFF_A.	<a href="#">SIMCOP_HWSEQ_STEP_CTRL2_j[2:0]</a> COEFF_A (i = 1)	0x1
Set ROT_A_O to access COEFF_B.	<a href="#">SIMCOP_HWSEQ_STEP_CTRL2_i[6:4]</a> COEFF_B (i = 1)	0x6

#### 8.4.2.4.4 LDC Operational Mode Configuration

The LDC module fetches data from system memory, performs the transformation, and stores results into image buffers. DCT and VLCDJ modules are used to JPEG compress this data and store the results to the bitstream buffer. The SIMCOP DMA is used to transfer compressed data from bitstream buffer to system memory.

**Figure 8-258. LDC Transformation Pipeline**

**Table 8-1286. LDC Transformation**

Step	Register/Bit Field/Programming Model	Value
Set IMBUFF_A and IMCUFF_B as input buffer.	SIMCOP_CTRL[7:6] LDC_INPUT	0x1
Set LDC to access IMBUFF_E.	SIMCOP_HWSEQ_STEP_SWITCH_i[18:16] IMBUFF_E	0x6
Set DCT to access COEFF_A.	SIMCOP_HWSEQ_STEP_CTRL2_i[2:0] COEFF_A	0x5
Set VLCDJ_IO to access COEFF_B.	SIMCOP_HWSEQ_STEP_CTRL2_i[6:4] COEFF_B	0x4
Set DCT to access IMBUFF_E.	SIMCOP_HWSEQ_STEP_SWITCH_i[18:16] IMBUFF_E	0x4
Set LDC to access IMBUFF_F.	SIMCOP_HWSEQ_STEP_SWITCH_i[18:16] IMBUFF_F	0x6
Set VLCDJ_IO to access COEFF_A.	SIMCOP_HWSEQ_STEP_CTRL2_i[2:0] COEFF_A	0x4
Set DCT to access COEFF_B.	SIMCOP_HWSEQ_STEP_CTRL2_i[6:4] COEFF_B	0x5

#### 8.4.2.4.5 Concurrent Software and Hardware Sequencing

Software can perform sequencing tasks concurrently with hardware sequencing. This is supported through the hardware sequencer override registers:

- [SIMCOP\\_HWSEQ\\_OVERRIDE](#)
- [SIMCOP\\_HWSEQ\\_STEP\\_CTRL\\_OVERRIDE](#)
- [SIMCOP\\_HWSEQ\\_STEP\\_SWITCH\\_OVERRIDE](#)
- [SIMCOP\\_HWSEQ\\_STEP\\_CTRL2\\_OVERRIDE](#)

Software can select which hardware resources are controlled by the hardware sequencer and which resources are controlled by software. Configuration parameters for software-controlled resources are provided using those registers as well.

**Table 8-1287. Concurrent Software and Hardware Sequencing**

Step	Register/Bit Field/Programming Model	Value
Set software to control IMBUFF_E.	<a href="#">SIMCOP_HWSEQ_OVERRIDE</a> [13] IMBUFF_E	0x1
Set DMA to access IMBUFF_E.	<a href="#">SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE</a> [1:8:16] IMBUFF_E	0x1
Set software to control IMBUFF_F.	<a href="#">SIMCOP_HWSEQ_OVERRIDE</a> [14] IMBUFF_F	0x1
Set DCT_S to access IMBUFF_F.	<a href="#">SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE</a> [2:2:20] IMBUFF_F	0x4
Set software to control COEFF_A.	<a href="#">SIMCOP_HWSEQ_OVERRIDE</a> [17] COEFF_A	0x1
Set iMX A to access the COEFF_A.	<a href="#">SIMCOP_HWSEQ_STEP_CTRL2_OVERRIDE</a> [2:0] COEFF_A	0x2
Set hardware sequencer to control COEFF_B.	<a href="#">SIMCOP_HWSEQ_OVERRIDE</a> [18] COEFF_B	0x0
Set iMX B to access the COEFF_B.	<a href="#">SIMCOP_HWSEQ_STEP_CTRL2_i</a> [6:4] COEFF_B	0x3

## 8.4.2.5 ISS SIMCOP Hardware Sequencer and Buffers Register Manual

### 8.4.2.5.1 Hardware Sequencer Instance Summary

Table 8-1288 summarizes the hardware sequencer instance.

**Table 8-1288. Hardware Sequencer Instance Summary**

Module Name	Base Address L3 Interconnect	Base Address Cortex-M3 Private Access	Size
HWSEQ	0x5202 0000	0x5506 0000	256 bytes

**NOTE:** Private Access is an access that does not use the L3/L4 interconnects.

### 8.4.2.5.2 Hardware Sequencer Registers

#### 8.4.2.5.2.1 Hardware Sequencer Register Summary

Table 8-1289 lists the HWSEQ register mapping.

**Table 8-1289. HWSEQ Register Mapping Summary**

Register Name	Type	Register Width (Bits)	Address Offset	Physical Address L3 Interconnect	Physical Address Cortex-M3 Private Access
<a href="#">SIMCOP_HWSEQ_CTRL</a>	RW	32	0x0000 0068	0x5202 0068	0x5506 0068
<a href="#">SIMCOP_HWSEQ_STATUS</a>	R	32	0x0000 006C	0x5202 006C	0x5506 006C

#### 8.4.2.5.2.2 Hardware Sequencer Register Descriptions

through describe the registers in detail.

**Table 8-1290. SIMCOP\_HWSEQ\_CTRL**

<b>Address Offset</b>	0x0000 0068	<b>Instance</b>	HWSEQ_L3
<b>Physical Address</b>	0x5202 0068 0x5506 0068		HWSEQ_CORTEX-M3
<b>Description</b>	SIMCOP hardware sequencer control register		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HW_SEQ_STEP_COUNTER																RESERVED		STEP		CPU_PROC_DONE	BBM_SYNC_CHAN	BBM_STATUS	BITSTREAM		BITSTR_XFER_SIZE	HW_SEQ_STOP	HW_SEQ_START				

Bits	Field Name	Description	Type	Reset
31:16	HW_SEQ_STEP_COUNTER	Number of steps executed by the hardware sequencer. HW_SEQ_STEP_COUNTER=0 corresponds to manual sequencing.	RW	0x0000
15:13	RESERVED	Read returns 0.	R	0x0
12:11	STEP	This register is automatically updated by the hardware sequencer when it is active. Otherwise, software can use it to activate the content of a given set of step registers (SIMCOP_HWSEQ_STEP_i) or to choose the first step number of a sequence.	RW	0x0
10	CPU_PROC_DONE	Used by the CPU to tell that it has completed data processing. This feature should be used together with the CPU_PROC_START_IRQ event Read's always return 0. Write 0x0: No effect. Write 0x1: CPU processing completed.	W	0
9:8	BBM_SYNC_CHAN	Defines the SIMCOP DMA hardware synchronization channel to be used for BBM. This register is only used when BITSTREAM=ENCODE or DECODE. Software must ensure that the same DMA hardware synchronization channel is not used by the hardware sequencer.	RW	0x0
7	BBM_STATUS	Status of the Bitstream buffer management hardware. Used only during automatic mode [BITSTREAM=5 or 6]. Equals 0 (IDLE) in manual mode [BITSTREAM=0..4]. Set when automatic mode is entered. Automatic encode mode: used to detect when all banks have been flushed after the processing has completed (i.e. but request bank signals have been de-asserted by BBM). Automatic decode mode (BITSTREAM=DECODE): returns to 0 (IDLE) when automatic mode is left (BITSTREAM=COPR). Read 0x1: BBM is busy. Read 0x0: BBM is idle	R	0

Bits	Field Name	Description	Type	Reset
6:4	BITSTREAM	<p>Bitstream buffer access control</p> <p>0x0: Bank 0: coprocessor bus (0x1000-0x17FF) Bank 1: coprocessor bus (0x1800-0x1FFF)</p> <p>0x1: Bank 0: DMA (0x1000-0x17FF) Bank 1: DMA (0x1800-0x1FFF)</p> <p>0x2: Bank 0: VLCDJ.B (0x000-0x7FF) Bank 1: VLCDJ.B (0x800-0xFFFF)</p> <p>0x3: Bank 0: DMA (0x1000-0x17FF) Bank 1: VLCDJ.B (0x800-0xFFFF)</p> <p>0x4: Bank 0: VLCDJ.B (0x000-0x7FF) Bank 1: DMA (0x1800-0x1FFF)</p> <p>0x5: The bitstream buffer is managed by hardware as a PING/PONG buffer to support JPEG encode use case. It can be accessed by the SIMCOP DMA or the VLCDJ module. The BITSTREAM hardware sequence is reset when the mode is changed to COPR, VLCDJ or DMA.</p> <p>0x6: The bitstream buffer is managed by hardware as a PING/PONG buffer to support JPEG decode use case. It can be accessed by the SIMCOP DMA or the VLCDJ module. The BITSTREAM hardware sequence is reset when the mode is changed to COPR, VLCDJ or DMA.</p>	RW	0x0
3:2	BITSTR_XFER_SIZE	<p>Defines the amount of data to be transferred per hardware request to the SIMCOP DMA. Bigger sizes lead to better SDRAM efficiency but prevents fine grained DMA transfer arbitration. This register is only used by hardware when BITSTREAM=ENCODE or BITSTREAM=DECODE.</p> <p>0x0: 2048 bytes</p> <p>0x1: 1024 bytes</p> <p>0x2: 512 bytes</p> <p>0x3: 256 bytes</p>	RW	0x0
1	HW_SEQ_STOP	<p>Stop the hardware sequencer. This feature is typically used to recover from an error condition. Read's always return 0.</p> <p>Write 0x0: No effect.</p> <p>Write 0x1: Stop the hardware sequence immediately (don't wait for expected DONE events). Setting this bit while the sequencer is idle has no effect.</p>	W	0
0	HW_SEQ_START	<p>Start the hardware sequencer. Read's always return 0.</p> <p>Write 0x0: No effect.</p> <p>Write 0x1: Starts step number <a href="#">SIMCOP_HWSEQ_CTRL[12:11]</a> STEP of the hardware sequence. Setting this bit while the sequencer is running has no effect.</p>	W	0

<b>Physical Address</b>	0x5202 0070 0x5506 0070		HWSEQ_CORTEX-M3
<b>Description</b>	Hardware sequencer override control register. Bits in this register select what configuration register control a resource. 0: Resource controlled by hardware sequencer. Hardware uses the value from SIMCOP_HWSEQ_STEP_xx registers for the chosen resource 1: Resource controlled by software. Hardware uses the value from SIMCOP_HWSEQ_STEP_x_OVERRIDE registers for the chosen resource The bit field name matches the one of the resource. For example, IMX_A_D_OFST_OVR selects if <a href="#">SIMCOP_HWSEQ_STEP_CTRL_[12:11]</a> IMX_A_D_OFST or <a href="#">SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE[12:11]</a> IMX_A_D_OFST controls how image buffers are arranged in the iMX A address map.

### 8.4.3 ISS SIMCOP DMA Module

This section describes the direct memory access (DMA) module in the still image coprocessor (SIMCOP) subsystem.

#### 8.4.3.1 ISS SIMCOP DMA Overview

The direct memory access (DMA) module transfers data from system memory to the still image coprocessor (SIMCOP) memories and from SIMCOP memories. [Figure 8-259](#) is an overview of the DMA module in the SIMCOP subsystem.

**Figure 8-259. DMA in the SIMCOP Subsystem**

scpdma-001

The SIMCOP DMA supports the following features:

- Configuration interface, for register access
- Imaging subsystem (ISS) data interconnect master interface, for system memory access
  - Supports 1-dimensional (1D) and 2-dimensional (2D) burst
- SIMCOP crossbar master interface, for SIMCOP memories access
- Eight logical channels supported
- Hardware synchronization support
- 4-dimensional (4D) addressing modes
- 2D data block transfer (base address, stride, height, width)
- Array of 2D block transfer support

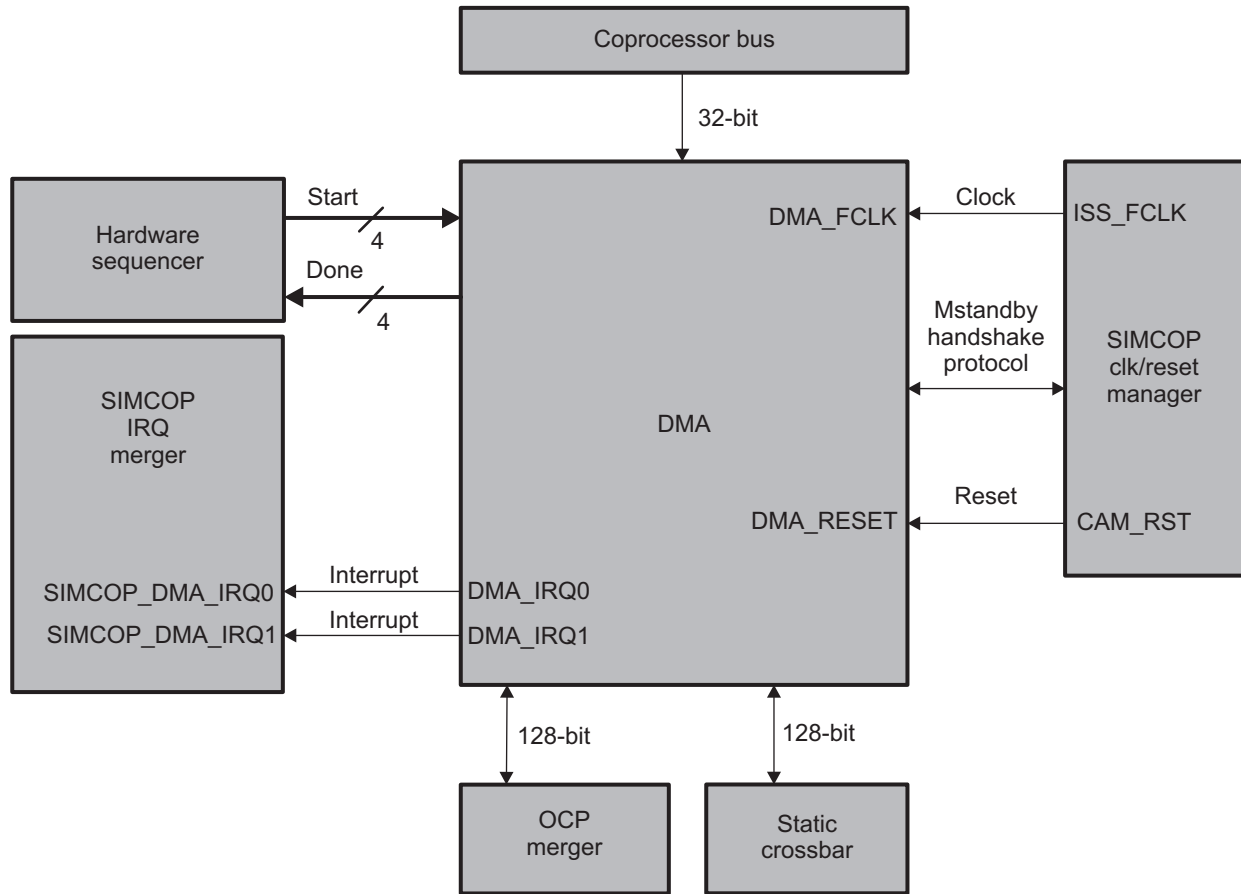

- Performance: Software-controllable bandwidth limiter

### 8.4.3.2 ISS SIMCOP DMA Integration

The DMA module is part of the SIMCOP subsystem in the ISS. Figure 8-260 shows the integration of the DMA in the SIMCOP subsystem.

Table 8-1310, Table 8-1311, and Table 8-1312 list the SIMCOP DMA integration attributes, clocks and resets, and hardware requests, respectively.

Figure 8-260. DMA Engine Integration

scpdma-004

Table 8-1310. Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
DMA	PD_CAM	

Table 8-1311. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DMA	DMA_FCLK	ISS_FCLK	PRCM	Functional clock provided by ISS_CLK from the PRCM module. It is used by all ISS submodules and ISS top-level resources.
Resets				

**Table 8-1311. Clocks and Resets (continued)**

Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DMA	DMA_RESET	CAM_RST	PRCM	ISS and SIMCOP global reset

For information about clock and reset management, see [Section 8.4.1.2.1](#), *ISS SIMCOP Local Power and Clock Management*.

**Table 8-1312. Hardware Requests**

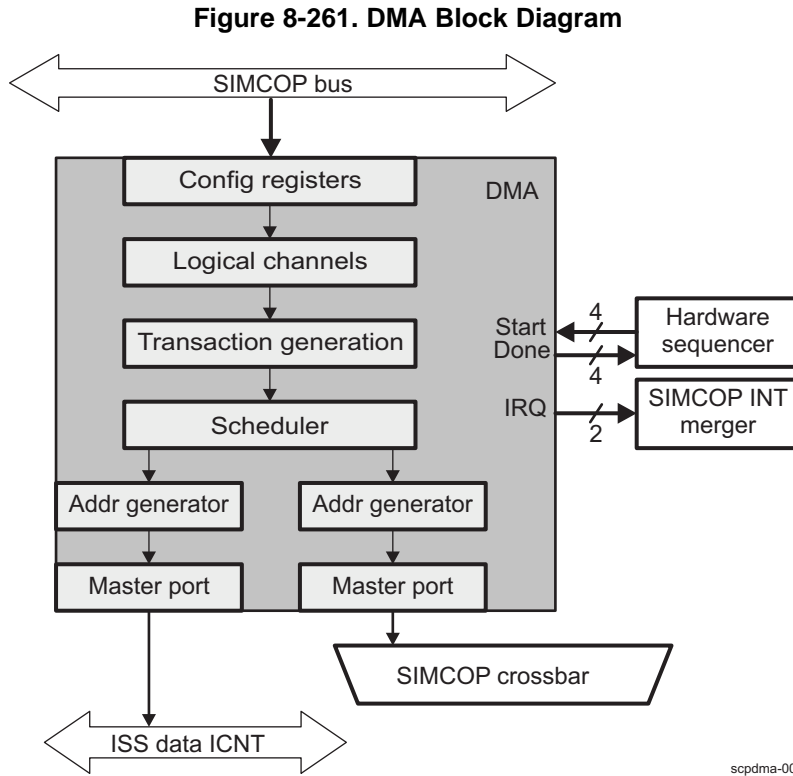

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
DMA	DMA_IRQ0	SIMCOP_DMA_I RQ0	SIMCOP IRQ merger	Interrupt triggered by SIMCOP DMA
DMA	DMA_IRQ1	SIMCOP_DMA_I RQ1	SIMCOP IRQ merger	Interrupt triggered by SIMCOP DMA

For more information about interrupt requests, see [Section 8.4.1.2.3](#), *Interrupt Merger*.

### 8.4.3.3 ISS SIMCOP DMA Functional Description

#### 8.4.3.3.1 ISS SIMCOP DMA Block Diagram

Figure 8-261 is a block diagram of the SIMCOP DMA.

An external initiator sets up logical channels using the configuration interface.

When a logical channel becomes active, a transfer must be executed. A transfer corresponds to a 2D block of data copied from system memory to SIMCOP memory and vice versa.

A transfer is decomposed into one or multiple transactions by the transaction generation unit.

The scheduler issues transactions when tags are available. There can be one outstanding command per tag on the ISS data interconnect.

#### 8.4.3.3.2 ISS SIMCOP DMA Power Management

Table 8-1313 lists the power-management features available in the DMA module.

**Table 8-1313. Local Power-Management Features**

Feature	Registers	Description
Master standby modes	<a href="#">SIMCOP_DMA_SYSCONFIG</a> [5:4] STANDBYMODE	Force-standby, no-standby, and smart-standby modes are available.

#### 8.4.3.3.3 ISS SIMCOP DMA Interrupt Requests

The SIMCOP DMA module can generate two interrupts, SIMCOP\_DMA\_IRQ0 and SIMCOP\_DMA\_IRQ1. These two interrupts are controlled by four registers:

- [SIMCOP\\_DMA\\_IRQSTATUS\\_RAW\\_j](#): The status of the interrupt before masking
- [SIMCOP\\_DMA\\_IRQSTATUS\\_j](#): The status of the interrupt after masking
- [SIMCOP\\_DMA\\_IRQENABLE\\_SET\\_j](#): Enable an interrupt to propagate to SIMCOP\_DMA\_IRQi signal

(unmask)

- [SIMCOP\\_DMA\\_IRQENABLE\\_CLR\\_j](#): Disable an interrupt to propagate to SIMCOP\_DMA\_IRQi signal (mask)

To clear an interrupt, software must write 1 in the corresponding bit of the [SIMCOP\\_DMA\\_IRQSTATUS\\_j](#) register even if the event is not enabled ([SIMCOP\\_DMA\\_IRQSTATUS\\_RAW\\_j](#) is also cleared).

[Table 8-1314](#) lists all the SIMCOP DMA events that can lead to an interrupt generation.

**Table 8-1314. SIMCOP DMA Events List**

Bit Name	Bit	Event
BUS_ERR	0	Error occurred on bus
CHAN0_BLOCK_DONE_IRQ	16	Channel 0 has completed transfer of one 2D block.
CHAN1_BLOCK_DONE_IRQ	17	Channel 1 has completed transfer of one 2D block.
CHAN2_BLOCK_DONE_IRQ	18	Channel 2 has completed transfer of one 2D block.
CHAN3_BLOCK_DONE_IRQ	19	Channel 3 has completed transfer of one 2D block.
CHAN4_BLOCK_DONE_IRQ	20	Channel 4 has completed transfer of one 2D block.
CHAN5_BLOCK_DONE_IRQ	21	Channel 5 has completed transfer of one 2D block.
CHAN6_BLOCK_DONE_IRQ	22	Channel 6 has completed transfer of one 2D block.
CHAN7_BLOCK_DONE_IRQ	23	Channel 7 has completed transfer of one 2D block.
CHAN0_FRAME_DONE_IRQ	24	Channel 0 has completed transfer of the full frame.
CHAN1_FRAME_DONE_IRQ	25	Channel 1 has completed transfer of the full frame.
CHAN2_FRAME_DONE_IRQ	26	Channel 2 has completed transfer of the full frame.
CHAN3_FRAME_DONE_IRQ	27	Channel 3 has completed transfer of the full frame.
CHAN4_FRAME_DONE_IRQ	28	Channel 4 has completed transfer of the full frame.
CHAN5_FRAME_DONE_IRQ	29	Channel 5 has completed transfer of the full frame.
CHAN6_FRAME_DONE_IRQ	30	Channel 6 has completed transfer of the full frame.
CHAN7_FRAME_DONE_IRQ	31	Channel 7 has completed transfer of the full frame.

#### 8.4.3.3.4 ISS SIMCOP DMA Logical Channels

In the context of SIMCOP, multiple logical channels are required to offload the external initiator. Typical uses of multiple context are:

- Run a read transfer followed by a write transfer. That is the required mode to operate the NSF2 module. When the NSF2 completes processing, filtering outcome is first copied from the image buffers to system memory. When this transfer completes, new input data is fetched from system memory and stored in the image buffers.
- Read or write YUV4:2:0 data from system memory; YUV4:2:0 data is stored in two different system memory buffers.

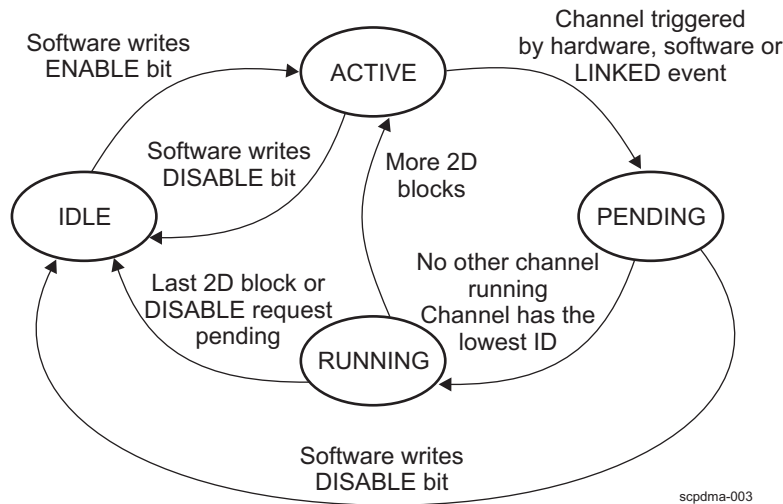

##### 8.4.3.3.4.1 Logical Channel States

The SIMCOP DMA supports up to eight ( $(\text{SIMCOP\_DMA\_HWINFO}[2] \text{ CHAN} + 1) * 4$ ) logical channels. Each logical channel can be configured and triggered separately.

Idle logical channels must be configured and enabled ([SIMCOP\\_DMA\\_CHAN\\_CTRL\\_i\[0\]](#) ENABLE = 1) to be used.

[Figure 8-262](#) shows the different states of a logical channel. Software can poll the current state from the [SIMCOP\\_DMA\\_CHAN\\_CTRL\\_i\[4:3\]](#) STATUS bit field.

Figure 8-262. DMA Logical Channel States

When a trigger event is received by a channel in the ACTIVE state, it moves to the PENDING state. Trigger events received when the channel is in the IDLE, PENDING, or RUNNING state are discarded.

A logical channel is automatically disabled by hardware when a complete frame (all 2D blocks) is transferred. It can be disabled earlier by software by writing the `SIMCOP_DMA_CHAN_CTRL_i[1]` DISABLE bit. When a disable request occurs in the RUNNING state, it is memorized and executed when the channel leaves the RUNNING state. Pending disable requests have higher priority than channel trigger events.

When multiple logical channels are pending simultaneously, the following rules apply:

- An ongoing transfer of a 2D block is never stopped. It must complete before the next one starts.
- The logical channel with the lowest ID wins the arbitration (that is, CHAN0 has higher priority than CHAN1). Software can give higher priority to a channel by choosing a lower ID.

This situation can, for example, occur when software triggers a channel while a transfer is ongoing for another channel. Two types of interrupts can be generated:

- `CHANx_BLOCK_DONE_IRQ` (where x = channel number) is generated when the channel leaves the RUNNING state (RUNNING -> ACTIVE or RUNNING -> IDLE).
- `CHANx_FRAME_DONE_IRQ` (where x = channel number) is generated when the channel enters the IDLE state.

#### 8.4.3.3.4.2 Logical Channel Chaining, Trigger, and Hardware Synchronization

Active logical channels can be triggered:

- By software. Writes the `SIMCOP_DMA_CHAN_CTRL_i[2]` SWTRIGGER bit
- By a hardware DMA request. A channel can be made sensitive to a pulse on the `START[y]` input when `SIMCOP_DMA_CHAN_CTRL_i[19:17]` HWSTART = y has been configured by software.
- When the previous channel in the linked list finishes. This feature is enabled through the `SIMCOP_DMA_CHAN_CTRL_i[16:12]` LINKED bit field of the preceding channel in the chain.

When a channel completes, it can optionally send a pulse to the `DONE[y]` output. Software enables this feature by configuring `SIMCOP_DMA_CHAN_CTRL_i[22:20]` HWSTOP = y.

Typically, the START + DONE synchronization mechanism is used together with the SIMCOP hardware sequencer. The hardware sequencer sends a pulse to `START[y]` a data transfer and the SIMCOP DMA responds with a `DONE[y]` pulse when the transfer completes. A transfer can be composed of one or multiple logical channels. For example, a YUV4:2:0-NV12 block copy from system memory to SIMCOP local memories requires two chained logical channels.

**CAUTION**

Software must ensure that only one trigger event source is selected at a given time for a logical channel; otherwise, unpredictable behavior may occur.

Typically, the following combinations can be used:

- Single channel triggered by software: Hardware synchronization and linking are disabled. Software writes the [SIMCOP\\_DMA\\_CHAN\\_CTRL\\_i\[2\]](#) SWTRIGGER bit to start the transfer of one 2D block. Software must not trigger the channel again before the CHANx\_BLOCK\_DONE\_IRQ (where x = channel number) event is generated by the DMA.
- Channels chain-triggered by software: Multiple channels are linked together using the [SIMCOP\\_DMA\\_CHAN\\_CTRL\\_i\[16:12\]](#) LINKED bit field. Software triggers the first one in the chain and monitors the CHANx\_BLOCK\_DONE\_IRQ (where x = channel number) event to know when the chain can be triggered again.
- Single channel triggered by hardware synchronization: Sensitivity on START pulses is activated through the [SIMCOP\\_DMA\\_CHAN\\_CTRL\\_i\[19:17\]](#) HWSTART bit field. DONE pulses are activated using the [SIMCOP\\_DMA\\_CHAN\\_CTRL\\_i\[22:20\]](#) HWSTOP bit field.
- Channels chain-triggered by hardware: Multiple channels are linked together using the [SIMCOP\\_DMA\\_CHAN\\_CTRL\\_i\[16:12\]](#) LINKED bit field. Sensitivity on START pulses is activated for the first channel in the chain through the [SIMCOP\\_DMA\\_CHAN\\_CTRL\\_i\[19:17\]](#) HWSTART bit field. DONE pulses for the last channel in the chain are activated using the [SIMCOP\\_DMA\\_CHAN\\_CTRL\\_i\[22:20\]](#) HWSTOP bit field.

**8.4.3.3.4.3 Logical Channel Data Transfer**

Each logical channel can handle 4D transfers from system memory to SIMCOP memory and vice versa.

A frame is composed of [SIMCOP\\_DMA\\_CHAN\\_FRAME\\_i\[9:0\]](#) XCNT \* [SIMCOP\\_DMA\\_CHAN\\_FRAME\\_i\[25:16\]](#) YCNT 2D blocks of data. One 2D block of data is transferred each time a logical channel is in the RUNNING state.

The size of a 2D block is [SIMCOP\\_DMA\\_CHAN\\_BLOCK\\_SIZE\\_i\[13:4\]](#) XNUM \* [SIMCOP\\_DMA\\_CHAN\\_BLOCK\\_SIZE\\_i\[28:16\]](#) YNUM words of 128 bits. The SIMCOP DMA can transfer only full 128-bit words.

2D blocks may overlap in system memory. This feature is typically used for source data fetches from system memory to handle filter dependencies. If this feature is not used, software must set:

- [SIMCOP\\_DMA\\_CHAN\\_BLOCK\\_SIZE\\_i\[13:4\]](#) XNUM = [SIMCOP\\_DMA\\_CHAN\\_BLOCK\\_STEP\\_i\[14:4\]](#) XSTEP
- [SIMCOP\\_DMA\\_CHAN\\_BLOCK\\_SIZE\\_i\[28:16\]](#) YNUM = [SIMCOP\\_DMA\\_CHAN\\_BLOCK\\_STEP\\_i\[29:16\]](#) YSTEP

Figure 8-263 shows DMA addressing.

Figure 8-263. DMA Addressing

The base position of 2D blocks in system memory is automatically computed by the SIMCOP DMA. The base address is computed using the following formula:

$$\begin{aligned} \text{SMEM\_BASE} &= \text{SIMCOP\_DMA\_CHAN\_SMEM\_ADDR\_i}[31:4] \text{ ADDR} + \\ &B_x * \text{SIMCOP\_DMA\_CHAN\_BLOCK\_STEP\_i}[14:4] \text{ XSTEP} + \\ &B_y * \text{SIMCOP\_DMA\_CHAN\_BLOCK\_STEP\_i}[29:16] \text{ YSTEP} * \\ &\text{SIMCOP\_DMA\_CHAN\_SMEM\_OFST\_i}[19:4] \text{ OFST} \end{aligned}$$

All 2D blocks of a logical channel have the same location in SIMCOP local memories:

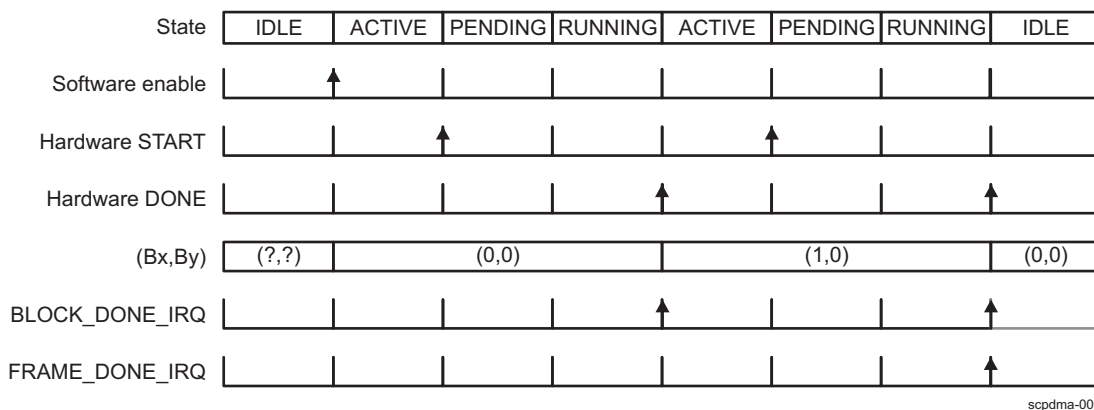

$$\text{BUF\_BASE} = \text{SIMCOP\_DMA\_CHAN\_BUF\_ADDR\_i}[23:4] \text{ ADDR}$$

The same functionality can also be used to read or write sparse data from synchronous dynamic random access memory (SDRAM). Typically, that is useful to split processing between two SIMCOP accelerators (that is, iMX).

Software can poll the status of a channel using the SIMCOP\_DMA\_CHAN\_CURRENT\_BLOCK\_i register. It holds the Bx, By values of the last-transferred 2D block. The Bx, By values are reset when a channel is enabled (set the SIMCOP\_DMA\_CHAN\_CTRL\_i[0] ENABLE bit) and they are updated when a channel enters the RUNNING state.

Figure 8-264 shows an example of a 2-block large transfer.

Figure 8-264. 2-Block Large Transfer Example

#### 8.4.3.3.5 Transaction Generation

Each transfer is decomposed into one or multiple transactions by the DMA engine. The firmware can define:

- Burst generation for regular or tiled accesses (SIMCOP\_DMA\_CHAN\_CTRL\_i[6] TILERMODE). Additional parameters must be defined for tiled accesses. See Section 8.4.3.3.5.2, Block Bursts for

#### Tiled Transfers.

- The maximum burst size ([SIMCOP\\_DMA\\_CTRL\[1:0\] MAX\\_BURST\\_SIZE](#)). It must be aligned with the interconnect configuration.
- Use of posted or nonposted writes ([SIMCOP\\_DMA\\_CTRL\[3\] POSTED\\_WRITES](#)). It must be aligned with the interconnect configuration. Mainly, in a multichannel system memory, system bursts must be issued nonposted.

#### 8.4.3.3.5.1 Incrementing Bursts for Regular Transfers

Lines of 2D blocks are processed sequentially. The following transaction process is used for a given line:

1. Perform a single nonaligned burst from the start address to the next [SIMCOP\\_DMA\\_CTRL\[1:0\] MAX\\_BURST\\_SIZE](#) boundary (or less if the transfer is smaller).
2. Perform "n" aligned bursts (n can be 0).
3. Perform a single nonaligned burst up to the end address (if needed).

A transaction is aligned when the start address modulo burst length is 0.

#### 8.4.3.3.5.2 Block Bursts for Tiled Transfers

The line stride is configured using the [SIMCOP\\_DMA\\_CHAN\\_SMEM\\_OFST\\_i\[19:4\] OFST](#) bit field. The full register content is used for internal address computation. The [SIMCOP\\_DMA\\_CHAN\\_SMEM\\_OFST\\_i\[19:4\] OFST](#) bit field must be a multiple of the [SIMCOP\\_DMA\\_CTRL\[1:0\] MAX\\_BURST\\_SIZE](#) bit field.

The SIMCOP DMA has the following alignment constraints:

- [SIMCOP\\_DMA\\_CHAN\\_SMEM\\_ADDR\\_i\[31:4\] ADDR](#) is 128 bit-aligned.
- [SIMCOP\\_DMA\\_CHAN\\_BLOCK\\_SIZE\\_i\[13:4\] XNUM](#) is 128 bit-aligned.

Only the values in [Table 8-1315](#) are allowed for the [SIMCOP\\_DMA\\_CTRL\[1:0\] MAX\\_BURST\\_SIZE](#) bit field. Other values lead to undefined behavior.

**Table 8-1315. Allowed Maximum Burst Size**

Minimum Burst Height	MAX_BURST_SIZE
2	2, 4, or 8 x 128 bits
4	4 or 8 x 128 bits

### 8.4.3.4 ISS SIMCOP DMA Basic Programming Model

#### 8.4.3.4.1 Initialization of Surrounding Modules

To initialize the DMA, the surrounding modules must be initialized. [Table 8-1316](#) lists these modules.

**Table 8-1316. Initialization of Surrounding Modules**

Module	Minimum Required Setting	Optional Settings
CLKC	Enable SIMCOP clock.	
Buffers	Configure DMA access to image buffer.	
SIMCOP CTRL		Configure SIMCOP CTRL to handle DMA interrupts.

#### 8.4.3.4.2 ISS SIMCOP DMA Channel Configuration and Hardware Synchronization

Software must fully configure a DMA channel before enabling it. It then configures channel linking and the used synchronization method.

The following example shows four logical channels chained with hardware synchronization used to copy YUV4:2:0-NV12 data from SIMCOP local memories to system memory, and then to copy YUV4:2:0-NV12 data from system memory to SIMCOP local memories.

YUV4:2:0-NV12 data is stored in two separate buffers in SDRAM. Therefore, two channels are used for the SIMCOP -> system copy, and two channels are used for the system -> SIMCOP copy.

In this example, the intent is to transfer a 2 x 2 array of 64 x 32 pixel blocks. It is assumed that input data is stored contiguously in system memory and that the output buffer size in system memory is 256 x 32 pixels. In SIMCOP local memories, data is contiguously stored starting at address 0.

The following configuration is used:

- Channel i = 0, input Y buffer:
  - `SIMCOP_DMA_CHAN_SMEM_ADDR_i[31:4]` ADDR = Start address of Y input buffer
  - `SIMCOP_DMA_CHAN_SMEM_OFST_i[19:4]` OFST = 16 (= 256 bytes)
  - `SIMCOP_DMA_CHAN_BUF_ADDR_i[23:4]` ADDR = 0
  - `SIMCOP_DMA_CHAN_BUF_OFST_i[23:4]` OFST = 8 (= 128 bytes)
  - `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[13:4]` XNUM = 4 (= 64 bytes)
  - `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[28:16]` YNUM = 32
  - `SIMCOP_DMA_CHAN_FRAME_i[9:0]` XCNT = 2
  - `SIMCOP_DMA_CHAN_FRAME_i[25:16]` YCNT = 2
  - `SIMCOP_DMA_CHAN_BLOCK_STEP_i[14:4]` XSTEP = 4 (= 64 bytes)
  - `SIMCOP_DMA_CHAN_BLOCK_STEP_i[29:16]` YSTEP = 32
- Channel i = 1, input UV buffer:
  - `SIMCOP_DMA_CHAN_SMEM_ADDR_i[31:4]` ADDR = Start address of UV input buffer
  - `SIMCOP_DMA_CHAN_SMEM_OFST_i[19:4]` OFST = 16 (= 256 bytes)
  - `SIMCOP_DMA_CHAN_BUF_ADDR_i[23:4]` ADDR = 128 (2KB)
  - `SIMCOP_DMA_CHAN_BUF_OFST_i[23:4]` OFST = 8 (= 128 bytes)
  - `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[13:4]` XNUM = 4 (= 64 bytes)
  - `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[28:16]` YNUM = 16
  - `SIMCOP_DMA_CHAN_FRAME_i[9:0]` XCNT = 2
  - `SIMCOP_DMA_CHAN_FRAME_i[25:16]` YCNT = 2
  - `SIMCOP_DMA_CHAN_BLOCK_STEP_i[14:4]` XSTEP = 4 (= 64 bytes)
  - `SIMCOP_DMA_CHAN_BLOCK_STEP_i[29:16]` YSTEP = 16
- Channel i = 2, output Y buffer:
  - `SIMCOP_DMA_CHAN_SMEM_ADDR_i[31:4]` ADDR = Start address of Y output buffer
  - `SIMCOP_DMA_CHAN_SMEM_OFST_i[19:4]` OFST = 16 (= 256 bytes)
  - `SIMCOP_DMA_CHAN_BUF_ADDR_i[23:4]` ADDR = 0
  - `SIMCOP_DMA_CHAN_BUF_OFST_i[23:4]` OFST = 8 (= 128 bytes)
  - `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[13:4]` XNUM = 4 (= 64 bytes)
  - `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[28:16]` YNUM = 32
  - `SIMCOP_DMA_CHAN_FRAME_i[9:0]` XCNT = 2
  - `SIMCOP_DMA_CHAN_FRAME_i[25:16]` YCNT = 2
  - `SIMCOP_DMA_CHAN_BLOCK_STEP_i[14:4]` XSTEP = 4 (= 64 bytes)
  - `SIMCOP_DMA_CHAN_BLOCK_STEP_i[29:16]` YSTEP = 32
- Channel i = 3, output UV buffer:
  - `SIMCOP_DMA_CHAN_SMEM_ADDR_i[31:4]` ADDR = Start address of UV output buffer
  - `SIMCOP_DMA_CHAN_SMEM_OFST_i[19:4]` OFST = 16 (= 256 bytes)
  - `SIMCOP_DMA_CHAN_BUF_ADDR_i[23:4]` ADDR = 128 (= 2KB)
  - `SIMCOP_DMA_CHAN_BUF_OFST_i[23:4]` OFST = 8 (= 128 bytes)
  - `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[13:4]` XNUM = 4 (= 64 bytes)
  - `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[28:16]` YNUM = 16

- `SIMCOP_DMA_CHAN_FRAME_i[9:0]` XCNT = 2
- `SIMCOP_DMA_CHAN_FRAME_i[25:16]` YCNT = 2
- `SIMCOP_DMA_CHAN_BLOCK_STEP_i[14:4]` XSTEP = 4 (= 64 bytes)
- `SIMCOP_DMA_CHAN_BLOCK_STEP_i[29:16]` YSTEP = 16

Figure 8-265 shows the channel linking chain used. All four channels are executed sequentially. Doing so prevents access collision in SIMCOP local memories or system memories. Channel 0 is started by a START[0] pulse from SIMCOP. When Channel 3 completes the last transfer, a pulse to DONE[0] is sent back to SIMCOP.

Figure 8-266 shows the temporal channel sequence.

**Figure 8-265. YUV4:2:0-NV12 Read/Write Chain**

**Figure 8-266. Temporal Channel Sequence**

The following configuration is used for each channel:

- Channel  $i = 0$ , input Y buffer, first in sequence:
  - `SIMCOP_DMA_CHAN_CTRL_i[16:12]` LINKED = 0x11 (= CHAN1)
  - `SIMCOP_DMA_CHAN_CTRL_i[19:17]` HWSTART = 0x4 (= CHAN0)
  - `SIMCOP_DMA_CHAN_CTRL_i[5]` DIR = 1 (=SIMCOP buffers -> system memory)
  - `SIMCOP_DMA_CHAN_CTRL_i[0]` ENABLE = 1
- Channel  $i = 1$ , input UV buffer, second in sequence:
  - `SIMCOP_DMA_CHAN_CTRL_i[16:12]` LINKED = 0x12 (= CHAN2)
  - `SIMCOP_DMA_CHAN_CTRL_i[5]` DIR = 1 (= SIMCOP buffers -> system memory)
  - `SIMCOP_DMA_CHAN_CTRL_i[0]` ENABLE = 1
- Channel  $i = 2$ , output Y buffer, third in sequence:
  - `SIMCOP_DMA_CHAN_CTRL_i[16:12]` LINKED = 0x13 (= CHAN3)
  - `SIMCOP_DMA_CHAN_CTRL_i[5]` DIR = 0 (= system memory -> SIMCOP buffers)
  - `SIMCOP_DMA_CHAN_CTRL_i[0]` ENABLE = 1
- Channel  $i = 3$ , output UV buffer, last in sequence:
  - `SIMCOP_DMA_CHAN_CTRL_i[16:12]` LINKED = 0x00 (no link)

- `SIMCOP_DMA_CHAN_CTRL_i[22:20]` HWSTART = 0x4 (= CHAN0)
- `SIMCOP_DMA_CHAN_CTRL_i[5]` DIR = 0 (= system memory -> SIMCOP buffers)
- `SIMCOP_DMA_CHAN_CTRL_i[0]` ENABLE = 1

Software can read the status of a logical channel at any time. However, logical channel configuration registers can be changed only when the channel is in the IDLE state.

Software can disable a logical channel by writing the `SIMCOP_DMA_CHAN_CTRL_i[1]` DISABLE bit. A channel is effectively disabled when `SIMCOP_DMA_CHAN_CTRL_i[4:3]` STATUS = IDLE. In case of linked channels, software must disable all channels in the chain and wait until all of them are back in the IDLE state before channels can be reprogrammed.

#### **8.4.3.4.3 Software Synchronization**

Software performs the following sequence:

1. Configures the channel
2. Enables the channel
3. Triggers the channel by writing the `SIMCOP_DMA_CHAN_CTRL_i[2]` SWTRIGGER bit
4. Waits for BLOCK\_DONE\_IRQ

Step 2 and Step 4 are repeated until all 2D blocks have been transferred.

### 8.4.3.5 ISS SIMCOP DMA Register Manual

#### 8.4.3.5.1 ISS SIMCOP DMA Instance Summary

Table 8-1317 summarizes the DMA instance.

**Table 8-1317. SIMCOP DMA Instance Summary**

Module Name	Base Address L3 Interconnect	Base Address Cortex-M3 Private Access	Size
DMA	0x5202 0200	0x5506 0200	512 bytes

**NOTE:** Private Access is an access that does not use the L3/L4 interconnects.

BW_LIMITER																RESERVED						TAG_CNT			POSTED_WRITES	RESERVED	MAX_BURST_SIZE				

Bits	Field Name	Description	Type	Reset
31:16	BW_LIMITER	SIMCOP DMA guarantees that there are at least BW_LIMITER functional clock cycles between two OCP requests. No IDLE cycles are inserted during an OCP transaction. This parameter could be used to reduce traffic generated by the SIMCOP DMA for non timing critical applications. Doing so leaves more BW for other system initiators. Default value corresponds to maximum performance.	RW	0x0000
15:8	RESERVED		R	0x00
7:4	TAG_CNT	Limits the outstanding transactions count. Only tags 0 - TAG_CNT will be used by SIMCOP DMA. The maximum allowed value is $2^{(SIMCOP\_DMA\_GNC\_CONTEXT+2)-1}$	RW	0x3
3	POSTED_WRITES	Select write type. Setting depend on the used interconnect  0x0: Only nonposted writes are generated 0x1: Only posted writes are generated	RW	0
2	RESERVED		R	0
1:0	MAX_BURST_SIZE	Defines the maximum burst length for INCR bursts. In case of 2D bursts, length x height is less or equal to this value.  0x0: Single requests only 0x1: less or equal to 2 0x2: less or equal to 4 0x3: less or equal to 8	RW	0x0

### 8.4.4 ISS SIMCOP LDC Module

This chapter describes the lens distortion correction (LDC) module in the still image coprocessor (SIMCOP) subsystem.

#### 8.4.4.1 ISS SIMCOP LDC Overview

The LDC deals with lens geometric distortion issues, chromatic aberration, and affine transformation for camera images. [Figure 8-267](#) is an overview of the LDC in the SIMCOP subsystem.

**Figure 8-267. LDC in the SIMCOP Subsystem**

ldc-001

For still image or video applications the LDC supports:

- Lens distortion correction:
  - YCbCr 4:2:2/4:2:0 data format input/output (I/O) for post-image-pipe correction
  - Correct barrel distortion and pin-cushion distortion

- Radius-to-magnification-factor table to accommodate various distortion functions through programming
- Configurable center point and horizontal/vertical adjustment
- One 256-entry look-up table (LUT) for Y, Cb, and Cr
- 8 bits for YCbCr
- Bicubic interpolation for Y and bilinear interpolation for Cb/Cr
- Bilinear interpolation mode for Y to offer faster processing
- Up to 16,383 x 16,383 image dimension
- Format restriction:
  - YCbCr 4:2:2 format: Tile width must be a multiple of 16.
  - YCbCr 4:2:0 format: Tile width must be a multiple of 32.
- Image warping, scaling, and rotation:
  - Affine transformation for image warping, scaling, and rotation
  - 8 bits for YCbCr
  - Bicubic interpolation for Y and bilinear interpolation for Cb/Cr
  - Bilinear interpolation mode for Y to offer double throughput
  - Format restriction:
    - YCbCr 4:2:2 format: Tile width must be a multiple of 16.
    - YCbCr 4:2:0 format: Tile width must be a multiple of 32.
- Chromatic aberration correction:
  - Supports Bayer data in unpacked 12-bit per pixel, 8-bit per pixel A-Law, 8-bit per pixel unpacked, and 12-bit per pixel packed formats
  - Radius-to-magnification-factor table to accommodate various distortion functions through programming
  - Configurable center point and horizontal/vertical adjustment
  - Red and blue distortion only. Green pixels are copied to output.
  - Independent 128-entry LUTs for red and blue
  - Bilinear interpolation
  - Up to 16,383 x 16,383 image dimension
  - Format restriction:
    - Unpacked 12-bit format: Tile width must be a multiple of 16.
    - A-Law 8-bit format: Tile width must be a multiple of 32.
    - Unpacked 8-bit format: Tile width must be a multiple of 32.
    - Packed 12-bit format: Tile width must be a multiple of 64.

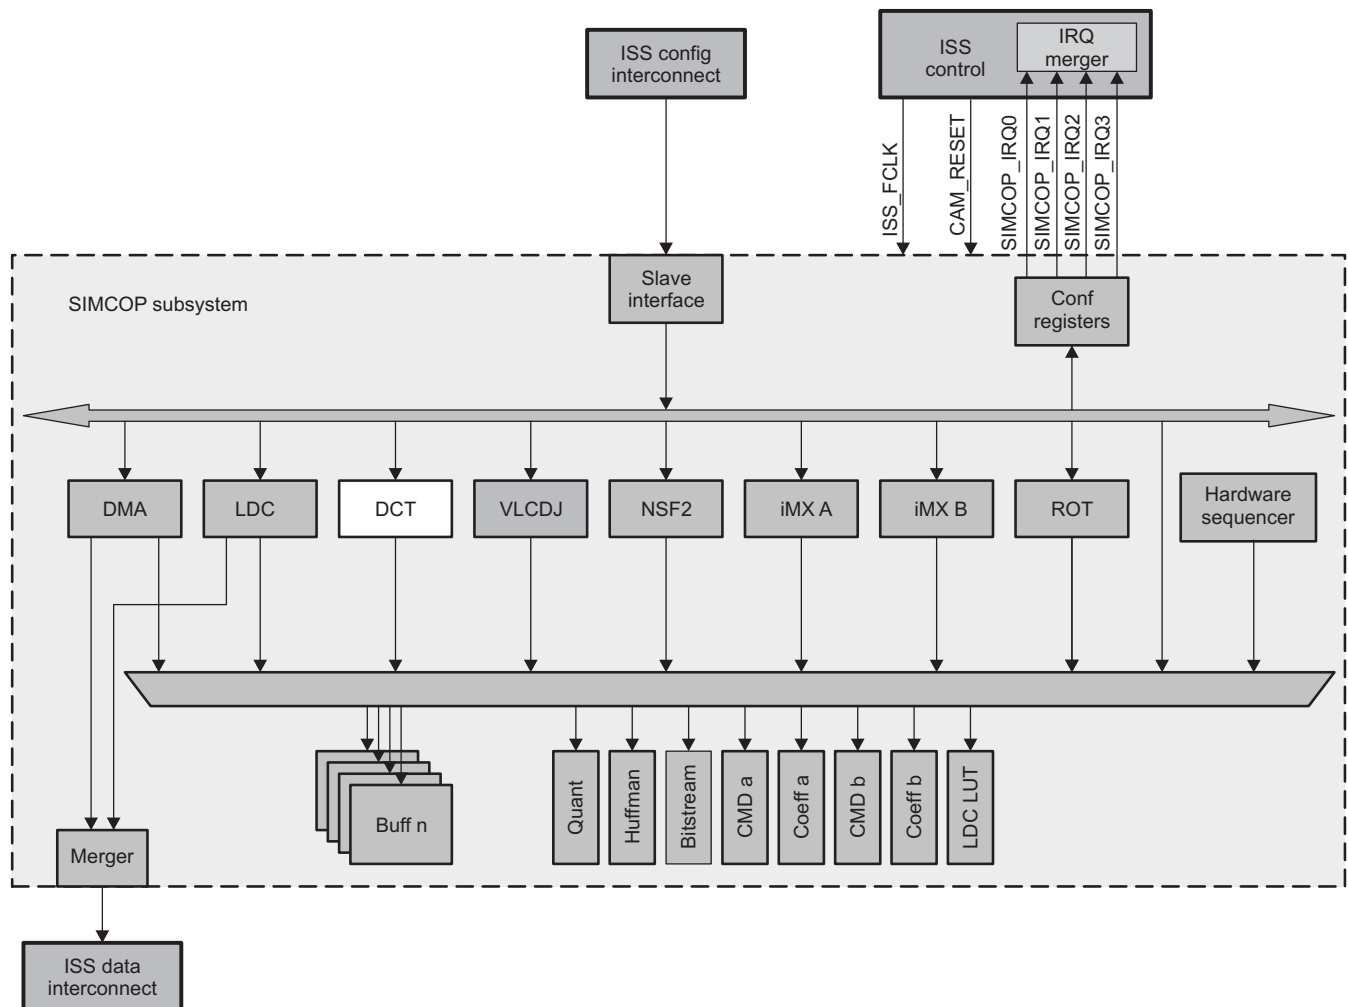

### 8.4.5 ISS SIMCOP Discrete Cosine Transform Module

This section describes the discrete cosine transform (DCT) module in the still-image coprocessor (SIMCOP) subsystem.

#### 8.4.5.1 ISS SIMCOP DCT Overview

The DCT module performs DCT and inverse DCT (IDCT) operations required for still-image coder/decoder (codec) applications. [Figure 8-268](#) is an overview of the DCT in the SIMCOP subsystem.

**Figure 8-268. DCT in the SIMCOP Subsystem**

dct-001

For still-image or video applications, the DCT supports:

- 8-bit data in the spatial domain (input to DCT or output of IDCT) with  $-128$  offset on color components
- 16-bit data in the frequency domain
- Exact input/output (I/O) range:
  - DCT expected input range  $[0, 255]$ , subtracting 128 offset before transform, output saturated to  $[-1024, 1023]$
  - IDCT expected input range  $[-1280, 1079]$ , adding 128 to inverse transform outcome and saturating to  $[0, 255]$
  - IDCT input range is from DCT output range plus  $[-256, 256]$  worst-case quantization error
- Configurable to process up to 32 microcontroller units (MCUs) at a time (21 MCUs for YUV4:2:0, and 32 MCUs for YUV4:2:2, because of memory size limitations)

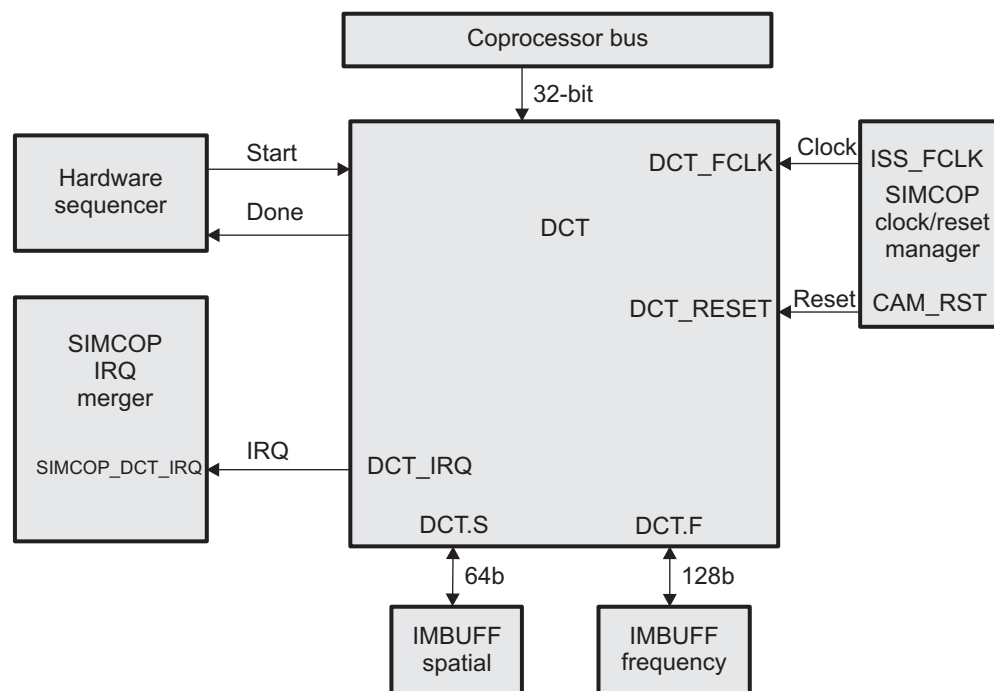

- The following formats are supported by the DCT:
  - 16 x 16-pixel block MCU for YUV4:2:0 format, spatial data storage follows NV12
  - 16 x 8-pixel block MCU for YUV4:2:2 format, spatial data storage follows UYVY
  - Sequential 8 x 8 block mode, other than YUV4:2:0 and YUV4:2:2, a color-neutral format to allow flexibility in color component configuration in MCU, processes up to 64 blocks per task
- JPEG baseline sequential is supported by sequential 8 x 8 block mode. Some post-processing to reorder data and color space conversion may be required.
- All frequency domain data are stored sequentially for each 8 x 8 block, 16 bits per data point.

#### 8.4.5.2 ISS SIMCOP DCT Integration

The DCT is part of the SIMCOP subsystem in the imaging subsystem (ISS). [Figure 8-269](#) shows the integration of the DCT in the SIMCOP subsystem.

**Figure 8-269. DCT Engine Integration**

dct-002

[Table 8-1353](#) through [Table 8-1355](#) list the integration attributes, clocks and resets, and hardware requests, respectively, for the DCT.

**Table 8-1353. Integration Attributes**

Module Instance	Attributes	
	Power Domain	Interconnect
DCT	PD_CAM	

**Table 8-1354. Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DCT	DCT_FCLK	ISS_FCLK	PRCM	Functional clock provided by ISS_CLK from the power, reset, and clock management (PRCM) module. It is used by all ISS submodules and ISS top-level resources.
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DCT	DCT_RESET	CAM_RST	PRCM	ISS and SIMCOP global reset

For information about clock and reset management, see [Section 8.4.1.2.1, ISS SIMCOP Local Power and Clock Management](#).

**Table 8-1355. Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
DCT	DCT_IRQ	SIMCOP_DCT_IRQ	SIMCOP IRQ merger	DCT operation is complete.

For more information about interrupt requests, see [Section 8.4.1.2.3, Interrupt Merger](#).

### 8.4.5.3 ISS SIMCOP DCT Functional Description

#### 8.4.5.3.1 ISS SIMCOP DCT Block Diagram

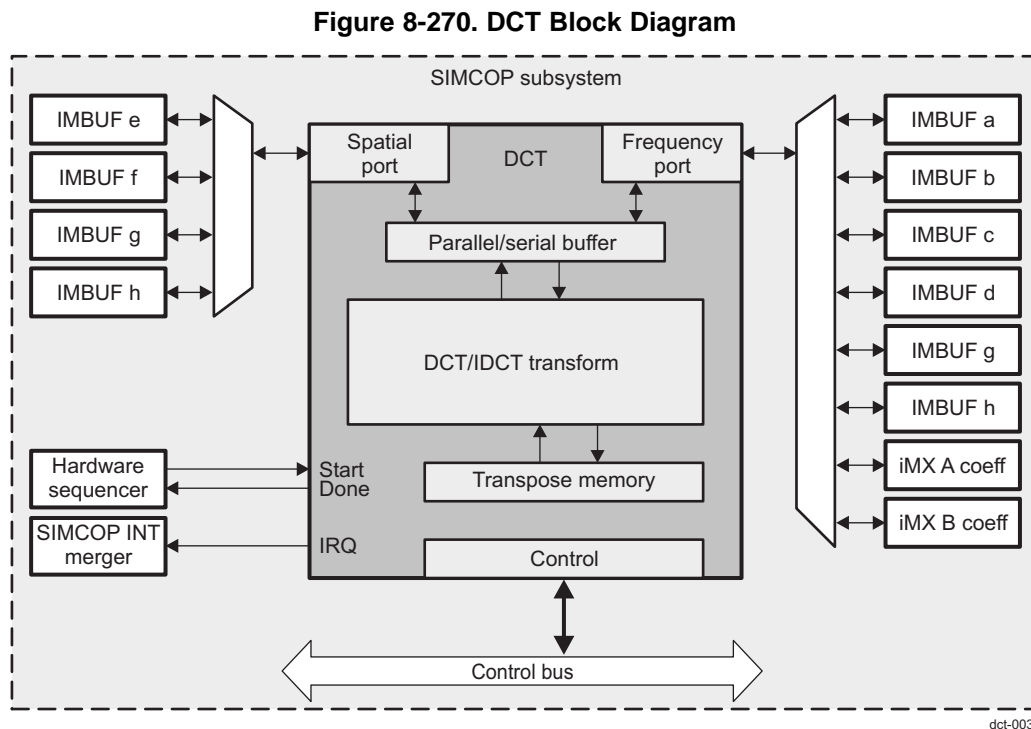

The DCT implements  $8 \times 8$ , 2-dimensional (2D) DCT and IDCT specified in JPEG image coding standards:

- In 4:2:0 mode, spatial domain data is organized in NV12 format. The frequency domain is organized as six blocks of  $8 \times 8$ .
- In 4:2:2 mode, spatial domain data is organized in UYVY format. The frequency domain is organized as four blocks of  $8 \times 8$ .
- In sequential  $8 \times 8$  block mode, spatial and frequency domain data are organized as N blocks of  $8 \times 8$  blocks.

**NOTE:**

- The spatial domain is the DCT input and IDCT output.
- The frequency domain is the DCT output and IDCT input.

Figure 8-270 is a block diagram of the DCT.

#### 8.4.5.3.2 ISS SIMCOP DCT Power Management

Table 8-1356 describes the power-management features available for the DCT.

**Table 8-1356. Local Power-Management Features**

Feature	Registers	Description
Clock autogating	<a href="#">DCT_CFG[5]</a> AUTOGATING	Free-running or autogating modes are available.

#### 8.4.5.3.3 ISS SIMCOP DCT Interrupt Requests

Table 8-1357 lists the event flags, and their mask, that can cause module interrupts.

**Table 8-1357. Events**

Event Flag	Event Mask	Map to	Description
N/A	DCT_CFG[3] INTEN	DCT_IRQ	End of processing

**8.4.5.3.4 Control and Status**

The DCT is controlled through the control registers accessed through the coprocessor bus by an external initiator. Before starting the DCT, the buffer memory must be configured for DCT access and initialized, and the control register must be set (for more information about DCT/IDCT processing, see [Section 8.4.5.3.4.1, DCT Configuration](#)).

The DCT\_CFG[4] TRIG\_SRC bit is used to select the DCT start source:

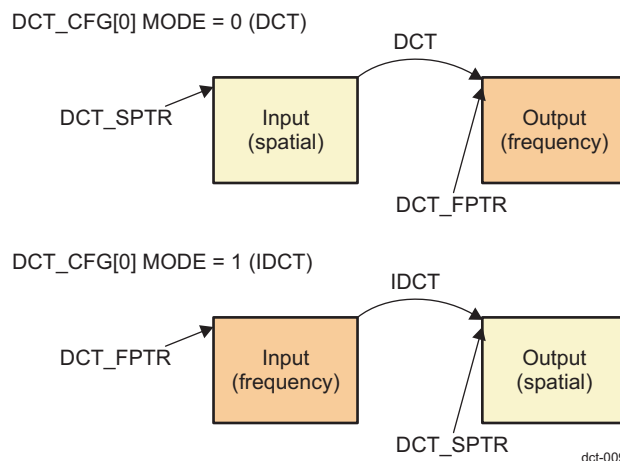

- If TRIG\_SRC = 0, the DCT is started through the DCT\_CTRL[0] EN bit.
- If TRIG\_SRC = 1, the DCT is started by a hardware-start signal generated by the SIMCOP hardware sequencer.

When the DCT is configured for one trigger, the other trigger has no effect on the DCT.

An external initiator can read the state of the DCT (running or not running) by reading the DCT\_CTRL[15] BUSY bit. When the BUSY bit goes back to 0, processing is complete (TRIG\_SRC = 0 or 1).

Before starting the DCT, the DCT\_SPTR and DCT\_FPTR registers must be configured with spatial and frequency addresses. [Figure 8-271](#) shows the use of spatial and frequency addresses.

**Figure 8-271. DCT I/O Address Configuration**

An interrupt can be generated when DCT operation completes (the configured number of MCUs for YUV4:2:0/4:2:2 mode, or the number of blocks for sequential block mode). To enable interrupt generation, set the DCT\_CFG[3] INTEN bit to 1.

When the DCT\_CFG[3] INTEN bit is set to 0, no interrupt generation is performed.

**8.4.5.3.4.1 DCT Configuration**

The following features can be configured in the DCT register:

- DCT module operation: The DCT\_CFG[0] MODE bit configures the processing:
  - MODE = 0: DCT processing
  - MODE = 1: IDCT processing
- Number of MCUs to process: The number of MCUs to process –1 is configured in the DCT\_CFG[13:8] NMCUS bit field:
  - YUV4:2:0 maximum MCUs = 21 (memory limitation, 126 blocks)
  - YUV4:2:2 maximum MCUs = 32 (128 blocks)

- Sequential maximum MCUs = 64 (64 blocks)

#### 8.4.5.3.5 Data Format

The DCT reads and writes data from and to image buffers. I/O format can be configured in the [DCT\\_CFG\[2:1\]](#) FMT bit field. The following formats can be configured:

- YUV4:2:0
- YUV4:2:2
- Sequential

##### 8.4.5.3.5.1 YUV4:2:0 Format

In JPEG YUV4:2:0 format, each MCU is  $16 \times 16$  pixels, and has  $16 \times 16$  Y data points,  $8 \times 8$  U data points, and  $8 \times 8$  V data points. Each square array of  $8 \times 8$  data points is called a block. Thus, an MCU with a YUV4:2:0 format has four Y blocks, one U block, and one V block.

This module follows the NV12 data storage format for YUV4:2:0 spatial data. For YUV4:2:0 format:

- `line_offset_in_bytes` = ([DCT\\_CFG\[13:8\]](#) NMCUS + 1) 16
- `starting_addr_uv` = [DCT\\_SPTR](#) + ([DCT\\_CFG\[13:8\]](#) NMCUS + 1) 256

[Figure 8-272](#) shows the organization of the data for two MCUs in the spatial domain, when the DCT is configured to process two MCUs. To select the YUV4:2:0 format, write 0x0 in the [DCT\\_CFG\[2:1\]](#) FMT bit field. YUV4:2:0 processes six blocks (four Y, one U, and one V) during each MCU DCT processing.

**Figure 8-272. YUV4:2:0 Format Data Order**

		Byte offset					
		0	1	2	3	...	31
0		Y(0,0)	Y(1,0)	Y(2,0)	Y(3,0)	...	Y(15,0)
32		Y(0,1)	Y(1,1)	Y(2,1)	Y(3,1)	...	Y(15,1)
64		Y(0,2)	Y(1,2)	Y(2,2)	Y(3,2)	...	Y(15,2)
		⋮					
480		Y(0,15)	Y(1,15)	Y(2,15)	Y(3,15)	...	Y(15,15)
512		U(0,0)	V(0,0)	U(2,0)	V(2,0)	...	V(14,0)
544		U(0,2)	V(0,2)	U(2,2)	V(2,2)	...	V(14,2)
736		U(0,14)	V(0,14)	U(2,14)	V(2,14)	...	V(14,2)

dct-005

Each YUV4:2:0 has four Y blocks, one U block, and one V block. For the first MCU in [Figure 8-272](#), the blocks are:

- Y\_Block 0:
  - Y(0, 0), Y(1, 0), ..., Y(7, 0)
  - Y(0, 1), Y(1, 1), ..., Y(7, 1)
  - ....
  - Y(0, 7), Y(1, 7), ..., Y(7, 7)
- Y\_Block 1:
  - Y(8, 0), Y(9, 0), ..., Y(15, 0)
  - Y(8, 1), Y(9, 1), ..., Y(15, 1)
  - ....
  - Y(8, 7), Y(9, 7), ..., Y(15, 7)
- Y\_Block 2:
  - Y(0, 8), Y(1, 8), ..., Y(7, 8)
  - Y(0, 9), Y(1, 9), ..., Y(7, 9)

- ....
- Y(0, 15), Y(1, 15), ..., Y(7, 15)
- Y\_Block 3:
  - Y(8, 8), Y(9, 8), ..., Y(15, 8)
  - Y(8, 9), Y(9, 9), ..., Y(15, 9)
  - ....
  - Y(8, 15), Y(9, 15), ..., Y(15, 15)
- U\_Block:
  - U(0, 0), U(2, 0), ..., U(14, 0)
  - U(0, 2), U(2, 2), ..., U(14, 2)
  - ....
  - U(0, 14), U(2, 14), ..., U(14, 14)
- V\_Block:
  - V(0, 0), V(2, 0), ..., V(14, 0)
  - V(0, 2), V(2, 2), ..., V(14, 2)
  - ....
  - V(0, 14), V(2, 14), ..., V(14, 14)

**8.4.5.3.5.2 YUV4:2:2 Format**

In JPEG YUV4:2:2 format, each MCU is 16 × 8 pixels and has 16 × 8 Y data points, 8 × 8 U data points, and 8 × 8 V data points. Thus, an MCU with a YUV4:2:2 format has two Y blocks, one U block, and one V block.

This module follows the UYVY data storage format for YUV4:2:2 spatial data. For YUV4:2:2 format: `line_offset_in_bytes = (DCT_CFG[13:8] NMCUS + 1) 32`

Figure 8-273 shows the organization of the data for two MCUs in the spatial domain when the DCT is configured to process two MCUs. To select the YUV4:2:2 format, write 0x1 in the `DCT_CFG[2:1]` FMT bit field. YUV4:2:2 processes four blocks (two Y, one U, and one V) during each MCU DCT processing.

**Figure 8-273. YUV4:2:2 Format Data Order**

Byte offset	0	1	2	3	4	5	6	7	...	31	32	33	34	...	63
0	U(0,0)	Y(0,0)	V(0,0)	Y(1,0)	U(2,0)	Y(2,0)	V(2,0)	Y(3,0)	...	Y(15,0)	U(16,0)	Y(16,0)	V(16,0)	...	Y(31,0)
64	U(0,1)	Y(0,1)	V(0,1)	Y(1,1)	U(2,1)	Y(2,1)	V(2,1)	Y(3,1)	...	Y(15,1)	U(16,1)	Y(16,1)	V(16,1)	...	Y(31,1)
128	U(0,2)	Y(0,2)	V(0,2)	Y(1,2)	U(2,2)	Y(2,2)	V(2,2)	Y(3,2)	...	Y(15,2)	U(16,2)	Y(16,2)	V(16,2)	...	Y(31,2)
	⋮								...					...	
448	U(0,7)	Y(0,7)	V(0,7)	Y(1,7)	U(2,7)	Y(2,7)	V(2,7)	Y(3,7)	...	Y(15,7)	U(16,7)	Y(16,7)	V(16,7)	...	Y(31,7)

dct-011

Each YUV4:2:2 has two Y blocks, one U block, and one V block. The four blocks of the first MCU are:

- Y\_Block 0:
  - Y(0, 0), Y(1, 0), ..., Y(7, 0)
  - Y(0, 1), Y(1, 1), ..., Y(7, 1)
  - ....
  - Y(0, 7), Y(1, 7), ..., Y(7, 7)
- Y\_Block 1:
  - Y(8, 0), Y(9, 0), ..., Y(15, 0)
  - Y(8, 1), Y(9, 1), ..., Y(15, 1)

- ....
- $Y(8, 7), Y(9, 7), \dots, Y(15, 7)$

#### 8.4.5.3.5.3 Sequential Block Format

The sequential block format supports any color format other than YUV4:2:0 or YUV4:2:2. There is no notion of colors, and each  $8 \times 8$  block is ordered sequentially. The DCT can be configured to process N blocks (versus N MCUs for YUV4:2:0 and YUV4:2:2, N is up to 64). In this format:

- Block  $i =$ 
  - $X(8*i, 0), X(8*i+1, 0), \dots, X(8*i+7, 0)$
  - $X(8*i, 1), X(8*i+1, 1), \dots, X(8*i+7, 1)$
  - ....
  - $X(8*i, 7), X(8*i+1, 7), \dots, X(8*i+7, 7)$

To select sequential block format, write 0x2 in the [DCT\\_CFG\[2:1\]](#) FMT bit field.

### 8.4.5.4 ISS SIMCOP DCT Basic Programming Model

#### 8.4.5.4.1 Initialization of Surrounding Modules

To initialize the DCT, the surrounding modules must be initialized. [Table 8-1358](#) lists these modules.

**Table 8-1358. Initialization of Surrounding Modules**

Module	Minimum Required Setting	Optional Settings
CLKC	Enable the SIMCOP clock.	
Buffers	Configure DCT access to the image buffer.	
SIMCOP CTRL		Configure SIMCOP CTRL to handle DCT interrupts.

#### 8.4.5.4.2 Using the DCT for DCT Processing

To configure the DCT for DCT processing, software must follow the procedure listed in [Table 8-1359](#).

**Table 8-1359. DCT Processing Procedure**

Step	Register/Bit Field	Value
Prepare data in buffer memory.	SIMCOP buffers	
Switch buffer access to the DCT.	SIMCOP buffers	
Configure the start of the DCT input address (address must be in the memory buffer).	<a href="#">DCT_SPTR</a> [12:5] ADDR	Start address (spatial domain)
Configure the start of the DCT output address (address must be in the memory buffer).	<a href="#">DCT_FPTR</a> [13:4] ADDR	Start address (frequency domain)
Set the <a href="#">DCT_CFG</a> register.	<a href="#">DCT_CFG</a> [0] MODE	0 (DCT mode)
	<a href="#">DCT_CFG</a> [2:1] FMT	Depends on data format
	<a href="#">DCT_CFG</a> [3] INTEN	0: No interrupt 1: Interrupt at end of processing
	<a href="#">DCT_CFG</a> [4] TRIG_SRC	1: Start controlled by hardware signal 0: Start controlled by a register
	<a href="#">DCT_CFG</a> [13:8] NMCUS	Number of MCUs to process
<b>IF:</b> <a href="#">DCT_CFG</a> [4] TRIG_SRC = 0		
Start DCT through the register.	<a href="#">DCT_CTRL</a> [0] EN	1
<b>ELSE</b>		
Start the DCT using the hardware sequencer.	SIMCOP hardware sequencer	
<b>ENDIF</b>		

The DCT is now processing the blocks. To detect the end of DCT processing:

- If [DCT\\_CFG](#)[3] INTEN = 1, wait for the interrupt signal.
- If [DCT\\_CFG](#)[3] INTEN = 0, the processor must poll the [DCT\\_CTRL](#)[15] BUSY bit. When the BUSY bit is 0, processing is complete.

When DCT processing completes, the frequency output result is stored in the memory buffer at the address given by the [DCT\\_FPTR](#)[13:4] ADDR bit field.

#### 8.4.5.4.3 Using the DCT for IDCT Processing

To configure the DCT for IDCT processing, software must follow the procedure listed in [Table 8-1360](#).

**Table 8-1360. IDCT Processing Procedure**

Step	Register/Bit Field	Value
Prepare data in buffer memory.	SIMCOP buffers	
Switch buffer access to the DCT.	SIMCOP buffers	

**Table 8-1360. IDCT Processing Procedure (continued)**

Step	Register/Bit Field	Value
Configure the start of the DCT output address (address must be in the memory buffer).	<a href="#">DCT_SPTR</a> [12:5] ADDR	Start address (spatial domain)
Configure the start of the DCT input address (address must be in the memory buffer).	<a href="#">DCT_FPTR</a> [13:4] ADDR	Start address (frequency domain)
Set the <a href="#">DCT_CFG</a> register.	<a href="#">DCT_CFG</a> [0] MODE	1 (IDCT mode)
	<a href="#">DCT_CFG</a> [2:1] FMT	Depends on data format
	<a href="#">DCT_CFG</a> [3] INTEN	0: No interrupt 1: Interrupt at end of processing
	<a href="#">DCT_CFG</a> [4] TRIG_SRC	1: Start controlled by a hardware signal 0: Start controlled by a register
	<a href="#">DCT_CFG</a> [13:8] NMCUS	Number of MCUs to process
<b>IF:</b> <a href="#">DCT_CFG</a> [4] TRIG_SRC = 0		
Start the DCT through a register.	<a href="#">DCT_CTRL</a> [0] EN	1
<b>ELSE</b>		
Start the DCT using hardware sequencer.	SIMCOP hardware sequencer	
<b>ENDIF</b>		

The DCT is now processing the blocks. To detect the end of IDCT processing:

- If [DCT\\_CFG](#)[3] INTEN = 1, wait for the interrupt signal.
- If [DCT\\_CFG](#)[3] INTEN = 0, the processor must poll the [DCT\\_CTRL](#)[15] BUSY bit. When the BUSY bit is 0, processing is complete.

When IDCT processing completes, the spatial output result is stored in the memory buffer at the address given by the [DCT\\_SPTR](#)[12:5] ADDR bit field.

### 8.4.5.5 ISS SIMCOP DCT Register Manual

#### 8.4.5.5.1 ISS SIMCOP DCT Instance Summary

[Table 8-1361](#) summarizes the DCT instance.

**Table 8-1361. ISS SIMCOP DCT Instance Summary**

Module Name	Base Address L3 Interconnect	Base Address Cortex-M3 Private Access	Size
DCT	0x5202 0800	0x5506 0800	32 bytes

---

**NOTE:** Private Access is an access that does not use the L3/L4 interconnects.

---

#### 8.4.5.5.2 DCT Registers

##### 8.4.5.5.2.1 DCT Register Summary

[Table 8-1362](#) summarizes the DCT register mapping.

**Table 8-1362. DCT Register Mapping Summary**

Register	Type	Register Width (Bits)	Address Offset	Physical Address L3 Interconnect	Physical Address Cortex-M3 Private Access
<a href="#">DCT_VERSION</a>	R	32	0x0000 0000	0x5202 0800	0x5506 0800

### 8.4.6 ISS SIMCOP Variable Length Coder/Decoder for JPEG Module

This section describes the variable-length coder/decoder for JPEG (VLCDJ) module in the still-image coprocessor (SIMCOP) subsystem.

#### 8.4.6.1 ISS SIMCOP VLCDJ Overview

The VLCDJ module handles quantization (Q) and variable-length coding (VLC) in JPEG encoding, and variable-length decoding (VLD) and inverse quantization (IQ) in JPEG decoding. These operations are required for JPEG image compression and decompression. Figure 8-274 is an overview of the VLCDJ in the SIMCOP subsystem.

Figure 8-274. VLCDJ in the SIMCOP Subsystem

vlcdj-001

The VLCDJ supports the following operations:

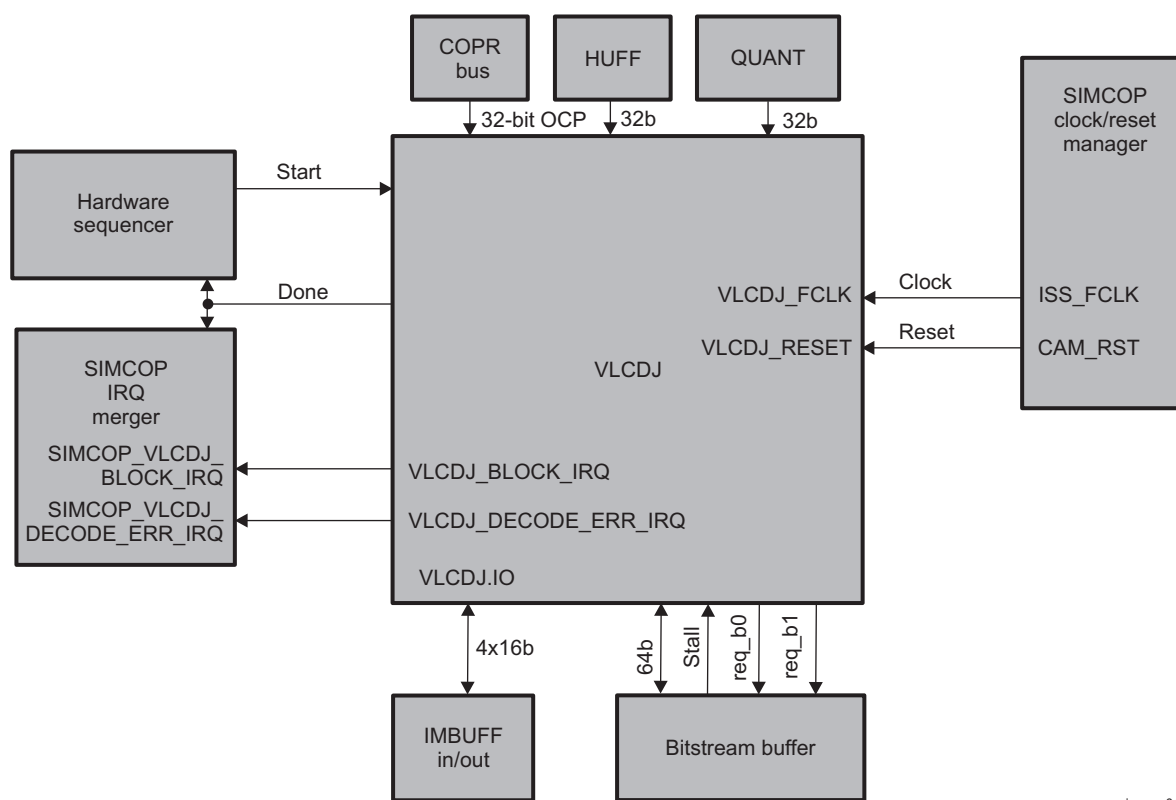

- Q and VLC for JPEG encoding
- VLD and IQ for JPEG decoding
- Data formats:
  - YUV4:2:0 format in 16 × 16-pixel microcontroller unit (MCU)
  - YUV4:2:2 format in 16 × 8-pixel MCU
  - Sequential block mode to support arbitrary color component configuration within JPEG baseline sequential (software intervention required to context-switch among color components)
- Configurable for number of MCUs per initiation (up to 21 MCUs for YUV4:2:0, 32 MCUs for YUV4:2:2,

- 64 8 × 8 blocks for sequential block mode)
- Discrete cosine transform (DCT) coefficients are stored sequentially for each 8 × 8 block, 16 bits per data point
- Stall processing for interface with bitstream data overrun/underrun protection
- Insertion of restart markers during encoding (YUV4:2:0, YUV4:2:2, sequential block modes)
- Record of restart marker locations during encoding (YUV4:2:0, YUV4:2:2 only)
- Processing of restart markers on the MCU boundary during decoding, reset of direct coefficient (DC) predictors as required by the JPEG standard (YUV4:2:0, YUV4:2:2, sequential block modes)

### 8.4.6.2 ISS SIMCOP VLCDJ Integration

The VLCDJ is part of the SIMCOP subsystem in the imaging subsystem (ISS). Figure 8-275 shows the integration of the VLCDJ in the SIMCOP subsystem.

Figure 8-275. VLCDJ Engine Integration

simcop-013

Table 8-1373 through Table 8-1375 list the integration attributes, clocks and resets, and hardware requests, respectively, for the VLCDJ.

Table 8-1373. Integration Attributes

Module Instance	Attributes
	Power Domain
VLCDJ	PD_CAM

Table 8-1374. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description

**Table 8-1374. Clocks and Resets (continued)**

VLCDJ	VLCDJ_FCLK	ISS_FCLK	PRCM	Functional clock provided by ISS_CLK from the power, reset, and clock management (PRCM) module. It is used by all ISS submodules and ISS top-level resources.
<b>Resets</b>				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
VLCDJ	VLCDJ_RESET	CAM_RST	PRCM	ISS and SIMCOP global reset

For information about clock and reset management, see [Section 8.4.1.2.1](#), *ISS SIMCOP Local Power and Clock Management*.

**Table 8-1375. Hardware Requests**

<b>Interrupt Requests</b>				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
VLCDJ	VLCDJ_BLOCK_IRQ	SIMCOP_VLCDJ_BLOCK_IRQ	SIMCOP IRQ merger	A macroblock has been processed.
VLCDJ	VLCDJ_DECODE_ERROR_IRQ	SIMCOP_VLCDJ_DECODE_ERROR_IRQ	SIMCOP IRQ merger	A decode error has been signaled by the VLCDJ.

For more information about interrupt requests, see [Section 8.4.1.2.3](#), *Interrupt Merger*.

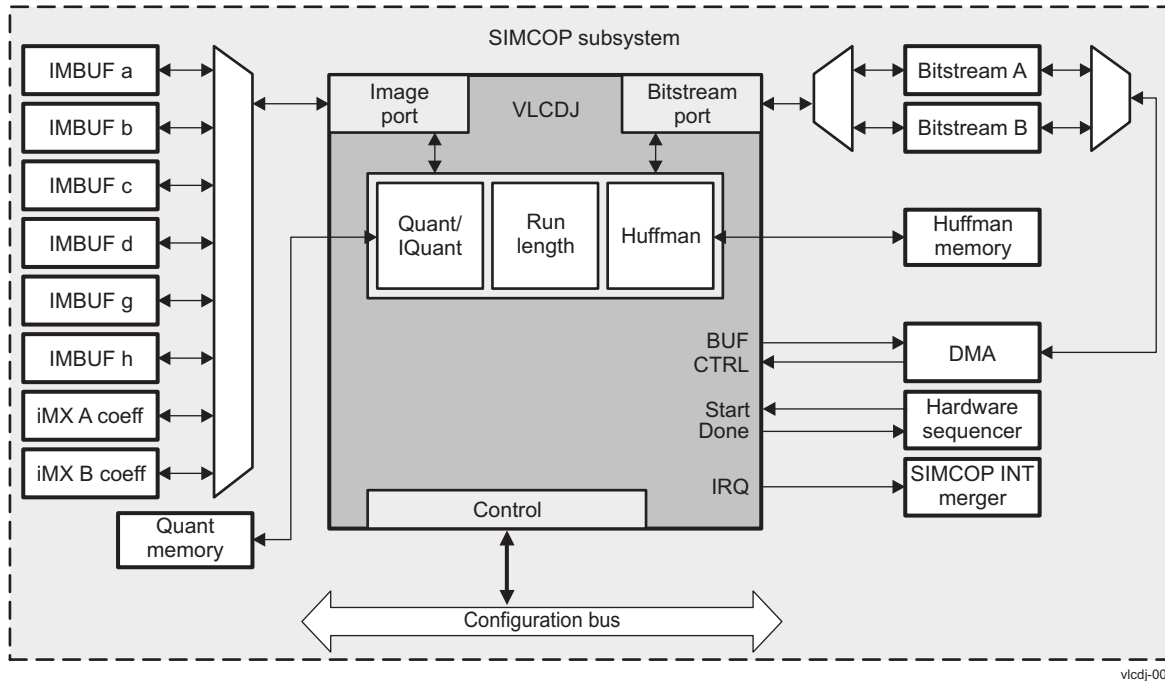

### 8.4.6.3 ISS SIMCOP VLCDJ Functional Description

#### 8.4.6.3.1 ISS SIMCOP VLCDJ Block Diagram

The VLCDJ implements quantization, run-length encode, and Huffman encode stages of JPEG compression, and Huffman decode, run-length expansion, and dequantization stages of JPEG decompression. [Figure 8-276](#) is a block diagram of the VLCDJ with connected memories and modules.

**Figure 8-276. VLCDJ Block Diagram**

#### 8.4.6.3.2 ISS SIMCOP VLCDJ Power Management

The VLCDJ uses clock autogating to conserve power. When any substantial subblocks are not in use, the corresponding clock trees are gated off. [Table 8-1376](#) describes the power-management feature available for the VLCDJ.

**Table 8-1376. Local Power-Management Feature**

Feature	Registers	Description
Clock autogating	<a href="#">VLCDJ_CTRL</a> [3] AUTOGATING	Free-running or autogating modes are available.

#### 8.4.6.3.3 ISS SIMCOP VLCDJ Interrupt Requests

[Table 8-1377](#) lists the event flags and their masks that can cause module interrupts.

**Table 8-1377. Events**

Event Flag	Event Mask	Map to	Description
N/A	<a href="#">VLCDJ_CTRL</a> [4] INTEN_DONE	VLCDJ_BLOCK_IRQ	End of block processing
N/A	<a href="#">VLCDJ_CTRL</a> [5] INTEN_ERR	VLCDJ_DECODE_ER R_IRQ	Error occurred

#### 8.4.6.3.4 ISS SIMCOP VLCDJ in JPEG Encoding Flow

Figure 8-277 shows the JPEG compression or encoding flow.

Figure 8-277. JPEG Encoding Flow

The DCT coefficients are quantized by dividing each data point with a quantizer. The quantizers form an  $8 \times 8$  matrix for Luma Y, and another  $8 \times 8$  matrix for U and V, and the matrices are fixed in each image. The quantizer matrices can vary between images, and are sometimes fine-tuned in a multiple-pass process to regulate the compressed JPEG file size.

For quantization, the VLCDJ reads a reciprocal of the quantizer values (16 bits per entry carrying  $2^{15}/\text{quant}$ ) so that hardware performs multiplications rather than divisions. The result is rounded to the nearest integer.

After quantization, the DC terms (the first term in each  $8 \times 8$  block of DCT coefficients) are differentially coded within each color. Thus, three predictors are used for the common formats.

Next, the coefficients are scanned in a zigzag order (the same order for all colors) to form DC term + zero-run and nonzero level pairs for the alternative coefficient (AC) terms. The run-level pairs are then coded with a Huffman table.

The DC level is first categorized into size groups, basically the number of bits that represents the absolute value of the level. This size is translated to a bit segment using the Huffman table. Then, additional bits are appended to represent the exact DC level.

For AC run-level pairs, the process is similar. Each AC level is first categorized into size groups, basically the number of bits that represents the absolute value of the level. The size and the run are combined and translated to a bit segment using the Huffman table. Then, additional bits are appended to represent the exact AC level.

The number of additional bits to encode after the Huffman-coded segment, for DC or AC level, equals the size value. For example, coefficient values  $-3$ ,  $-2$ , and  $3$  are of size 2, because 2 bits are required to represent the absolute values 2 and 3. There are four coefficient values in the size  $-2$  category, so 2 additional bits are required to uniquely identify each value.

Some special symbols go with the AC run/size pairs. The ZRL symbol represents a run of 15 zeros, and is used to code unusually long zero runs. The EOB symbol represents end of block, meaning that there are only 0 AC coefficients at the end.

In the bitstream management level, after each byte of  $0xFF$ , a byte of 0 is inserted to prevent the decoder from detecting special markers in the bitstream.

Because the VLCDJ handles multiple MCUs and allows restart marker insertion in MCU boundaries inside a task, the inserted flags are flagged to prevent the insertion of a 0 byte after  $0xFF$ .

#### 8.4.6.3.5 ISS SIMCOP VLCDJ in JPEG Decoding Flow

Decoding or decompression operates in the reverse order, as shown in Figure 8-278.

**Figure 8-278. JPEG Decoding Flow**

1. In decoding, in the MCU data section, when the VLCDJ recognizes the 0xFF byte in the bitstream, it detects whether the next byte is a 0 byte. If it is, the 0 byte is removed and decoding continues as if the 0 byte is not there (the 0xFF byte is kept). If the next byte is not a 0 byte, the VLCDJ flags this as a JPEG data error. This can be caused by an earlier bitstream error that causes the module to parse outside the MCU entropy data and into markers that are not supported by the module.
2. Because the VLCDJ decodes for multiple MCUs, restart markers can occur in MCU boundaries. Restart marker detection and processing work with the 0 byte removal logic to ensure that restart markers are detected and removed correctly. When the VLCDJ detects a restart marker, it resets the DC predictors in the IQ stage.
3. The VLCDJ looks up the Huffman table to convert a variable-length bit segment into a DC size or an AC run/size pair. The number of additional bits equal to the size is extracted and the DC/AC coefficient is reconstructed. Then, zero runs are expanded.
4. IQ is performed, which is simply multiplication of the coefficients with values in the quantizer matrices.

#### 8.4.6.3.6 Memory Interfaces

The VLCDJ has four memory interfaces (all memories are inside the SIMCOP subsystem):

- Image buffer (input DCT coefficients for encoding and output DCT coefficients for decoding)
- Quantizer memory
- Huffman memory
- Bitstream memory (output for encoding and input for decoding)

##### 8.4.6.3.6.1 Image Buffer

An image buffer stores DCT data in the context of the VLCDJ. This is an input in encode mode and an output in decode mode.

When multiple MCUs are configured, DCT coefficients for the MCUs are stored sequentially (MCU 0 is stored first, followed by MCU 1, and so on).

Blocks in an MCU are stored sequentially; that is, block 0 first, block 1 next, and so on. There are six blocks per MCU in YUV4:2:0 format, {Y0, Y1, Y2, Y3, U, V}, and four blocks per MCU in YUV4:2:2 format, {Y0, Y1, U, V}.

The 64 DCT coefficients for each block are stored in an 8 × 8 transposed format (the companion DCT module handles the transposed format). Each coefficient, up to [−2047, 2047] in range is stored on a 16-bit word. [Table 8-1378](#) lists the data format in each 8 × 8 block of coefficients.

**Table 8-1378. Image Buffer Block Format**

Byte Offset								
0	1	2	3	4	5	...	14	15
c(0, 0)		c(0, 1)		c(0, 2)		...	c(0, 7)	
c(1, 0)		c(1, 1)		c(1, 2)		...	c(1, 7)	
c(2, 0)		c(2, 1)		c(2, 2)		...	c(2, 7)	
:								
c(7, 0)		c(7, 1)		c(7, 2)		...	c(7, 7)	

The DCT coefficients are processed in zigzag order (see [Figure 8-279](#)), as required by JPEG.

**Figure 8-279. JPEG Zigzag Order**

vlcd-011

#### 8.4.6.3.6.2 Quantizer Memory

The quantization memory stores the reciprocal of quantizers,  $2^{15}/qmat[i][j]$  so that hardware performs multiplications rather than divisions. Each data point is stored in 16 bits.

The quantizer matrices have a fixed size, 64 16-bit elements each. The quantizer memory (QMEM) is sized to hold up to four matrices ([Table 8-1379](#) lists the recommended allocation for YUV4:2:0 and YUV4:2:2).

**Table 8-1379. Recommended QMEM Allocation for YUV4:2:0 and YUV4:2:2**

Quadrant of QMEM	Address Offset (Bytes)	Contents
00	0x000	(Encode) Quantizer reciprocal for Y ( $2^{15}/qmat[i][j]$ )
01	0x080	(Encode) Quantizer reciprocal for UV ( $2^{15}/qmat[i][j]$ )
10	0x100	(Decode) Quantizer for Y ( $qmat[i][j]$ )
11	0x180	(Decode) Quantizer for UV ( $qmat[i][j]$ )

Each matrix is stored in zigzag order to make quantization and inverse quantization more efficient.

#### 8.4.6.3.6.3 Huffman Memory

Huffman memories store Huffman encode tables and Huffman control/decode tables. For information about Huffman tables, see [Section 8.4.6.3.7, Huffman Table Organization](#).

#### 8.4.6.3.6.4 Bitstream Memory

Bitstream memory is for input/output (I/O) bitstream. Bitstream data is stored in little-endian format in the memory. Circular buffer (CBUFF) start and end addresses are provided in registers to facilitate bitstream data management:

- [VLCDJE\\_CBUF\[11:10\]](#) START, start of ring buffer for encode mode (address must be 1KB-aligned)
- [VLCDJE\\_CBUF\[27:26\]](#) END, end of ring buffer for encode mode (address must be 1KB-aligned)
- [VLCDJD\\_CBUF\[11:10\]](#) START, start of ring buffer for decode mode (address must be 1KB-aligned)
- [VLCDJD\\_CBUF\[27:26\]](#) END, end of ring buffer for decode mode (address must be 1KB-aligned)

[Figure 8-280](#) shows the start and end addresses of a ring buffer.

Figure 8-280. VLCDJ Ring Buffer

In encoding and decoding, a bit-level boundary defines bitstream data written (for encoding) or parsed (for decoding). To point to that boundary, bit and byte pointers are provided in the registers:

- [VLCDJE\\_BSPTR\[19:16\]](#) BITPTR (encoding)
- [VLCDJE\\_BSPTR\[11:0\]](#) BYTEPTR (encoding)
- [VLCDJD\\_BSPTR\[19:16\]](#) BITPTR (decoding)
- [VLCDJD\\_BSPTR\[11:0\]](#) BYTEPTR (decoding)

BYTEPTR (byte pointer) points to the byte where the boundary lies, and BITPTR (bit pointer) specifies the number of available vacant data bits (for encoding) or remaining data bits (for decoding). BITPTR is always in the range of 1 to 8, where 8 indicates that an entire byte is available for writing or reading.

For example, for encoding, if BYTEPTR = 0 and BITPTR = 8, after the hardware encodes a specified number of MCUs that together generate 30 bits, or 3 full bytes and 6 bits, BYTEPTR = 3 and BITPTR = 2. The JPEG standard requires that at the end of MCU data, any remaining bits of the last byte are padded with 1s. For example, if the last byte has 4 bits written 0101, the last byte of MCU data in the JPEG data is 0x5F.

#### 8.4.6.3.7 Huffman Table Organization

##### 8.4.6.3.7.1 Huffman Table for Encode Mode

Because the Huffman encode tables are compact, they are fixed relative to a common pointer:

- The Luma DC table starts at [VLCDJE\\_VLCTBL\[11:2\]](#) ADDR (12 entries  $\times$  4 = 48 bytes)
- The Luma AC table starts at [VLCDJE\\_VLCTBL\[11:2\]](#) ADDR + 48 bytes (11  $\times$  16  $\times$  4 = 704 bytes)
- The Chroma DC table starts at [VLCDJE\\_VLCTBL\[11:2\]](#) ADDR + 752 bytes (12 entries  $\times$  4 = 48 bytes)
- The Chroma AC table starts at [VLCDJE\\_VLCTBL\[11:2\]](#) ADDR + 800 bytes (11  $\times$  16  $\times$  4 = 704 bytes)

For DC tables, the index of each table corresponds to the size of the absolute value of the DC coefficient.

For AC tables, the index of each table corresponds to a formula including the size (of absolute value of nonzero AC coefficients) and the zero run: Index = SIZE  $\times$  16 + run. Because the size cannot be 0, the first 16 entries hold special symbols. EOB is at entry 0, and ZRL is at entry 15.

The size of a nonnegative value is the number of bits required to represent the value (for example, a size of 4..7 = 3).

[Figure 8-281](#) shows the organization of the Huffman encode table.

**Figure 8-281. Huffman Encode Table Organization**

vlcdj-002

### 8.4.6.3.8 Restart Marker

#### 8.4.6.3.8.1 Restart Marker Insertion for Encode

As specified in the JPEG standard, the VLCDJ can insert a restart marker at a specified MCU interval (for information about restart markers, see [Section 8.4.6.3.5, ISS SIMCOP VLDCJ in JPEG Decoding Flow](#)). Any remaining bits in the last partial byte are padded with 1s.

When enabled, the VLCDJ inserts a restart marker at the end of a group of MCUs. A partial byte is automatically padded with 1s.

#### 8.4.6.3.8.2 Restart Marker Location Recording

To facilitate reordering of compressed JPEG data sections to achieve JPEG rotation, the VLCDJ also records the restart marker locations.

#### 8.4.6.3.8.3 Restart Marker Handling for Decoding

Restart markers are handled automatically during MCU data decoding according to the JPEG standard. The DC predictors are reset at the MCU boundary where restart markers are present.

Because the handling of restart markers is complex, there is no check of the consistency of restart marker value or existence/nonexistence with the restart interval (which is not part of the decoder register setting). Correct JPEG files are decoded correctly. Incorrect JPEG files can escape error detection.

To decode correctly, in spite of the presence of restart markers, software must configure the VLCDJ with the correct byte pointer for the VLCDJ. To reset DC predictors to occur before an MCU, the byte pointer must point to the restart marker before the MCU data in the bitstream data. In other words, the VLCDJ does not search for the correct marker and resume MCU decoding after the marker. The VLCDJ detects the presence of the marker only at the MCU boundaries.

#### 8.4.6.3.9 Encode/Decode Context Switching

The bitstream memory is organized as two banks of memory. When the VLCDJ performs only encoding or only decoding, the two banks are used to achieve VLCDJ and DMA concurrence, and automatic bitstream data DMA is supported.

When the VLCDJ performs one encode and one decode concurrently, both contexts can coexist in the configuration registers, because encode and decode configurations are in separate registers. The bitstream memory must be partitioned half-and-half between encode and decode. For example:

- [VLCDJE\\_CBUF](#)[11:10] START = 0x0
- [VLCDJE\\_CBUF](#)[27:26] END = 0x7FF
- [VLCDJD\\_CBUF](#)[11:10] START = 0x800
- [VLCDJD\\_CBUF](#)[27:26] END = 0xFFF

The byte pointers and the bitstream data DMA must be set up accordingly.

When the VLCDJ is encoding, the decode half of bitstream memory can be refilled by DMA. When the VLCDJ is decoding, the encode half of bitstream memory can be transferred out by DMA. Hardware does not support automatic triggering of DMA; software must submit DMA based on the byte pointer value of each context. For good SDRAM efficiency, the DMA block must be aligned correctly.

#### 8.4.6.3.10 Using Sequential Block Mode for YUV4:4:4 Encoding/Decoding

In sequential block mode, because it deals with only one color component, the VLCDJ does the following:

- Uses DCPREDY for the DC predictor
- Uses the first quantizer matrix pointed by QM/QMR
- Starts from the first block pointed to by DCT
- Uses the first VLC/VLD table

Thus, to encode/decode YUV4:4:4 format using sequential block mode, software must switch context among Y, U, and V between initiations of the VLCDJ. Memory organization and registers are designed so that QM/QMR, DCT, and VLC/VLD tables can be swapped by changing the corresponding pointers in the registers. The DC predictor must be saved and restored.

For more information, see [Section 8.4.6.4.6, Example of YUV4:4:4 Encoding](#).

#### 8.4.6.3.11 Error Reporting

The VLCDJ can report the following decode errors:

- Invalid Huffman code
- Block exceeding 64 coefficients

---

**NOTE:** Decoding of an 0xFF byte followed by a nonzero byte is not reported as an error (for more information, see [Section 8.4.6.3.5, ISS SIMCOP VLCDJ in JPEG Decoding Flow](#)).

---

When there is a decode error, VLCDJ operation is suspended immediately. Bit and byte pointers to the bitstream near where the error occurs are reflected in the [VLCDJD\\_BSPTR](#)[19:16] BITPTR and [VLCDJD\\_BSPTR](#)[11:0] BYTEPTR bit fields. The DCT coefficient index, in zigzag order of the task, near where the error occurs, is also reflected in a read-only bit field, [VLCDJD\\_DCTERR](#)[13:0] ERRPTR. For example, if decoding fails at the fifth coefficient of the third block of the VLCDJ task (which can be multiple MCUs), ERRPTR returns  $2 \times 64 + 4 = 195$ .

The IQ stage of the hardware does not stop and runs to completion. When there is a decode error, the DC predictor and decoded DCT coefficient outcomes are indeterminate.

Because the VLCDJ does not start in the middle of an MCU, software must recover from the error and configure the VLCDJ from an MCU boundary.

### 8.4.6.4 ISS SIMCOP VLCDJ Basic Programming Model

#### 8.4.6.4.1 Initialization of Surrounding Modules

To initialize the VLCDJ, surrounding modules must be initialized. [Table 8-1380](#) lists these modules.

**Table 8-1380. Initialization of Surrounding Modules**

Module	Minimum Required Setting	Optional Settings
CLKC	Enable the SIMCOP clock.	
Buffers	Configure VLCDJ access to the image buffer.	
SIMCOP CTRL		Configure SIMCOP CTRL to handle VLCDJ interrupts.

#### 8.4.6.4.2 ISS SIMCOP VLCDJ Start and Register Modification During Processing

The module operation can be started with two mechanisms, depending on the status of the [VLCDJ\\_CTRL\[2\]](#) TRIG\_SRC bit.

When the [VLCDJ\\_CTRL\[2\]](#) TRIG\_SRC bit is set to 0 and the module is idle (the [VLCDJ\\_CTRL\[16\]](#) BUSY bit is set to 0), the module is started by setting the [VLCDJ\\_CTRL\[0\]](#) EN bit to 1. Any hardware start pulses are ignored. To simplify software control, in the same register write, changing the [VLCDJ\\_CTRL\[2\]](#) TRIG\_SRC bit from 1 to 0 and setting the [VLCDJ\\_CTRL\[0\]](#) EN bit to 1 is recognized as a valid starting condition.

When the [VLCDJ\\_CTRL\[2\]](#) TRIG\_SRC bit is set to 1 and the module is idle (the [VLCDJ\\_CTRL\[16\]](#) BUSY bit is set to 0), the module is started by the START signal going active. Any software write to the [VLCDJ\\_CTRL\[0\]](#) EN bit is ignored.

During encoding, encode configuration registers must not be modified by software, whereas decode configuration registers can be freely modified.

During decoding, decode configuration registers must not be modified by software, whereas encode configuration registers can be freely modified.

#### 8.4.6.4.3 JPEG Encoding

For JPEG encoding of a YUV4:2:0 image consisting of eight MCUs per task, software first composes the JPEG header, which includes image dimension, YUV4:2:0 format, Huffman tables, quantizer matrices, and the start-of-scan marker and scan header, all before the MCU data. Software then sets up the encoding task, once per image, with the procedure listed in [Table 8-1381](#).

**Table 8-1381. JPEG Encoding Procedure**

Step	Register/Bit Field	Value
Configure the encode configuration register.	<a href="#">VLCDJE_CFG[1:0]</a> FMT	0 (YUV4:2:0 mode)
	<a href="#">VLCDJE_CFG[13:8]</a> NMCUS	7 (eight MCUs)
	<a href="#">VLCDJE_CFG[2]</a> RSTEN	0 (no restart marker)
Configure the DC predictor.	<a href="#">VLCDJE_DCPREDY[11:0]</a> PREDY	0 (reset DC predictor for Y)
	<a href="#">VLCDJE_DCPREDU[11:0]</a> PREDU	0 (reset DC predictors for U)
	<a href="#">VLCDJE_DCPREDV[27:16]</a> PREDV	0 (reset DC predictors for V)
Configure the input and output memories.	<a href="#">VLCDJE_BSPTR[11:0]</a> BYTEPTR	0 (beginning of bitstream memory)
	<a href="#">VLCDJE_BSPTR[19:16]</a> BITPTR	8 (initially empty byte, thus 8 free bits)
	<a href="#">VLCDJE_CBUF[11:10]</a> START	0 (bitstream starts from beginning of first quadrant of bitstream memory)
	<a href="#">VLCDJE_CBUF[27:26]</a> END	3 (bitstream ends at end of fourth quadrant of bitstream memory)
	<a href="#">VLCDJE_DCTQM[13:4]</a> DCT	0 (DCT coefficients at beginning of image buffer)

**Table 8-1381. JPEG Encoding Procedure (continued)**

Step	Register/Bit Field	Value
Configure Huffman and quantizer memory pointers.	<a href="#">VLCDJE_DCTQM</a> [24:23] QMR	0 (quantizer matrix reciprocal at beginning of QMEM)
	<a href="#">VLCDJE_VLCTBL</a> [11:2] ADDR	0 (VLC table at beginning of HUFMEM)
Start encode with automatic ring buffer management.	<a href="#">VLCDJ_CTRL</a> [1] MODE	0 (encode mode)
	<a href="#">VLCDJ_CTRL</a> [0] EN	1 (start VLCDJ operation)

For each group of eight MCUs (the VLCDJ does not care if these MCUs cross multiple MCU rows), software sets the [VLCDJ\\_CTRL](#)[0] EN bit to 1 (restart VLCDJ operation).

Alternately, the hardware sequencer can start the VLCDJ. Usually, DMA is also configured to bring in YUV4:2:0 image data as input to DCT, and DMA, DCT, and VLCDJ are all put under control of the hardware sequencer.

Bitstream data is managed automatically between the VLCDJ and DMA throughout JPEG encoding of MCUs.

---

**NOTE:** Many registers change during the encoding of a frame, but software is not required to access these registers, because the VLCDJ manages the status information between tasks.

---

The last hardware task may require a smaller number of MCUs (the [VLCDJE\\_CFG](#)[13:8] NMCUS bit field) to adjust for the number of MCUs in the last group.

After the last VLCDJ task for the image, software must disable the automatic bitstream buffer management and prepare for the next image by setting the following values (these can be issued as a single write):

- [VLCDJ\\_CTRL](#)[6] RBEN = 0 (disable automatic DMA interaction)
- [VLCDJ\\_CTRL](#)[7] CLRRB = 1

Finally, software must pad the last data byte with bit 1s, then place an end-of-image marker after the last data byte. The [VLCDJE\\_BSPTR](#)[11:0] BYTEPTR and [VLCDJE\\_BSPTR](#)[19:16] BITPTR bit fields indicate the locations of the last data byte and bit, respectively. Software must then set up DMA to transfer out the remaining data in bitstream memory.

The number of MCUs processed by hardware per task must be set according to image buffer allocation. For example, with 8KB available for DCT coefficient memory, and YUV4:2:0 format, it is possible to process  $8K / (16 \times 16 \times 1.5 \times 2) = 10$  MCUs. Because the bitstream DMA is automatic, bitstream data does not overflow bitstream memory for this many MCUs in densely coded JPEG.

#### 8.4.6.4.4 JPEG Decoding

For JPEG decoding of an image, software first parses the JPEG header, which includes image dimension, YUV sampling, Huffman tables, quantizer matrices, and start-of-scan marker and scan header, before the MCU data. Software then sets up DMA to load bitstream data into the first half of bitstream memory.

The Huffman tables must be processed to generate hardware control tables and decode tables for a particular JPEG file, unless the Huffman tables match previously processed tables for which the hardware control and decode tables are known. The hardware control and decode tables must be transferred to HUFMEM.

If the JPEG file is YUV4:2:0, and image buffer memory is sufficient to process eight MCUs per hardware task, software must set up the decode task, once per image, with the procedure listed in [Table 8-1382](#).

**Table 8-1382. JPEG Decoding Procedure**

Step	Register/Bit Field	Value
Configure the decode configuration register.	<a href="#">VLCDJD_CFG</a> [1:0] FMT	0 (YUV4:2:0 mode)

**Table 8-1382. JPEG Decoding Procedure (continued)**

Step	Register/Bit Field	Value
Configure the DC predictor.	<a href="#">VLCDJD_CFG</a> [13:8] NMCUS	7 (eight MCUs)
	<a href="#">VLCDJD_CFG</a> [2] RSTEN	0 (no restart marker)
	<a href="#">VLCDJD_DCPREDY</a> [11:0] PREDY	0 (reset DC predictor for Y)
Configure the input and output memories.	<a href="#">VLCDJD_DCPREDUV</a> [11:0] PREDU	0 (reset DC predictors for U)
	<a href="#">VLCDJD_DCPREDUV</a> [27:16] PREDV	0 (reset DC predictors for V)
	<a href="#">VLCDJD_BSPTR</a> [11:0] BYTEPTR	0 (beginning of bitstream memory)
	<a href="#">VLCDJD_BSPTR</a> [19:16] BITPTR	8 (initially empty byte, thus 8 free bits)
Configure Huffman and quantizer memory pointers.	<a href="#">VLCDJD_CBUF</a> [11:10] START	0 (bitstream starts from beginning of first quadrant of bitstream memory)
	<a href="#">VLCDJD_CBUF</a> [27:26] END	3 (bitstream ends at end of fourth quadrant of bitstream memory)
	<a href="#">VLCDJD_DCTQM</a> [13:4] DCT	0 (DCT coefficients at the beginning of the image buffer)
	<a href="#">VLCDJD_DCTQM</a> [24:23] QMR	0 (quantizer matrix at beginning of QMEM)
	<a href="#">VLCDJD_CTRLTBL</a> [11:2] ADDR	0 (typically, control table is placed at the beginning of HUFMEM)
	<a href="#">VLCDJD_DCDTBL0</a> [11:2] TBL0	30 (typically, the first decode table follows the control table, 60 shorts = 120 bytes = 30 words)
Start decode with automatic ring buffer management.	<a href="#">VLCDJD_DCDTBL0</a> [27:18] TBL1	? (where the second decode table starts)
	<a href="#">VLCDJD_DCDTBL23</a> [11:2] TBL2	? (where the third decode table starts)
	<a href="#">VLCDJD_DCDTBL23</a> [27:18] TBL3	? (where the fourth decode table starts)
	<a href="#">VLCDJ_CTRL</a> [1] MODE	1 (decode mode)
	<a href="#">VLCDJ_CTRL</a> [0] EN	1 (start VLCDJ operation)

For each group of eight MCUs (the VLCDJ does not care if these MCUs cross multiple MCU rows), software sets the [VLCDJ\\_CTRL](#)[0] EN bit to 1 (restart VLCDJ operation).

Alternately, the hardware sequencer can start the VLCDJ, as well as control buffer switches and coordinate among the VLCDJ, DCT, and DMA.

Bitstream data is managed automatically between the VLCDJ and DMA throughout JPEG encoding of MCUs.

---

**NOTE:** Many registers change during the decoding of a frame, but software is not required to access these registers, because the VLCDJ manages the status information between tasks.

---

The last hardware task may require a smaller number of MCUs (the [VLCDJD\\_CFG](#)[13:8] NMCUS bit field) to adjust for the number of MCUs in the last group.

After the last VLCDJ task for the image, software must disable the automatic bitstream buffer management and prepare for the next image by setting the following values (these can be issued as a single write):

- [VLCDJ\\_CTRL](#)[6] RBEN = 0 (disable automatic DMA interaction)
- [VLCDJ\\_CTRL](#)[7] CLRRB = 1

Before the VLCDJ processes the next image decode, new bitstream data must be brought in, thereby overwriting the old data, and bit/byte pointers must be reset to the beginning of bitstream memory. As a result, any remaining bitstream data in bitstream memory afterward is harmless.

The number of MCUs processed by hardware per task must be set according to image buffer allocation. For example, with 16KB available for DCT coefficient memory, and YUV4:2:0 format, it is possible to process  $16K/(16 \times 16 \times 1.5 \times 2) = 21$  MCUs. Because the bitstream DMA is automatic, there is no bitstream data underrun for this many MCUs.

#### 8.4.6.4.5 Concurrent JPEG Encoding and Decoding

For concurrent decoding and encoding, the two operations are configured separately but similarly.

Half of bitstream memory is used for encoding (for example, the first half), and the rest is used for decoding. Automatic bitstream DMA does not work in this case, so the number of MCUs must accommodate the worst-case bitstream size per MCU.

Theoretically, the worst case is 16 bits of Huffman code plus 12 additional bits per coefficient, or 28 bits per coefficient. With natural images, there are typically about 8 bits per pixel when quantizers are minimal (that is, all 1s). With 16 bits per coefficient, or 768 bytes per MCU in YUV4:2:0 (this is 24 bits per pixel and three times the typical worst case), half of bitstream memory is 2KB, which can safely hold two MCUs.

In this case, half of QMEM is used for encoding and half is used for decoding. Encode and decode Huffman tables are placed so that they coexist in HUFFMEM.

The Huffman tables for encoding, decoding, and quantizer matrices must be placed accordingly in HUFMEM and QMEM. Bitstream data is filled at the second half of bitstream memory for decoding.

Register fields are configured as listed in [Table 8-1383](#).

**Table 8-1383. Concurrent JPEG Encoding and Decoding**

Step	Register/Bit Field	Value
Configure the encode register.	<a href="#">VLCDJE_CFG[1:0]</a> FMT	0 (YUV4:2:0 mode)
	<a href="#">VLCDJE_CFG[13:8]</a> NMCUS	1 (two MCUs)
	<a href="#">VLCDJD_CFG[2]</a> RSTEN	0 (no restart marker)
	<a href="#">VLCDJE_DCPREDY[11:0]</a> PREDY	0 (reset DC predictor for Y)
	<a href="#">VLCDJE_DCPREDUV[11:0]</a> PREDU	0 (reset DC predictors for U)
	<a href="#">VLCDJE_DCPREDUV[27:16]</a> PREDV	0 (reset DC predictors for V)
	<a href="#">VLCDJE_BSPTR[19:16]</a> BITPTR	8 (initially empty byte, thus 8 free bits)
	<a href="#">VLCDJE_DCTQM[13:4]</a> DCT	0 (DCT coefficients at beginning of image buffer)
Configure the decode register.	<a href="#">VLCDJD_CFG[1:0]</a> FMT	0 (YUV4:2:0 mode)
	<a href="#">VLCDJD_CFG[13:8]</a> NMCUS	1 (two MCUs)
	<a href="#">VLCDJD_CFG[2]</a> RSTEN	0 (no restart marker)
	<a href="#">VLCDJD_DCPREDY[11:0]</a> PREDY	0 (reset DC predictor for Y)
	<a href="#">VLCDJD_DCPREDUV[11:0]</a> PREDU	0 (reset DC predictors for U)
	<a href="#">VLCDJD_DCPREDUV[27:16]</a> PREDV	0 (reset DC predictors for V)
	<a href="#">VLCDJD_BSPTR[19:16]</a> BITPTR	8 (initially empty byte, thus 8 free bits)
	<a href="#">VLCDJD_DCTQM[13:4]</a> DCT	0 (DCT coefficients at the beginning of the image buffer)
Configure the byte pointer to bitstream memory.	<a href="#">VLCDJE_BSPTR[11:0]</a> BYTEPTR	0 (beginning of bitstream memory)
	<a href="#">VLCDJD_BSPTR[11:0]</a> BYTEPTR	0x800 (beginning of bitstream memory second half)
Configure the bitstream memory partition.	<a href="#">VLCDJE_CBUF[11:10]</a> START	0 (bitstream starts at beginning of first quadrant of bitstream memory)
	<a href="#">VLCDJE_CBUF[27:26]</a> END	1 (bitstream ends at end of second quadrant of bitstream memory)
	<a href="#">VLCDJD_CBUF[11:10]</a> START	2 (bitstream starts at beginning of third quadrant of bitstream memory)
	<a href="#">VLCDJD_CBUF[27:26]</a> END	3 (bitstream ends at end of fourth quadrant of bitstream memory)

**Table 8-1383. Concurrent JPEG Encoding and Decoding (continued)**

Step	Register/Bit Field	Value
Configure the quantizer matrix pointer.	VLCDJE_DCTQM[24:23] QMR	0 (quantizer matrix at beginning of QMEM)
	VLCDJD_DCTQM[24:23] QMR	2 (quantizer matrix at second half of QMEM)
Configure Huffman tables.	VLCDJE_VLCTBL[11:2] ADDR	0 (VLC table at beginning of HUFMEM)
	VLCDJD_CTRLTBL[11:2] ADDR	376 (after VLC table, 2 × (24 + 352) shorts = 376 words)
	VLCDJD_DCDBL01[11:2] TBL0	406 (after control table of 30 words)
	VLCDJD_DCDBL01[27:18] TBL1	? (where the second decode table starts)
	VLCDJD_DCDBL23[11:2] TBL2	? (where the third decode table starts)
	VLCDJD_DCDBL23[27:18] TBL3	? (where the fourth decode table starts)

Software sets the following values to start encoding:

- VLCDJ\_CTRL[1] MODE = 0 (encode mode)
- VLCDJ\_CTRL[0] EN = 1 (start VLCDJ operation)

When the VLCDJ completion interrupt is detected by software, encoding is complete and software must service the encoded bitstream data in the first half of bitstream memory, letting hardware access the second half of the bitstream for decoding. Software sets up bitstream writes to transfer the encoded bitstream from bitstream memory[0] to bitstream memory[128 × (VLCDJE\_BSPTR[11:0] BYTEPTR/128)] (rounding down to 128-byte alignment improves SDRAM efficiency). Software must identify the bitstream data already transferred out, for the next round of servicing encoded bitstream data. Software must also service to-encode input data to the DCT.

After kicking off encode DMAs, without waiting for DMA completion, software must set the following values to start VLCDJ decoding in parallel with the DMA:

- VLCDJ\_CTRL[1] MODE = 1 (decode mode)
- VLCDJ\_CTRL[0] EN = 1 (start VLCDJ operation)

When the VLCDJ completion interrupt is detected by software, decoding is complete and software must service the decoded bitstream data in the second half of bitstream memory, letting hardware access the first half of the bitstream for encoding. Software sets up bitstream writes to transfer the bitstream to be decoded from bitstream memory[0] to bitstream memory[128 × (VLCDJD\_BSPTR[11:0] BYTEPTR/128)] (rounding down to 128-byte alignment improves SDRAM efficiency). Software must identify the bitstream data already transferred in, for the next round of servicing bitstream data to be decoded. Software must also service decoded image data in the output image buffer of the DCT.

After kicking off decode DMAs, without waiting for DMA completion, software must start VLCDJ encoding in parallel with the DMA.

Software must continue to alternate between encoding and decoding until the image completes.

Figure 8-282 shows the concurrence schedule for JPEG encoding and decoding.

**Figure 8-282. Concurrence Schedule for JPEG Encoding and Decoding**

DMA in	E[0]		E[1]		E[2]		E[3]					
			D[0]		D[1]		D[2]		D[3]			
DCT		E[0]		E[1]	D[0]	E[2]	D[1]	E[3]	D[2]		D[3]	
VLCDJ			E[0]	D[0]	E[1]	D[1]	E[2]	D[2]	E[3]	D[3]		
DMA out				E[0]		E[1]		E[2]		E[3]		
					D[0]		D[1]		D[2]		D[3]	

vldcj-007

Management of bitstream I/O and image I/O is heavy in intervals of only two MCUs. It is better to run only encoding for many MCUs, switch context, and then run decoding for many MCUs.

When running JPEG transcoding, decoding a picture and re-encoding it, to adjust quantizers and/or remove/insert restart markers, it can be more efficient to run encode and decode concurrently in VLCDJ, skipping DCT and image I/O DMA altogether. In this case, software handles only bitstream data I/O, which is more manageable.

Figure 8-283 shows the concurrence schedule for JPEG transcoding.

**Figure 8-283. Concurrence Schedule for JPEG Transcoding**

DMA in	D[0]		D[1]		D[2]		D[3]			
VLCDJ		D[0]	E[0]	D[1]	E[1]	D[2]	E[2]	D[3]	E[3]	
DMA out				E[0]		E[1]		E[2]		E[3]

vldcj-008

#### 8.4.6.4.5.1 DMA and Buffer Manual Management

When the VLCDJ performs one encode and one decode concurrently, both contexts can coexist in the configuration registers, because encode and decode configurations are in separate registers. The bitstream memory must be partitioned half-and-half between encode and decode:

- `VLCDJE_CBUF[11:10] START = 0 (0x0)`
- `VLCDJE_CBUF[27:26] END = 1 (0x7FF)`
- `VLCDJD_CBUF[11:10] START = 2 (0x800)`
- `VLCDJD_CBUF[27:26] END = 3 (0xFFF)`

The byte pointers and the bitstream data DMA must be set up accordingly.

When the VLCDJ is encoding, the decode half of the bitstream memory can be refilled by DMA. When the VLCDJ is decoding, the encode half of the bitstream memory can be transferred out by DMA. Hardware does not support automatic triggering of DMA; software must submit DMA based on the byte pointer value of each context. For greater SDRAM efficiency, the DMA block must be aligned correctly. For example, the pseudocode that sets up the DMA for an encode task may appear as:

```
new_dma_ptr = VLCDJ_BSPTTR.BYTEPTR & ~0x3F; // align to 64-byte

if (new_dma_ptr > saved_dma_ptr)
{
    setup_dma(saved_dma_ptr, new_dma_ptr - saved_dma_ptr);
    // start DMA at saved_dma_ptr, length = new_dma_ptr - saved_dma_ptr
}
else // wraps around, need to DMA 2 blocks
{
    setup_dma(saved_dma_ptr, 0x800 - saved_dma_ptr);
    setup_dma(saved_dma_ptr, new_dma_ptr);
}

saved_dma_ptr = new_dma_ptr;
```

This DMA setup can be carried out concurrently with VLCDJ operation; thus, this code is executed with each encode or decode task. When the VLCDJ is encoding, software can access the decode bit/byte points to set up DMA for decoding, and vice versa.

Because hardware stalling does not work in this case, the number of MCUs must be configured so that in the worst case there is no bitstream data overrun or underrun.

The bitstream buffer can be allocated at a quarter of bitstream memory granularity, or 1KB. This allows at most four separate buffers to coexist in bitstream memory.

If multiple encode and/or decode threads are performed concurrently, software must save and restore the appropriate configuration registers. The register map has common registers in one group, encode registers in another group, and decode registers in a third group. Bitstream memory partitioning and corresponding DMA submission are left to software.

### 8.4.6.4.6 Example of YUV4:4:4 Encoding

The following pseudocode shows the general sequence involved in YUV4:4:4 encoding. Decoding can be similarly derived.

```

encode_yuv444()
{
    VLCDJ_CTRL[1] MODE = 0; /* encode */
    VLCDJE_CFG[1:0] FMT = 2; /* sequential block mode */
    VLCDJE_CFG[13:8] NMCUS = 0; /* 1 block at a time */
    pred_y = 0;
    pred_u = 0;
    pred_v = 0;

    for (i=0; i<num_mcus; i++)
    {
        VLCDJE_DCPREDY = pred_y; /* restore Y context */
        VLCDJE_DCT = DCT_Y;
        VLCDJE_QMR = QMR_Y;
        VLCDJE_VLCTBL = VLC_Y;

        VLCDJ_CTRL[0] EN = 1; /* kick off VLCDJ for Y */

        pred_y = VLCDJE_DCPREDY; /* save Y context */
        VLCDJE_DCPREDY = pred_u; /* restore U context */
        VLCDJE_DCT = DCT_U;
        VLCDJE_QMR = QMR_UV;
        VLCDJE_VLCTBL = VLC_UV;

        VLCDJ_CTRL[0] EN = 1; /* kick off VLCDJ for U */

        pred_u = VLCDJE_DCPREDY; /* save U context */
        VLCDJE_DCPREDY = pred_v; /* restore V context */
        VLCDJE_DCT = DCT_V;

        VLCDJ_CTRL[0] EN = 1; /* kick off VLCDJ for V */

        pred_v = VLCDJE_DCPREDY; /* save V context */
    }
}

```

### 8.4.6.4.7 Example of Huffman Encode and Decode Tables

#### 8.4.6.4.7.1 Huffman Encode Table

Sample JPEG Luma DC encode table:

```

unsigned short jpeg_dc_y[24] =
{
    0x0000,0x0002,0x0002,0x0003,0x0003,0x0003,0x0004,0x0003,
    0x0005,0x0003,0x0006,0x0003,0x000e,0x0004,0x001e,0x0005,
    0x003e,0x0006,0x007e,0x0007,0x00fe,0x0008,0x01fe,0x0009
};

```

**Table 8-1384** corresponds to Table 17 in the JPEG standard *ISO/IEC JTC1/SC29/WG10 Standard 10918-1 (JPEG), Information Technology – Digital Compression and Coding of Continuous-Tone Still Images – Requirements and Guidelines*.

**Table 8-1384. Sample Luma DC Huffman Code Table**

Category	Code Length	Code Word
0	2	00
1	3	010
2	3	011
3	3	100

**Table 8-1384. Sample Luma DC Huffman Code Table (continued)**

Category	Code Length	Code Word
4	3	101
5	3	110
6	4	1110
7	5	11110
8	6	111110
9	7	1111110
10	8	11111110
11	9	111111110

To code a DC coefficient value of  $-5$ :

Use  $\text{abs}(-5) = 5$  to select a size of 3. Look up the encode table to find:

- $\text{jpeg\_dc\_y}[2 \times 3] = 4$  (code)
- $\text{jpeg\_dc\_y}[2 \times 3 + 1] = 3$  (length)

Thus, the VLCDJ adds 100 to the bitstream as the Huffman code of the size.

The additional bits for negative coefficients are ones complement of the absolute value, so for  $-5$ , this is 010, or 2. After the Huffman code of the size, the VLCDJ adds 010 to the bitstream.

The AC coefficient table is the same, except that the VLCDJ uses  $16 \times \text{size} + \text{run}$  to index the encode table.

#### 8.4.6.4.7.2 Huffman Decode Tables

Sample JPEG Luma DC control and decode tables:

```
unsigned short jpeg_dc_yctl_tbl[13]=
{
    0x0000,0x0000,0x0000,0x0000,0x1800,0x2001,0x2802,0x3003,
    0x3804,0x4005,0x4806,0x4806,0x4806
};

unsigned short jpeg_dc_ydcd_tbl[14]=
{
    0x0000,0x480b,0x400a,0x3809,0x3008,0x2807,0x2006,0x1805,
    0x1804,0x1803,0x1802,0x1801,0x1000,0x1000
};
```

These tables contain the same information as [Table 8-1384](#), which complies with the JPEG standard.

## 8.4.6.5 ISS SIMCOP VLCDJ Register Manual

### 8.4.6.5.1 ISS SIMCOP VLCDJ Instance Summary

Table 8-1385 summarizes the VLDCJ instance.

**Table 8-1385. ISS SIMCOP VLCDJ Instance Summary**

Module Name	Base Address L3 Interconnect	Base Address Cortex-M3 Private Access	Size
VLCDJ	0x5202 0600	0x5506 0600	128 bytes

**NOTE:** Private Access is an access that does not use the L3/L4 interconnects.

### 8.4.6.5.2 VLCDJ Registers

#### 8.4.6.5.2.1 VLCDJ Register Summary

Table 8-1386 summarizes VLDCJ register mapping.

## 8.4.7 ISS SIMCOP Rotation Accelerator Module

This section describes the rotation accelerator (ROT) module in the still-image coprocessor (SIMCOP) subsystem.

### 8.4.7.1 ISS SIMCOP ROT Overview

The ROT module is intended to be used in the SIMCOP to perform block data rotation and data shifting from one SIMCOP local memory to another. The following formats and operations are supported:

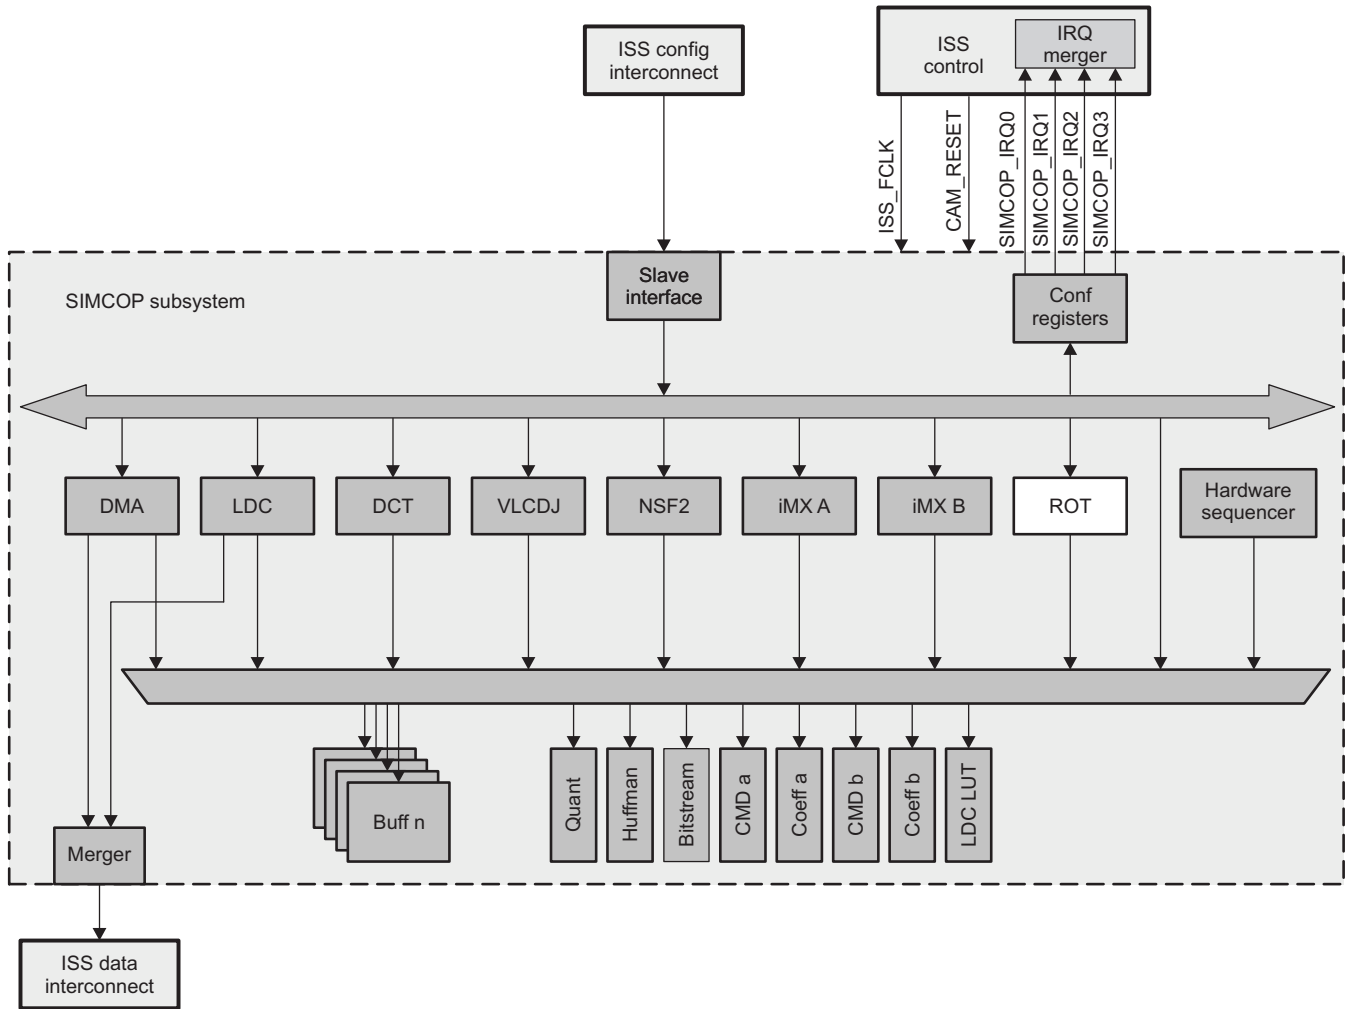

- YUV4:2:2 and generic 8-/16-/32-bit data block rotation by 90, 180, and 270 degrees
- YUV4:2:0 rotation by 90, 180, and 270 degrees
- Multiple-block rotation
- Data block shifting
- Data block horizontal circular shifting

The ROT supports a simple 1-block-per-initiation interaction, and includes a microcontroller unit (MCU) software-writable enable bit and hardware trigger signal to start the processing (see [Section 8.4.7.3.7, ISS SIMCOP ROT Synchronization](#)). It relies on external direct memory access (DMA) for transfers, and can work with the MCU or hardware sequencer to coordinate between transfer and computation.

The ROT has an input and output memory interface (see [Figure 8-286](#)). The rotation and horizontal-shifting operations read from the input memory and write to the output memory. The module connects to an input memory of up to 16KB (2048 × 64-bit), and an output memory of up to 16KB (2048 × 64-bit) using synchronous single-port memory interface.

[Figure 8-284](#) is an overview of the ROT.

Figure 8-284. ISS SIMCOP ROT Module Overview

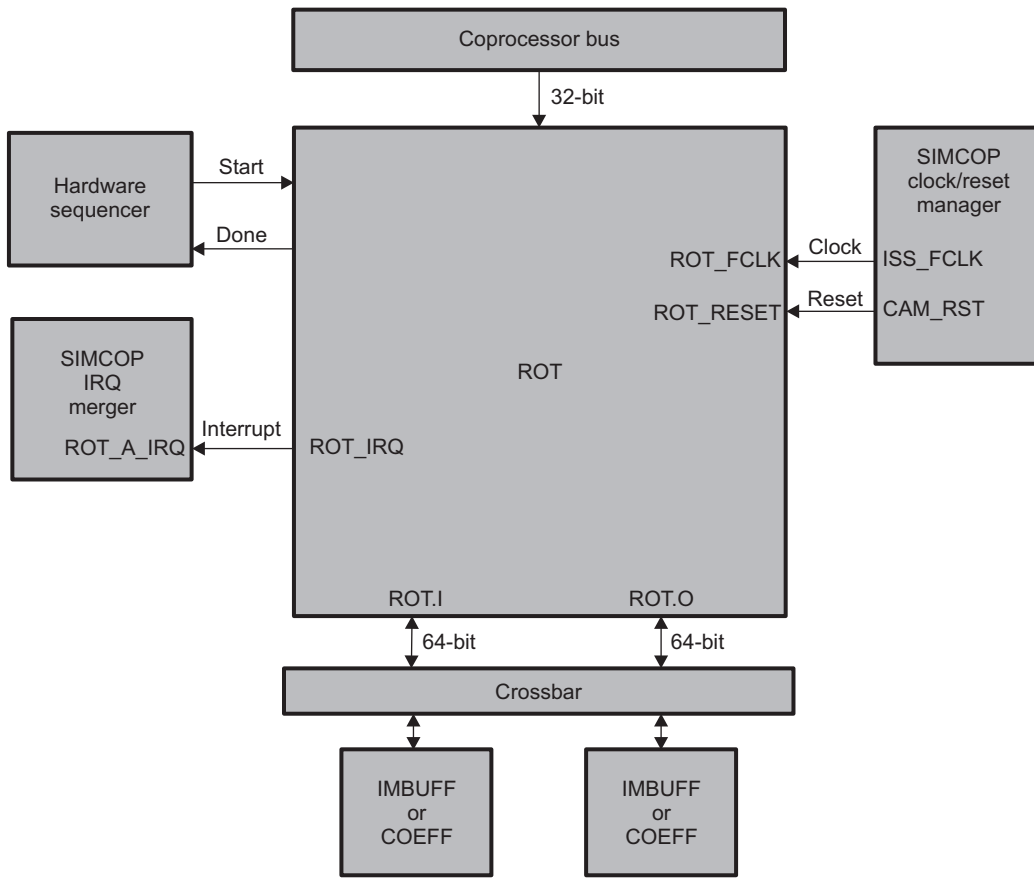

rot-001

### 8.4.7.2 ISS SIMCOP ROT Integration

The ROT is part of the SIMCOP subsystem in the imaging subsystem (ISS). [Figure 8-285](#) shows the integration of the ROT in the SIMCOP subsystem.

**Figure 8-285. ISS SIMCOP ROT Engine Integration**

rot-013

Table 8-1431 through Table 8-1433 list the integration attributes, clocks and resets, and hardware requests, respectively, of the SIMCOP ROT.

**Table 8-1431. ISS SIMCOP ROT Integration Attributes**

Module Instance	Attributes
	Power Domain
ROT	PD_CAM

**Table 8-1432. ISS SIMCOP ROT Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
ROT	ROT_FCLK	ISS_FCLK	PRCM	Functional clock provided by ISS_CLK from the power, reset, and clock management (PRCM) module. It is used by all ISS submodules and ISS top-level resources.
Resets				
ROT	ROT_RESET	CAM_RST	PRCM	ISS and SIMCOP global reset

For information about clock and reset management, see Section 8.4.1.2.1, *ISS SIMCOP Local Power and Clock Management*.

**Table 8-1433. ISS SIMCOP ROT Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
ROT	ROT_IRQ	ROT_A_IRQ	SIMCOP IRQ merger	Event triggered by the ROT engine.

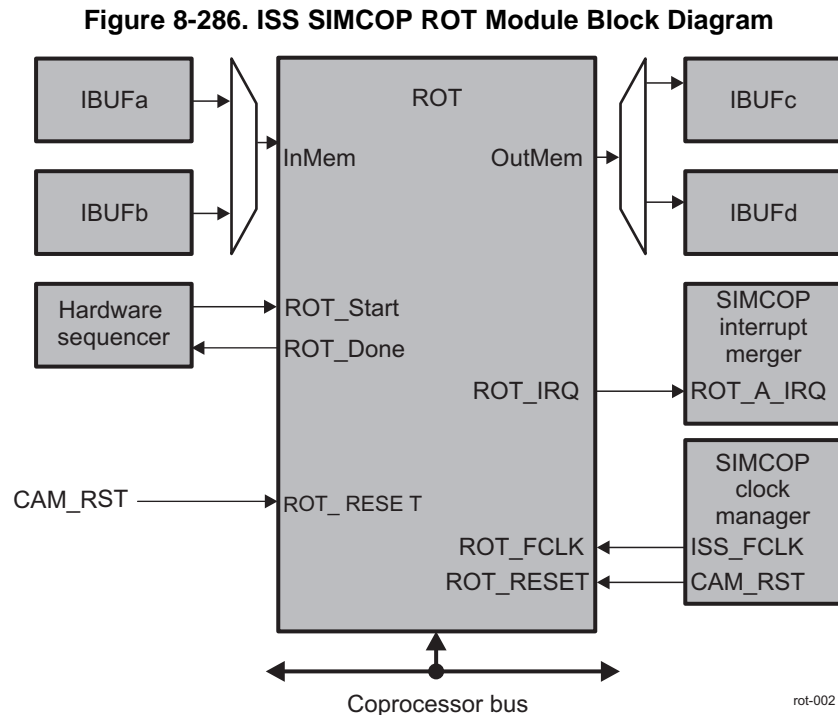

For more information about interrupt requests, see [Section 8.4.1.2.3](#), *Interrupt Merger*.

### 8.4.7.3 ISS SIMCOP ROT Functional Description

#### 8.4.7.3.1 ISS SIMCOP ROT Block Diagram

Figure 8-286 shows the block diagram of the ROT.

#### 8.4.7.3.2 ISS SIMCOP ROT Clock Configuration

The ROT receives a functional clock (ISS\_FCLK) from the ISS SIMCOP. The configuration clock is derived from the functional clock and interconnect clock enable signal (the [ROT\\_CFG\[9\]](#) AUTOGATING bit).

#### 8.4.7.3.3 ISS SIMCOP ROT Reset

The ROT receives an asynchronous hardware reset signal (CAM\_RST) from the ISS SIMCOP.

#### 8.4.7.3.4 ISS SIMCOP ROT Power Management

The ROT uses clock autogating to conserve power. When a subblock is not in use, the corresponding clock tree is gated. The [ROT\\_CFG\[9\]](#) AUTOGATING bit controls whether autogating is enabled.

#### 8.4.7.3.5 ISS SIMCOP ROT Interrupt Requests

One interrupt output line, ROT\_A\_IRQ, is used as a sideband signal of the interconnect slave port. This signal is connected to the SIMCOP interrupt merger. See [Section 8.4.1.2.3, Interrupt Merger](#).

#### 8.4.7.3.6 ISS SIMCOP ROT DMA Requests

The ROT has no DMA requests from the module.

### 8.4.7.3.7 ISS SIMCOP ROT Synchronization

The ROT has a simple one-block-per-task interaction with outside logic/microprocessor unit (MPU). The module can be started by setting the `ROT_CTRL[0]` EN bit to 0x1, or through the `ROT_START` signal of the hardware sequencer interface. When the ROT completes the specified rotation or data shift task, it sends a pulse on the `ROT_DONE` signal and, when the interrupt is enabled, sends a pulse on the `ROT_A_IRQ` interrupt output.

The `ROT_CFG[8]` TRIG\_SRC bit specifies to which source the hardware must respond:

- When the ROT is idle and the `ROT_CFG[8]` TRIG\_SRC bit is set to 0x0, hardware responds to the memory mapped register (MMR) mechanism, and any pulses on the start signal are ignored.
- When the ROT is idle and the `ROT_CFG[8]` TRIG\_SRC bit is set to 0x1, hardware responds to the hardware start signal, and any write operation to the enable bit field is ignored.

When the ROT is busy, both triggering mechanisms are ignored.

### 8.4.7.3.8 ISS SIMCOP ROT Formats and Operations

The ROT supports the formats and operations described in the following sections.

#### 8.4.7.3.8.1 ISS SIMCOP ROT YUV4:2:0 and Generic 8-/16-/32-Bit Data Block Rotation

Rotation of YUV4:2:0 and generic 8-bit, 16-bit, 32-bit data blocks is straightforward. None of the data points are altered; each data point is copied to an appropriate address location. Zero-degree rotation is included for completeness of the programming model, and involves only data copy.

When YUV4:2:0 data have separate Y and UV processing and must be separately rotated, Y data can use generic 8-bit data rotation, and UV data can use generic 16-bit data rotation.

#### 8.4.7.3.8.2 ISS SIMCOP ROT YUV4:2:2 Rotation

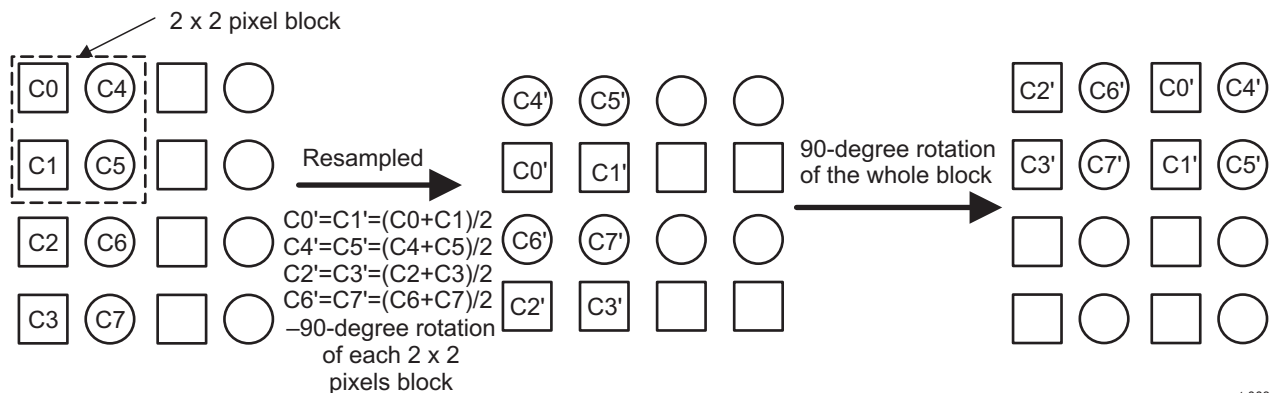

Various rotation cases of YUV4:2:2 data are described in the following and shown in [Figure 8-287](#) through [Figure 8-289](#) using 4 x 4-pixel block as an example.

The degree of rotation is defined as rotating clockwise. For 90-degree rotation:

- The two U samples in each 2 x 2-pixel input block are averaged and then replicated to provide the two U samples in the 2 x 2-pixel output block.
- V samples - processed in the same way.

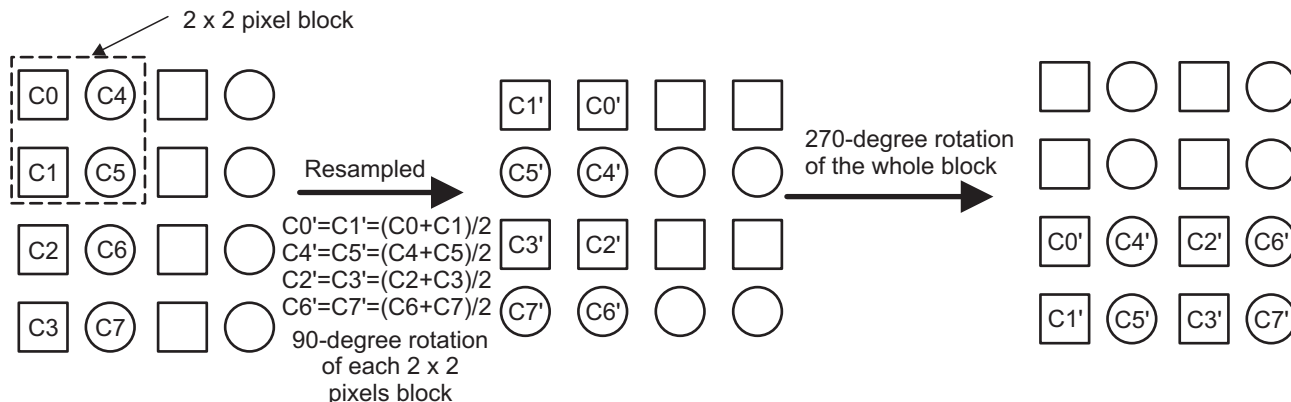

Thus, each 2N x 2N-pixel output block depends on only one 2N x 2N-pixel input block. After resampling every 2 x 2-pixel block, it is rotated -90 degrees, and then the whole 2N x 2N block is rotated 90 degrees.

**Figure 8-287. ISS SIMCOP ROT 90-Degree Rotation of YUV4:2:2 Data**

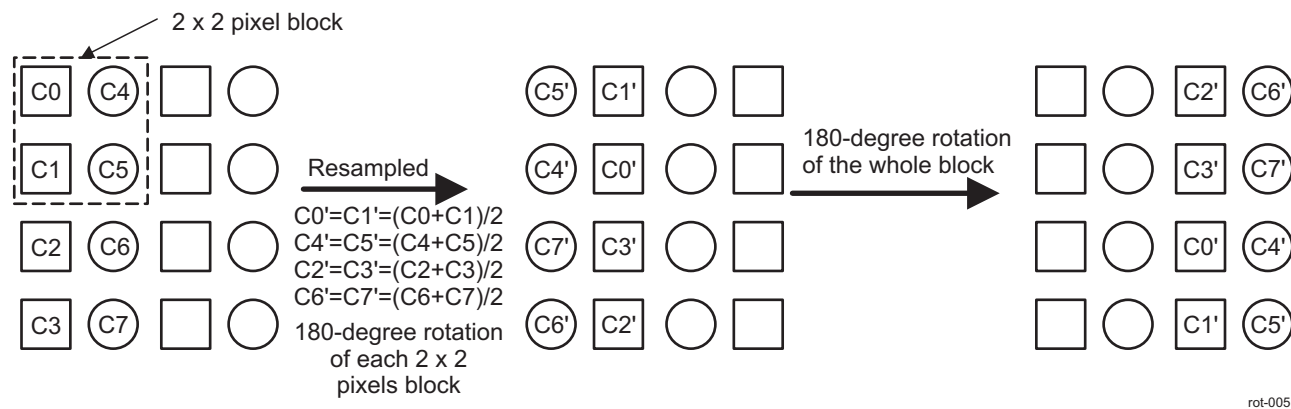

rot-003

The same algorithm is used for 270-degree rotation.

**Figure 8-288. ISS SIMCOP ROT 270-Degree Rotation of YUV4:2:2 Data**

For 180-degree rotation, there is no arithmetic operation; Chroma values are simply shifted horizontally before being rotated.

**Figure 8-289. ISS SIMCOP ROT 180-Degree Rotation of YUV4:2:2 Data**

**NOTE:** The intermediate process of 2 x 2 pixel block rotation, represented in the middle section in [Figure 8-287](#) through [Figure 8-289](#), does not involve data storage and reading into memory. This middle section is for better visualization of the process. The whole process is performed with a single memory reading and writing.

Zero-degree rotation is included for completeness of programming model, and involves only data copy.

#### 8.4.7.3.8.3 ISS SIMCOP ROT Multiple-Block Rotation

For generic 8-/16-/32-bit data rotation and YUV4:2:0/4:2:2 rotation, multiple-block operation per hardware task is supported.

[Figure 8-290](#) through [Figure 8-293](#) show the multiple-block rotation feature.

The multiple blocks are in the horizontal dimension, and the blocks are horizontally adjacent to one another. In other words, in the source data and 180-degree rotated data, address offset between blocks is the source block width times the data size.

In the 90-degree and 270-degree rotated data, address offset is the source block height times the data size. The source/destination line offsets must be sufficiently large to accommodate the multiple blocks.

**Figure 8-290. ISS SIMCOP ROT Block Representation Before Rotation**

rot-006

**Figure 8-291. ISS SIMCOP ROT 90-Degree Block Rotation**

rot-007

**Figure 8-292. ISS SIMCOP ROT 180-Degree Block Rotation**

rot-008

**Figure 8-293. ISS SIMCOP ROT 270-Degree Block Rotation**

rot-009

The operation is configured with these parameters:

- **ROT\_CFG[2:0]** OP (rotation orientation)
- **ROT\_CFG[6:4]** FMT (data format)
- **ROT\_CFG[15:12]** NBLKS (number of blocks minus 1; register value of 0 means one block, etc.)
- **ROT\_BLKSZ[11:0]** BLKW (width of each block; all blocks have the same width/height)
- **ROT\_BLKSZ[27:16]** BLKH (height of each block)
- **ROT\_SRC\_START1[13:0]** ADDR (starting address of the first input block)
- **ROT\_SRC\_LOFST[15:0]** ADDR (line offset of input block)
- **ROT\_DST\_START1[13:0]** ADDR (starting address of the first output block)
- **ROT\_DST\_LOFST[15:0]** ADDR (line offset of output block)
- **ROT\_SRC\_START2[13:0]** ADDR (starting address of the first input UV block, if format is YUV4:2:0)
- **ROT\_DST\_START2[13:0]** ADDR (starting address of the first output UV block, if format is YUV4:2:0)

#### 8.4.7.3.8.4 ISS SIMCOP ROT Data-Block Shifting

The ROT supports shifting of 2-dimensional (2D) data blocks in 8-bit granularity. This function is intended to supplement the SIMCOP DMA module, which operates on 128-bit alignment.

Figure 8-294 is an example of a 14 × 7-byte data block copied from one location in input memory to another location in output memory.

**Figure 8-294. ISS SIMCOP ROT Data-Block Shifting Example**

The following parameters are specified:

- **ROT\_BLKSZ[11:0]** BLKW = 14 (in bytes)
- **ROT\_BLKSZ[27:16]** BLKH = 7 (in rows)
- **ROT\_SRC\_LOFST[15:0]** LOFST = 24 (in bytes)
- **ROT\_DST\_LOFST[15:0]** LOFST = 16 (in bytes)

---

**NOTE:** This function can be used to shift horizontally as well as vertically.

---

#### 8.4.7.3.8.5 ISS SIMCOP ROT Data-Block Horizontal Circular Shifting

The ROT supports shifting of 2D data blocks in 8-bit granularity, with horizontal circular buffer addressing. This function is intended to supplement the SIMCOP DMA module, which operates on 128-bit alignment.

Figure 8-295 is an example of a 28 × 7-byte data block copied from one location in input memory to another location in output memory, and horizontal wrap-around occurs in the output memory.

**Figure 8-295. ISS SIMCOP ROT Horizontal Circular Shifting Example**

The following parameters are specified:

- `ROT_BLKSZ[11:0]` BLKW = 28 (in bytes)
- `ROT_BLKSZ[27:16]` BLKH = 7 (in rows)
- `ROT_SRC_LOFST[15:0]` LOFST = 32 (in bytes)
- `ROT_DST_LOFST[15:0]` LOFST = 64 (in bytes)

Wrapping around is allowed in the input memory, in the output memory, or in both. For this mode of operation, the line offset of the source and destination must be a power of 2, and at least 32 bytes. Source and destination line offsets can be different. This function is used to handle misaligned SDRAM data. The following example shows that the line offset is at least the minimal transfer width, or the SDRAM burst. For target applications, 32 bytes is the minimal burst size to support.

---

**NOTE:** This function can be used to shift horizontally as well as vertically. Input and output blocks can also have different line offsets.

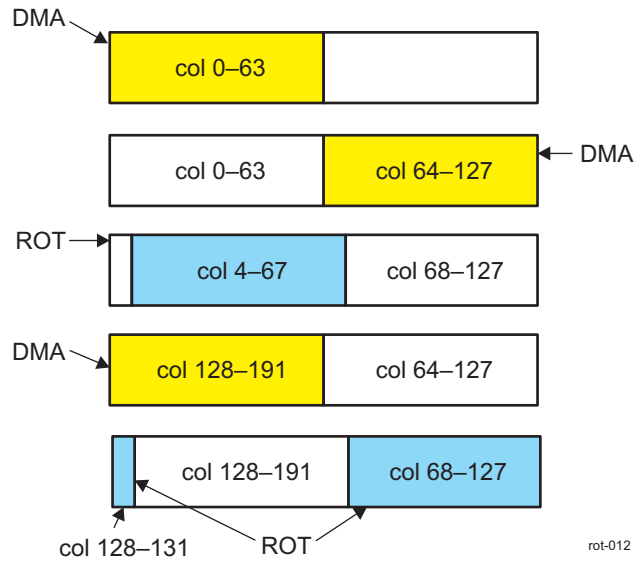

---

This mode of operation is intended to be used to manage 2D data blocks that are out of SDRAM alignment (for example, to crop out the left-most 2 pixels of the ISP YUV4:2:2 output image before JPEG compression). Assume that the ISP output is 64-byte SDRAM burst-aligned; thus, the starting address for JPEG input is 4 bytes out of alignment. Without the horizontal circular shifting function, the best solution is to use wide data blocks (for example, 128 pixels = 256 bytes wide) to reduce the bandwidth penalty of misalignment (costing five bursts to get four bursts worth of data). With horizontal circular shifting, the bandwidth penalty can be eliminated. In this example, the SIMCOP DMA is configured to transfer aligned data, and the ROT is used to perform the crop-out. A memory transaction log would be:

- The DMA writes columns 0–63, starting at byte address 0.
- The DMA writes columns 64–127, starting at byte address 64.
- The ROT module reads columns 4–67, starting at byte address 4.
- The DMA writes columns 128–191, starting at byte address 0.
- The ROT module reads columns 68–131, starting at byte address 68, and so on.

Figure 8-296 shows the data movement by the DMA and the ROT.

**Figure 8-296. ISS SIMCOP ROT Using Horizontal Circular Shifting to Manage Misaligned Data**

## 8.4.7.4 ISS SIMCOP ROT Module Programming Guide

### 8.4.7.4.1 ISS SIMCOP ROT Low-Level Programming Models

This section describes the low-level programming sequences for configuration and use of the ROT.

#### 8.4.7.4.1.1 ISS SIMCOP ROT Global Initialization

##### 8.4.7.4.1.1.1 ISS SIMCOP ROT Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the ROT is to be used for the first time after a device reset. Initialization of surrounding modules is based on the integration and environment of the module.

[Table 8-1434](#) describes the global initialization of the surrounding modules.

**Table 8-1434. ISS SIMCOP ROT Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
SIMCOP (clock management)	The ROT functional clock must be enabled. See <a href="#">Section 8.4.7.3.2, ISS SIMCOP ROT Clock Configuration</a> .
SIMCOP (power management)	The ROT must be enabled (SIMCOP_CLKCTRL[7] ROT_A). See <a href="#">Section 8.4.1.2.1, ISS SIMCOP Local Power and Clock Management</a> .
Buffers	Configure the ROT access to the image buffer inside the SIMCOP_HWSEQ_STEP_SWITCH_i register. See <a href="#">Section 8.4.2, ISS SIMCOP Hardware Sequencer and Buffers Module</a> .
SIMCOP IRQ merger	Configure SIMCOP to handle the ROT interrupts. See <a href="#">Section 8.4.1.2.3, Interrupt Merger</a> .
SIMCOP hardware sequencer	Configure the hardware sequencer to activate the ROT. See <a href="#">Section 8.4.2, ISS SIMCOP Hardware Sequencer and Buffers Module</a> .

##### 8.4.7.4.1.1.2 ISS SIMCOP ROT Global Initialization

[Table 8-1435](#) describes the global initialization of the ROT.

**Table 8-1435. ISS SIMCOP ROT Global Initialization of the ROT**

Step	Register/Bit Field/Programming Model	Value
Enable the ROT.	ROT_CTRL[0] EN	0x0

##### 8.4.7.4.1.2 ISS SIMCOP ROT Operational Modes Configuration

###### 8.4.7.4.1.2.1 ISS SIMCOP ROT Rotation

The proper value for the trigger source bit (ROT\_CFG[8] TRIG\_SRC) is set depending on whether the operation is to be triggered by software, writing to MMR, or by the hardware sequencer. [Table 8-1436](#) lists the procedure to set the value of the trigger source bit.

**Table 8-1436. ISS SIMCOP ROT Trigger Source Bit Value**

Step	Register/Bit Field/Programming Model	Value
Configure the degree of rotation.	ROT_CFG[2:0] OP	xxx
Configure the data format.	ROT_CFG[6:4] FMT	xxx
Specify the block width and height.	ROT_BLKSZ[11:0] BLKW ROT_BLKSZ[27:16] BLKH	xxx
Specify the input and output starting addresses.	ROT_SRC_START1[13:0] ADDR, ROT_DST_START1[13:0] ADDR	xxx
Specify the line offsets.	ROT_SRC_LOFST[15:0] LOFST, ROT_DST_LOFST[15:0] LOFST	xxx

**Table 8-1436. ISS SIMCOP ROT Trigger Source Bit Value (continued)**

Step	Register/Bit Field/Programming Model	Value
For UV data of YUV4:2:0, input and output second starting addresses.	<a href="#">ROT_SRC_START2</a> [13:0] ADDR, <a href="#">ROT_DST_START2</a> [13:0] ADDR	xxx

**8.4.7.4.1.2.2 ISS SIMCOP ROT Data-Block Shifting**

[Table 8-1437](#) lists the bit field values for data-block shifting.

**Table 8-1437. ISS SIMCOP ROT Data-Block Shifting**

Step	Register/Bit Field/Programming Model	Value
Configure shifting.	<a href="#">ROT_CFG</a> [2:0] OP	xxx
Set the data shifting block.	<a href="#">ROT_CFG</a> [6:4] FMT	xxx
Specify the block width and height.	<a href="#">ROT_BLKSZ</a> [11:0] BLKW, <a href="#">ROT_BLKSZ</a> [27:16] BLKH	xxx
Specify the input and output starting addresses.	<a href="#">ROT_SRC_START1</a> [13:0] ADDR, <a href="#">ROT_DST_START1</a> [13:0] ADDR	xxx
Specify the line offsets.	<a href="#">ROT_SRC_LOFST</a> [15:0] LOFST, <a href="#">ROT_DST_LOFST</a> [15:0] LOFST	xxx

Once the input data and output buffer are available, the [ROT\\_CTRL](#)[0] EN bit is set to 1 to trigger the operation through software. Alternatively, DMA transfer(s) and the hardware sequencer are configured to trigger the ROT with the hardware start signal when appropriate.

## 8.4.7.5 ISS SIMCOP ROT Register Manual

### 8.4.7.5.1 ISS SIMCOP ROT Instance Summary

Table 8-1438 lists the ROT instance.

**Table 8-1438. ISS SIMCOP ROT Instance Summary**

Module Name	Base Address L3 Interconnect	Base Address Cortex-M3 Private Access	Size
ROT	0x5202 0700	0x5506 0700	64 bytes

**NOTE:** Private Access is an access that does not use the L3/L4 interconnects.

### 8.4.7.5.2 ISS SIMCOP ROT Registers

#### 8.4.7.5.2.1 ISS SIMCOP ROT Register Summary

Table 8-1439 summarizes the ROT registers.

**Table 8-1439. ROT Register Mapping Summary**

Register Name	Type	Register Width (Bits)	Address Offset	Physical Address L3 Interconnect	Physical Address Cortex-M3 Private Access
<a href="#">ROT_REVISION</a>	R	32	0x0000 0000	0x5202 0700	0x5506 0700

## **Face Detect**

---

---

---

This chapter describes the features and functions of the Face Detect (FDIF) module of the multimedia device.

<b>Topic</b>	<b>Page</b>
<b>9.1 Face Detect Overview .....</b>	<b>2454</b>
<b>9.2 FDIF Integration .....</b>	<b>2456</b>
<b>9.3 FDIF Functional Description .....</b>	<b>2458</b>
<b>9.4 FDIF Programming Guide .....</b>	<b>2462</b>
<b>9.5 FDIF Register Manual .....</b>	<b>2465</b>

## 9.1 Face Detect Overview

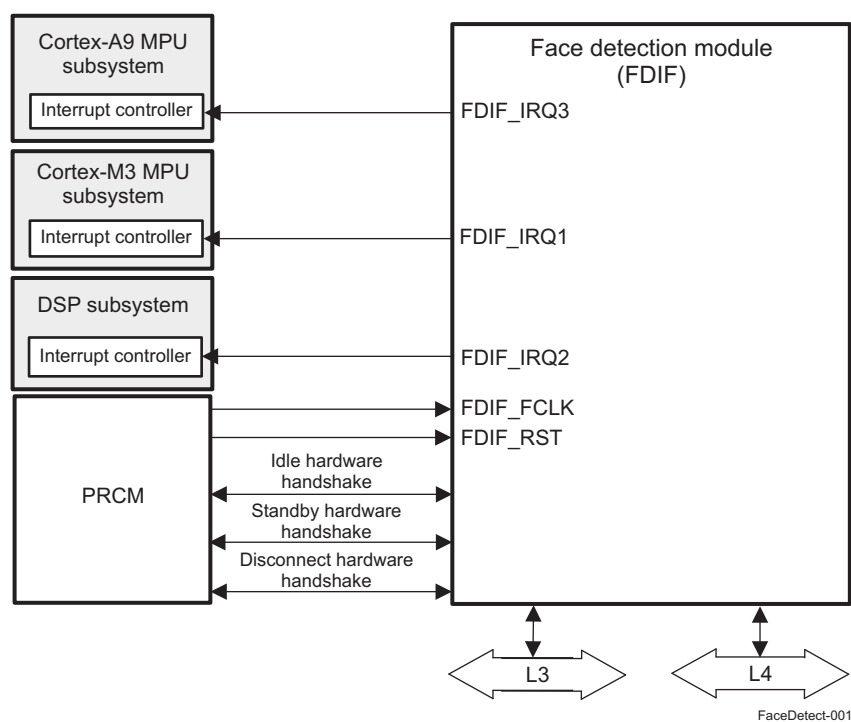

The FDIF module performs face detection within a picture stored in memory (QVGA luminance data resolution). This module is typically used for video encoding and face-based priority auto-focusing.

The face detect (FD) core is a standalone module: it embeds its own direct memory access (DMA) engine for accessing data in memory. The FD core is under microprocessor unit (MPU) control for its initialization and to start the processing operation.

The FD core supports single input resolution (QVGA) in a single format (8-bit luma). The FD core requires the input image to be stored in synchronous dynamic random access memory (SDRAM). The core also requires working memory mapped in SDRAM. The input image data (320x240) requires 75KB for the SDRAM and 51.25KB for the working memory.

Figure 9-1 is an overview of the FDIF. Three interrupt lines go to the three central processing units (CPUs) to allow control of the FD core module by different processors, but only one interrupt at a time can be active. The three interrupt lines provide flexibility for controlling the module.

**Figure 9-1. Face Detect Highlight**

### 9.1.1 Main Features

The FDIF has the following features:

- Two interconnects interface:
  - 32-bit-wide level 4 (L4) interface for register configuration
  - 32-bit-wide level 3 (L3) interface for command
- Supports the IDLE, STANDBY, and DISCONNECT protocols
- 3rd party IP features: For information about the input image features and detection capabilities, see [Table 9-1](#).

**Table 9-1. 3rd Party IP Features**

Items	Description
Input image size	QVGA input image size H x V = 320 x 240

**Table 9-1. 3rd Party IP Features (continued)**

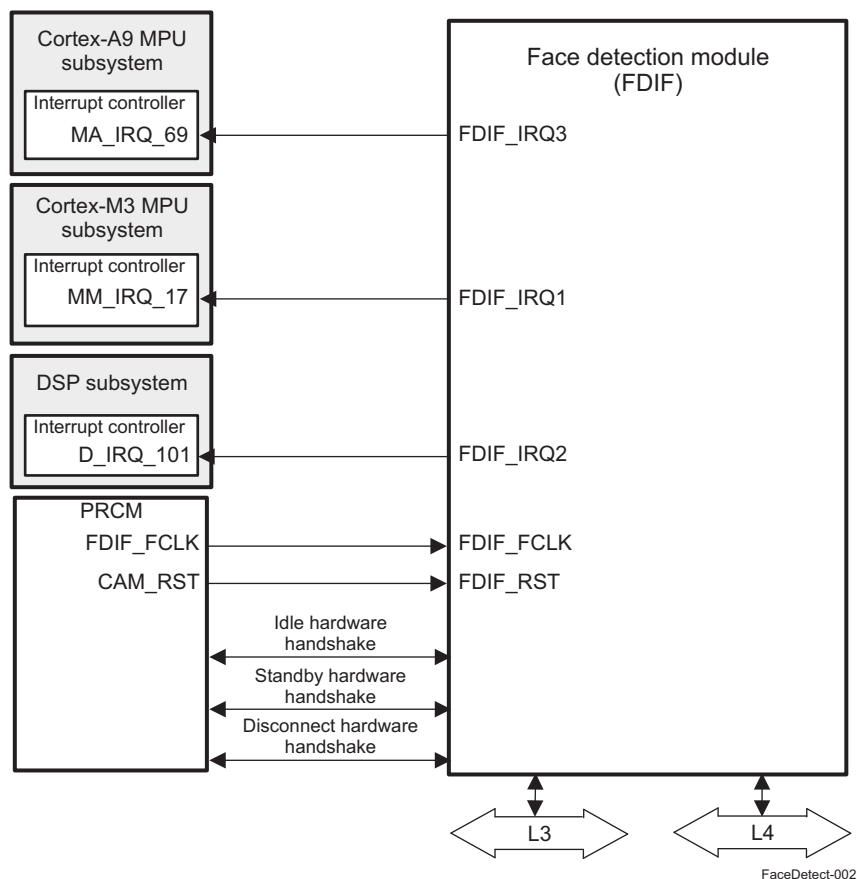

<b>Items</b>	<b>Description</b>
Input data format	8-bit gray scale data in little-endian format (color pictures must be converted before FD can be applied) 0x00 = black and 0xFF = white
Face inclination	± 45 degrees
Face direction	Up/down: ± 30 degrees Left/right: ± 60 degrees
Maximum detection count	35 faces
Detection direction	The face orientation must be selected from the following possibilities: 0 degrees: Faces are vertical. + 90 degrees: Faces are rotated right by 90 degrees. – 90 degrees: Faces are rotated left by 90 degrees.
Detection minimum face size	Four grades are available: 20 pixels 25 pixels 32 pixels 40 pixels
Detection area	Detection start position: X = 0 to 160 Y = 0 to 120 Detection area size: X = 160 to 320 Y = 120 to 240
Detection result	The following information is provided by the module for each face: Size Position Angle Confidence level

## 9.2 FDIF Integration

This section describes the integration of FDIF in the device, including information about clocks, resets, and hardware requests.

Figure 9-2 shows the integration of the module in the device.

**Figure 9-2. FDIF Integration**

**NOTE:** For more information about the IDLE, STANDBY, and DISCONNECT hardware handshakes, see [Chapter 3, Power, Reset, and Clock Management](#).

[Table 9-2](#) through [Table 9-4](#) summarize the integration of the module in the device. For more information about the power domain or the clock and reset signals, see [Chapter 3, Power, Reset, and Clock Management](#).

**Table 9-2. Integration Attributes**

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
Face Detect	PD_CAM	No	L3

**Table 9-3. Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description

**Table 9-3. Clocks and Resets (continued)**

Module Instance	Destination Signal Name	Source Signal Name	Source	Description
Face detect	FDIF_FCLK	FDIF_FCLK	PRCM	For information about PRCM clock gating and management, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
<b>Resets</b>				
Face detect	FDIF_RST	CAM_RST	PRCM	For information about PRCM reset sources and distribution, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .

**Table 9-4. Hardware Requests**

<b>Interrupt Requests</b>				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
Face detect	FDIF_IRQ3	MA_IRQ_69	Cortex™-A9 MPU subsystem	FDIF interrupt to the Cortex-A9 MPU subsystem
Face detect	FDIF_IRQ1	MM_IRQ_17	Cortex™-M3 MPU subsystem	FDIF interrupt to the Cortex-M3 MPU subsystem
Face detect	FDIF_IRQ2	D_IRQ_101	DSP subsystem	FDIF interrupt to the digital signal processor (DSP) subsystem
<b>No DMA Requests</b>				

**NOTE:** For more information about interrupt sources, see [Section 9.3.4, Interrupts and Events](#).

## 9.3 FDIF Functional Description

### 9.3.1 FDIF Block Description

The FDIF is a standalone module. It has a port connected to the L4 interconnect, which is used for configuration, and a port connected to the L3 interconnect, which is used to read and write data to the system memory.

#### CAUTION

These ports are accessible only in 32 bits.

The FDIF core contains the following submodules:

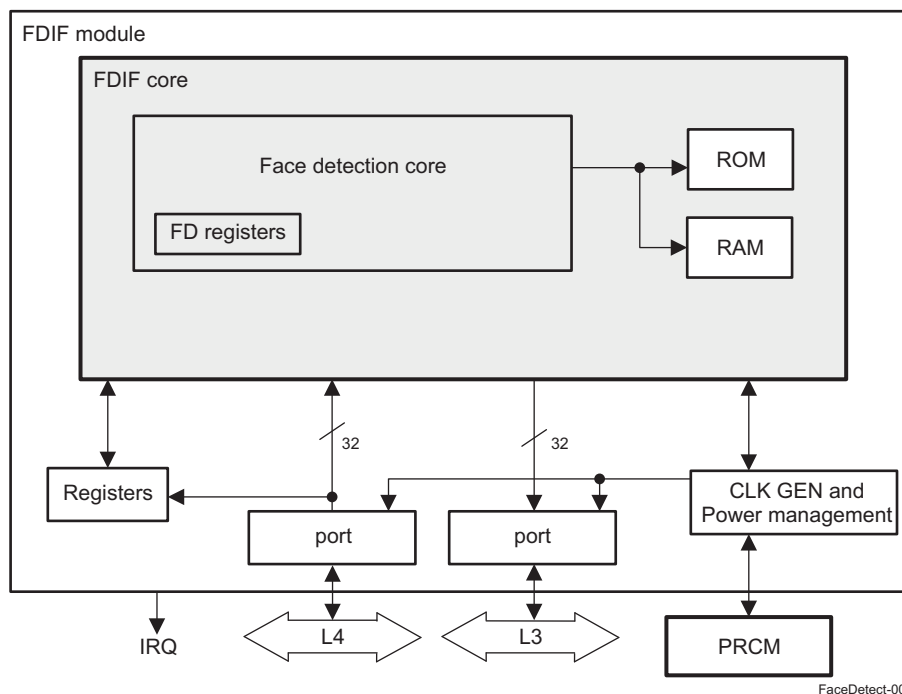

- Face detection (FD) IP core
- RAM and ROM memories

The FDIF module wraps the FD core for integration in the device. The following submodules are added:

- Clock generation
- Interrupt generation
- Power management
- L3 and L4 interface ports: Two ports required to decorrelate the FDIF clocks from other system clocks, one on the L3 port interface, and one on the L4 port interface.

Figure 9-3 shows the overall architecture of the FDIF.

**Figure 9-3. FDIF Block Diagram**

### 9.3.2 Software Reset

The module is reset by writing the `FDIF_SYSCONFIG[0]` SOFTRESET bit to 1. The bit is automatically reset by hardware. During reads, it always returns 0.

The FD core also provides a software reset setup by the `FD_CTRL[0]` SRST bit, but it is strongly recommended to use only the `FDIF_SYSCONFIG[0]` SOFTRESET bit.

### 9.3.3 System Power Management

There is one clock domain in FDIF: the L4 port domain and L3 port domain are synchronized with the module functional clock domain, FDIF\_FCLK.

Table 9-5 lists the power-management features available for FDIF.

**NOTE:**

- For more information about source clock gating, see [Chapter 3, Power, Reset, and Clock Management](#).
- For descriptions of idle mode and standby mode and the power, reset, and clock management (PRCM) power handshake, see [Chapter 3, Power, Reset, and Clock Management](#).

**Table 9-5. Local Power-Management Features**

Feature	Registers	Description
Clock autogating	No software control for it.	It is always enabled.
Slave idle modes	FDIF_SYSCONFIG[3:2] IDLEMODE	Force-idle, no-idle, and smart-idle modes are available
Clock activity	N/A	
Master standby modes	FDIF_SYSCONFIG[5:4] STANDBYMODE	Force-standby, no-standby, and smart-standby mode modes are available. See <a href="#">Section 9.3.3.2.1</a> for more information.
Global wake-up enable	N/A	
Wake-up sources enable	N/A	

#### 9.3.3.1 Autogating

The FDIF performs clock autogating whenever possible. There is no software control for it; it is always enabled.

#### 9.3.3.2 PRCM Hardware Handshake

The FDIF supports the IDLE protocol between the L4 port and the PRCM module and the STANDBY protocol between the L3 port and the PRCM module. The FDIF also supports the DISCONNECT protocol on the L4 and L3 ports.

The FDIF first initiates the STANDBY protocol with the PRCM module, which in turn generates the IDLE protocol with the FDIF. The functional clock is gated by the PRCM module only when the IDLE and STANDBY power-management protocols are complete.

For more information about these protocols, see [Chapter 3, Power, Reset, and Clock Management](#).

##### 9.3.3.2.1 Protocol Transitions

The FDIF goes to IDLE as soon as it is done processing and the MPU has read the results of the computation.

[Figure 9-4](#) shows the principle. The 33-ms period corresponds to 30 fps, which is usually the target for imaging applications. Time spent in READ state (= ON state) is always the same, and the time in OFF state depends on the time spent in ON state.

**Figure 9-4. FDIF Power-Management Transitions**

FaceDetect-004

### 9.3.3.2.1.1 Normal Mode to Idle Mode

Software programs `FDIF_SYSCONFIG[5:4] STANDBYMODE = 0x2` to program the power-management mode.

When its processing is complete, the FD core generates the `FINISH_IRQ` event. At this time the `FD_CTRL[1] RUN` bit reflects that the FD core is idle.

Software running on the MPU reads the results of the FD algorithm. When it finishes reading the results, it clears the `FDIF_IRQSTATUS_RAW_j[8] FINISH_IRQ` bit and writes `FDIF_CTRL[5] MSTANDBY = 1` to initiate the MStandby signal generation. For more information about the STANDBY and IDLE hardware handshakes, see [Chapter 3, Power, Reset, and Clock Management](#).

The FDIF clock can be gated only when the STANDBY and IDLE protocols are complete.

### 9.3.3.2.1.2 Idle Mode to Normal Mode

The PRCM module deasserts a signal to the FDIF under software control so that the module can switch back to normal mode. Then, the module functional clock is ensured and stable. Software disables the MStandby signal generation by writing `FDIF_CTRL[5] MSTANDBY = 0`, and then polls for `FDIF_CTRL[6] MSTANDBY_HDSHK = 1` to ensure that the power-management handshaking is complete. For more information about the standby and idle modes, see [Chapter 3, Power, Reset, and Clock Management](#).

## 9.3.4 Interrupts and Events

The FDIF has three interrupt lines (`FDIF_IRQ1`, `FDIF_IRQ2`, and `FDIF_IRQ3`) to enable flexibility for controlling the module. Each event can be enabled to only a single interrupt line (that is, to only one interrupt controller), because only one interrupt at a time can be active.

The FDIF generates events listed in [Table 9-6](#). An interrupt can be enabled by using the `FDIF_IRQENABLE_SET_j` register and can be disabled by using the `FDIF_IRQENABLE_CLR_j` register.

**Table 9-6. Interrupts and Events Description**

Event Name	Description
<code>FDIF_IRQSTATUS_RAW_j / FDIF_IRQSTATUS_j[8] FINISH_IRQ</code>	This event is generated by the FD IP core. It flags the completion of the processing by the IP.
<code>FDIF_IRQSTATUS_RAW_j / FDIF_IRQSTATUS_j[0] ERR_IRQ</code>	This event flags that the L3 port has received an error.

The [FDIF\\_IRQSTATUS\\_RAW\\_j](#) and [FDIF\\_IRQSTATUS\\_j](#) registers give the interrupt status. The difference between them is that the [FDIF\\_IRQSTATUS\\_RAW\\_j](#) register is set even if events are not enabled.

The [FDIF\\_IRQSTATUS\\_j](#) register can be used to clear events.

### 9.3.5 Typical Use

Typically, FD processing is applied to buffers provided by the ISP module, already in the correct format.

To enable FD processing, the 32-bit address of the input image in memory must be set up in the [FDIF\\_PICADDR](#) register, and the 32-bit address of the working memory must be set up in the [FDIF\\_WKADDR](#) register.

The detection condition settings can be set with the following registers:

- [FD\\_DCOND](#)
- [FD\\_STARTX](#)
- [FD\\_STARTY](#)
- [FD\\_SIZEX](#)
- [FD\\_STARTY](#)

For more information, see [Section 9.4, FDIF Programming Guide](#).

When the [FD\\_CTRL\[1\]](#) RUN bit is set to 1, the process starts. When the process is complete ([FD\\_CTRL\[2\]](#) FINISH = 1), the results are available in the following registers:

- [FD\\_DNUM](#)
- [FD\\_CENTERX\\_j](#)
- [FD\\_CENTERY\\_j](#)
- [FD\\_CONFSIZE\\_j](#)
- [FD\\_ANGLE\\_j](#)

For more information, see [Section 9.4, FDIF Programming Guide](#).

### 9.3.6 Performance Parameters

[Table 9-7](#) lists the register settings that affect performance.

**Table 9-7. Performance Parameters**

Parameter	Comments
<a href="#">FD_DCOND[1:0]</a> MIN	Sets the minimum face size. The permitted values are 20x20, 25x25, 32x32, and 40x40. A high value leads to higher performance.
<a href="#">FD_DCOND[3:2]</a> DIR	Sets the detection direction setting. The permitted values are UP, RIGHT, and LEFT. The UP value should lead to better performance than RIGHT and LEFT.
<a href="#">FD_LHIT[3:0]</a> LHIT	Sets the detection threshold. The permitted values are in the range of 0 to 9. A low value increases the FD probability detection, but it also increases false detections.

### 9.3.7 L3 Interconnect Parameters

The FDIF is an initiator on the L3 interconnect. L3 accesses can be configured with the [FDIF\\_CTRL\[4:1\]](#) MAX\_TAGS bit field and the [FDIF\\_CTRL\[0\]](#) WRNP bit. For more information about these parameters, see [Section 13.2 L3 interconnect](#).

## 9.4 FDIF Programming Guide

### 9.4.1 FDIF Low-level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the FDIF.

#### 9.4.1.1 Global Initialization

##### 9.4.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the FDIF is to be used for the first time after a device reset. This initialization of the surrounding modules is based on the integration of the FDIF.

For more information, see [Section 9.2, FDIF Integration](#).

**Table 9-8. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	FDIF_FCLK functional clock must be enabled. See <a href="#">Section 3.6.22, CD_CAM Clock Domain</a> , in <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Cortex-A9 MPU interrupt controller (INTC) (or Cortex-M3 MPU INTC or DSP INTC)	The Cortex-A9 MPU (or Cortex-M3 MPU or DSP) interrupt controller must be configured to enable the interrupt request generation to the Cortex-A9 MPU (or Cortex-M3 MPU or DSP) subsystem when interrupt requests are generated by the FDIF. See the respective Functional Description in <a href="#">Chapter 17, Interrupt Controller</a> , for the MPUs <a href="#">Section 17.4.1</a> , <a href="#">Section 17.4.2</a> , and the DSP interrupt request lines in <a href="#">Chapter 5, DSP Subsystem</a> , for the DSP.
Interconnect (L3 and L4)	For more information, see <a href="#">Section 13.2, L3 Interconnect</a> , and <a href="#">Section 13.3, L4 Interconnect</a> .

##### 9.4.1.1.2 FDIF Global Initialization

###### 9.4.1.1.2.1 Main Sequence – FDIF Global Initialization

[Table 9-9](#) lists the procedure to initialize the FDIF after a power-on or software reset.

**Table 9-9. FDIF Global Initialization**

Step	Register/Bit Field/Programming Model	Value
Perform a software reset.	FDIF_SYSCONFIG[0] SOFTRESET	0x1
Wait until reset is finished.	FDIF_SYSCONFIG[0] SOFTRESET	0x0
Set the maximum interconnect tags.	FDIF_CTRL[4:1] MAX_TAGS	0xA
Enable ERROR type Interrupt.	FDIF_IRQENABLE_SET_j[0] ERR_IRQ	0x1

## 9.4.1.2 FD Operational Modes Configuration

### 9.4.1.2.1 FD Processing Modes

#### 9.4.1.2.1.1 Main Sequence – FDIF Polling Method

Step	Register/Bit Field/Programming Model	Value
Set image parameters.	See <a href="#">Section 9.4.1.2.1.3, Subsequence – Set Image Parameters.</a>	
Request the processing.	FD_CTRL[1] RUN	0x1
Wait until process is finished.	FD_CTRL[2] FINISH	0x1
Read the results.	See <a href="#">Section 9.4.1.2.1.4</a>	

#### 9.4.1.2.1.2 Main Sequence – FDIF Interrupt Method

Step	Register/Bit Field/Programming Model	Value
Set image parameters.	See <a href="#">Section 9.4.1.2.1.3, Subsequence – Set Image Parameters.</a>	
Enable FINISH type interrupt.	FDIF_IRQENABLE_SET_j[8] FINISH IRQ	0x1
Request the processing.	FD_CTRL[1] RUN	0x1

#### WHEN INTERRUPT OCCURS:

Step	Register/Bit Field/Programming Model	Value
IF: This is FD Process Complete Event?	FDIF_IRQSTATUS_j[8] FINISH_IRQ	0x1
Clear (Disable) FINISH type interrupt.	FDIF_IRQENABLE_CLR_j[8] FINISH IRQ	0x1
Read the results	See <a href="#">Section 9.4.1.2.1.4, Subsequence – Read the Results.</a>	
<b>ELSE</b>		
Clear (Disable) ERROR type Interrupt.	FDIF_IRQENABLE_CLR_j[0] ERR_IRQ	0x1
Perform a software reset.	FDIF_SYSCONFIG[0] SOFTRESET	0x1
For possible errors and the explanations of them, see <a href="#">Chapter 13, Interconnect.</a>		
<b>ENDIF</b>		

#### 9.4.1.2.1.3 Subsequence – Set Image Parameters

Step	Register/Bit Field/Programming Model	Value
Set input image 32-bit address.	FDIF_PICADDR[31:5] ADDR	0x----
Set working memory 32-bit address.	FDIF_WKADDR[31:5] ADDR	0x----
Set the minimum face size.	FD_DCOND[1:0] MIN	0x-
Set the face direction.	FD_DCOND[3:2] DIR	0x-
Set the horizontal start position of the detection area.	FD_STARTX[7:0] STARTX	0x-
Set the vertical start position of the detection area.	FD_STARTY[6:0] STARTY	0x-
Set the horizontal start size of the detection area.	FD_SIZEX[8:0] SIZEX	0x-
Set the vertical start size of the detection area.	FD_SIZEY[7:0] SIZEY	0x-
Set the detection threshold.	FD_LHIT[3:0] LHIT	0x-

#### 9.4.1.2.1.4 Subsequence – Read the Results

Step	Register/Bit Field/Programming Model	Value
Read the number of found faces	<a href="#">FD_DNUM</a> [5:0] DNUM	0x-
For each face detected, read the following parameters by processing loop until <a href="#">FD_DNUM</a> [5:0] DNUM = 0:		
For each face read X <sub>i</sub> coordinate	<a href="#">FD_CENTERX<sub>i</sub></a> [8:0] CENTERX	0x-
For each face read Y <sub>i</sub> coordinate	<a href="#">FD_CENTERY<sub>i</sub></a> [7:0] CENTERY	0x-
For each face read confidence level	<a href="#">FD_CONFSIZE<sub>i</sub></a> [11:8] CONF	0x-
For each face read size <sub>i</sub>	<a href="#">FD_CONFSIZE<sub>i</sub></a> [7:0] SIZE	0x-
For each face read the angle	<a href="#">FD_ANGLE<sub>i</sub></a> [8:0] ANGLE	0x-

## 9.5 FDIF Register Manual

### 9.5.1 FDIF Instance Summary

Table 9-10 is the FDIF instance.

**Table 9-10. FDIF Instance Summary**

Module Name	Base Address	Size
FDIF	0x4A10 A000	4 KB

### 9.5.2 FDIF Registers

Table 9-11 summarizes the FDIF register mapping. Table 9-12 through Table 9-54 describe the register bits.

#### 9.5.2.1 FDIF Register Summary

RESERVED																MSTANDBY_HDSHK	MSTANDBY	MAX_TAGS				WRNP									

Bits	Field Name	Description	Type	Reset
31:7	RESERVED	Reserved	R	0x0000000
6	MSTANDBY_HDSHK	<p>MStandby / Wait power management handshaking status bit</p> <p>The power management framework of the FDIF module is based on the handshaking of the MSTANDBY and WAIT signals. When going from a idle to normal power management transition, the software polls for <a href="#">FDIF_CTRL.MSTANDBY_HDSHK = 1</a> before starting the face detection processing.</p> <p>Read 0x0: Handshaking not completed. Do not initiate traffic on L3.</p> <p>Read 0x1: Handshaking completed. Can safely use the FDIF module.</p>	R	0
5	MSTANDBY	<p>MStandby signal generation. This bit shall be set to initiate a power management transition from NORMAL to IDLE or IDLE to NORMAL.</p> <p>0x0: Write: Clear MStandby signal. One polls <a href="#">FDIF_CTRL.MSTANDBY_HDSHK = 1</a> after writing this bit to ensure that the power management handshaking is completed.</p> <p>0x1: Write: Asserts MStandby signal</p>	RW	1
4:1	MAX_TAGS	<p>Max interconnect tags. This bit field sets the maximum number of interconnect tags that the module shall use. This number is programmable between 1 (<math>MAX\_TAGS = 0</math>) and <math>FDIF\_TAGS</math> (<math>MAX\_TAGS = FDIF\_TAGS - 1</math>). The value of <math>MAX\_TAGS</math> is reflected in the <math>FIDIF\_HWINFO</math> register setting. This register setting is expected to have impact on performance. It shall be set once at initialization. Higher value will give more bandwidth to the initiator. Lower value will give less bandwidth to the initiator. This value shall be set as low as possible such that other system initiators are not penalized.</p>	RW	0xF
0	WRNP	<p>L3 port non-posted write control. Dynamic usage of this feature is not supported. This bit shall be set at initialization and not modified hereafter until the processing is completed. When non-posted writes are used, tags shall be used for best performance (<math>MAX\_TAGS &gt; 1</math>).</p> <p>0x0: All writes are non posted</p> <p>0x1: All writes are posted</p>	RW	0

## Display Subsystem

---

---

---

This chapter describes the display subsystem (DSS) for the device.

Topic	Page
<b>10.1 Display Subsystem Overview .....</b>	<b>2481</b>
<b>10.2 Display Controller .....</b>	<b>2503</b>
<b>10.3 MIPI Display Serial Interface .....</b>	<b>2752</b>
<b>10.4 High-Definition Multimedia Interface .....</b>	<b>2943</b>
<b>10.5 Remote Frame Buffer Interface .....</b>	<b>2946</b>
<b>10.6 Video Encoder .....</b>	<b>2993</b>

## 10.1 Display Subsystem Overview

The display subsystem (DSS) provides the logic to display a video frame from the memory frame buffer on a liquid-crystal display (LCD) panel or a TV set.

The DSS can display different pictures simultaneously by using the primary LCD1 and secondary LCD2 outputs, in addition to the TV output.

The primary LCD output can be one of the following:

- Display serial interface (DSI) ( MIPI® DSI)
- Remote frame buffer interface (RFBI) (MIPI DBI 2.0)

The secondary LCD output can be one of the following:

- Parallel CMOS output (MIPI DPI 1.0)
- DSI (MIPI DSI)
- RFBI (MIPI DBI 2.0)

The TV output can be one of the following:

- Composite signal
- High-definition multimedia interface (HDMI)

The modules integrated in the DSS are:

- Display controller (DISPC):
  - One direct memory access (DMA) engine
  - Two LCD outputs and one TV output, each one with a dedicated overlay manager
  - One graphics pipeline (GFX), three video pipelines, and one write-back pipeline
- RFBI:
  - 8-, 9-, 16-bit parallel interface
  - Programmable pixel memory formats
  - Programmable output formats on one or multiple cycles per pixel
- Two DSI protocol engines:
  - 4-data lane complex input/output (I/O) for DSI1 and 2-data lane complex I/O for DSI2
  - Bidirectional data link support (only one data lane is used in reverse direction in command mode)
  - Supports video mode and command mode
  - Supports data interleaving
- NTSC/PAL video encoder (VENC):
  - Composite output signal through external video digital-to-analog converter (DAC)

---

**NOTE:** The video DAC (VDAC) function is not supported.

---

- HDMI protocol engine:
  - Supports HDMI 1.3 (including HDMI 1.4 3D frame-packing support up to 1080p, 24 Hz)
  - 30-bit RGB color
  - HDCP key protection
  - Deep color mode support (10-bit for 1080p and up to 12-bit for 1080i/720p)

The necessary phase-locked loops (PLLs) with their control modules and the physical layers (PHYS) are outside the DSS. The PHYSs can be:

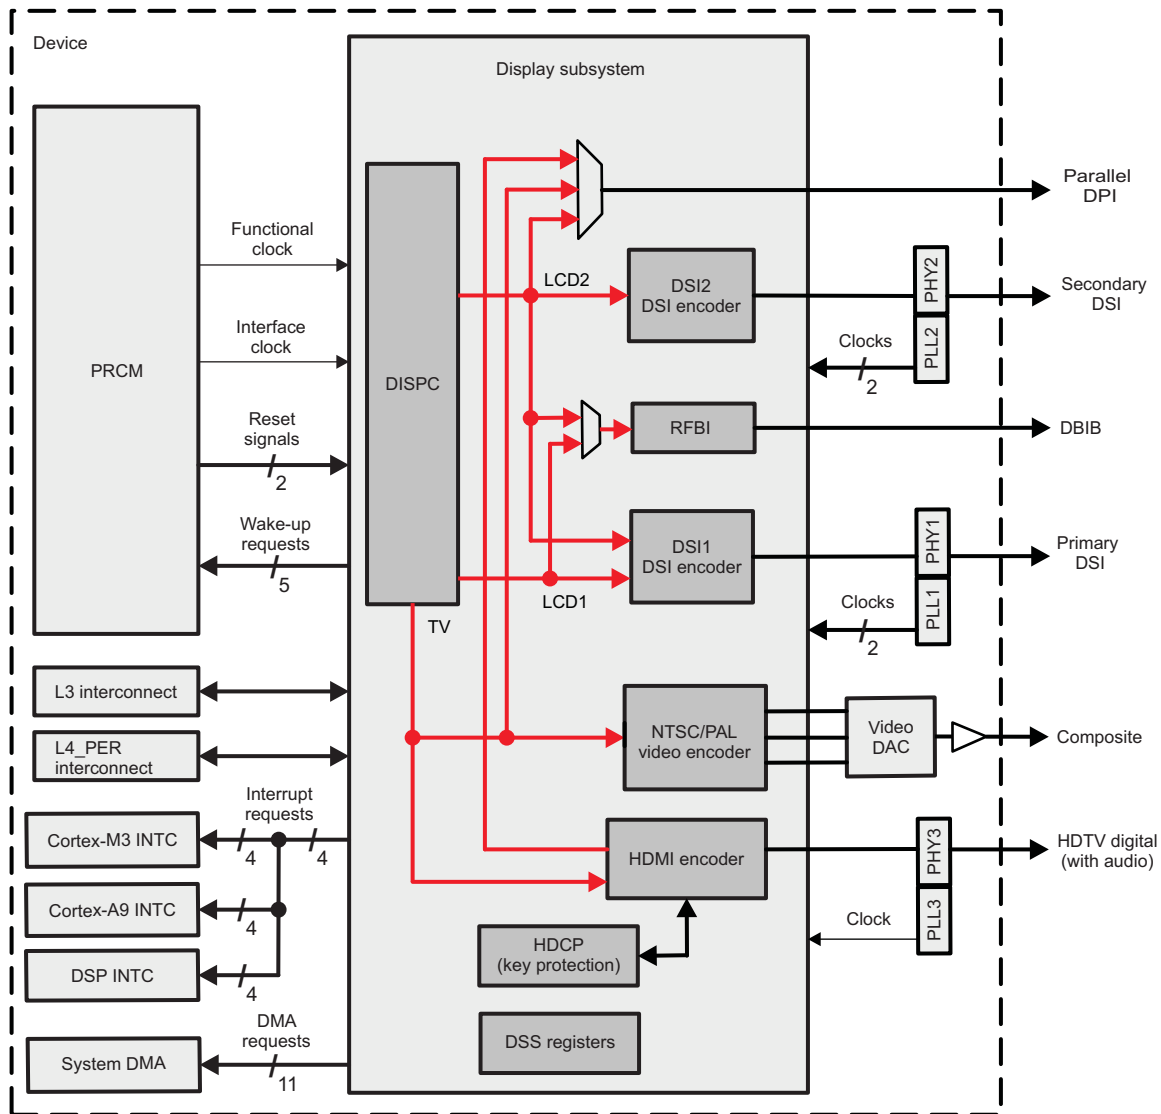

- HDMI-PHY
- VDAC
- DSI-PHY

To ensure efficient bandwidth, the DSS integrates:

- Local 32-bit interconnect with a level 4 (L4\_PER) connection to configure the DSS modules
- Connection between level 3 (L3) interconnect and the DISPC to exchange data with synchronous dynamic random access memory (SDRAM) and memory using the DISPC DMA engine

Figure 10-1 is a high-level diagram of the DSS.

**Figure 10-1. DSS Overview**

dss-001

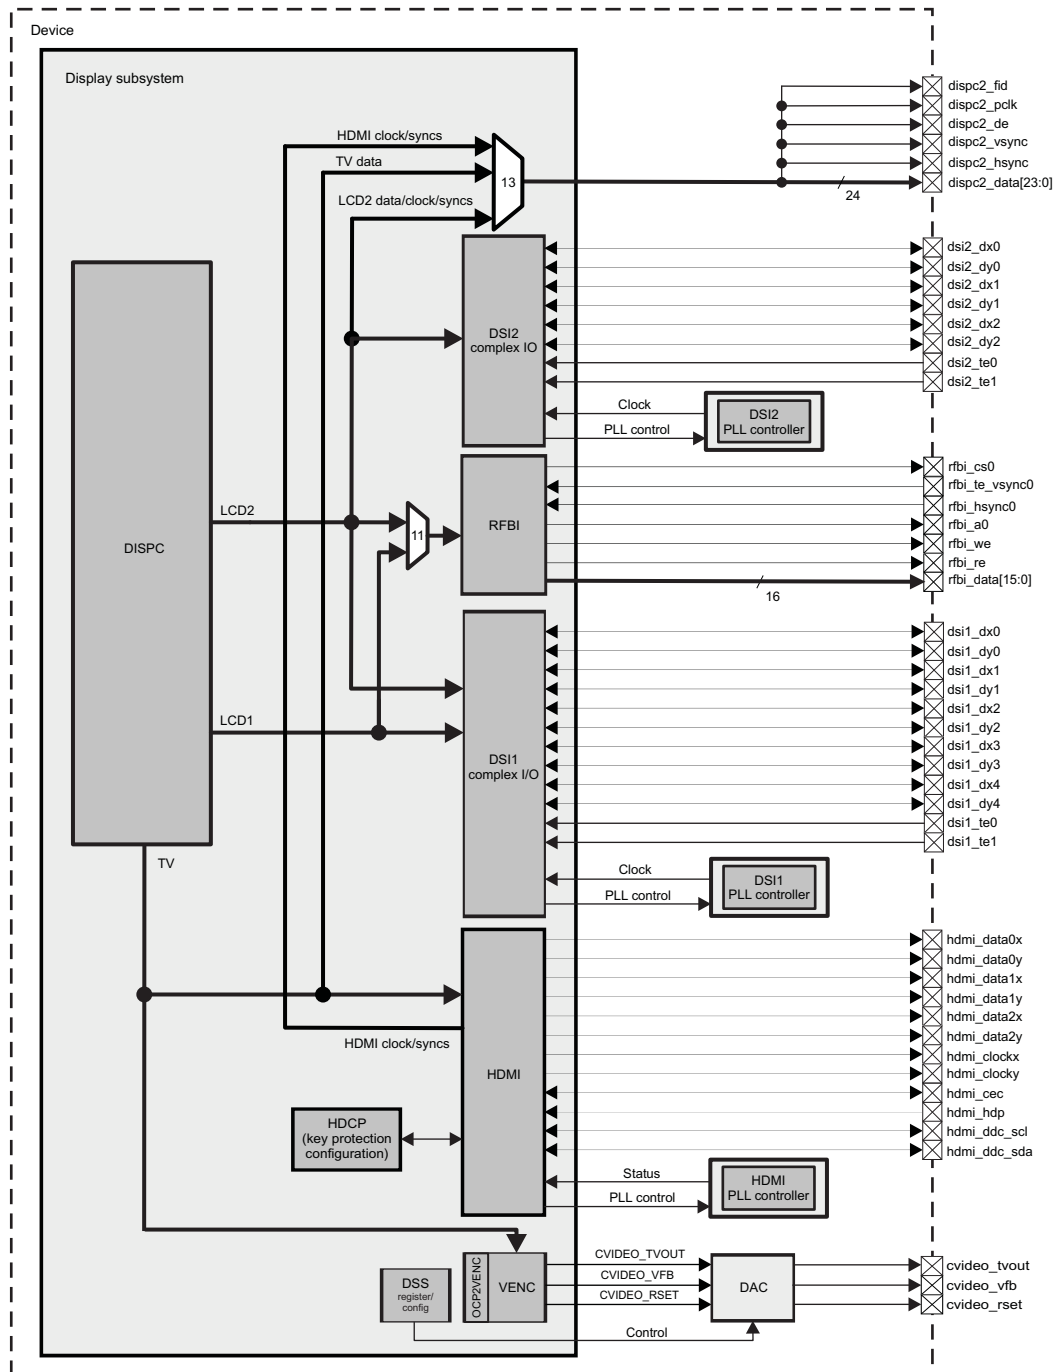

### 10.1.1 DSS Environment

This section describes the various outputs handled by the DSS:

- LCD support
- TV display support

Figure 10-2 is a diagram of the DSS environment.

Figure 10-2. DSS Environment

dss-002

### 10.1.1.1 DSS LCD Support

LCD panels must be connected to the DSS of the device using parallel and/or serial interfaces. Two modes are supported in parallel:

- DBIB
- Display parallel interface (DPI)

#### 10.1.1.1.1 Parallel Interface

In parallel interface, the modules of the DSS path are the DISPC and the RFBI.

The DISPC is connected to the memory through the L3 interconnect and uses its own DMA (with embedded FIFO) to read data from the system memory.

The remote frame buffer (RFB) of the LCD panel is connected directly to the RFBI module of the device. The RFBI controls the reads/writes from/to the RFB. The RFBI receives the output data from the DISPC and generates the signals to control the LCD panel. Through the RFBI, the microprocessor unit (MPU) can send commands or parameter/display data to the LCD panel and directly set the DISPC registers to read/write the data from/to the memory in the LCD panel.

The RFBI can be connected to either of the DISPC LCD outputs, but only one at a time can be used. The selection (multiplexer 11 in [Figure 10-2](#)) is done through the `DSS_CTRL[14]` RFBI\_SWITCH bit. It is not allowed to change the configuration, when the DISPC or RFBI modules are active.

For more details, see [Section 10.2, Display Controller](#), and [Section 10.5, Remote Frame Buffer Interface](#).

In synchronous parallel interface, the required data and control signals are provided directly to an external MIPI DPI-compatible parallel panel.

Two configuration options are available, selected through the `DSS_CTRL[17]` LCD2\_TV\_SEL bit field (multiplexer 13 in [Figure 10-2](#)):

- LCD2\_TV\_SEL = 0 (default): The LCD2 channel of DISPC (pixel data, clock and synchronization signals) is output on the parallel interface.
- LCD2\_TV\_SEL = 1: The TV channel of DISPC (pixel data), together with the pixel clock and synchronization signals of HDMI, is output on the parallel interface.

, [Table 10-1](#) lists the exact DSS signals outgoing on the device boundary pads.

**Table 10-1. Display Parallel Interface Signals Mapping**

Signal names at device pads (See <a href="#">Figure 10-2</a> )	<code>DSS_CTRL[17]</code> LCD2_TV_SEL = 0 DISPC LCD2 channel out (pixel data, clock, syncs)	<code>DSS_CTRL[17]</code> LCD2_TV_SEL = 1 DISPC TV channel out (pixel data) HDMI (pixel clock, syncs)
dispc2_fid	DISPC_LCD2_FID	HDMI_M_FID
dispc2_pclk	DISPC_LCD2_PCLK	HDMI_M_PCLK
dispc2_de	DISPC_LCD2_DE	HDMI_M_DE
dispc2_vsync	DISPC_LCD2_VSYNC	HDMI_M_VS
dispc2_hsync	DISPC_LCD2_HSYNC	HDMI_M_HS
dispc2_data[23:0]	DISPC_LCD2_DATA[23:0]	DISPC_TV_DATA[29:0]

For more details on LCD2 and TV out pixel data formats for the parallel interface, see [Section 10.2.2, Display Controller Environment](#).

#### 10.1.1.1.2 Serial Interfaces

In serial interface, the DISPC and the two DSI modules with their associated PLLs are used in the data path. The DISPC is connected to the memory through the L3 interconnect and uses its own DMA to read the data from the system memory.

The DSI module contains a PLL to multiply the pixel clock by an appropriate factor. The resulting serialized data is then transmitted on one to four differential data pairs and an additional clock pair that has a reference transition at the boundary between pixels.

For more details, see [Section 10.3](#), *MIPI DSI*.

### 10.1.1.2 DSS TV Display Support

#### 10.1.1.2.1 Video Encoder

In a TV output configuration, the DISPC, the VENC and the associated PLL modules, and the Video DAC are used in the data path. The DISPC receives synchronization signals from the VENC and synchronously sends pixel data to the VENC with these signals. The digital output of the DISPC is always a 24-bit RGB value based on a pixel request from the VENC.

The VENC converts RGB video signals to conform to the NTSC/PAL standard for analog video.

For more details, see [Section 10.6](#), *VENC*.

---

**NOTE:** The VDAC function is not supported.

---

#### 10.1.1.2.2 HDMI

In an HDMI configuration, the DISPC, HDMI, and HDCP modules and the associated PLL modules are used in the data path. The HDMI module converts the RGB video into standard high-definition digital video format. The module has a PLL, which can multiply the pixel clock by an appropriate factor. The data is transmitted on three differential data pairs and an additional clock pair.

For more details, see [Section 10.4](#), *HDMI*.

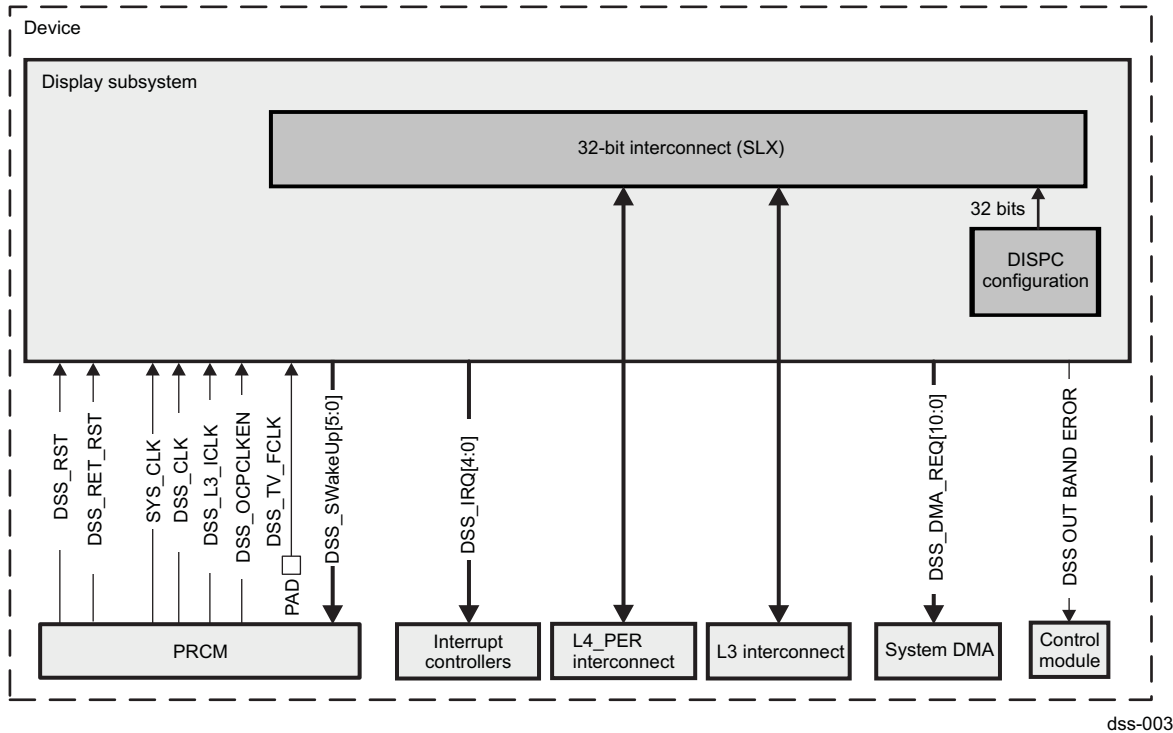

## 10.1.2 DSS Integration

This section describes the integration of the DSS module in the device, including information about clocks, resets, and hardware requests.

Figure 10-3 shows the integration of the DSS in the device.

**Figure 10-3. DSS Integration**

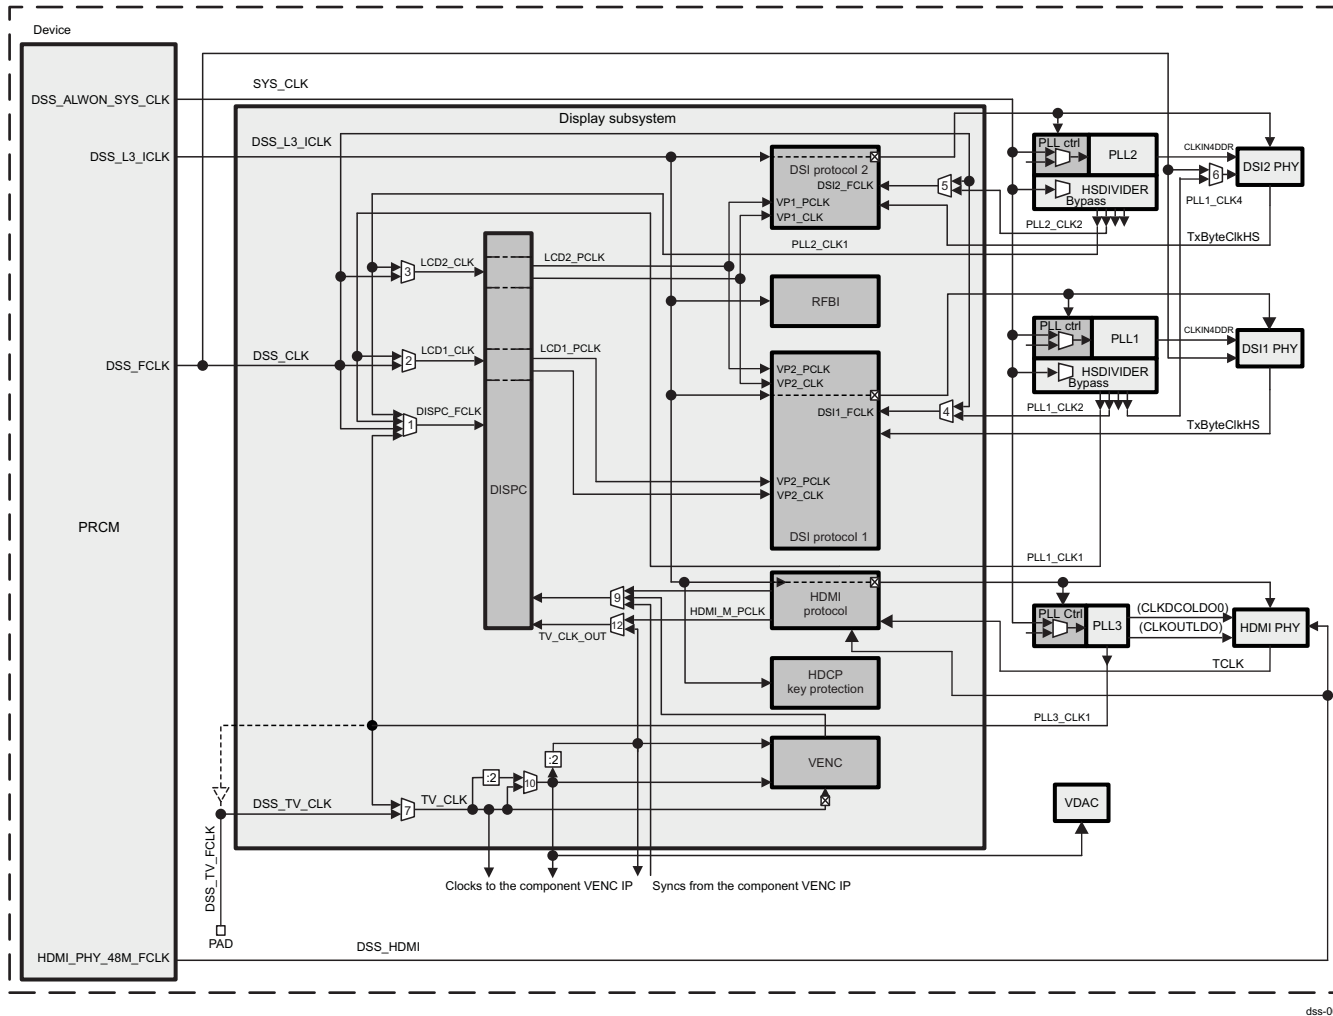

### 10.1.2.1 DSS Clocks

The power, reset, and clock management (PRCM) module provides clock signals to the DSS.

Figure 10-4 shows the details of the DSS clock tree.

Figure 10-4. DSS Clock Tree

dss-004

Table 10-2 lists the main DSS clocks and their sources.

**Table 10-2. DSS Clocks**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DSS	DSS_HDMI	HDMI_PHY_48M_FCLK	PRCM module	Functional clock
	DSS_CLK	DSS_FCLK	PRCM module	Functional clock
	SYS_CLK	DSS_ALWON_SYS_CLK	PRCM module	System clock
	DSS_TV_CLK	DSS_TV_FCLK	PAD	TV output interface clock
	DSS_L3_ICLK	DSS_L3_ICLK	PRCM module	Interface clock

- The clock source for the L3 interface clock is DSS\_L3\_ICLK.
- The clock sources for the DSS modules are listed in [Table 10-3](#).

**Table 10-3. DSS Modules Clock Sources**

Destination	Source Signal Name	Source	Multiplexer Number	DSS_CTRL Register Bit Field
DISPC functional clock (DISPC_FCLK)	DSS_CLK	DPLL_PER (PRCM)	1	[9:8] FCK_CLK_SWITCH
	PLL1_CLK1	PLL1	1	
	PLL2_CLK1	PLL2	1	
	PLL3_CLK1	PLL3	1	
DSI1 functional clock (LCD1_CLK)	DSS_CLK	DPLL_PER (PRCM)	2	[0] LCD1_CLK_SWITCH
	PLL1_CLK1	PLL1	2	
DSI2 functional clock (LCD2_CLK)	DSS_CLK	DPLL_PER (PRCM)	3	[12] LCD2_CLK_SWITCH
	PLL2_CLK1	PLL2	3	
DSI1 protocol engine functional clock (DSI1_FCLK)	DSS_CLK	DPLL_PER (PRCM)	4	[1] DSI1_CLK_SWITCH
	PLL1_CLK2	PLL1	4	
DSI2 protocol engine functional clock (DSI2_FCLK)	DSS_CLK	DPLL_PER (PRCM)	5	[10] DSI2_CLK_SWITCH
	PLL2_CLK2	PLL2	5	
VENC/HDMI functional clock (TV_CLK)	DSS_TV_CLK	PAD	7	[11] TV_CLK_SWITCH
	PLL3_CLK1	PLL3	7	
DISPC external clock (TV_CLK_OUT)	TV_CLK	Multiplexer 7	12	[15] VENC_HDMI_SWITCH
	HDMI_M_PCLK	HDMI	12	

**NOTE:** : For more information about the DSI1 and DSI2 video port clocks (VPn\_PCLK and VPn\_CLK, where n = 1 or 2), see [Table 10-4](#) and [Section 10.3.4.2, DSI Clock Configuration](#).

**NOTE:** Multiplexer 9 in [Figure 10-4](#) has the same control as multiplexer 12 when switched between VENC and HDMI.

Multiplexer 6 in [Figure 10-4](#) allows the DSS\_FCLK or PLL1\_CLK4 clock to be sent on the DSI2 PHY bypass input. The use of the bypassed clock allows both DSI modules to run on DSS\_FCLK or on a single PLL. The selection is done on device control module level. For more information, see [Section 10.3.4.2, DSI Clock Configuration](#) in [Section 10.3, MIPI Display Serial Interface](#).

- VENC clocks generation  
The TV\_CLK clock is divided into three balanced clocks, depending on the clock mode selected by the

**DSS\_CTRL[2] VENC\_CLOCK\_MODE** register bit. For more details on clock modes configuration see [Section 10.6.3, Video Encoder Integration](#).

[Table 10-4](#) lists the maximum frequencies of various DSS clocks for OPP100 and OPP50.

**Table 10-4. DSS Clock Frequencies**

Clock Name	OPP100	OPP50	Notes
DSS_L3_ICLK	200 MHz	100 MHz	For the description and clock source, see <a href="#">Table 10-2</a> .
DSS_CLK	186 MHz	186 MHz	For the description and clock source, see <a href="#">Table 10-2</a> .
DISPC_FCLK	186 MHz	186 MHz	For the description and clock source, see <a href="#">Table 10-3</a> .
DISPC_CORE_CLK	186 MHz	93 MHz	DISPC internal functional clock. Generated from DISPC_CLK after LCD divider at the DISPC module level. For more details, see <a href="#">Section 10.2.4.1, Clock Configuration</a> .
LCDn_CLK (n = 1 or 2)	186 MHz	93 MHz	For description and clock source, see <a href="#">Table 10-3</a> .
LCDn_PCLK (n = 1 or 2)	170 MHz	93 MHz	DISPC LCD output pixel clock. Generated from LCDn_CLK after two dividers (LCDn and PCDn) at the DISPC module level. For more details, see <a href="#">Section 10.2.4.1, Clock Configuration</a> .
VPn_PCLK (n = 1 or 2)	148.5 MHz	74.25 MHz	DSI video port pixel clock. Sourced from LCDn_PCLK.
VPn_CLK (n = 1 or 2)	186 MHz	93 MHz	DSI video port clock. Generated from LCDn_CLK after a divider (LCDn) at DISPC module level. For more details, see <a href="#">Section 10.2.4.1, Clock Configuration</a> .
DSIn_FCLK (n = 1 or 2)	170 MHz	93 MHz	For the description and clock source, see <a href="#">Table 10-3</a> .
TV_CLK	59 MHz	59 MHz	For the description and clock source, see <a href="#">Table 10-3</a> .
DSS_TV_CLK	59 MHz	59 MHz	DSS_TV_CLK from PAD
DSS_HDMI_TCLK	185.625 MHz	92.8125 MHz	TMDS clock from the HDMI PHY. For the clock source, see <a href="#">Figure 10-4</a> .
TXCLKESC	20 MHz	20 MHz	DSI escape-mode transmit clock. For more details, see <a href="#">Section 10.3.4.4.4, Clock Requirements</a> .
TXBYTECLKHS	112.5 MHz	103 MHz	DSI high-speed transmit byte clock (generated by the complex I/Os) TXBYTECLKHS = 112.5 MHz for up to three data lanes (900 Mbps per lane); TXBYTECLKHS = 103 MHz for four data lanes (824 Mbps per lane)
DSS_HDMI	48 MHz	48 MHz	For the description and clock source, see <a href="#">Table 10-2</a> .

### 10.1.2.2 DSS Resets

The PRCM module provides two reset signals to the DSS.

[Figure 10-5](#) shows the details of the reset tree for the DSS.

Figure 10-5. DSS Reset Scheme

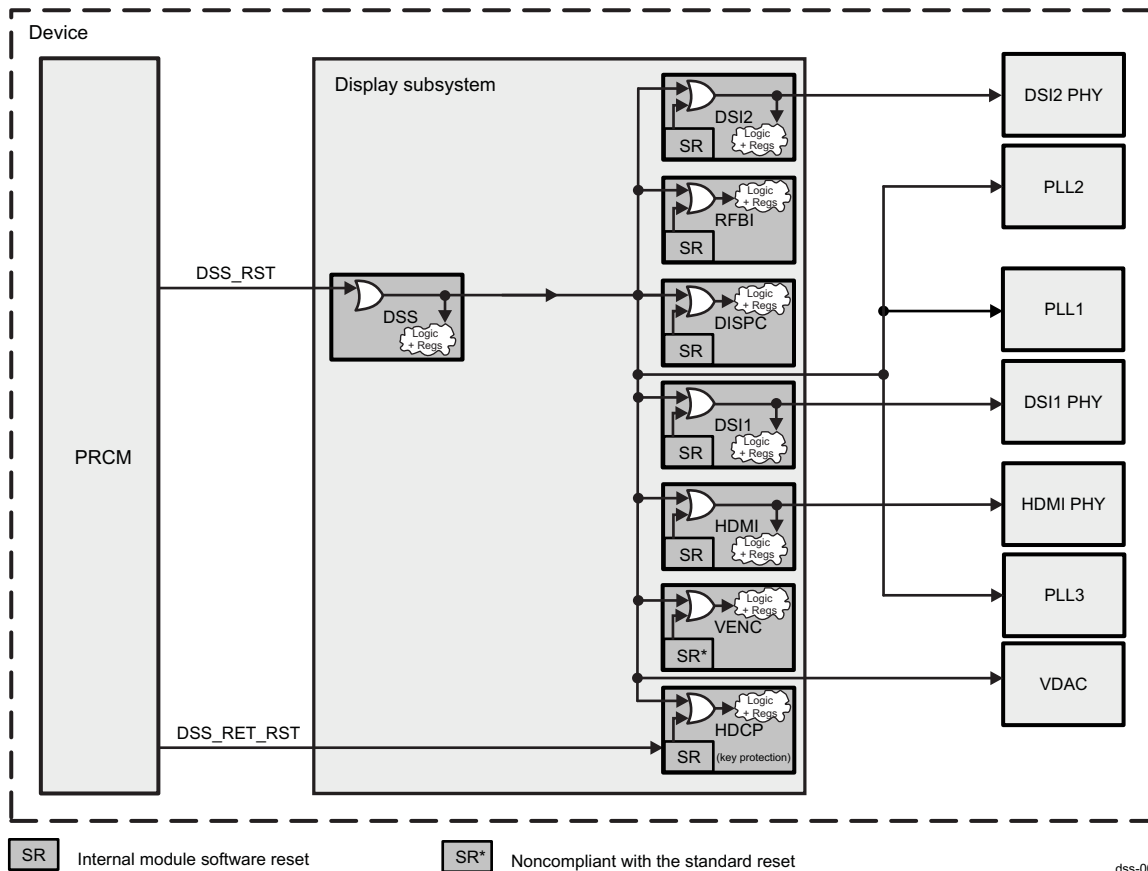

Table 10-5 lists the resets for the DSS.

Table 10-5. DSS Resets

Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DSS	DISPSS_RET_RST	DSS_RET_RST	PRCM module	Retention reset
	DISPSS_RST	DSS_RST	PRCM module	Nonretention reset

#### 10.1.2.2.1 Hardware Reset

The DSS receives its DISPSS\_RST reset signal (the reset signal of the DSS power domain) from the PRCM module. The DISPSS\_RET\_RST is used only for the HDCP key protection module.

#### 10.1.2.3 DSS Power Management

The DSS modules are in the DSS power domain, except for the dual video DACs, which are in the analog VDDADAC voltage domain.

Table 10-6 lists the DSS power domains.

Table 10-6. DSS Power Domains

Module Instance	Attributes
	Power Domain
Display subsystem	PD_DSS
DISPC	For more details, see <a href="#">Section 10.2, Display Controller</a> .

**Table 10-6. DSS Power Domains (continued)**

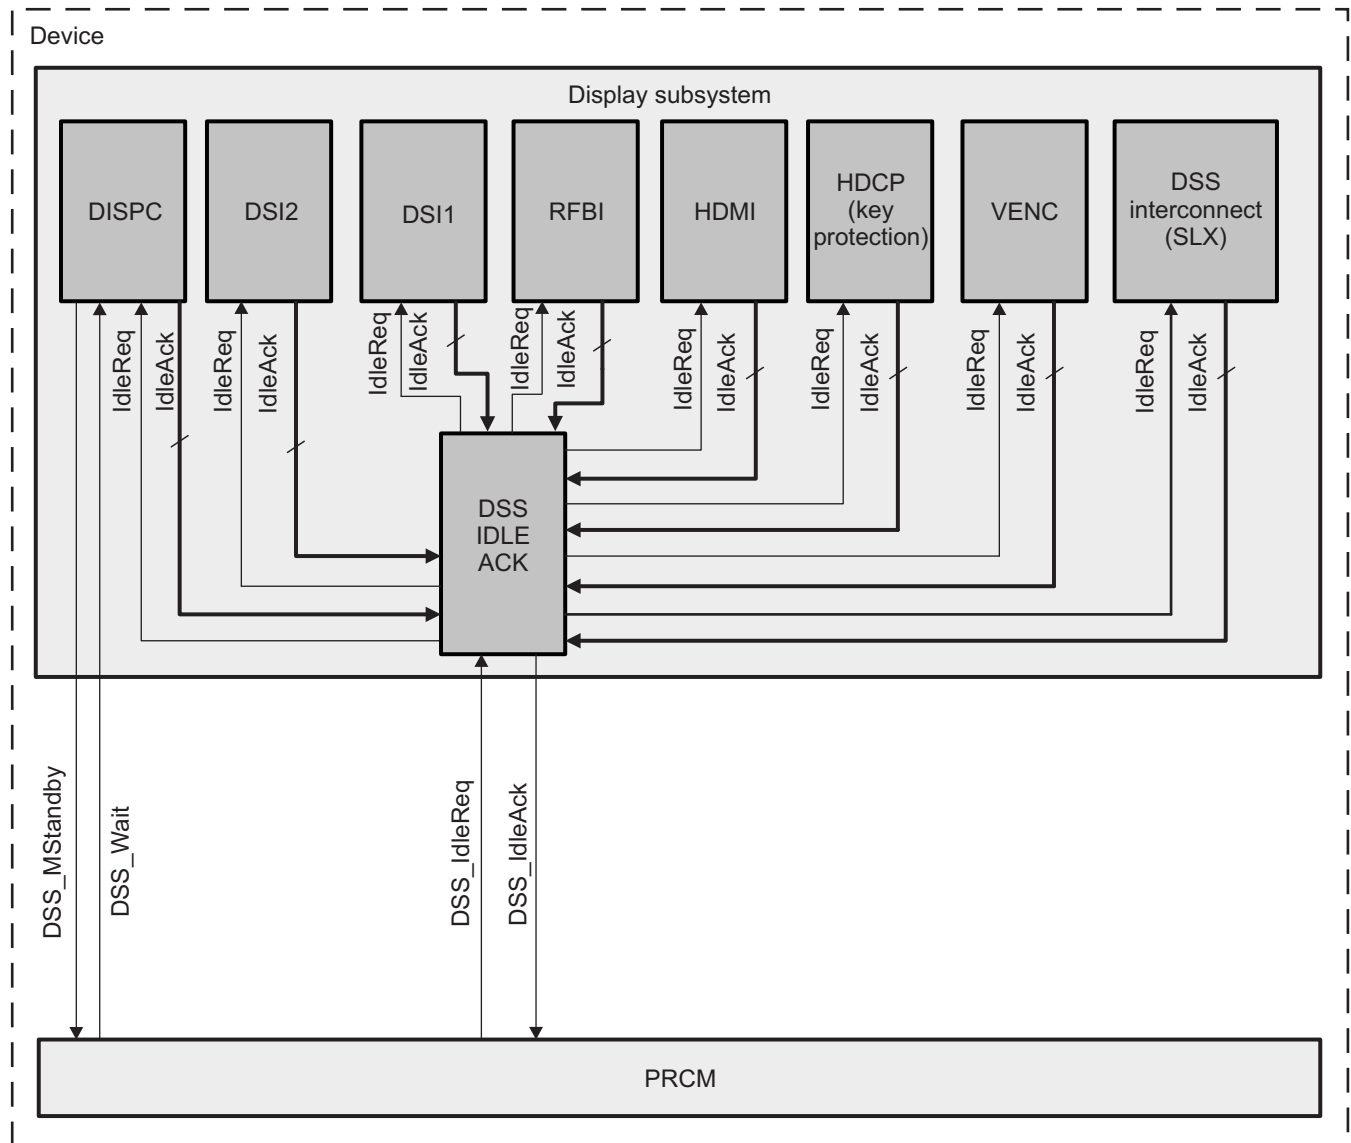

MIPI DSI1	For more details, see <a href="#">Section 10.3</a> , <i>MIPI Display Serial Interface</i> .
MIPI DSI2	For more details, see <a href="#">Section 10.3</a> , <i>MIPI Display Serial Interface</i> .
RFBI	For more details, see <a href="#">Section 10.5</a> , <i>Remote Frame Buffer Interface</i> .
HDMI	For more details, see <a href="#">Section 10.4</a> , <i>High-Definition Multimedia Interface</i> .
Video encoder	For more details, see <a href="#">Section 10.6</a> , <i>Video Encoder</i> .

### 10.1.2.3.1 Standby Mode

As part of the system-wide power-management scheme, the DSS supports the MStandby/MWait and SIdleReq/SIdleAck protocols:

- MStandby/MWait
  - DISPC
- SIdleReq/SIdleAck
  - DISPC
  - DSI1
  - DSI2
  - RFBI
  - HDMI
  - HDCP (key protection)
  - VENC
  - DSS interconnect

[Figure 10-6](#) shows the details of the DSS wake-up generation.

**Figure 10-6. DSS IdleAck/MStandby Generation**

dss-007

**10.1.2.3.1.1 Conditions to Exit Standby Mode**

For information about the conditions that allow the subsystem to exit standby mode, see [Section 10.2, Display Controller](#).

**10.1.2.3.1.2 Standby Procedure Description**

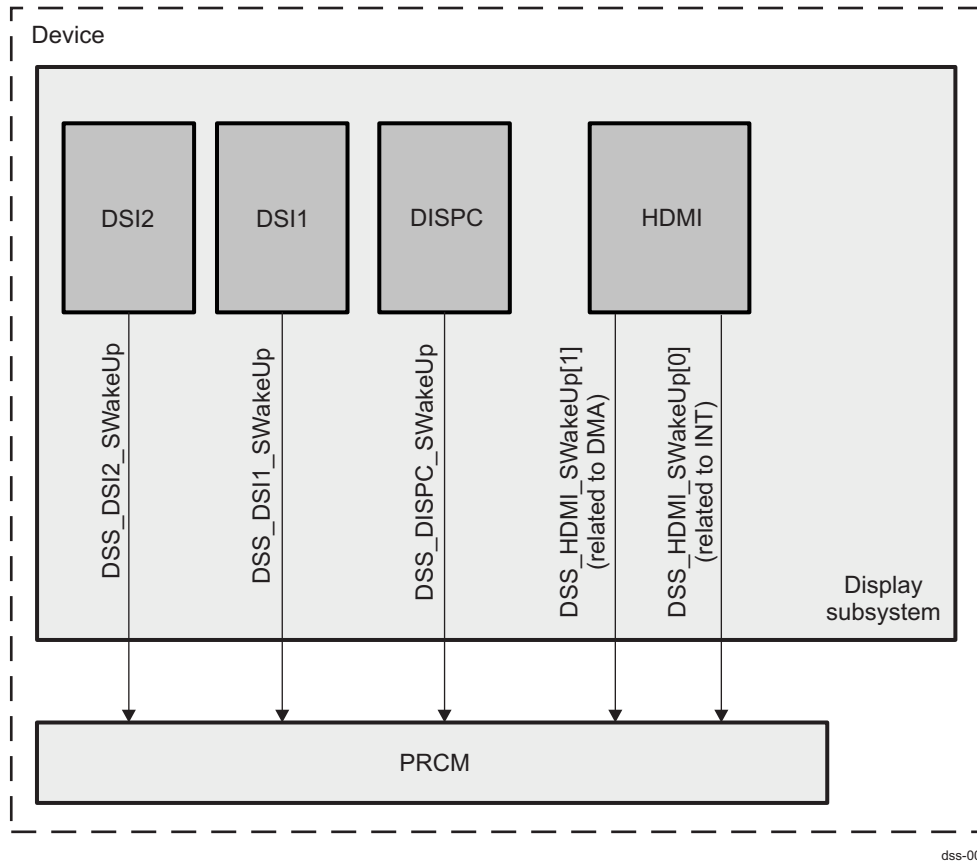

When the DSS initiates a standby procedure, it also initiates a standby/wait handshake protocol with the PRCM module that lets the PRCM module cut the DSS clocks.

**10.1.2.3.2 Wake-Up Mode**

The DISPC, DSI1, DSI2, and HDMI modules support the wake-up protocol. DSS\_HDMI\_SWakeUp is associated with DSS\_HMDI\_IRQ, which is generated by the HDMI module. For the events that generate an Swakeup and the description and configuration of the registers, see the DISPC, DSI, and HDMI TRM chapters.

[Figure 10-7](#) shows DSS wake-up generation.

Figure 10-7. DSS Wake-Up Generation

#### 10.1.2.4 DSS Interrupt Requests

The DSS has four interrupt lines. The interrupt signals are connected to the MPUs and DSP interrupt controller (INTC) modules. The interrupts are generated from the DISPC, DSI1 and DSI2 protocol engines, and HDMI.

Figure 10-8 shows DSS interrupt generation.

Figure 10-8. DSS Interrupt Generation

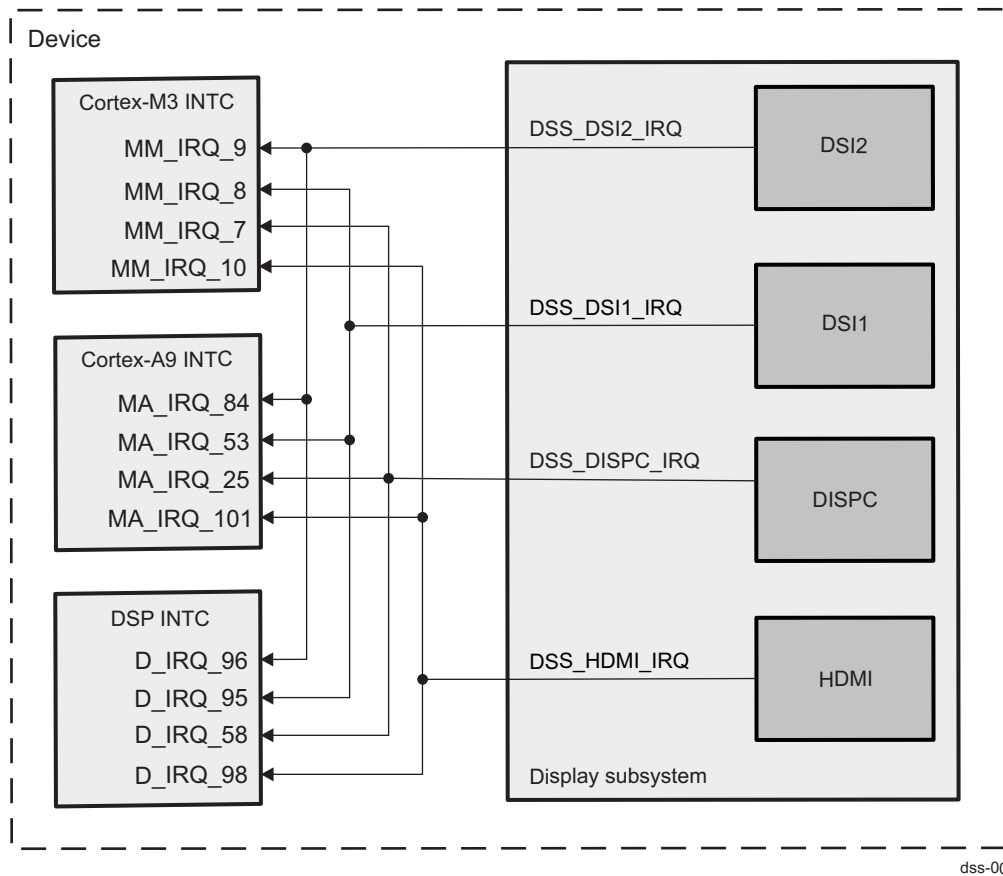

Table 10-7 lists the DSS interrupts.

Table 10-7. DSS Interrupts

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
DSS				
DISPC	DSS_DISPC_IRQ	D_IRQ_58	DSP INTC	DISPC interrupt request
		MA_IRQ_25	Cortex™-A9 INTC	DISPC interrupt request
		MM_IRQ_7	Cortex™-M3 INTC	DISPC interrupt request
MIPI DSI1	DSS_DSI1_IRQ	D_IRQ_95	DSP INTC	Display DSI1 interrupt request
		MA_IRQ_53	Cortex-A9 INTC	Display DSI1 interrupt request
		MM_IRQ_8	Cortex-M3 INTC	Display DSI1 interrupt request
MIPI DSI2	DSS_DSI2_IRQ	D_IRQ_96	DSP INTC	Display DSI2 interrupt request
		MA_IRQ_84	Cortex-A9 INTC	Display DSI2 interrupt request
		MM_IRQ_9	Cortex-M3 INTC	Display DSI2 interrupt request
HDMI	DSS_HDMI_IRQ	D_IRQ_98	DSP INTC	Display HDMI interrupt request
		MA_IRQ_101	Cortex-A9 INTC	Display HDMI interrupt request
		MM_IRQ_10	Cortex-M3 INTC	Display HDMI interrupt request

### 10.1.2.5 DSS DMA Requests

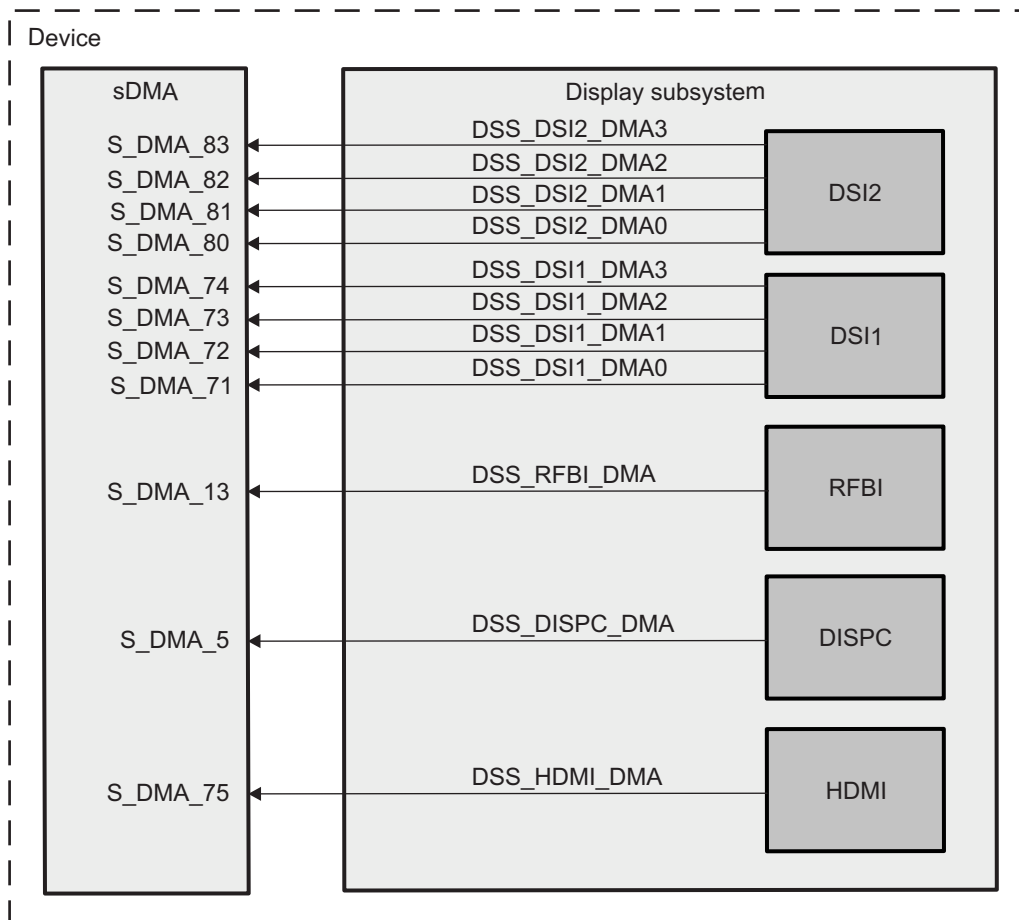

Eleven DMA requests are connected to the system DMA (sDMA).

The DMA requests are:

- Four DMA request signals from each DSI protocol engine (data traffic: from SDRAM or IVA-HD SL2 to DSI protocol engine and from DSI protocol engine to SDRAM or IVA-HD SL2)
- One DMA request signal from RFBI module (data traffic: from SDRAM to RFBI)
- One DMA request signal from HDMI module (audio traffic: from SDRAM or IVA-HD SL2 to HDMI)
- One DMA request signal from DISPC module (used for synchronization of a logical channel in the sDMA for memory-to-memory transfers)

Figure 10-9 shows the details of DSS DMA request generation.

**Figure 10-9. DSS DMA Request Generation**

dss-010

Table 10-8 lists the DSS DMA requests.

**Table 10-8. DSS DMA Requests**

DMA Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
RFBI	DSS_RFBI_DMA	S_DMA_13	sDMA	DSS RFBI DMA request
DISPC	DSS_DISPC_DMA	S_DMA_5	sDMA	The line trigger signal to synchronize a memory-to-memory logical channel in the DMA4 sDMA is generated by the DISPC IP.

**Table 10-8. DSS DMA Requests (continued)**

MIPI DSI1	DSS_DSI1_DMA0	S_DMA_71	sDMA	DSS DSI1 DMA request 0
	DSS_DSI1_DMA1	S_DMA_72	sDMA	DSS DSI1 DMA request 1
	DSS_DSI1_DMA2	S_DMA_73	sDMA	DSS DSI1 DMA request 2
	DSS_DSI1_DMA3	S_DMA_74	sDMA	DSS DSI1 DMA request 3
MIPI DSI2	DSS_DSI2_DMA0	S_DMA_80	sDMA	DSS DSI2 DMA request 0
	DSS_DSI2_DMA1	S_DMA_81	sDMA	DSS DSI2 DMA request 1
	DSS_DSI2_DMA2	S_DMA_82	sDMA	DSS DSI2 DMA request 2
	DSS_DSI2_DMA3	S_DMA_83	sDMA	DSS DSI2 DMA request 3
HDMI	DSS_HDMI_DMA	S_DMA_75	sDMA	DSS HDMI audio DMA request

### 10.1.3 DSS Register Manual

#### CAUTION

The main access to all DSS registers is through the L3 interconnect.  
The access through the L4\_PER interconnect is provided for back software compatibility.

#### 10.1.3.1 DSS Instance Summary

**Table 10-9. DSS Instance Summary**

Module Name	L4_PER Base Address	L3 Base Address	Size

## 10.2 Display Controller

### 10.2.1 Display Controller Overview

Figure 10-10 shows a block diagram of the display subsystem.

Figure 10-10. Display Subsystem Highlight

dispc-064

The DISPC includes the following main features:

- Five pipelines for processing:
  - One Graphics pipeline (GFX):
    - Pixel formats: ARGB16-4444, xRGB12-4444, RGBA16-4444, RGBx12-4444, RGB16-565, ARGB16-1555, xRGB16-1555, ARGB32-8888, RGBA32-8888, xRGB32-8888, RGBx32-8888, RGB24-888, and BITMAP (1-, 2-, 4-, or 8-bits per pixel) (x means that the correspond bits in the container are not used)
    - Selection of the color depth expansion from ARGB16-4444, RGBA16-4444, and ARGB16-1555 to ARGB32-8888 and from xRGB12-4444, RGBx12-4444, and xRGB16-1555 to xRGB32-8888 (replication of the MSBs or adding 0s)
    - Support for color look-up table (CLUT): 256 × 24-bit entries palette in RGB
    - Support for antiflicker on RGB pixel formats using 3-tap filter.
  - Three Video pipelines (VID1,VID2, and VID3):

- Pixel formats: ARGB16-4444, xRGB12-4444, RGBx12-4444, RGBA12-3333, RGBA16-4444, RGB16-565, ARGB16-1555, xRGB16-1555, ARGB32-8888, RGBA32-8888, xRGB32-8888, RGBx32-8888, RGB24-888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, and YUV4:2:0-NV12 (x means that the correspond bits in the container are not used)
- Selection of the color depth expansion from ARGB16-4444, RGBA16-4444, and ARGB16-1555 to ARGB32-8888 and from xRGB12-4444, RGBx12-4444, and xRGB16-1555 to xRGB32-8888 (replication of the MSBs or adding 0s)
- Programmable polyphase filter:
  - Independent horizontal and vertical resampling: upsampling (up to x8) and downsampling (down to 1/4)
  - Maximum input width of 1920 pixels
  - No limitation on the input height
  - Supported input formats are ARGB32-8888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, and YUV4:2:0-NV12
  - Alpha blending factor is rescaled like the R, G, and B color components.
- Programmable color space conversion from YUV4:2:2 (YUV4:4:4, YUV4:2:0 after Chroma upsampling through the scaler) into ARGB32-8888. Images in YUV4:2:2 format with 90/270 degree rotation are preprocessed to YUV4:4:4 before the scaler, by duplicating the missing Chroma.
- Programmable VC-1 range mapping
- One Write-back pipeline (WB): allows to take benefit of the hardware processing available inside the DISPC like color space conversion, rescaling, compositing to perform memory-to-memory transfer with data processing or capturing a displayed frame.
  - Programmable color space conversion RGB24 into YUV4:4:4 or to YUV4:2:2-UYVY, YUV4:2:2-YUV2, or YUV4:2:0-NV12 using programmable polyphase filter.
  - Programmable color space conversion RGB24 into YUV4:2:2-UYVY, YUV4:2:2-YUV2, or YUV4:2:0-NV12
  - Selection of the color depth reduction from RGB24 to RGB16
  - Programmable polyphase filter:
    - Independent horizontal and vertical resampling: upsampling (up to x8) and downsampling (down to 1/4)
    - Maximum input width of 1920 pixels
    - No limitation on the input height
    - Supported input formats are ARGB32-8888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, and YUV:2:0-NV12
    - Alpha blending factor is rescaled like the R, G, and B color components.
- Selection of the source of the data:
  - Overlay output:
    - Primary LCD
    - Secondary LCD
    - TV
  - Pipelines:
    - Graphic
    - Video 1
    - Video 2
    - Video 3

- Two LCD outputs, primary (LCD1) and secondary (LCD2):
  - Input pixel format: ARGB32-8888
  - Output pixel format: RGB24-888
  - Overlay of graphic and video 1, 2, and 3 pipelines
  - Source and destination transparency color key
  - Global and pixel alpha blending (up to 8-bit blending factor)
  - Z-order programmable (full flexibility)
  - Three types of displays are supported:
    - Passive matrix monochrome: 4-/8-bit monochrome panel interface support (15 grayscale levels supported using dithering block)
    - Passive matrix color: 8-bit color panel interface support (3375 colors supported for a color panel using dithering block)
    - Active matrix color: 12-/16-/18-/24-bit panel interface support (replicated or dithered encoded pixel values)
  - Independent programmable timing generators for LCD1 and LCD2 to support:

<b>Primary LCD</b>	Using DSI1 interface	SXGA VESA timing @ 60 FPS
	Using RFBI	WVGA @ 30 fps
<b>Secondary LCD</b>	Using DSI2 interface	SXGA VESA timing @ 85 fps
	Using RFBI	WVGA @ 30 fps
	Using CMOS interface	SXGA VESA timing @ 85 fps 1080i/720p CEA-861-D

- Configurable LCD output mode: progressive or interlace mode
- Selection between RGB and YUV4:2:2 output pixel format
- Remote frame buffer support through the RFBI module
- Partial display through the RFBI
- Multiple-cycle output format on 8-/9-/12-/16-bit interface time division multiplexing (TDM)
- One TV output
  - Input pixel format: ARGB40-10.10.10.10
  - Output pixel format: ARGB40-10.10.10.10
  - Overlay of graphic and video 1, 2, and 3 pipelines
  - Source and destination transparency color key
  - Global and pixel alpha blending (up to 10-bit blending factor)
  - Z-order programmable (full flexibility)
  - Slave mode support (no master mode support) with synchronization signals provided by the VENC (NTSC/PAL encoder or HDMI TX)
    - HSYNC (horizontal synchronization signal)
    - VSYNC (vertical synchronization signal)
    - RE (data request signal)
    - FID (field ID: odd/even field information)
  - RGB24-888 data bus output for connection to the NTSC/PAL VENC
  - RGB30-10.10.10 data bus output for connection to HDMI TX and extended to 36 by duplication of the MSBs
  - SD-576i and SD-480i using NTSC/PAL VEC
  - HD-1080p, HD-1080i, HD-720p, SD-480p, SD-576p, SD-576i, and SD-480i using HDMI
  - HDMI deep color mode support, 30-bit data output to HDMI encoder
  - Pixel duplication capability (from one pixel clock cycle up to eight cycles)

---

**NOTE:** The video DAC (VDAC) function is not supported.

---

- Panel support with MIPI DPI protocol
  - 4-/8-bit monochrome passive matrix panel interface support (15 grayscale levels supported using dithering block)
  - 8-bit color passive matrix panel interface support (3375 colors supported for a color panel using dithering block)
  - 12-/16-/18-/24-bit active matrix panel interface support (replicated or dithered encoded pixel values)
- Common
  - Rotation 0, 90, 180, and 270 using DMM-TILER
  - Synchronized buffer update
  - Hardware cursor (using the graphics pipeline or one of the video pipelines)
  - Independent gamma curve support on primary LCD output, secondary LCD output and TV output
  - Multiple-buffer support
  - Mirroring/flip-flop support (using DMM-TILER)
  - Programmable color phase rotation (CPR)
  - Alpha blending support:
    - Embedded pixel factor (ARGB and RGBA)
    - Global alpha
- DMA (internal to the DISPC)
  - Support for accessing tiled structure through the TILER inside the dynamic memory management (DMM)
  - Support for rotation, flip-flop, and mirroring through the TILER inside the DMM
  - Support for memory fragmentation through the TILER inside the DMM
  - Integrated shared buffers between DMA engine and pipelines
  - Programmable buffer thresholds
  - Bandwidth limiter on write request (insertion on idle cycles between requests)
- Advanced
  - Mode outputting data on display only from the DMA buffer (self-refresh using the DMA FIFO)
  - DMA buffer hand-check in STALL mode
  - Arbitration between high/low priority (GFX, VID1, VID2, VID3, and WB pipelines)
- Power modes
  - Low-power saving modes
  - Support on-the-fly dynamic voltage and frequency scaling (DVFS)
  - Merge capability of the DMA buffers to support greater OFF period on the L3 interconnect
    - All buffers associated to a single pipeline
    - Reallocation of the buffers of the nonactive pipelines to the active pipelines

### 10.2.2 Display Controller Environment

The DISPC provides the required control signals to interface directly to an external parallel panel for the MIPI DPI protocol.

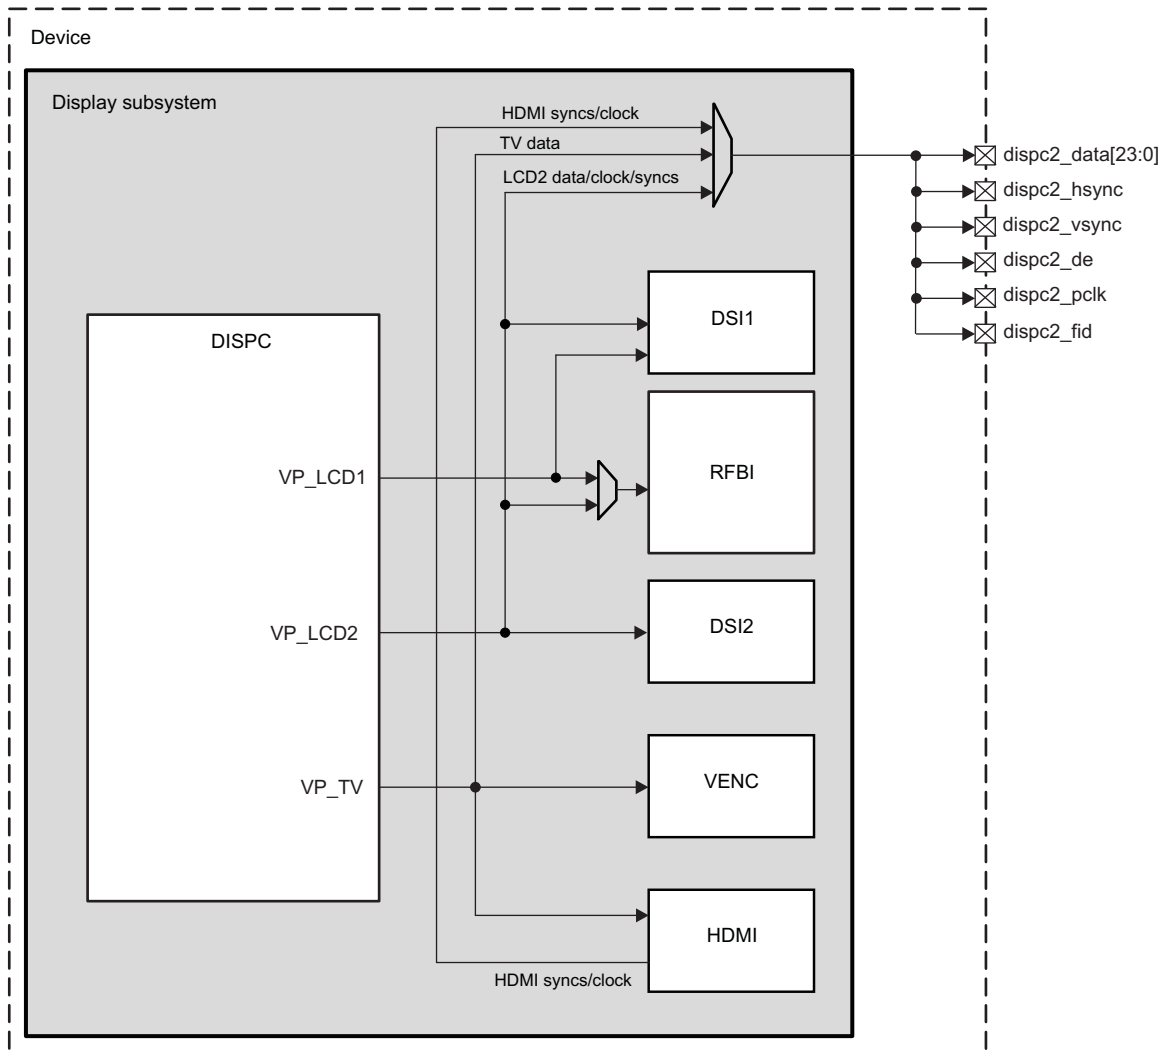

Figure 10-11 shows the LCD support parallel interface.

**NOTE:** Parallel interface is available through the LCD2 and TV outputs of the DISPC.

The LCD2 data and control signals are multiplexed with the TV output data, and control signals provided by the HDMI module.

The selection can be done at DSS top level. For further details and signals mapping, see [Section 10.1.1.1.1 Parallel Interface](#), under [Section 10.1 Display Subsystem Overview](#).

**Figure 10-11. LCD Support Parallel Interface**

disp2-083

Table 10-19 describes the interface signals to/from the LCD panel in bypass mode.

**Table 10-19. Parallel Interface Signals**

Signal Name	Type <sup>(1)</sup>	Description
disp2_data[23:0]	O	Pixels data

<sup>(1)</sup> I = Input, O = Output, I/O = Input/Output

**Table 10-19. Parallel Interface Signals (continued)**

Signal Name	Type <sup>(1)</sup>	Description
dispc2_pclk	O	Pixel clock
dispc2_vsync	O	Vertical synchronization. The LCD frame clock (vsync) toggles after all the lines in a frame are transmitted to the LCD panel and a programmable number of line clock cycles has elapsed at the beginning and at the end of each frame.
dispc2_hsync	O	Horizontal synchronization. The LCD line clock (hsync) toggles after all pixels in a line are transmitted to the LCD panel and a programmable number of pixel clock wait-states elapse, at the beginning and the end of each line.
dispc2_de	O	<ul style="list-style-type: none"> <li>In passive matrix technology, the de signal is configured to transition each time a programmable number of line clocks occurs. To prevent a dc charge within the screen pixels, the power and ground supplies of the panel are periodically switched. The DISPC signals the panel to switch the polarity by toggling the de pin.</li> <li>In active matrix technology, the de signal acts as an output-enable signal to indicate when data must be latched using the pixel clock.</li> </ul>
dispc2_fid	O	The FID signal indicates the field identifier for the LCD output field <ul style="list-style-type: none"> <li>0 means even.</li> <li>1 means odd.</li> </ul>

### 10.2.2.1 LCD Output and Data Format for the Parallel Interface

This section describes the pixel data bus and shows timing diagrams of transactions and synchronizations.

Figure 10-12 through Figure 10-18 show the pixel data bus, depending on the use of 4-, 8-, 12-, 16-, 18-, or 24-pixel data output pins.

Table 10-20 lists the number of displayed pixels per pixel clock cycle based on the type of display panel.

**Table 10-20. Number of Displayed Pixels per Pixel Clock Cycle Based on Display Type**

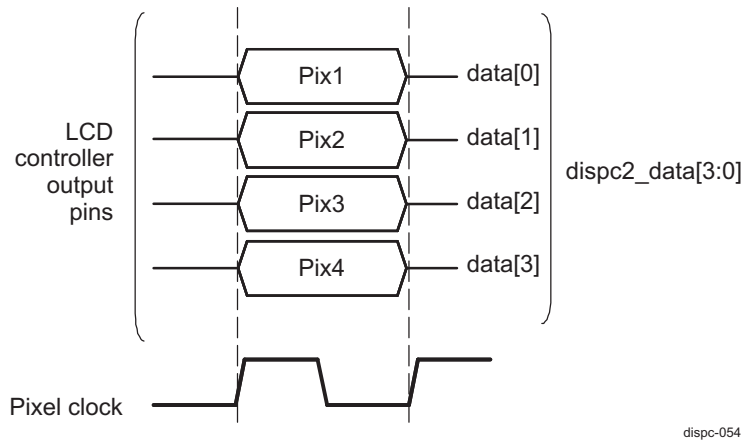

Display Panel	Number of Displayed Pixels per Pixel Clock Cycle
Monochrome 4-bit	4
Monochrome 8-bit	8
Passive matrix color	8/3
Active matrix	1

- Passive matrix technology, monochrome mode

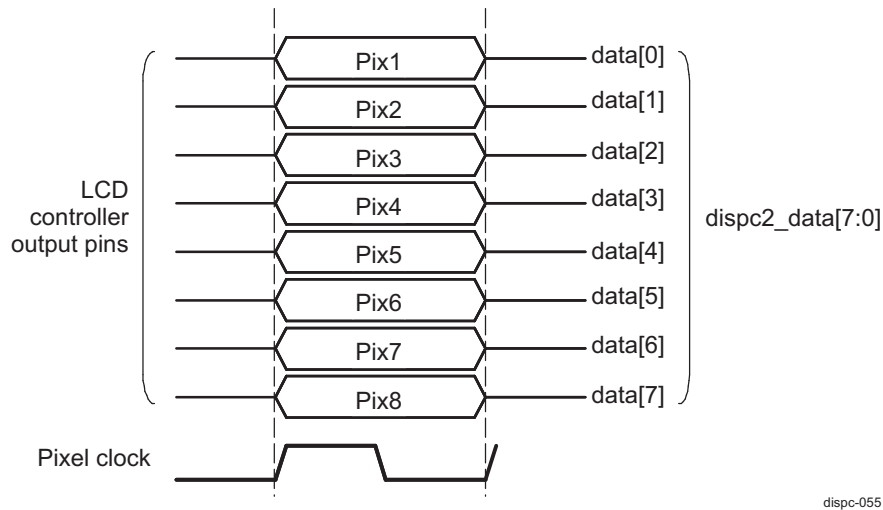

Monochrome displays use a 4-bit or 8-bit interface. Each bit represents one pixel (on or off), which means that 4 or 8 pixels are sent to the LCD at each pixel clock.

Figure 10-12 and Figure 10-13 show 4- and 8-bit monochrome displays, respectively.

**Figure 10-12. LCD Pixel Data Monochrome4 Passive Matrix**

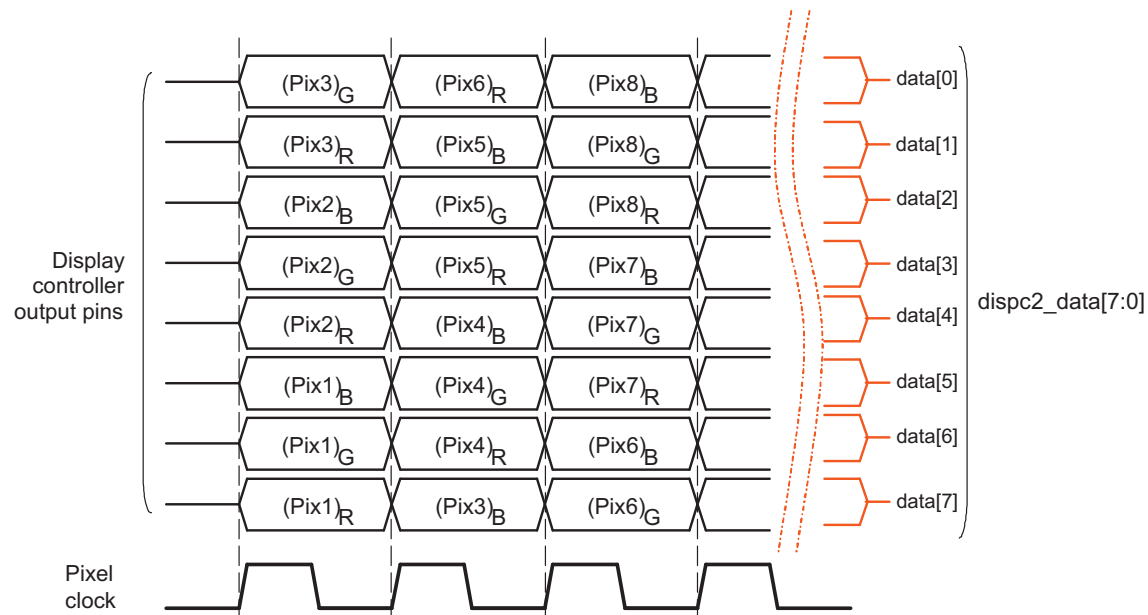

**Figure 10-13. LCD Pixel Data Monochrome8 Passive Matrix**

- Passive matrix technology, color mode  
Color passive displays use 8-bit data input lines. In a given pixel clock cycle, each line represents one color component (red, green, or blue).

Figure 10-14 shows an 8-bit color passive matrix display.

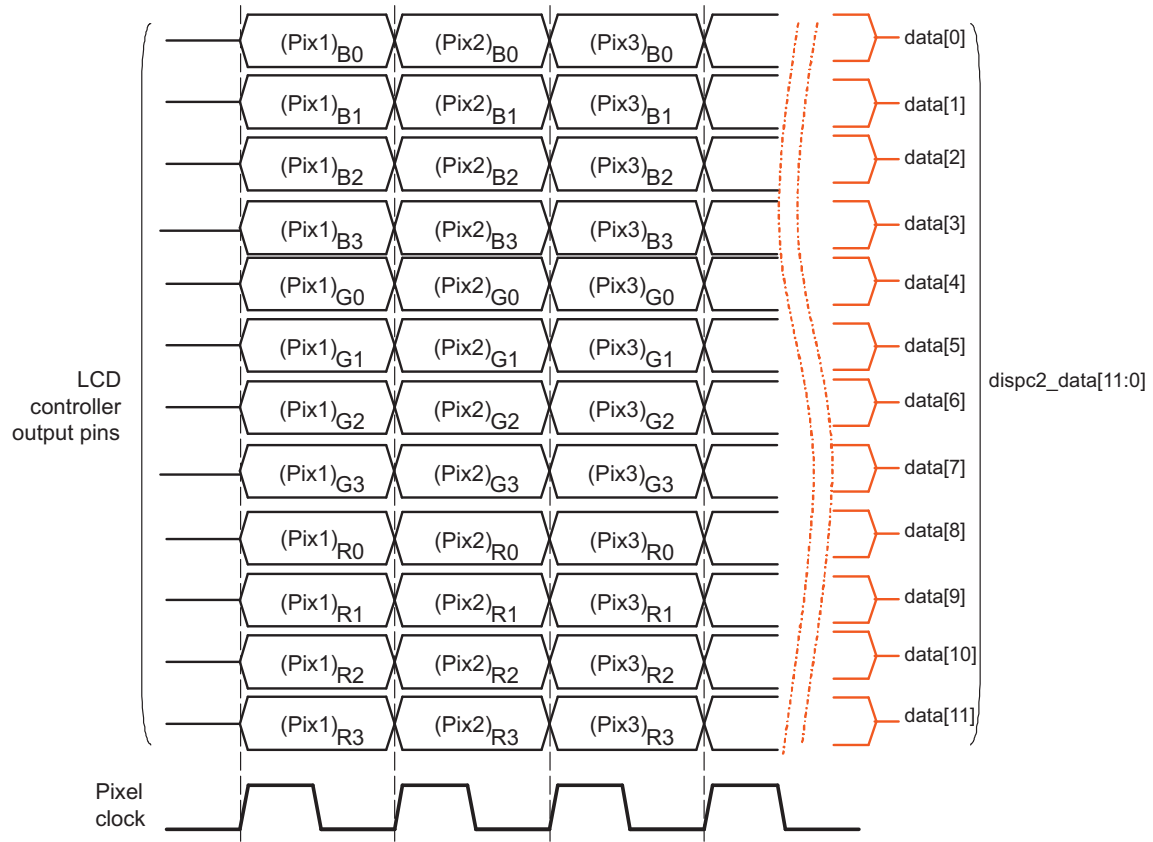

**Figure 10-14. LCD Pixel Data 8-Bit Color Passive Matrix**

- Active matrix technology

Active matrix displays bypass the STN dithering logic block and the output FIFO. Each line represents one pixel.

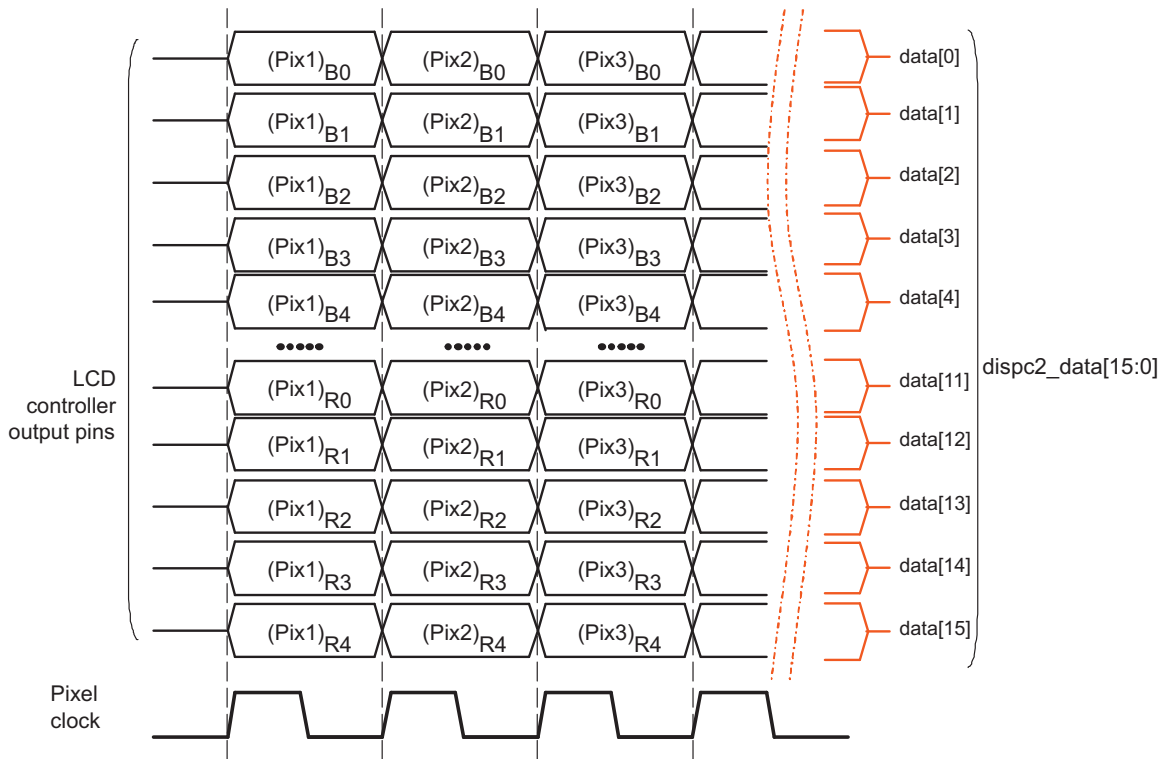

Figure 10-15 through Figure 10-18 show 12-, 16-, 18-, and 24-active matrix displays, respectively.

### 10.2.2.2 Transaction Timing Diagrams

Figure 10-19 through Figure 10-34 show timing diagrams of synchronization signals and pixel clock for passive matrix and active matrix panels. The DISPC directly drives these signals, which are related to the programmable fields described in Table 10-21.

Table 10-21. Programmable Fields in Bypass Mode

Name	Register	Description
PPL	DISPC_SIZE_LCD0[10:0] PPL bit field value + 1	Pixels per line
LPP	DISPC_SIZE_LCD0[26:16] LPP bit field value + 1	Lines per panel
HBP	DISPC_TIMING_Ho[31:20] HBP bit field value + 1	Horizontal back porch
HFP	DISPC_TIMING_Ho[19:8] HFP bit field value + 1	Horizontal front porch
HSW	DISPC_TIMING_Ho[7:0] HSW bit field value + 1	Horizontal synchronization pulse width
VBP	DISPC_TIMING_Vo[31:20] VBP bit field value	Vertical back porch
VFP	DISPC_TIMING_Vo[19:8] VFP bit field value	Vertical front porch
VSW	DISPC_TIMING_Vo[7:0] VSW bit field value + 1	Vertical synchronization pulse width
ONOFF	DISPC_POL_FREQ0[17] ONOFF bit	DISPC_HSYNC and DISPC_VSYNC pixel clock control
RF	DISPC_POL_FREQ0[16] RF bit	DISPC_HSYNC and DISPC_VSYNC pixel clock edge control
IEO	DISPC_POL_FREQ0[15] IEO bit	Invert DISPC_ACBIAS
IPC	DISPC_POL_FREQ0[14] IPC bit	Invert DISPC_PCLK
IHS	DISPC_POL_FREQ0[13] IHS bit	Invert DISPC_HSYNC
IVS	DISPC_POL_FREQ0[12] IVS bit	Invert DISPC_VSYNC

- Active matrix timing configuration 1
  - DISPC\_POL\_FREQ0[17] ONOFF bit = 0
  - DISPC\_POL\_FREQ0[16] RF bit = 0
  - The HSYNC and VSYNC signals are driven on the opposite edge of PCLK from the pixel data.
  - DISPC\_POL\_FREQ0[15] IEO = 0

- The DE signal is active high.
- DISPC\_POL\_FREQo[14] IPC = 0  
The pixel data are driven on the rising edge of PCLK.
- DISPC\_POL\_FREQo[13] IHS = 0  
The HSYNC signal is active high.
- DISPC\_POL\_FREQo[12] IVS = 0  
The VSYNC signal is active high.

**Figure 10-19. Active Matrix Timing Diagram of Configuration 1 (Start of Frame)**

**Figure 10-20. Active Matrix Timing Diagram of Configuration 1 (Between Lines)**

**Figure 10-21. Active Matrix Timing Diagram of Configuration 1 (Between Frames)**

**Figure 10-22. Active Matrix Timing Diagram of Configuration 1 (End of Frame)**

- Active matrix timing configuration 2
  - DISPC\_POL\_FREQo[17] ONOFF bit = 1
  - DISPC\_POL\_FREQo[16] RF bit = 1  
The HSYNC and VSYNC signals are driven on the rising edge of PCLK.

- DISPC\_POL\_FREQo[15] IEO = 1  
The DE signal is active low.
- DISPC\_POL\_FREQo[14] IPC = 1  
The pixel data is driven on the falling edge of PCLK.
- DISPC\_POL\_FREQo[13] IHS = 1  
The HSYNC signal is active low.
- DISPC\_POL\_FREQo[12] IVS = 1  
The VSYNC signal is active low.

### 10.2.2.3 TV Output and Data Format for the Parallel Interface

This section describes the TV output pixel data bus for the parallel interface.

The TV pixel data interface is a 30-bit RGB interface. Only the MSB part of each color component is connected to the DSS boundary: R[9:2], G[9:2], B[9:2]. The output of the data is synchronized to the data request signal (HDMI\_M\_DE) from the HDMI encoder.

Figure 10-35 describes the TV output pixel data format.

Figure 10-35. TV Output Pixel Data

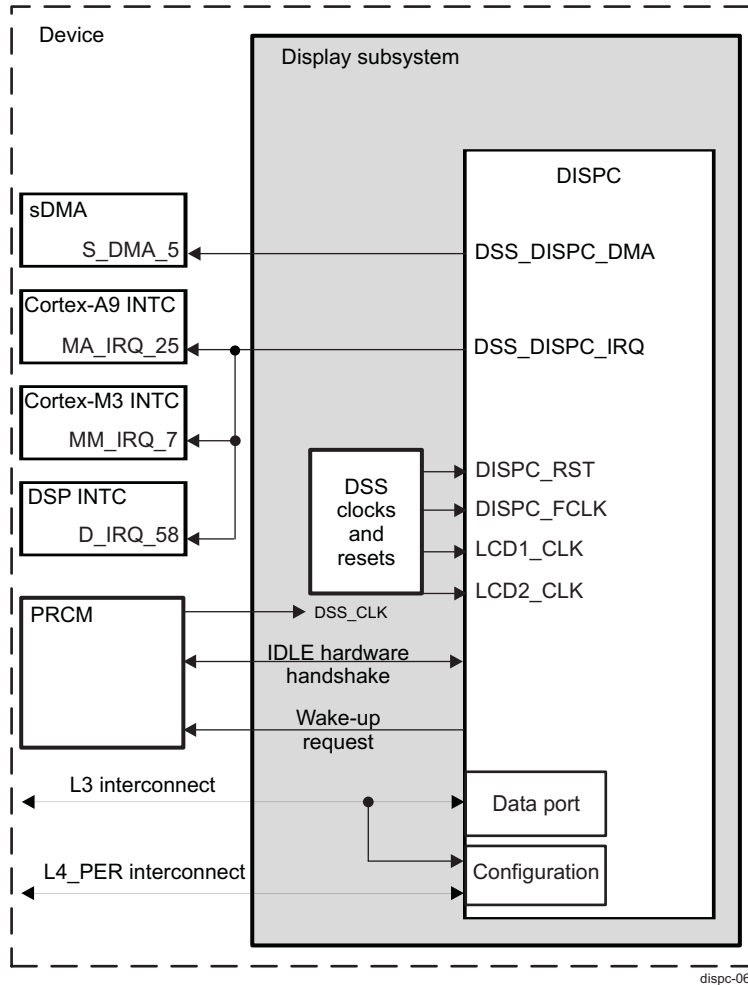

dispc-093

### 10.2.3 Display Controller Integration

This section describes the DISPC integration in the device. The complete details about clocks, resets are detailed in the [Section 10.1, Display Subsystem Overview](#).

**Figure 10-36. Display Controller Integration**

[Table 10-22](#) and [Table 10-23](#) list the integration attributes and clock and resets, respectively.

[Table 10-24](#) summarize the integration of the module in the device.

**Table 10-22. Integration Attributes**

Module Instance	Attributes	
	Power Domain	Interconnect
DISPC	PD_DSS	L3 for data transfer L4_PER for configuration

**Table 10-23. Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DISPC	DISPC_FCLK	DSS_CLK/PLL1_CLK1/PLL2_CLK1/PLL3_CLK1	PRCM/PLLs	Functional clock for the DISPC logic. For multiplexing description and frequency ratings, see <a href="#">Section 10.1.2.1, DSS Clocks</a> .
	LCD1_CLK	DSS_CLK/PLL1_CLK1	PRCM/PLL1	Clock used to generate the divided pixel clock for the primary LCD interface. For multiplexing description and frequency ratings, see <a href="#">Section 10.1.2.1, DSS Clocks</a> .
	LCD2_CLK	DSS_CLK/PLL2_CLK1	PRCM/PLL2	Clock used to generate the divided pixel clock for the secondary LCD interface. For multiplexing description and frequency ratings, see <a href="#">Section 10.1.2.1, DSS Clocks</a> .
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DISPC	DISPC_RST	DISPSS_RST	PRCM/DSS	Hardware reset is coming form PRCM, or via a software reset performed at DSS level. For the tree reset description, see <a href="#">Section 10.1.2.2, DSS Resets</a> .

**NOTE:** If video mode is used, the VPn\_PCLK and VPn\_CLK clocks must be generated using a CLKIN4DDR clock.

**Table 10-24. Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
DISPC	DSS_DISPC_IRQ	MM_IRQ_	Cortex-M3	Display controller interrupt. For information about Cortex-M3 interrupt control, see <a href="#">Chapter 7</a> .
	DSS_DISPC_IRQ	D_IRQ_58	DSP	Display controller interrupt. For information about DSP interrupt control, see <a href="#">Chapter 5</a> .
	DSS_DISPC_IRQ	MA_IRQ_25	Cortex-A9	Display controller interrupt. For information about Cortex-A9 interrupt control, see <a href="#">Chapter 4</a> .

**Table 10-24. Hardware Requests (continued)**

DMA Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
DISPC	DSS_DISPC_DMA	S_DMA_5	System DMA	The line trigger signal informs the sDMA that a programmable number of lines are output to the LCD, and that the system memory can be updated. For more details, see <a href="#">Section 10.2.4.5, sDMA Requests</a> .

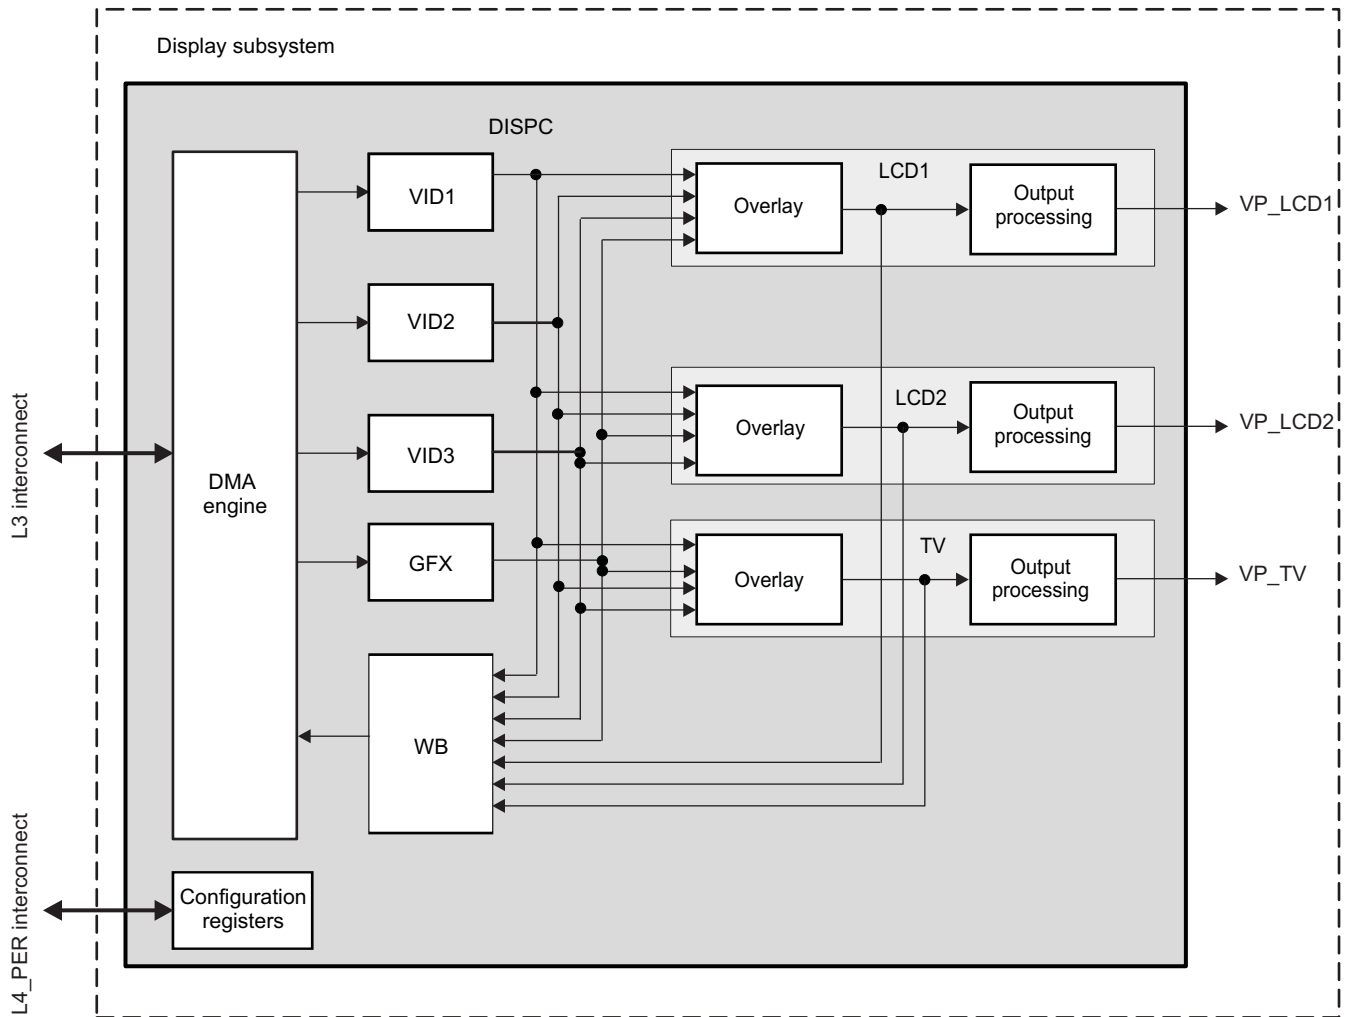

**NOTE:**

- For a description of interrupt sources, see [Section 10.2.4.4, Interrupt Requests](#).
- For a description of DMA sources, see [Section 10.2.4.5, sDMA Requests](#).

### 10.2.4 Display Controller Functional Description

The DISPC can read and display the encoded pixel data stored in memory (see [Figure 10-37](#)).

**Figure 10-37. DISPC Architecture Overview**

dispc-068

The DISPC can read and display the encoded pixel data stored in memory and write the output of one of the overlays or one of the pipelines into system memory.

Several processes can be configured to manage the graphics pipeline (palette, antiflicker) and video pipelines (VC-1, color space conversion, scaling, overlay, and transparency ...).

The data coming out of a pipeline is sent to one of the three outputs depending on user configuration. An overlay manager manages inputs of multiple pipelines. Timings user configuration for LCD and TV are available.

The DISPC allows capturing of one output of the pipeline or overlay manager to redirect it into the WB pipeline. It allows to take benefit of the hardware processing available inside the DISPC like color space conversion, rescaling, compositing, etc., to perform memory-to-memory transfer with data processing.

### 10.2.4.1 Clock Configuration

The PCLK frequency for each LCD output is derived from a dedicated input clock: LCD1\_CLK and LCD2\_CLK for the primary and secondary LCD outputs, respectively. Each input clock is divided by the values of the `DISPC_DIVISORo[23:16]` LCD bit field and then the `DISPC_DIVISORo[7:0]` PCD bit field independently for each LCD pixel clock (see [Figure 10-38](#)). LCD1\_PCLK and LCD2\_PCLK are independent.

$$\text{LCD1\_PCLK} = (\text{LCD1\_CLK} / \text{LCD1}) / \text{PCD1}$$

$$\text{LCD2\_PCLK} = (\text{LCD2\_CLK} / \text{LCD2}) / \text{PCD2}$$

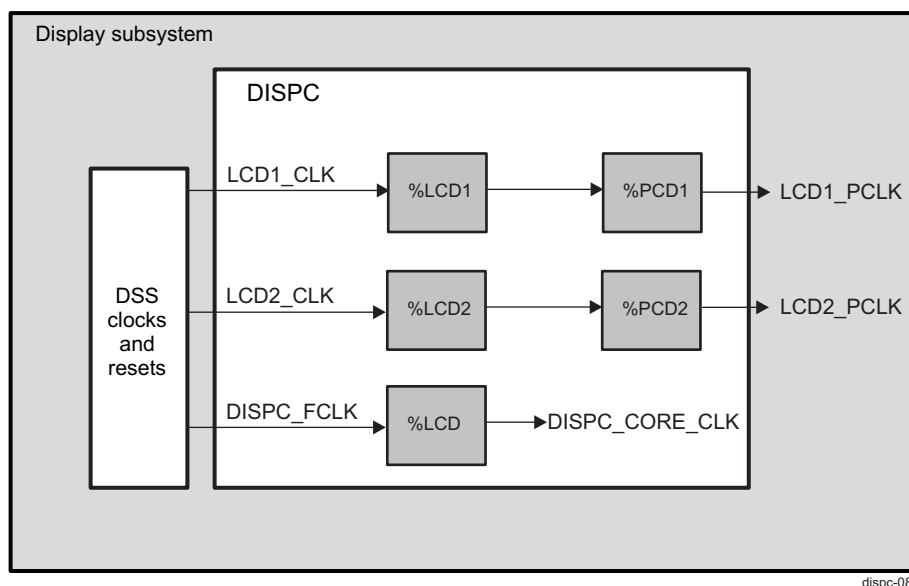

The functional clock of the DISPC (`DISPC_CORE_CLK`) is derived from `DISPC_FCLK` by an independent divisor. The dividing value is set in the `DISPC_DIVISORo[23:16]` LCD bit field.

**NOTE:** `DISPC_CORE_CLK` must be higher than or equal to the `LCD1_PCLK`, `LCD2_PCLK`, and `TV_CLK` clocks.

For more information about the DISPC clocks and frequency ratings, see [Section 10.1.2.1, DSS Clocks](#).

For backward compatibility, the divisor value `LCD` can be set to the value of `LCD1`. To enable this functionality, the `DISPC_DIVISORo[0]` `ENABLE` bit must be set to 1.

**Figure 10-38. DISPC Clock Tree Overview**

### 10.2.4.2 Software Reset

To perform a software reset on the DISPC, set the `DISPC_SYSCONFIG[1]` `SOFTRESET` bit to 0x1. The `DISPC_SYSSTATUS[0]` `RESETDONE` bit indicates that the software reset is complete when its value is 0x1. When the software reset completes, the `DISPC_SYSCONFIG[1]` `SOFTRESET` bit is automatically reset. Software must ensure that the software reset completes before doing DISPC operations.

### 10.2.4.3 Power Management

The DISPC supports the MStandby/Wait, IdleReq/SidleAck, and wake-up protocols as defined in PRCM chapter.

### 10.2.4.3.1 Idle Mode

The DISPC supports no-idle mode, force-idle mode, and smart-idle mode. The mode can be selected by programming the appropriate value in the `DISPC_SYSCONFIG[4:3]` SIDLEMODE bit field.

Condition of assertion of SIdleAck signal:

- In no-idle mode: In this mode, SIdleAck is never asserted.
- In force-idle mode: In this mode, SIdleAck is asserted unconditionally with a 1-configuration port interface clock cycle delay with respect to IdleReq assertion.

---

**NOTE:** A proper use of force-idle mode assumes that no interrupt need to be generated.

---

- In smart-idle mode: In this mode, SIdleAck is asserted when all at least the following conditions are satisfied:
  - No interrupt is pending.
  - The DISPC no longer uses the interface clock for the slave port.

Once SIdleAck is asserted:

- The DISPC interface lock used by the slave port may be shut down at any time.
- Any transactions on the configuration port (L4\_PER interconnect) are ignored.

The condition of deassertion of SIdleAck signal are:

- In force-idle mode: In this mode, SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to IdleReq deassertion.
- In smart-idle mode: In this mode, SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to IdleReq deassertion.

Once SIdleAck is released, the DISPC is fully operational and a DMA request can be processed normally.

### 10.2.4.3.2 StandBy Mode

The DISPC supports the no-standby mode, the force-standby mode and a single smart-standby mode. The mode is set in MIDLEMODE field `DISPC_SYSCONFIG[13:12]`. The functional clock is always active if the module is enabled. The L3 clock can be shut down at any time independently of the status of MStandby.

The condition of assertion of MStandby signal are:

- In no-standby mode: In this mode, MStandby is never asserted.
- In force-standby mode: In this mode, MStandby is asserted when the module is disabled.
- In smart-standby: In the case of one of the following conditions:
  - GFX pipeline is disabled, or GFX pipeline is enabled but the data fetch is completed for GFX window, or GFX pipeline is enabled and the data fetch did not complete and data in the DMA buffer is greater than high threshold value.
  - VID1 pipeline is disabled, or VID1 pipeline is enabled but the data fetch is completed for VID1 window, or VID1 pipeline is enabled and the data fetch did not complete and data in the DMA buffer is greater than high threshold value.
  - VID2 pipeline is disabled, or VID2 pipeline is enabled but the data fetch is completed for VID2 window, or VID2 pipeline is enabled and the data fetch did not complete and data in the DMA buffer is greater than high threshold value.
  - VID3 pipeline is disabled, or VID3 pipeline is enabled but the data fetch is completed for VID3 window, or VID3 pipeline is enabled and the data fetch did not complete and data in the DMA buffer is greater than high threshold value.
  - WB pipeline is disabled, or WB pipeline is enabled but the data store to memory is completed for WB picture, or WB pipeline is enabled and the data storage did not complete but data in the DMA buffer is lower than low threshold value.

MStandby signal asserts whenever all five events have occurred or the DISPC is disabled. While the MStandby is asserted, the DISPC does not generate any transaction on the L3 master port.

The condition of deassertion of the MStandby signal are:

- In force-standby mode: In this mode, MStandby is deasserted only when the DISPC is enabled.
- In smart-standby mode: In the case of one of the following conditions:
  - GFX pipeline is enabled and the data fetch did not complete for GFX window and the data in the DMA buffer is less than low threshold value.
  - VID1 pipeline is enabled and the data fetch did not complete for VID1 window and the data in the DMA buffer is less than low threshold value.
  - VID2 pipeline is enabled and the data fetch did not complete for VID2 window and the data in the DMA buffer is less than low threshold value.
  - VID3 pipeline is enabled and the data fetch did not complete for VID3 window and the data in the DMA buffer is less than low threshold value.
  - WB pipeline is enabled and the data store did not complete for WB picture and the data in the DMA buffer more than high threshold value.

Detection of the deassertion conditions assumes that the interface clocks are active.

#### 10.2.4.3.3 Wakeup

The DISPC supports wake-up signaling. The mode can be selected by programming the appropriate value in the [DISPC\\_SYSCONFIG\[2\]](#) ENAWAKEUP bit. The SWakeup signal is asynchronous so it does not require the interface clock.

The conditions of assertion of the SWakeup signal are:

- GFX pipeline is enabled and the data fetch did not complete for the GFX window and the data in DMA buffer are less than low threshold value.
- VID1 pipeline is enabled and the data fetch did not complete for the VID1 window and the data in DMA buffer are less than low threshold value.
- VID2 pipeline is enabled and the data fetch did not complete for the VID2 window and the data in DMA buffer are less than low threshold value.
- VID3 pipeline is enabled and the data fetch did not complete for the VID3 window and the data in DMA buffer are less than low threshold value.
- WB pipeline is enabled and the data in DMA buffer are more than high threshold value.
- The last pixel displayed into LCD1 panel if it is not the last frame
- The last pixel displayed into LCD2 panel if it is not the last frame
- The last pixel displayed into TV panel if it is not the last frame

SWakeup signal is asserted whenever any one of eight events occurs and IdleAck is asserted.

When one of the active pipelines reaches the low threshold and must refill its DMA buffer for the current frame, all other pipelines refill their own DMA buffer even if their low threshold has not been reached. The [DISPC\\_CONFIG1\[17\]](#) BUFFERFILLING bit field is used to increase the probability that the time increases, where there is no access to the L3 interconnect.

The condition of deassertion of SWakeup signal is:

- Immediately after deassertion of IdleReq

#### 10.2.4.4 Interrupt Requests

[Table 10-25](#) details the interrupts generated for the DISPC.

The interrupt line, DSS\_DISPC\_IRQ, indicates when one or more events are detected by the hardware. Each event is independently maskable by setting the [DISPC\\_IRQENABLE](#) register.

To check when a particular interrupt event occurs and to reset a particular event, the [DISPC\\_IRQSTATUS](#) register must be accessed. This register regroups all the status of the module internal events that generate an interrupt (read 0: No interrupt occurred; read 1: Interrupt occurred; write 1: Status bit reset). See *Display Subsystem Register Manual*, for more information on checking and clearing interrupt events.

[Table 10-25](#) lists the DISPC interrupt events.

**Table 10-25. DISPC Interrupts**

<b>Interrupt Name</b>	<b>Description</b>
FRAMEDONE1_IRQ	Frame Done for LCD1 output: Active frame related to the LCD1 has completed and LCD1 output of the DISPC is disabled.
FRAMEDONE2_IRQ	Frame Done for LCD2 output: Active frame related to the LCD2 has completed and LCD2 output of the DISPC is disabled.
FRAMEDONETV_IRQ	Frame Done for TV output: Active frame related to the TV output has completed and TV output of the DISPC is disabled.
FRAMEDONEWB_IRQ	Frame Done for WB output: Active frame related to the WB has completed. First, it is used when the WB channel is connected to one of the pipelines to determine when the memory-to-memory transfer through DISPC is completed. Second, it is used when the WB channel is connected to one of the overlay output in nonreal-time mode to determine when the memory-to-memory transfer with overlay processing is completed.
VSYNC1_IRQ	VSYNC for primary LCD output: VSYNC interrupt for the primary LCD has occurred at the end of the frame.
VSYNC2_IRQ	VSYNC for secondary LCD output: VSYNC interrupt for the secondary LCD has occurred at the end of the frame.
EVSYNC_EVEN_IRQ	VSYNC for even field: EVSYNC_EVEN interrupt has occurred at the end of the frame (EVSYNC received and the field polarity is even) (VENC/HDMI)
EVSYNC_ODD_IRQ	VSYNC for odd field: EVSYNC_ODD interrupt has occurred at the end of the frame (EVSYNC received and the field polarity is odd) (VENC/HDMI)
ACBIASCOUNTSTATUS1_IRQ	AC Bias Count Status for LCD1 output: AC Bias transition counter has decremented to 0.
ACBIASCOUNTSTATUS2_IRQ	AC Bias Count Status for LCD2 output: AC Bias transition counter has decremented to 0
PROGRAMMEDLINENUMBER_IRQ	Programmed Line Number: The primary LCD has reached the user programmed line number.
VID1ENDWINDOW_IRQ	End of the VID1 window: The DMA engine has fetched all the data from memory for the VID1 for the current frame.
VID2ENDWINDOW_IRQ	End of the VID2 window: The DMA engine has fetched all the data from memory for the VID2 for the current frame.
VID3ENDWINDOW_IRQ	End of the VID3 window: The DMA engine has fetched all the data from memory for the VID3 for the current frame.
GFXENDWINDOW_IRQ	End of the graphics window: The DMA engine has fetched all the data from memory for the graphics for the current frame.
VID1BUFFERUNDERFLOW_IRQ	VID1 DMA buffer underflow: The input VID1 DMA buffer goes underflow.
VID2BUFFERUNDERFLOW_IRQ	VID2 DMA buffer underflow: The input VID2 DMA buffer goes underflow.
VID3BUFFERUNDERFLOW_IRQ	VID3 DMA buffer underflow: The input VID3 DMA buffer goes underflow.
WBUFFEROVERFLOW_IRQ	WB DMA buffer overflow: The output WB DMA buffer goes overflow. It cannot occur when WB channel is used in memory-to-memory transfer mode but only in capture mode. In capture mode the timings are defined by the timer associated with the output. In memory-to-memory mode, there is timing constraint.
GFXBUFFERUNDERFLOW_IRQ	GFX DMA buffer underflow: The input Graphics DMA buffer goes underflow.
PALETTEGAMMALOADING_IRQ	Palette/Gamma Table Loading: The palette/Gamma table in the graphics pipeline has been loaded using the DISPC DMA engine.
WBUNCOMPLETEERROR_IRQ	The write back buffer has been flushed before been fully drained. In WB capture mode, if the new frame starts before the WB DMA buffers are fully drained (onto external memory), then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). This interrupt is an indication of that, and will trigger every frame.

**Table 10-25. DISPC Interrupts (continued)**

Interrupt Name	Description
OCPERROR_IRQ	OCP Error: L3 interconnect has sent SResp = ERR
SYNCLOST1_IRQ	Synchronization Lost on LCD1 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (LCD output).
SYNCLOST2_IRQ	Synchronization Lost on LCD2 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (LCD output).
SYNCLOSTTV_IRQ	Synchronization Lost on TV output: Occurs when porches are not wide enough to load the pipelines with data (TV output connected to the video NTSC/PAL encoder or HDMI).
WAKEUP_IRQ	Wakeup: Occurs when the SWakeUp signal is asserted.

#### 10.2.4.5 sDMA Requests

The DMA synchronization line, DSS\_DISPC\_DMA, is connected to the sDMA. This DMA request is not a classical one but rather a synchronization signal between the DISPC and sDMA. The sDMA is informed that a programmable number of lines are output to the LCD, and that a system memory can be updated. This request is related to the interrupt event PROGRAMMEDLINENUMBER\_IRQ described in [Table 10-25](#). This allows the sDMA channel to be synchronized with the display subsystem internal DMA controller.

In other words, it allows to synchronize a memory-to-memory frame buffer update based on the scan line of the frame buffer in system memory (SDRAM or SRAM) by the DISPC. The DSS\_DISPC\_DMA DMA request is generated at a programmable line number defined in the DISPC\_LINE\_NUMBER[10:0] LINENUMBER bit field. This process allows an application to use a single frame buffer and update it after a certain number of lines has been read by the DISPC.

#### 10.2.4.6 DMA Engine

The DMA engine:

- Supplies data (encoded pixel data, palette, and gamma curve) from memories to GFX, VID1, VID2, and VID3 pipelines through the interconnect based on the configuration of the DISPC and pipelines settings.
- Stores (encoded pixel data) from GFX/VID pipelines or overlays to memories through the WB pipeline and interconnect based on the configuration of the DISPC and WB pipeline settings.

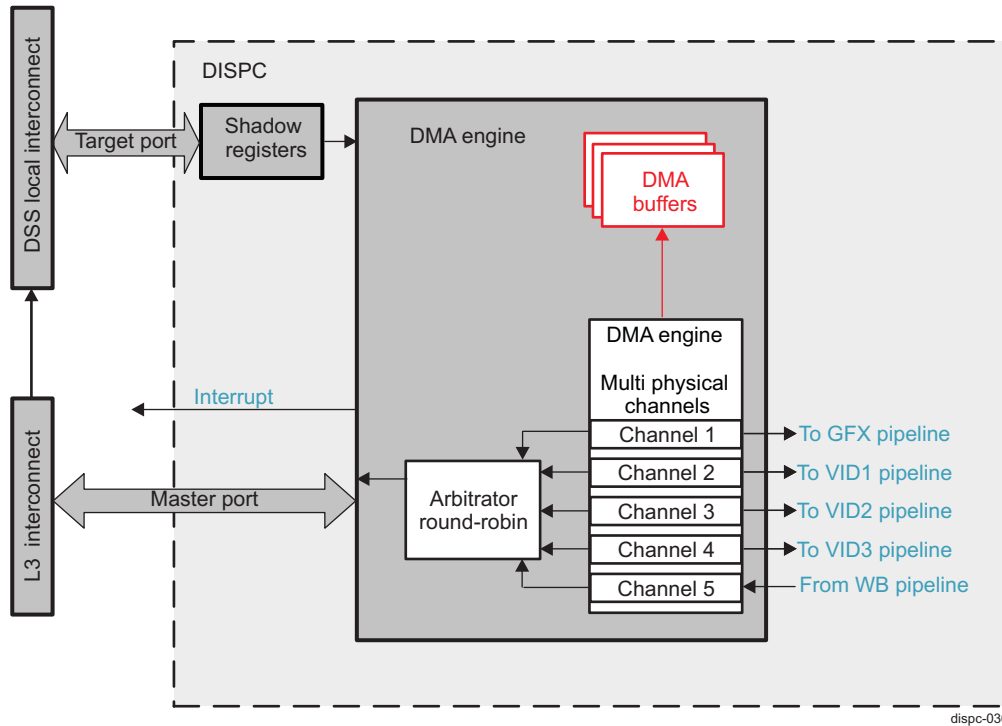

Each pipeline has a dedicated buffer and a channel with independent settings. The default size and allocation of the DMA buffer is detailed in [Table 10-26](#). Each DMA buffer is divided into two spaces, top and bottom buffer. Depending on the application, a DMA buffer space can be associated to a pipeline or merged with other spaces. The total number of spaces for each individual pipeline is from 0 (pipeline inactive) to number of pipelines x2 (in that case, all the DMA buffers are associated to a single pipeline). The sum of the number of spaces allocated for each pipeline must not be greater than the maximum number of spaces available. The correct number of spaces must be allocated to ensure no underflow. The spaces allocated to each pipeline must be greater than or equal to the minimum number of spaces required to support the throughput and the system latency. The space assignment are done in the DISPC\_GLOBAL\_BUFFER register.

[Figure 10-39](#) shows an overview of the DMA engine.

**Table 10-26. DMA Buffer Size**

Pipelines	DMA Buffer Size
GFX	2 lines × 640 × 128 bits
VID1	2 lines × 1024 × 128 bits
VID2	2 lines × 1024 × 128 bits
VID3	2 lines × 1024 × 128 bits
WB	2 lines × 1024 × 128 bits

Figure 10-39. DMA Engine Overview

#### 10.2.4.6.1 Addressing and Bursts

For each line to be fetched/stored, the DMA engine:

- Calculates the pixel address.
- Aligns the address.
- Defines the burst structure:
  - Type of the burst (1D or 2D burst structure).
  - Length of the burst.

The DMA engine generates scan addresses to read/write data from/to system memory. The base address defines the start address of the first pixel, then the address is incremented based on the number of pixels per line, offset between two consecutive lines and number of lines. The byte address of each pixel in the frame buffer in the system memory is determined by:

$$\text{Pixel address} = \text{Base address} + x \times \text{bpp} + (y \times ((\text{width} \times \text{bpp}) + \text{increment}))$$

where:

- Base address corresponds to the base address (for YUV–NV12 format) defined by:
  - DISPC\_GFX\_BA\_0[31:0], BA bit field
  - DISPC\_GFX\_BA\_1[31:0], BA bit field
  - DISPC\_VIDp\_BA\_0[31:0], BA bit field
  - DISPC\_VIDp\_BA\_1[31:0], BA bit field
  - DISPC\_VIDp\_BA\_UV\_0[31:0], BA bit field
  - DISPC\_VIDp\_BA\_UV\_1[31:0], BA bit field
- bpp corresponds to the number of bits per pixel defined by the DISPC\_GFX\_ATTRIBUTES[4:1] FORMAT bit field or DISPC\_VIDp\_ATTRIBUTES[4:1] FORMAT bit field.
- width corresponds to the number of pixels per line defined by DISPC\_GFX\_SIZE[10:0] SIZE+1 bit field or DISPC\_VIDp\_SIZE[10:0] SIZE+1 bit field.
- increment corresponds to the number of bytes to skip between two contiguous lines defined by

**DISPC\_GFX\_ROW\_INC**[31:0] ROWINC –1 bit field or **DISPC\_VIDp\_ROW\_INC**[31:0] ROWINC –1 bit field.

- x corresponds to the pixel position on the x-axis.
- y corresponds to the pixel position on the y-axis.

---

**NOTE:** For YUV format, the pixel values are defined in two separated buffers (Y and UV). The Y buffers base address are defined in the **DISPC\_VIDp\_BA\_j**[31:0] BA bit field. The UV buffers base address are defined in the **DISPC\_VIDp\_BA\_UV\_j**[31:0] BA bit field.

---

**Table 10-27** resumes the registers settings for a simple access of a picture in system memory.

**Table 10-27. Register Settings for Accessing Image in Internal Memory**

Registers	Value
<b>DISPC_GFX_BA_j</b> / <b>DISPC_VIDp_BA_j</b> / <b>DISPC_WB_BA_j</b>	PBA, the physical base address of image in the memory
<b>DISPC_VIDp_BA_UV_j</b> / <b>DISPC_WB_BA_UV_j</b>	PBA, the physical base address of UV buffers image in the memory
<b>DISPC_GFX_PIXEL_INC</b> / <b>DISPC_VIDp_PIXEL_INC</b> / <b>DISPC_WB_PIXEL_INC</b>	1 or other in pixel incremental value
<b>DISPC_GFX_ROW_INC</b> / <b>DISPC_VIDp_ROW_INC</b> / <b>DISPC_WB_ROW_INC</b>	1 or other in row incremental value

An interconnect request, 128-bits, corresponds to one or several pixels depending on bits per pixels. Therefore, the DMA engine determines the appropriate burst sequence to optimize each new line fetching/storing. The DMA engine must prevent a single burst from crossing two lines. The DMA engine supports bursts of 2 × 128 bits, 4 × 128 bits, and 8 × 128 bits. The default burst size at reset time is 8 × 128 bits. The maximum burst size can be configured for each pipeline by setting the **DISPC\_GFX\_ATTRIBUTES**[7:6] BURSTSIZE bit field or **DISPC\_VIDp\_ATTRIBUTES**[15:14] BURSTSIZE bit field. Because the burst size must be aligned to the burst boundary, in case of misalignment, the DMA engine may issue single and/or smaller burst requests. Two types of burst are present:

- 1D-burst is used if the fetch/storage is linear in memory through the TILER. There is no rotation of the frame buffer. The frame buffer is not tiled.
- 2D-burst is used if the frame buffer is tiled.

Even if the **DISPC\_VIDp\_ROW\_INC** does not equal 1, the 2D-burst can be selected by the user. It is used when the DISPC is configured to read one field of a frame by accessing only the even and odd lines.

---

**NOTE:** The burst size is initialized once at configuration and can be changed when the DISPC is disabled.

---

## 10.2.4.6.2 DMA Buffers

### 10.2.4.6.2.1 READ DMA Buffers (GFX and VID Pipelines)

When the vertical front porch (VFP) period starts after the last horizontal front porch (HFP) of the last line or the external VSYNC is received, the DMA buffers are flushed according to the selected output associated with the pipeline. The DMA engine restarts fetching data from the memory through the L3 Interconnect. Enabling/disabling the DISPC flushes the DMA buffers (except WB DMA buffers).

Programmable high and low thresholds, independent for each DMA buffer, are used by the DMA engine to start and stop requesting data to the L3 interconnect.

- When low threshold (set in the **DISPC\_GFX\_BUF\_THRESHOLD**[15:0] BUFLOWTHRESHOLD bit field or **DISPC\_VIDp\_BUF\_THRESHOLD**[15:0] BUFLOWTHRESHOLD bit field) is reached, the DMA engine starts a request on the L3 interconnect to fill the DMA buffer.
- When high threshold (set in the **DISPC\_GFX\_BUF\_THRESHOLD**[31:16] BUFHIGHTHRESHOLD bit field or **DISPC\_VIDp\_BUF\_THRESHOLD**[31:16] BUFHIGHTHRESHOLD bit field) is reached, the DMA engine stops requesting encoded pixels.

To avoid underflow at the beginning of a frame and have sufficient encoded pixel data to start some processing, a preloading of the DMA buffer is configurable between a fixed value of bytes or the high threshold value. The preload ensures a minimum number of pixels present in the buffer. When the preload value is reached, the associated channel must start pulling pixels out of the DMA buffer. To enable the preload based on the value entered in the [DISPC\\_GFX\\_PRELOAD\[11:0\]](#) PRELOAD bit field or [DISPC\\_VIDp\\_PRELOAD\[11:0\]](#) PRELOAD bit field, the [DISPC\\_GFX\\_BUF\\_THRESHOLD\[11\]](#) BUFPRELOAD bit, or [DISPC\\_VIDp\\_BUF\\_THRESHOLD\[19\]](#) BUFPRELOAD bit must be set to 0x0.

---

**NOTE:** When self-refresh mode is selected, meaning the data in the DMA buffers are used for multiple frames, and at the end of each frame, the DMA buffers are not flushed.

---

#### 10.2.4.6.2.2 WRITE DMA Buffer (WB Pipeline)

Two modes are supported by the WB channel, selectable through the [DISPC\\_WB\\_ATTRIBUTES\[19\]](#) WRITEBACKMODE bit:

- Capture mode, WRITEBACKMODE bit set to 0: One of the overlay outputs going to LCD or TV outputs is captured and at the same time the data are sent on the output. The WB timings are controlled by the LCD or TV timings.
- Memory-to-memory mode, WRITEBACKMODE bit set to 1: One of the overlay outputs or one of the pipelines is captured in order to perform memory-to-memory transfer with some processing by the DISPC (rescaling, overlaying, color space conversion, etc.)

**In capture mode:** The WB DMA buffers are flushed when the VFP period starts after the HFP following the last line, or when the external VSYNC is received, depending on which output (LCD/TV) the WB pipeline is capturing data, if the programmed value in [DISPC\\_WB\\_ATTRIBUTES2\[7:0\]](#) WBDELAYCOUNT bit field is set to 0. If the programmed value in [DISPC\\_WB\\_ATTRIBUTES2\[7:0\]](#) WBDELAYCOUNT bit field is set to N (1:255), the write buffers DMA are flushed N lines later. The DMA engine starts storing data to memory through the L3-based interconnect as soon as enough data is available for the programmed burst size. When enabling/disabling the DISPC, the DMA buffers are flushed. The programmable thresholds low and high are used by the DMA engine to start and stop sending data to the L3 interconnect.

---

**NOTE:** If [DISPC\\_WB\\_ATTRIBUTES2\[7:0\]](#) WBDELAYCOUNT bit field is set to 0, the WB is reinitialized just at the end of the last line of a frame at the beginning of the VFP signal. To let the WB complete the data write to the external memory, the highest possible value compatible with the vertical blanking period must be set.

---

---

**NOTE:** In WB capture mode, if a new frame starts before the contents of the WB DMA buffers are fully written onto external memory, then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). The [DISPC\\_IRQSTATUS\[26\]](#) WBUNCOMPLETEERROR\_IRQ interrupt bit indicates this situation and will trigger every frame. The WBUNCOMPLETEERROR interrupt can be enabled through the [DISPC\\_IRQENABLE\[26\]](#) WBUNCOMPLETEERROR\_EN bit. Software can avoid this by delaying the flush of WB DMA buffers through proper programming of the [DISPC\\_WB\\_ATTRIBUTES2\[7:0\]](#) WBDELAYCOUNT bit field.

---

**In memory-to-memory mode:** The WB pipeline is not synchronized to any internal or external timing generator. The WB pipeline stores the output of one of the overlay outputs or one of the pipelines. When enabling/disabling the DISPC, the DMA buffers are flushed. The programmable thresholds low and high are used by the DMA engine to start and stop sending data to the L3 interconnect.

Programmable high and low thresholds are used by the DMA engine to start and stop sending data to the L3 interconnect.

- When high threshold (set in the [DISPC\\_WB\\_BUF\\_THRESHOLD\[31:16\]](#) BUFHIGHTHRESHOLD bit field) is reached, the DMA engines start sending data on the L3 interconnect to empty buffer.
- When low threshold (set in the [DISPC\\_WB\\_BUF\\_THRESHOLD\[15:0\]](#) BUFLOWTHRESHOLD bit field)

is reached, the DMA engine stops sending encoded pixels.

At the end of the frame, in order to drain the DMA buffer, some smaller bursts (even single requests) must be issued to completely empty the DMA buffer. To limit the number of interconnect requests from the DISPC, a number of IDLE cycles between requests can be inserted. IDLE cycles can be inserted only when WB is used in memory-to-memory mode. It is ignored when WB is in capture mode.

The number of idle between requests can be activated and determined by :

- Setting the [DISPC\\_WB\\_ATTRIBUTES\[27\]](#) IDLESIZE bit to 0x0 (default value) and entering the number of idles between requests in the [DISPC\\_WB\\_ATTRIBUTES\[31:28\]](#) IDLENUMBER bit field. Idle numbers vary from 0 to 15.
- Setting the [DISPC\\_WB\\_ATTRIBUTES\[27\]](#) IDLESIZE bit to 0x1, which considers the size of the burst (the field [DISPC\\_WB\\_ATTRIBUTES\[15:14\]](#) BURSTSIZE bit field) to determine the number of idles.
  - If BURSTSIZE = 0x0, then idle equals IDLENUMBER (0 to 15).
  - If BURSTSIZE = 0x1, then idle equals IDLENUMBER \* 4 (0 to 60).
  - If BURSTSIZE = 0x2, then idle equals IDLENUMBER \* 8 (0 to 120).

### 10.2.4.6.3 Predecimation

The predecimation process consists of downscaling an image by fetching only the necessary pixels in the memory. Vertical and horizontal predecimation are possible:

- Vertical predecimation: The picture store in memory can be predecimated vertically by skipping lines. Burst mode is used to fetch the data when skipping lines. Only the lines that will be used by the DISPC are fetched from memory; the other lines are skipped. The DMA engine sends requests only for the useful lines using 1D burst or 2D burst, depending on the setting. The base address indicates the first valid pixel to fetch from memory. The number of lines to skip is set in the [DISPC\\_GFX\\_ROW\\_INC\[31:0\]](#) ROWINC bit field or [DISPC\\_VIDp\\_ROW\\_INC\[31:0\]](#) ROWINC bit field.

---

**NOTE:** When 2D burst mode is used, the access to data in memory is performed through the TILER module of DMM (see , [TILER](#), for more details), and as a result a maximum of one line can be skipped.

---

- Horizontal predecimation: When fetching data from memory, it is possible to skip 1 out of 2 pixel data containers, up to 1 out of 16 pixel data containers, by setting the [DISPC\\_GFX\\_PIXEL\\_INC\[7:0\]](#) PIXELINC bit field or [DISPC\\_VIDp\\_PIXEL\\_INC\[7:0\]](#) PIXELINC bit field to the number of pixel data containers to skip (n), multiplied by the size of a pixel data container (in bytes), + 1. See the following note for more details.

**NOTE:** The restriction to horizontal predecimation is that there is at least one useful pixel per 128-bit request. In that case, the DMA engine uses burst mode instead of singles to optimize the requests in terms of latency and SDRAM efficiency.

No decimation is supported when the input format is 1, 2, 4, 8 BITMAP.

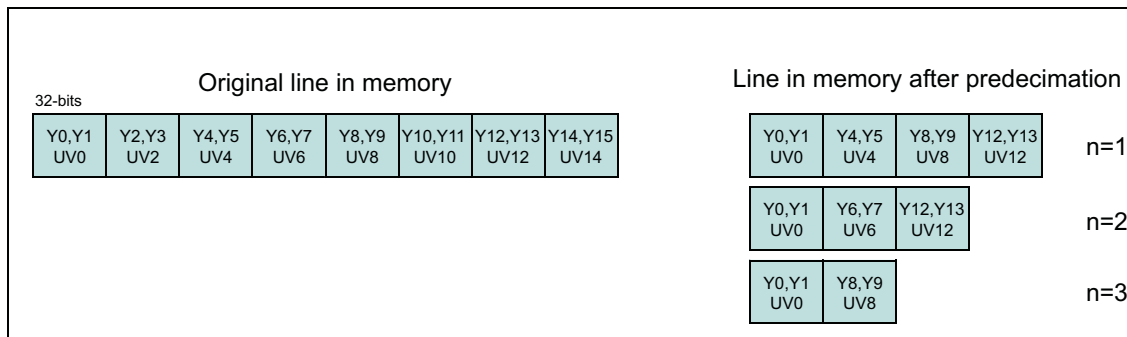

For RGB and YUV4:2:0 data formats, each pixel data container in memory holds 1 pixel. Thus, when configuring the PIXELINC bit field, the value of n equals the number of pixels to skip:

- For RGB format, one pixel data container = 32 bits = 1 pixel
- For YUV format:
  - One Y pixel data container = 8 bits = 1 pixel
  - One UV pixel data container = 16 bits = 1 pixel

For YUV4:2:2 format, each 32-bit pixel data container holds the Luma components for 2 pixels and the Chrominance component of 1 pixel (see the graphic representation in Figure 10-40). Therefore, for the valid values of the PIXELINC bit field in the following YUV4:2:2 format, caution must be taken, because n does not equal the number of pixels, but instead the number of pixel data containers to skip:

- For n = 1, PIXELINC = 5
- For n = 2, PIXELINC = 9
- For n = 3, PIXELINC = 13
- For n = 4, PIXELINC = 17, etc.

**Figure 10-40. YUV4:2:2 Predecimation**

dispc-094

#### 10.2.4.6.4 Progressive-to-Interlaced Format Conversion

The DMA engine can be used to perform YUV4:2:0 NV12 progressive-to-interlaced data conversion with 0- or 180-degree orientation. This section provides generic approach details.

Two possible configurations are available, depending on the setting of the DISPC\_VIDp\_ATTRIBUTES[22] DOUBLESTRIDE bit, which defines the stride of each pixel value buffer for the YUV format. The following must be considered for both configurations:

- To indicate 0-degree orientation, the DISPC\_VIDn\_BA\_j[31:29] BA and DISPC\_VIDn\_BA\_UV\_j[31:29] BA bit fields, and the DISPC\_VIDn\_ATTRIBUTES[13:12] ROTATION bit field must be set to 0x0.
- To indicate 180-degree orientation, the DISPC\_VIDn\_BA\_j[31:29] BA and DISPC\_VIDn\_BA\_UV\_j[31:29] BA bit fields must be set to 0x3, and the DISPC\_VIDn\_ATTRIBUTES[13:12] ROTATION bit field must be set to 0x2.

#### Configuration 1 – YUV4:2:0 progressive to interlaced conversion

The DISPC\_VIDp\_ATTRIBUTES[22] DOUBLESTRIDE bit is set to 0x1. The CbCr container is twice the size of the Y container. All Luma and Chroma lines for even and odd fields are fetched from memory. The scaler unit of the respective pipeline can be used to downscale by 2 (through filtering) the fetched data to create the interlaced output. For more information about the scaler configuration, see [Section 10.2.4.10.4, Scaler Unit](#).

### Configuration 2 – YUV4:2:0 progressive to YUV4:2:2 interlaced conversion

The DISPC\_VIDp\_ATTRIBUTES[22] DOUBLESTRIDE bit is set to 0x0. The CbCr container is the same size as the Y container. The DISPC\_VIDn\_ROW\_INC register for the respective pipeline must be configured so that only the Y data is vertically predecimated by 2 (see [Section 10.2.4.6.3, Predecimation](#), for more information). The CbCr data must not be predecimated. As a result, only the even Luma lines for the even field and the odd Luma lines for the odd field are fetched from memory. To create the interlaced output, the Chroma lines are all fetched from memory.

#### 10.2.4.6.5 Arbitration

The requests (reads or writes) sent to the L3 interconnect are pipelined and are arbitrated in a round-robin scheme. The default arbitration scheme must be modified by setting the priority attribute of each pipeline as defined in the DISPC\_GFX\_ATTRIBUTES[14] ARBITRATION bit, DISPC\_VIDp\_ATTRIBUTES[14] ARBITRATION bit, or DISPC\_WB\_ATTRIBUTES[14] ARBITRATION bit.

By default, all pipelines have the same priority (normal), which means all pipelines requests are treated in a round-robin order manner. If one or more pipelines require a higher number of requests going to the L3 interconnect, its priority can be moved up to high priority. In this case, the high-priority pipeline is granted access before any pipeline in normal priority. If more than one active pipeline is in high priority, the behavior is the same as all active pipelines in normal priority. Normal active pipelines are not treated until all high active pipelines are finished. The ARBITRATION bit cannot be modified during the entire frame.

This functionality balances the bandwidth of the pipeline depending on its constraint. It can be used to give higher priority to the pipelines with real-time constraints versus non-real-time pipelines. For example, pipelines associated with the LCD output in stall mode must have lower priority than pipelines associated with TV output.

#### 10.2.4.6.6 DMA Power Modes

##### 10.2.4.6.6.1 Low-Power Mode

Each DMA buffer is divided into two spaces. Each space can be associated with the pipeline or merged with other spaces. The total number of spaces for each individual pipeline is from 0 (pipeline inactive) to the number of pipelines  $\times$  2 (in that case all the DMA buffers are associated with a single pipeline). The sum of the number of spaces allocated for each pipeline must not be greater than the maximum available. The correct number of spaces must be allocated to ensure no underflow. The spaces allocated to each pipeline must be greater than or equal to the minimum required to support the throughput and the system latency.

---

**NOTE:** When the number of spaces is changed, the thresholds must be reprogrammed to reflect the new DMA buffer configuration.

---

##### 10.2.4.6.6.2 Ultralow-Power Mode

In low-power mode, the L3 interconnect is used to fill up the DMA buffers to store all the data required to display a full frame. The L3 interconnect is not used to fetch the new pixels for the following frames. The data in the DMA buffer are reused to display on the screen.

The setting of the mode is independent for each pipeline. One pipeline may have all the frame pixels in its DMA buffer and the other pipelines may have to refill their respective DMA buffers along the display scan because the frame buffer is too big to be stored in the DMA buffer.

The DMA buffers can be merged to optimize the L3 interconnect off time. Merging the DMA buffers into a single buffer can be used at the same time to improve ultralow-power mode (see [Section 10.2.4.6.6.1, Low-Power Mode](#)).

During the time in which the frames are fetched in the internal DMA buffer, MStandby must be asserted if the [DISPC\\_SYSCONFIG\[13:12\] MIDDLEMODE](#) bit field is set to 0x2 (smart-standby mode).

Two ultralow power modes can be entered manually or automatically:

- Self-refresh mode: Starting self-refresh mode is done manually by setting the [DISPC\\_GFX\\_ATTRIBUTES\[15\] SELFREFRESH](#) bit or [DISPC\\_VIDp\\_ATTRIBUTES\[15\] SELFREFRESH](#) bit to 0x1 after capturing a frame in the DMA buffers. Stopping self-refresh mode is done by setting the SELFREFRESH bit to 0x0.
- Automatic self-refresh mode: By setting the [DISPC\\_GFX\\_ATTRIBUTES\[17\] SELFREFRESHAUTO](#) bit or [DISPC\\_VIDp\\_ATTRIBUTES\[17\] SELFREFRESHAUTO](#) bit to 0x1, the transition from OFF to ON self-refresh mode is done by hardware after capturing the first frame. The hardware reflects the status of the self-refresh mode by setting the SELFREFRESH bit to 0x1, which means that the data are read inside the DMA buffer without accessing the interconnect and system memory during the frame. Setting the SELFREFRESH bit to 0x0 updates the DMA buffer.

---

**NOTE:** The WB pipeline does not support ultralow-power mode.

---

### 10.2.4.7 Rotation and Mirroring

The DISPC provides flexible mechanisms for an efficient implementation of rotation using the DISPC, its DMA engine, and the rotation engine of the TILER module. The rotation is handled only through the TILER module, which supplies the encoded pixels to the DISPC.

---

**NOTE:** No rotation or mirroring is supported when accessing internal SDRAM directly .

---

The TILER supports:

- Rotation 0-, 90-, 180-, 270-degree views
- Mirroring
- Any combination of the two previous (for example, Rot-90 + mirroring, etc.)

**Figure 10-41. 90-Degree Rotation With Mirroring**

When accessing YUV4:2:2 data, each 32-bit value loaded into the DMA buffer can represent either:

- Two consecutive pixels on the same line (for instance, 0-/180-degree rotation)
- Two pixels adjacent vertically (for instance, 90-/270-degree rotation)

The reading from the DMA buffer supports the extraction of the two pixels regardless of the rotation. When the pixels are not consecutive on the same line (90-/270-degree rotation), the chrominance sample of the first pixel of each 32-bit value is duplicated for the second pixel in the same 32-bit value.

The rotation flag [DISPC\\_VIDn\\_ATTRIBUTES\[13:12\] ROTATION](#) and the [DISPC\\_VIDn\\_ATTRIBUTES\[4:1\] FORMAT](#) bit fields define the processing to extract the pixels from YUV4:2:2 32-bit values. Software must ensure that the settings of the ROTATION and FORMAT bit fields are coherent with the rotation/mirroring defined through the address format in the TILER-specific address map. For more information, see [Section 15.2.3.6.2, TILER Macro-Architecture](#), in [Section 15.2, Dynamic Memory Manager](#).

**NOTE:** For YUV4:2:0 NV12, 2D tiled memory access cases, the DISPC\_VIDn\_ATTRIBUTES[13:12] ROTATION bit field should be set to match the intended rotation of the use case.

Table 10-28 describes the register settings of the DISPC when accessing, rotating, and mirroring an image using the TILER. A physical base address (PBA) for each rotation is determined and set as the buffer address (BA). The row incremental is determined and set in ROW\_INC. The value of the pixel increment, PIXEL\_INC, is set to 0x1 (contiguous pixels).

**Table 10-28. Register Settings for Rotation Using TILER**

Rotation	Registers	Rotation With and Without Mirroring
0 degree	DISPC_GFX_BA_j / DISPC_VIDp_BA_j / DISPC_WB_BA_j DISPC_GFX_PIXEL_INC / DISPC_VIDp_PIXEL_INC / DISPC_WB_PIXEL_INC DISPC_GFX_ROW_INC / DISPC_VIDp_ROW_INC / DISPC_WB_ROW_INC	PBA0 1 to 16 ROW0
90 degrees	DISPC_GFX_BA_j / DISPC_VIDp_BA_j / DISPC_WB_BA_j DISPC_GFX_PIXEL_INC / DISPC_VIDp_PIXEL_INC / DISPC_WB_PIXEL_INC DISPC_GFX_ROW_INC / DISPC_VIDp_ROW_INC / DISPC_WB_ROW_INC	PBA90 1 to 16 ROW90
180 degrees	DISPC_GFX_BA_j / DISPC_VIDp_BA_j / DISPC_WB_BA_j DISPC_GFX_PIXEL_INC / DISPC_VIDp_PIXEL_INC / DISPC_WB_PIXEL_INC DISPC_GFX_ROW_INC / DISPC_VIDp_ROW_INC / DISPC_WB_ROW_INC	PBA180 1 to 16 ROW180
270 degrees	DISPC_GFX_BA_j / DISPC_VIDp_BA_j / DISPC_WB_BA_j DISPC_GFX_PIXEL_INC / DISPC_VIDp_PIXEL_INC / DISPC_WB_PIXEL_INC DISPC_GFX_ROW_INC / DISPC_VIDp_ROW_INC / DISPC_WB_ROW_INC	PBA270 1 to 16 ROW270

**NOTE:** For YUV format, in addition to the DISPC\_VIDp\_BA\_j register used for the Y component, the DISPC\_VIDp\_BA\_UV\_j register must be set to define the base address of the UV frame buffer in memory.

The PBA rotation is determined by:

- PBA0 = PBA | (mode << 27) | (orientation << 29) | (1 << 32)
- PBA90 = PBA | (mode << 27) | (orientation << 29) | (1 << 32)
- PBA180 = PBA | (mode << 27) | (orientation << 29) | (1 << 32)
- PBA270 = PBA | (mode << 27) | (orientation << 29) | (1 << 32)

Where PBA is the physical base address of image in the memory.

The ROW rotation is determine by:

- If 8 bits per pixel:
  - ROW0 = 16384: Width of the video picture in memory (in bytes) + 1
  - ROW90 = 8192: Width of the video picture in memory (in bytes) + 1
  - ROW180 = 16384: Width of the video picture in memory (in bytes) + 1
  - ROW270 = 8192: Width of the video picture in memory (in bytes) + 1
- If 16 bits per pixel:
  - ROW0 = 32768: Width of the video picture in memory (in bytes) + 1
  - ROW90 = 8192: Width of the video picture in memory (in bytes) + 1
  - ROW180 = 32768: Width of the video picture in memory (in bytes) + 1
  - ROW270 = 8192: Width of the video picture in memory (in bytes) + 1
- If 32 bits per pixel:
  - ROW0 = 32768: Width of the video picture in memory (in bytes) + 1

- ROW90 = 16384: Width of the video picture in memory (in bytes) + 1
- ROW180 = 32768: Width of the video picture in memory (in bytes) + 1
- ROW270 = 16384: Width of the video picture in memory (in bytes) + 1

**Table 10-29. Mode Definition**

	8-Bit Tiled	16-Bit Tiled	32-Bit Tiled	Page Tiled
Mode	0	1	2	3

**Table 10-30. Orientation Definition**

Type of Orientation	Value
0-degree view	0x0
180-degree view with mirroring	0x1
0-degree view with mirroring	0x2
180-degree view	0x3
270-degree view with mirroring	0x4
270-degree view	0x5
90-degree view	0x6
90-degree view with mirroring	0x7

**NOTE:** For YUV4:2:0 progressive pixel format, because the value of the DISPC\_VIDp\_ROW\_INC register is defined for the Y buffer, the DISPC\_VIDp\_ATTRIBUTES[22] DOUBLESTRIDE bit field must be set to 1 when rotating the picture by 0 and 180 degrees and must be reset to 0 when rotating the picture by 90 and 270 degrees.

For YUV4:2:0 interlaced pixel format, because the value of the DISPC\_VIDp\_ROW\_INC register is defined for the Y buffer, the DISPC\_VIDp\_ATTRIBUTES[22] DOUBLESTRIDE bit field must be set to 1 when rotating the picture by 0 and 180 degrees. Rotations of 90 and 270 degrees are not supported with this pixel format.

#### 10.2.4.8 Memory Format

The graphic and video pipelines support various types of memory format. [Table 10-31](#) list all supported formats for each pipeline. The nibble mode is enabled by setting the DISPC\_GFX\_ATTRIBUTES[9] NIBBLEMODE bit to 0x1 and applies only to BITMAP format for the GFX pipeline.

**Table 10-31. Memory Formats Supported**

Formats	GFX	VID1	VID2	VID3	WB

### 10.2.4.9 Graphics Pipeline

The graphics pipeline is connected to the GFX FIFO for the input port and to the three overlay managers for the output or WB pipeline. The pixel output is directed to an LCD, TV, or WB path by setting the [DISPC\\_GFX\\_ATTRIBUTES\[8\]](#) CHANNELOUT bit and the [DISPC\\_GFX\\_ATTRIBUTES\[31:30\]](#) CHANNELOUT2 bit field. [Table 10-50](#) resumes the bit field settings to orient a pipeline to an LCD/TV or WB output. The default value directs the GFX pipeline to LCD1. The GFX pipeline can be enabled by setting the [DISPC\\_GFX\\_ATTRIBUTES\[0\]](#) ENABLE bit to 0x1.

**NOTE:** It is not possible to change the direction of the graphics pipeline on the fly. If the graphics pipeline connection needs to be changed to connect to a different overlay manager, then the following steps must be performed:

1. Disable the GFX pipeline by setting the [DISPC\\_GFX\\_ATTRIBUTES\[0\]](#) ENABLE bit to 0x0.
2. Modify bits [8] CHANNELOUT and [31:30] CHANNELOUT2 in the [DISPC\\_GFX\\_ATTRIBUTES](#) register, so that the GFX pipeline is directed to the new required overlay manager.
3. Disable the new overlay manager (the manager which the GFX pipeline will be connected next) by disabling the corresponding DISPC output. This is done by setting the [0] LCDENABLE bit to 0x0 in the [DISPC\\_CONTROL1](#) register (for LCD1 output) or the [DISPC\\_CONTROL2](#) register (for LCD2 output), or by setting the [DISPC\\_CONTROL1\[1\]](#) TVENABLE bit to 0x0 for (TV output).
4. Enable the GFX pipeline by setting the [DISPC\\_GFX\\_ATTRIBUTES\[0\]](#) ENABLE bit to 0x1.
5. Enable the new overlay manager (the manager which the GFX pipeline will be connected next) by enabling the corresponding DISPC output. This is done by setting the [0] LCDENABLE bit to 0x1 in the [DISPC\\_CONTROL1](#) register (for LCD1 output) or the [DISPC\\_CONTROL2](#) register (for LCD2 output), or by setting the [DISPC\\_CONTROL1\[1\]](#) TVENABLE bit to 0x1 (for TV output).

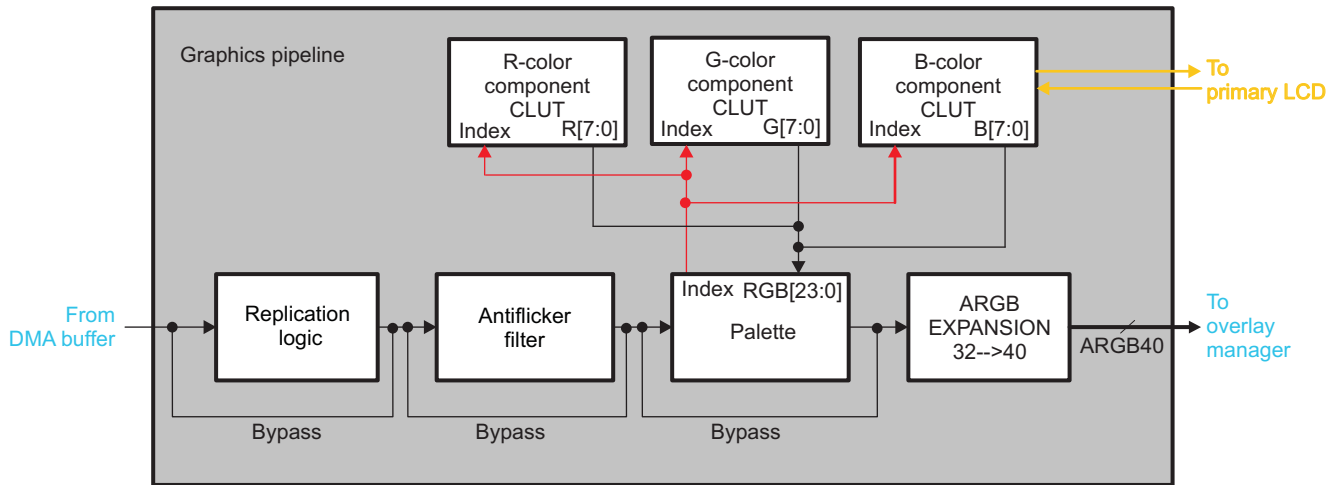

The pipeline consists of programmable replication logic, an antiflicker filter, and one 256-entry palette table. The replication logic is used to convert the RGB pixel formats into an ARGB40-based format. The antiflicker filter processes the graphics data in RGB format to remove some of the vertical flicker. The 256-entry palette is used to convert bitmap formats into RGB formats or for gamma corrections when RGB format is inputted.

[Table 10-31](#) lists the input formats supported by the graphics pipeline.

[Figure 10-42](#) shows the graphics pipeline.

Figure 10-42. Graphics Pipeline

dispc-001

10.2.4.9.1 Replication Logic

The replication logic increases the color depth of the graphics-encoded pixels (from true color RGB 12, and 16 to 40 BPP).

- When the replication logic is enabled by setting the `DISPC_GFX_ATTRIBUTES[5] REPLICATIONENABLE` bit to 0x1, the MSBs are copied to the missing LSB. Table 10-34 describes the remapping of the RGB pixels into ARGB 40-bit values.

Table 10-32. Replication Enabled: RGB Pixel Formats Remapping Into ARGB40-10.10.10.10

Formats	A[9:0]	R[9:0]	G[9:0]	B[9:0]
	MSB LSB	MSB LSB	MSB LSB	MSB LSB
xRGB12-4444	111111111	R[3:0]R[3:0]R[3:2]	G[3:0]G[3:0]G[3:2]	B[3:0]B[3:0]B[3:2]
RGBx12-4444	111111111	R[3:0]R[3:0]R[3:2]	G[3:0]G[3:0]G[3:2]	B[3:0]B[3:0]B[3:2]
RGB16-565	111111111	R[4:0]R[4:0]	G[5:0]G[5:2]	B[4:0]B[4:0]
xRGB16-1555	111111111	R[4:0]R[4:0]	G[4:0]G[4:0]	B[4:0]B[4:0]
ARGB16-1555	AAAAAAAAA	R[4:0]R[4:0]	G[4:0]G[4:0]	B[4:0]B[4:0]
ARGB16-4444	A[3:0]A[3:0]A[3:2]	R[3:0]R[3:0]R[3:2]	G[3:0]G[3:0]G[3:2]	B[3:0]B[3:0]B[3:2]
RGBA16-4444	A[3:0]A[3:0]A[3:2]	R[3:0]R[3:0]R[3:2]	G[3:0]G[3:0]G[3:2]	B[3:0]B[3:0]B[3:2]

- When the replication logic is disabled by setting the `DISPC_GFX_ATTRIBUTES[5] REPLICATIONENABLE` bit to 0x0, the encoded pixel values are shifted to the MSB boundary of the 24-bit format. The missing bit values are filled with 0s. Table 10-35 describes the remapping of the RGB pixels into ARGB 40-bit values.

Table 10-33. Replication Disabled: RGB Pixel Formats Remapping Into ARGB40-10.10.10.10

### 10.2.4.9.2 Antiflicker Filter

The antiflicker filter processes the graphics data to remove some of the vertical flicker. It is based on 3-tap FIR filter with fixed coefficients. For each pixel to be output from the graphics pipeline, the pixel above and the pixel below the current line must be read from the DMA graphics FIFO. Therefore, three lines of pixels must be stored in the DMA graphics FIFO.

The antiflickering equations for A, R, G, and B components are:

$$A_{out}(x,y) = 0.25*A_{in}(x,y-1) + 0.5*A_{in}(x,y) + 0.25*A_{in}(x,y + 1)$$

$$R_{out}(x,y) = 0.25*R_{in}(x,y-1) + 0.5*R_{in}(x,y) + 0.25*R_{in}(x,y + 1)$$

$$G_{out}(x,y) = 0.25*G_{in}(x,y-1) + 0.5*G_{in}(x,y) + 0.25*G_{in}(x,y + 1)$$

$$B_{out}(x,y) = 0.25*B_{in}(x,y-1) + 0.5*B_{in}(x,y) + 0.25*B_{in}(x,y + 1)$$

For the first line of processing, because there is no pixel above, the value (x, y) is duplicated.

$$Out(x,y) = 0.25*In(x,y) + 0.5*In(x,y) + 0.25*In(x,y + 1)$$

For the last line of processing, because there is no pixel below, the value (x, y) is duplicated.

$$Out(x,y) = 0.25*In(x,y-1) + 0.5*In(x,y) + 0.25*In(x,y)$$

---

**NOTE:** Antiflicker filtering is supported only in RGB formats and not in BITMAP formats.

Antiflickering is not supported for pictures with fewer than two lines. In this case, the user must disable the antiflickering processing.

By default, the antiflicker filtering is disabled. It can be enabled by setting the [DISPC\\_GFX\\_ATTRIBUTES\[24\]](#) ANTIFLICKER bit to 0x1.

---

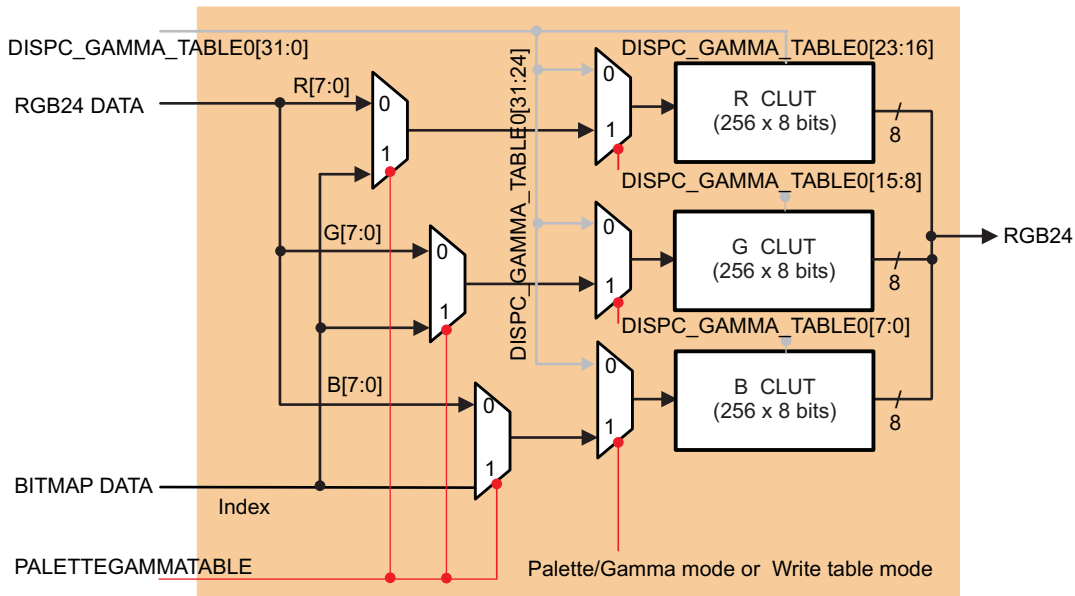

### 10.2.4.9.3 Color Look-Up Table (CLUT)

The graphics pipeline supports conversion of the BITMAP formats into RGB24 formats through a palette table. To enable palette mode, the [DISPC\\_CONFIG1\[3\]](#) PALETTEGAMMATABLE bit must be set to 0x0. [Figure 10-43](#) shows the internal architecture of the color look-up/gamma table.

The palette is split into three memories of 256-bit × 8-bit entries. For bitmap (CLUT) indexes, the same value (1-, 2-, 4-, or 8-BPP) indexes the three memories. The table can be reloaded every frame, once, or never (at the beginning of the frame before fetching pixels for the graphics). The table is loaded dynamically at the beginning of the frame by the DISPC DMA engine. The base address of the table buffer is set in the [DISPC\\_GFX\\_TABLE\\_BA\[31:0\]](#) TABLEBA bit field. It is possible to load the table for every frame or only for a specific frame by setting the [DISPC\\_CONFIG1\[2:1\]](#) LOAD MODE bit field.

The table can be loaded without fetching data for the graphics pipeline. The DMA buffer associated with the graphics pipeline is used to fetch the table from memory. Regardless of the mode (color or monochrome) for each entry into the table, one 32-bit value is fetched from memory.

Figure 10-43. Palette/Gamma Correction Architecture

dispc-002

The palette mode uses the encoded pixel values from the input graphics FIFO as pointers to index the 24-bit-wide palette: 1-BPP pixels address 2 palette entries, 2-BPP pixels address 4 palette entries, 4-BPP pixels address 16 palette entries, and 8-BPP pixels address 256 palette entries. In color mode, the value within the palette is made up of three 8-bit fields, one for each color component: red, green, and blue (see Figure 10-44). For color operation, an individual frame is limited to a selection of 256 colors (the number of palette entries). In monochrome mode, only one 8-bit value is present. 256 grayscales and 16,777,216 colors are obtained after passing through the palette (see Figure 10-45)

Figure 10-44. Data Memory Organization: Color Mode

dispc-025

Figure 10-45. Data Memory Organization: Gray Mode

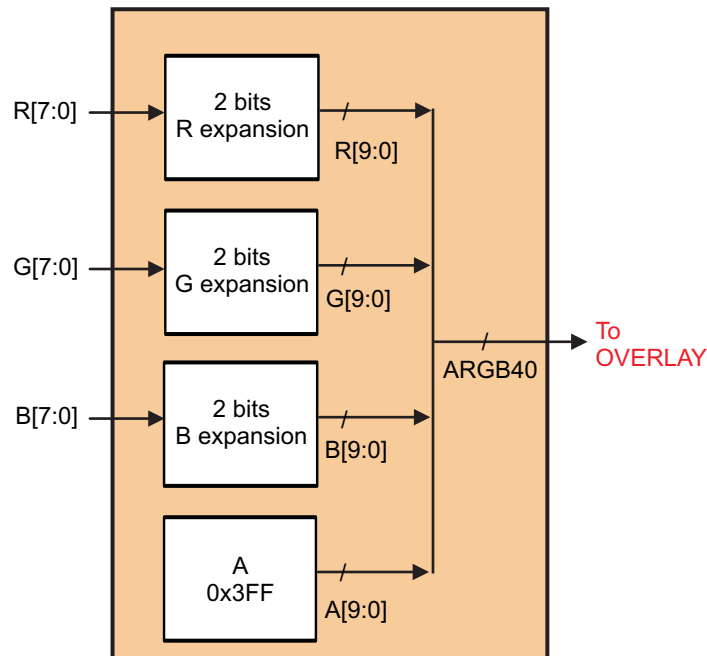

dispc-026

When a palette entry is selected by the encoded pixel value, both the content of the entry and the index are sent to the LCD1 overlay manager.

#### 10.2.4.9.4 Expansion to ARGB40

When the GFX pipeline input data is in a RGB pixel format, the expansion to ARGB40 format is done as described in Section 10.2.4.9.1, Replication Logic.

When the GFX pipeline input data is in BITMAP format, the expansion module takes in its inputs the RGB24 pixel format outputted from the palette module. The expansion module automatically replicates the 2 MSBs of each color component to create an ARGB40 pixel with the A component set to 0x3FF (see Figure 10-46).

**Figure 10-46. Expansion to ARGB40**

dispc-092

#### 10.2.4.10 Video Pipelines

Three identical video pipelines are available, VID1, VID2, and VID3. Each video pipeline is connected to its video FIFO controller for the input port and to the three overlay managers LCD 1, LCD2, and TV or WB pipeline. The pixel output is directed to the LCD, TV, or WB path by setting the DISPC\_VIDp\_ATTRIBUTES[16] CHANNELOUT bit and the DISPC\_VIDp\_ATTRIBUTES[31:30] CHANNELOUT2 bit field. [Table 10-50](#) resumes the bit field settings to orient a pipeline to an LCD/TV or WB output. The default value directs all video pipelines to LCD1.

**NOTE:** It is not possible to change the direction of the video pipelines on the fly. If a video pipeline connection needs to be changed to connect to a different overlay manager, then the following steps must be performed:

1. Disable the VIDp pipeline by setting the DISPC\_VIDp\_ATTRIBUTES[0] ENABLE bit to 0x0.
2. Modify bits [16] CHANNELOUT and [31:30] CHANNELOUT2 in the DISPC\_VIDp\_ATTRIBUTES register, so that the VIDp pipeline is directed to the new required overlay manager.
3. Disable the new overlay manager (the manager which the VIDp pipeline will be connected next) by disabling the corresponding DISPC output. This is done by setting the [0] LCDENABLE bit to 0x0 in the DISPC\_CONTROL1 register (for LCD1 output) or the DISPC\_CONTROL2 register (for LCD2 output), or by setting the DISPC\_CONTROL1[1] TVENABLE bit to 0x0 (for TV output).
4. Enable the VIDp pipeline by setting the DISPC\_VIDp\_ATTRIBUTES[0] ENABLE bit to 0x1.
5. Enable the new overlay manager, (the manager which the VIDp pipeline will be connected next) by enabling the corresponding DISPC output. This is done by setting the [0] LCDENABLE bit to 0x1 in the DISPC\_CONTROL1 register (for LCD1 output) or the DISPC\_CONTROL2 register (for LCD2 output), or by setting the DISPC\_CONTROL1[1] TVENABLE bit to 0x1 (for TV output).

A video pipeline consists of a scaler unit, a color space conversion unit (CSC), a VC-1 range mapping unit, and some programmable replication logic. The video pipeline unit order can be configured in two manners (see [Figure 10-47](#) and [Figure 10-48](#)):

- Configuration 1: VC-1 range mapping unit followed by a CSC unit and then a scaler unit. The configuration is used to support RGB, ARGB, and RGBA formats, and YUV4:2:2 in backward mode for both data types. Each block can be independently bypassed.
- Configuration 2: VC-1 range mapping unit followed by scaler unit, and then a CSC unit. The configuration is used to support RGB, ARGB, and RGBA formats, and YUV4:2:2 format and YUV420-NV12 formats taking advantage of the scaler to resample the chrominance using five taps horizontally and three or five taps vertically. Each block can be independently bypassed.

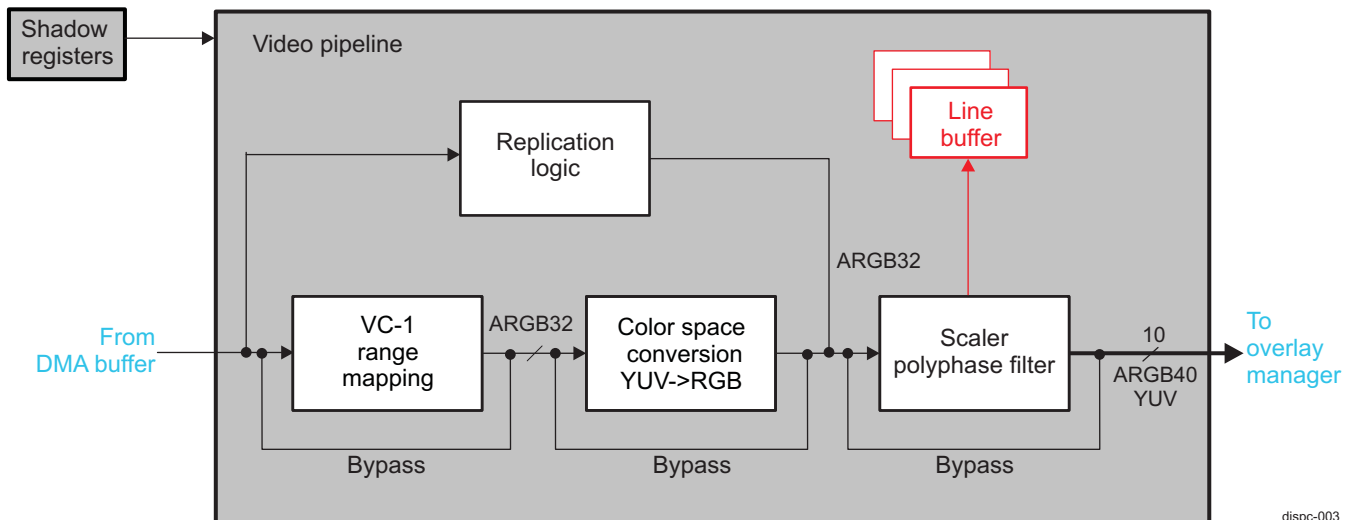

The DISPC\_VIDn\_ATTRIBUTES2[8] YUVCHROMARESAMPLING bit controls the order of the scaler unit in the video pipeline:

- When YUVCHROMARESAMPLING is set to 0x0, the video pipeline is in configuration 1, and the scaler is after the CSC unit. In case of YUV input data in 4:2:2 format, the chrominance resampling (4:2:2 to 4:4:4 format) is done by averaging the chrominance adjacent samples for only 0 degrees (zero rotation), because other rotation (90/180/270 degrees) is not supported in this mode. For more information about the supported chrominance resampling methods, see [Section 10.2.4.10.3.1, Chrominance Resampling](#).
- When YUVCHROMARESAMPLING is set to 0x1, the video pipeline is in configuration 2, and the scaler is before the CSC unit.
  - In case of YUV4:2:2 input data with 90-/270-degree rotation, the data is preprocessed by duplicating the missing chrominance samples.
  - In case of YUV4:2:2 input data with 0-/180-degree rotation, the chroma upsampling is performed in the scaler unit.

[Table 10-31](#) lists the input formats supported by the video pipelines.

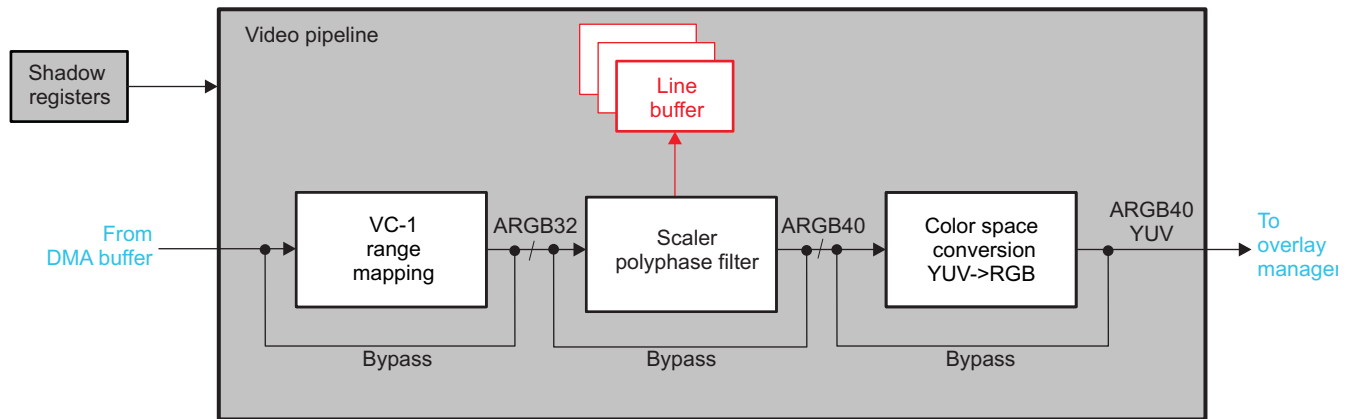

The video pipeline is enabled by setting ENABLE bit DISPC\_VIDp\_ATTRIBUTES[0] to 0x1.

**Figure 10-47. Configuration 1: Video Pipeline**

dispc-003

Figure 10-48. Configuration 2: Video Pipeline

dispc-004

### 10.2.4.10.1 Replication Logic

The replication logic increases the color depth of the video-encoded pixels (from true color RGB 12, and 16 to 32 BPP) and available only in configuration 1.

The expansion from 8 to 10 bits color component is done by:

- The CSC unit, when the scaler is after the CSC module and when the vertical scaler is disabled.
- The vertical scaler, when the scaler is after the CSC unit and enabled.
- The replication bit module, when both the CSC unit and scaler are disabled.
- When the replication logic is enabled by setting the DISPC\_VIDp\_ATTRIBUTES[10] REPLICATIONENABLE bit to 0x1, the MSBs are copied to the missing LSBs. Table 10-34 describes the remapping of the RGB pixels into ARGB 32-bit values.

Table 10-34. Replication Enabled: RGB Pixel Formats Remapping Into ARGB32-8888

Formats	A[7:0]	R[7:0]	G[7:0]	B[7:0]
	MSB LSB	MSB LSB	MSB LSB	MSB LSB
xRGB12-4444	11111111	R[3:0]R[3:0]	G[3:0]G[3:0]	B[3:0]B[3:0]
RGBx12-4444	11111111	R[3:0]R[3:0]	G[3:0]G[3:0]	B[3:0]B[3:0]
RGB16-565	11111111	R[4:0]R[4:2]	G[5:0]G[5:4]	B[4:0]B[4:2]

#### 10.2.4.10.2 VC-1 Range Mapping Unit

The VC-1 range mapping unit is used when the video frame picture is decoded using a VC-1 codec by the video accelerator. It remaps the Y, Cb, and Cr components. The unit is used primarily for YUV4:2:0-NV12 pixel format but also can be applied to YUV4:2:2 pixel formats (YUV2 and UYVY).

The VC-1 range mapping unit is enabled by setting the DISPC\_VIDp\_ATTRIBUTES2[0] VC1ENABLE bit to 0x1. The DISPC\_VIDp\_ATTRIBUTES2[3:1] VC1\_RANGE\_Y and DISPC\_VIDp\_ATTRIBUTES2[6:4] VC1\_RANGE\_CBCR bit fields are two 3-bit values programmed by the user and are independent for each video pipeline. The module is governed by the equations:

$$Y_{out} = \text{CLIP}(\left( (Y_{int} - 128) \times (\text{VC1\_RANGE\_Y} + 9) + 4 \right) / 8) + 128$$

$$C_b = \text{CLIP}(\left( (C_b - 128) \times (\text{VC1\_RANGE\_CBCR} + 9) + 4 \right) / 8) + 128$$

$$C_r = \text{CLIP}(\left( (C_r - 128) \times (\text{VC1\_RANGE\_CBCR} + 9) + 4 \right) / 8) + 128$$

---

**NOTE:** The input and output pixel values are unsigned (Y, Cr, and Cb).

The function CLIP () clips to 0 or 255 when min or max are reached respectively otherwise resulting output stay identical.

---

#### 10.2.4.10.3 CSC Unit YUV to RGB

The CSC unit converts the video-encoded pixel values from YUV4:4:4 format into RGB24 or RGB30 format. The output format depends on the video pipeline configuration selected:

- Configuration 1: RGB24 output format, with 8-bit value per component: red, green, and blue
- Configuration 2: RGB30 output format, with 10-bit value per component: red, green, and blue

In case of YUV4:2:0 or YUV4:2:2 formats, a chrominance resampling to YUV4:4:4 is required before converting the YUV into RGB values (see [Section 10.2.4.10.3.1, Chrominance Resampling](#)). YUV4:2:2 or YUV4:2:0 to YUV4:4:4 chrominance resampling is a preprocessing to the color space conversion.

[Figure 10-49](#) to [Figure 10-52](#) show the 3 × 3 11-bit coefficients used to convert from YUV4:4:4 into RGB24. The coefficients are set according to the standard used to encode the pixel data in YUV color space. [Table 10-36](#) resumes the coefficients with their respective bit fields.

**Table 10-36. Color Space Conversion YUV to RGB Bit Field Setting**

Coefficients	Bit Field Registers
R <sub>Y</sub>	RY field DISPC_VIDp_CONV_COEF0[10:0]
R <sub>Cr</sub>	RCR field DISPC_VIDp_CONV_COEF0[26:16]
R <sub>Cb</sub>	RCB field DISPC_VIDp_CONV_COEF1[10:0]
G <sub>Y</sub>	GY field DISPC_VIDp_CONV_COEF1[26:16]
G <sub>Cr</sub>	GCR field DISPC_VIDp_CONV_COEF2[10:0]
G <sub>Cb</sub>	GCB field DISPC_VIDp_CONV_COEF2[26:16]
B <sub>Y</sub>	BY field DISPC_VIDp_CONV_COEF3[10:0]
B <sub>Cr</sub>	BCR field DISPC_VIDp_CONV_COEF3[26:16]
B <sub>Cb</sub>	BCB field DISPC_VIDp_CONV_COEF4[10:0]

- For configuration 1 with an RGB24 output:

If the active range for the luminance samples (Y) is [16:235] and [16:240] for the chrominance samples (Cb and Cr), the range selection is done by setting the DISPC\_VIDp\_ATTRIBUTES[11] FULLRANGE bit to 0x0. The values of R, G, and B output components are clipped to the range [0:255].

**NOTE:** The scaling and CSC clipping is set by the same bit, DISPC\_VIDp\_ATTRIBUTES[11] FULLRANGE.

**Figure 10-49. YCbCr to RGB Registers (FULLRANGE = 0), 8-Bit Outputs**

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} - 16 \\ Cr_{IN} - 128 \\ Cb_{IN} - 128 \end{bmatrix}$$

dispc-005

If the active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [0:255], the range selection is done by setting the DISPC\_VIDp\_ATTRIBUTES[11] FULLRANGE bit to 0x1. The values of R, G, and B output components are clipped to the range [0:255].

**Figure 10-50. YCbCr to RGB Registers (FULLRANGE = 1), 8-Bit Outputs**

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} \\ Cr_{IN} - 128 \\ Cb_{IN} - 128 \end{bmatrix}$$

dispc-006

- For configuration 2 with an RGB30 output:

If the active range for the luminance samples (Y) is [64:940] and [64:960] for the chrominance samples (Cb and Cr), the range selection is done by setting the DISPC\_VIDp\_ATTRIBUTES[11] FULLRANGE bit to 0x0. The values of R, G, and B output components are clipped to the range [0:1023].

**NOTE:** The scaling and CSC clipping is set by the same bit, DISPC\_VIDp\_ATTRIBUTES[11] FULLRANGE.

**Figure 10-51. YCbCr to RGB Registers (FULLRANGE = 0), 10-Bit Outputs**

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} - 64 \\ Cr_{IN} - 512 \\ Cb_{IN} - 512 \end{bmatrix}$$

dispc-074

If the active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [0:1023], the range selection is done by setting the DISPC\_VIDp\_ATTRIBUTES[11] FULLRANGE bit to 0x1. The values of R, G, and B output components are clipped to the range [0:1023].

**Figure 10-52. YCbCr to RGB Registers (FULLRANGE = 1), 10-Bit Outputs**

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} \\ Cr_{IN} - 512 \\ Cb_{IN} - 512 \end{bmatrix}$$

dispc-075

### 10.2.4.10.3.1 Chrominance Resampling

Two methods are supported to resample chrominance:

- Averaging of the chrominance is done by software followed by hardware conversion when the video pipeline is in configuration 1.
- Filtering of the chrominance using the scaler unit (chrominance resampling and rescaling can be combined to support native resampling of YUV format) when the video pipeline is in configuration 2.

To convert the YUV4:2:2 encoded pixel values into YUV4:4:4 format, the averaging of the chrominance technique can be used as shown in Figure 10-53. The missing chrominance samples (Cb and Cr) are interpolated using the average values of the two closest values on the same line ( , ) or are repeated from the second pixel in the same 32-bit container (see Figure 10-54). For the last pixel, the chrominance samples are duplicated using the values from the previous pixel; otherwise, the chrominance samples are averaged using the two adjacent values. Figure 10-55 shows the flow of the pixel.

**Figure 10-53. Averaging of the Chrominance Formula**

$$Cb_n(YCbCr\ 444) = \frac{Cb_{n-1}(YCbCr\ 422) + Cb_{n+1}(YCbCr\ 422)}{2} \text{ (n odd)}$$

$$Cr_n(YCbCr\ 444) = \frac{Cr_{n-1}(YCbCr\ 422) + Cr_{n+1}(YCbCr\ 422)}{2} \text{ (n odd)}$$

dispc-010

**Figure 10-54. Averaging of the Chrominance Representation**

dispc-011

**Figure 10-55. YUV4:2:2 to RGB30 Using Averaging of the Chrominance**

dispc-007

The scaler unit can be used to resample the chrominance of YUV4:2:0 and YUV4:2:2, as shown in Figure 10-56 and Figure 10-57, respectively. The settings of the scaler unit to perform chrominance resampling are described in Section 10.2.4.10.4, Scaler Unit.

**Figure 10-56. YUV4:2:0 to RGB30 Using Scaler Unit for Resampling Chrominance**

dispc-008

**Figure 10-57. YUV4:2:2 to RGB30 Using Scaler Unit for Resampling Chrominance**

**NOTE:** If rotation must be supported, YUV4:2:2 and YUV4:2:0 (0-/180-degree rotation) chrominance resampling is done as shown in [Figure 10-57](#) and [Figure 10-56](#), respectively. For YUV4:2:2 (90-/270-degree rotation) data are preprocessed to present YUV4:4:4 on the scaler input (duplication of the missing chroma), as shown in [Figure 10-55](#).

#### 10.2.4.10.4 Scaler Unit

All video formats are supported, including formats with alpha blending. Alpha blending is scaled with the same parameters as RGB color components. For the YUV formats, Y and Cb/Cr are processed independently. The filter is based on a finite impulse response (FIR) filter. The filtering can be used for different processing:

- Upsampling of the picture
- Downsampling of the picture
- Antiflicker reduction
- De-interlacing using "bob" algorithm
- Chrominance resampling in case of YUV data formats

**NOTE:** The user must ensure the resizing frame displays in the LCD/screen boundaries.

[Figure 10-58](#) shows an example of video upsampling.

**Figure 10-58. Video Upsampling**

The up/downsampling filter is a polyphase filter with five taps and eight phases for the horizontal filter, and a programmable number of taps (three or five) and eight phases for vertical filter. The input buffer has five input memory lines. The following limitations must be considered:

- The upsampling ratio is up to x8.

- The downsampling ratio using 3-tap configuration is down to x0.5 for RGB format.
- The downsampling ratio using 5-tap configuration is down to x0.25 for RGB format.
- If the input format is changed from YUV4:2:2 to YUV4:2:0 (WB pipeline), the downsampling ratio is further reduced:
  - Using 5-tap configuration, the ratio is down to x0.5 for RGB format.
  - Using 3-tap configuration, no downscaling is available.

For the vertical up/downsampling in 3-tap configuration, the equations are:

<p style="text-align: center;">For RGB formats</p> $A_{out}(n) = \left( \sum_{i=-1}^{i=1} C_{vi}(\Phi) * A_{in}(n+i) \right) >> 5$ $R_{out}(n) = \left( \sum_{i=-1}^{i=1} C_{vi}(\Phi) * R_{in}(n+i) \right) >> 5$ $G_{out}(n) = \left( \sum_{i=-1}^{i=1} C_{vi}(\Phi) * G_{in}(n+i) \right) >> 5$ $B_{out}(n) = \left( \sum_{i=-1}^{i=1} C_{vi}(\Phi) * B_{in}(n+i) \right) >> 5$	<p style="text-align: center;">For YUV formats</p> $Y_{out}(n) = \left( \sum_{i=-1}^{i=1} C_{vi}(\Phi_y) * Y_{in}(n+i) \right) >> 5$ $Cr_{out}(n) = \left( \sum_{i=-1}^{i=1} C_{vci}(\Phi_c) * Cr_{in}(n+i) \right) >> 5$ $Cb_{out}(n) = \left( \sum_{i=-1}^{i=1} C_{vci}(\Phi_c) * Cb_{in}(n+i) \right) >> 5$
--	--

dispc-013 (7)

For the vertical up/downsampling in 5-tap configuration, the equations are:

<p style="text-align: center;">For RGB formats</p> $A_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{vi}(\Phi) * A_{in}(n+i) \right) >> 5$ $R_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{vi}(\Phi) * R_{in}(n+i) \right) >> 5$ $G_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{vi}(\Phi) * G_{in}(n+i) \right) >> 5$ $B_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{vi}(\Phi) * B_{in}(n+i) \right) >> 5$	<p style="text-align: center;">For YUV formats</p> $Y_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{vi}(\Phi_y) * Y_{in}(n+i) \right) >> 5$ $Cb_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{vci}(\Phi_c) * Cb_{in}(n+i) \right) >> 5$ $Cr_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{vci}(\Phi_c) * Cr_{in}(n+i) \right) >> 5$
--	--

dispc-012 (8)

For the horizontal up/downsampling in 5-tap configuration, the equations are:

<p style="text-align: center;">For RGB formats</p> $A_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{hi}(\Phi) * A_{in}(n+i) \right) >> 7$ $R_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{hi}(\Phi) * R_{in}(n+i) \right) >> 7$ $G_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{hi}(\Phi) * G_{in}(n+i) \right) >> 7$ $B_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{hi}(\Phi) * B_{in}(n+i) \right) >> 7$	<p style="text-align: center;">For YUV formats</p> $Y_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{hi}(\Phi_y) * Y_{in}(n+i) \right) >> 7$ $Cb_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{hci}(\Phi_c) * Cb_{in}(n+i) \right) >> 7$ $Cr_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{hci}(\Phi_c) * Cr_{in}(n+i) \right) >> 7$
--	--

dispc-014 (9)

---

**NOTE:** The pixel (n + 1) is the previous pixel with respect to pixel (n). The line (n + 1) is the previous line with respect to line (n).

The coefficients Ci() depend on the phase between input and output pixels.

---

**NOTE:** The coefficients are different for Y and Cr, Cb filtering because the calculations are independent due to the chrominance resampling for YUV4:2:2 and YUV4:2:0.

---

First, the vertical filter is applied to the encoded input pixel data, and then the horizontal filter is applied on the resulting pixel values to generate the output pixel values. The vertical input of the filter consists of five lines of 2048 x 32 bits for both 3-tap and 5-tap configurations (see [Table 10-37](#)).

**Table 10-37. Line Buffer Width for Scaler Unit**

Vertical Taps	Maximum Input Width (Pixels)
3, 5	2048 x 32 bits

At the beginning of frame scaling processing, the first line is duplicated to fill the first two lines in 3-tap configuration and the first three lines in 5-tap configuration.

At the end of frame scaling processing, the last line is duplicated if the scaling logic requires loading more lines and the last line has been reached.

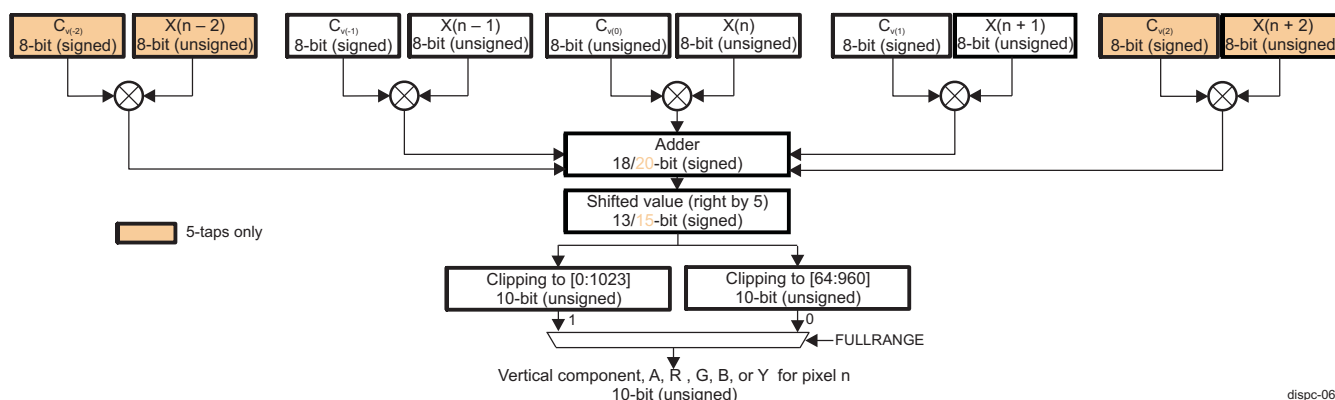

The programmable coefficients of the polyphase filters are signed 8-bit values (except for the central coefficient, which is unsigned). The video scalars have an 8-bit input and a 10-bit output. The vertical scaling changes the 8-bit input into a 10-bit clipped output and the horizontal scaling takes the 10-bit input.

Figure 10-59 and Figure 10-60 show the scaler macro-architecture for the component A, R, G, B and Y. Figure 10-61 and Figure 10-62 show the scaler macro-architecture for component Cr and Cb.

The scaling output can be clipped to an output range of [0:1023] or [64:960] by configuring the DISPC\_VIDp\_ATTRIBUTES[11] FULLRANGE bit.

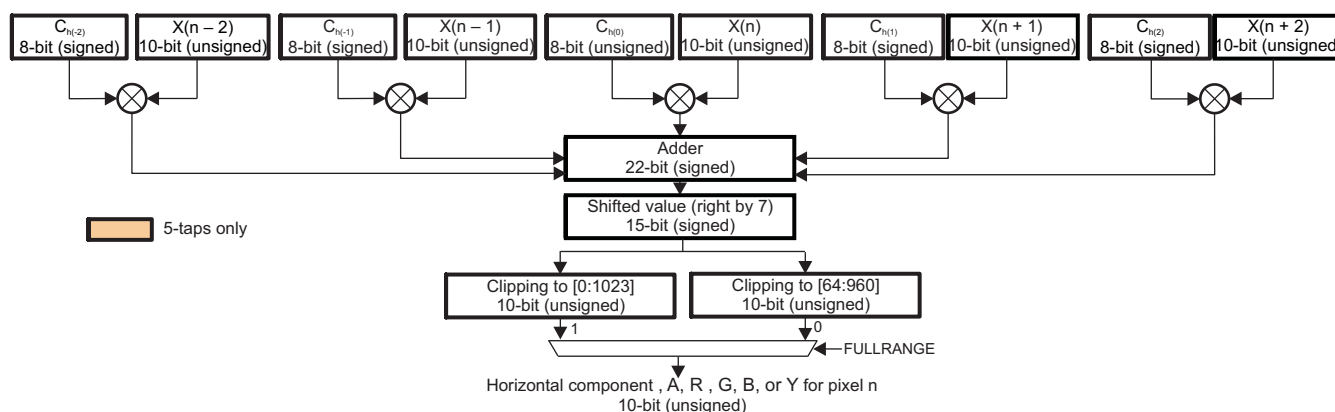

**NOTE:** The scaling and CSC clipping is set by the same bit, DISPC\_VIDp\_ATTRIBUTES[11] FULLRANGE.

The VID scaler unit vertical or/and horizontal sampling is defined by setting/resetting the DISPC\_VIDp\_ATTRIBUTES[6:5] RESIZEENABLE bit.

A set of configurations must be valid before enabling the video up/downsampling block.

The following fields define the configuration of the video up/downsampling block for VIDp:

- Vertical up/downsampling increment value DISPC\_VIDp\_FIR[28:16] FIRVINC bit field. The unsigned integer value range is [1:4096]. Software calculates the value using the following equation:

$$FIRVINC = 1024 * \left( \frac{ORGSIZEY}{SIZEY} \right)$$

dispc-066

(10)

**NOTE:**

- If the value of the DISPC\_VIDp\_FIR[28:16] FIRVINC bit field is greater than 4096, it is clipped to 4096.
  - If DISPC\_VIDp\_SIZE[26:16] SIZEY equals 0x1, SIZEY is replaced by 0x2 in the previous equation.
  - The values of the DISPC\_VIDp\_PICTURE\_SIZE[26:16] ORGSIZEY and DISPC\_VIDp\_SIZE[26:16] SIZEY bit fields must be programmed with the value desired minus 1.
-

- Horizontal up/downsampling increment value DISPC\_VIDp\_FIR[12:0] FIRHINC bit field: The unsigned integer value range is [1:4096]. Software calculates the value using the following equation:

$$FIRHINC = 1024 * \left( \frac{ORGSIZEX}{SIZEX} \right)$$

dispc-067

(11)

**NOTE:**

- If the value of the DISPC\_VIDp\_FIR[12:0] FIRHINC bit field is greater than 4096, it is clipped to 4096.
  - If DISPC\_VIDp\_SIZE[ 10:0] SIZEX equals 1, DISPC\_VIDp\_SIZE[ 10:0] SIZEX is replaced by 2 in the previous equation.
  - The values of the DISPC\_VIDp\_PICTURE\_SIZE[10:0] ORGSIZEX and DISPC\_VIDp\_SIZE[ 10:0] SIZEX bit field must be programmed with the value desired minus 1.
- 
- Vertical up/downsampling accumulator value DISPC\_VIDp\_ACCU\_j[26:16] VERTICALACCU bit field: The signed integer value range is [-1024:1023]. The accumulator value indicates on which phase the vertical filtering starts. The register DISPC\_VIDp\_ACCU\_0 is used for progressive output and for interlace output; the DISPC\_VIDp\_ACCU\_0 and DISPC\_VIDp\_ACCU\_1 registers are used. Similarly, DISPC\_VIDp\_ACCU2\_0 and DISPC\_VIDp\_ACCU2\_1 are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.
  - Vertical up/downsampling line buffer configuration DISPC\_VIDp\_ATTRIBUTES[21] VERTICALTAPS bit: The default value at reset time is 0x0 (3-tap configuration is used). If the bit field is reset, the 3-tap configuration is used.
  - Horizontal up/downsampling accumulator value DISPC\_VIDp\_ACCU\_j[10:0] HORIZONTALACCU bit field: The signed integer value range is [-1024:1023]. The accumulator value indicates on which phase the horizontal filtering starts. The register DISPC\_VIDp\_ACCU\_0 is used for progressive output and for interlace output; the DISPC\_VIDp\_ACCU\_0 and DISPC\_VIDp\_ACCU\_1 registers are used. Similarly, DISPC\_VIDp\_ACCU2\_0 and DISPC\_VIDp\_ACCU2\_1 are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.

**Table 10-40. Vertical/Horizontal Accumulator Phase**

Accumulator Value	Phases f
0	0
128 or -896	1
256 or -768	2
384 or -640	3
512 or -512	4
640 or -384	5
768 or -256	6
896 or -128	7

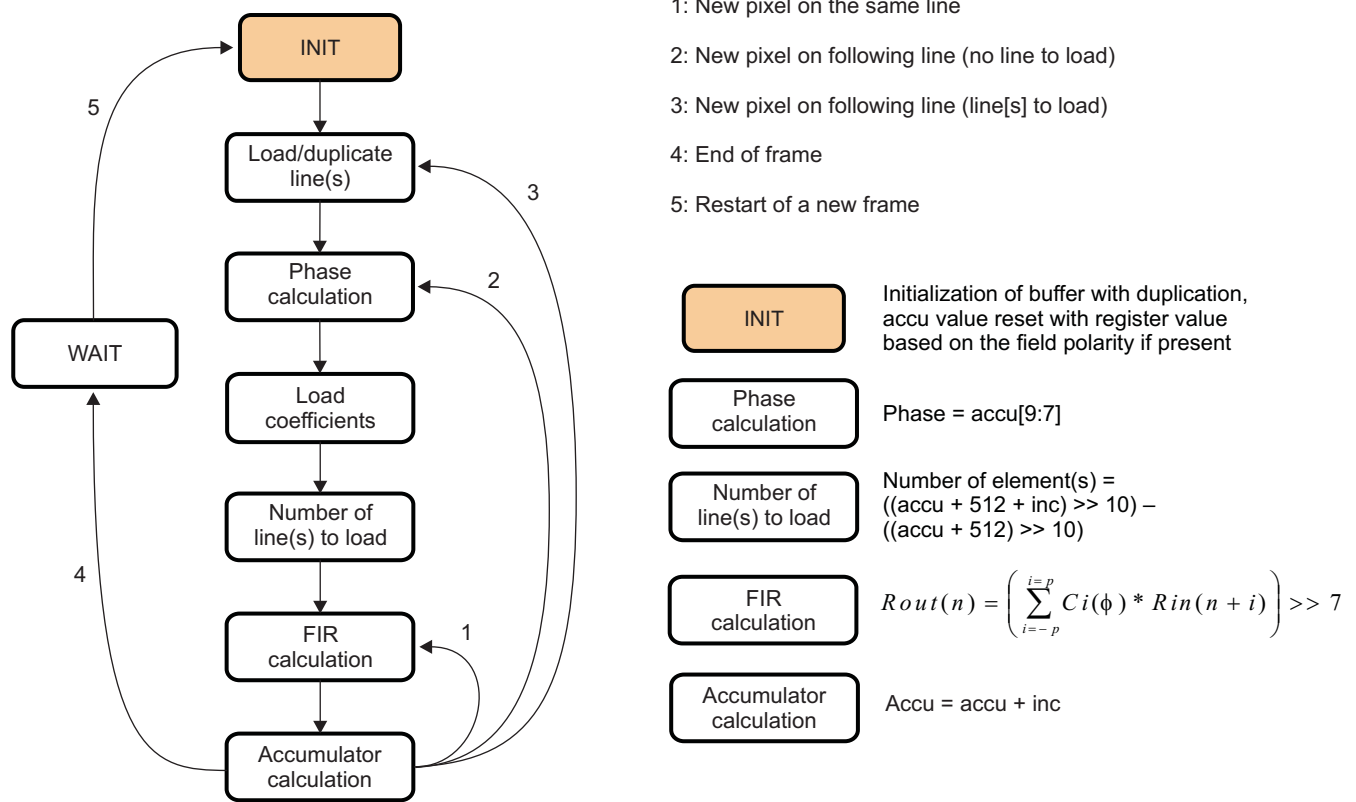

- Vertical up/downsampling coefficients:
  - The 3-tap vertical up/downsampling coefficients are defined in the DISPC\_VIDp\_FIR\_COEF\_HV\_i registers. There are eight registers for the eight phases with three coefficients for each, or a total of 24 programmable coefficients for the vertical up/downsampling block. Each register contains two 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one).
  - The 5-tap vertical up/downsampling coefficients: Two extra-tap vertical up/downsampling coefficients are defined in the DISPC\_VIDp\_FIR\_COEF\_V\_i registers. There are 8 registers for the 8 phases with 2 coefficients for each of them, so a total of 16 programmable coefficients for the vertical up/downsampling block are used in addition to the 3-tap registers previously defined. Four YUV vertical up/downsampling coefficients are set in DISPC\_VIDp\_FIR\_COEF\_HV2\_i and DISPC\_VIDp\_FIR\_COEF\_V2\_i registers. [Table 10-38](#) and [Table 10-39](#) resume all coefficients and their respective registers.
- Horizontal up/downsampling coefficients:

- The DISPC\_VIDp\_FIR\_COEF\_H\_i and DISPC\_VIDp\_FIR\_COEF\_HV\_i registers define the 5-tap horizontal up/downsampling coefficients. Each DISPC\_VIDp\_FIR\_COEF\_H\_i register contains three 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one). Each DISPC\_VIDp\_FIR\_COEF\_HV\_i register contains one 8-bit signed coefficient. A total of 40 programmable coefficients for the horizontal up/downsampling block are used. Four YUV horizontal up/downsampling coefficients are set in the DISPC\_VIDp\_FIR\_COEF\_HV2\_i and DISPC\_VIDp\_FIR\_COEF\_H2\_i registers. Table 10-38 and Table 10-39 resume all coefficients and their respective registers.

10.2.4.10.4.1 Scaling Algorithms

Figure 10-63 and Figure 10-64 show details of the up/downsampling finite state-machines (FSM). Figure 10-63 shows the vertical up/downsampling FSM.

dispc-087

**10.2.4.10.4.2 Scaling Limitations**

Table 10-41 through Table 10-44 list the minimum ratio between the pixel clock frequency (PCLK) and the functional clock (DISPC\_CORE\_CLK) in the input pixel format when using the scaler unit. PCLK and FCLK are asynchronous. For each LCD output, there is a dedicated LCD clock that is programmable with the LCD and PCD divisor values in DISPC\_DIVISORo[23:16][7:0].

**NOTE:** The DISPC\_CORE\_CLK is derived from DISPC\_FCLK through the LCD divisor.

**NOTE:** The downscaling ratio is not an integer, but it is the ratio DISPC\_CORE\_CLK/LCDn\_PCLK, meaning if the ratio is 2.7, then the downscaling ratio is 2.7 and not 2.

**Table 10-41. Pixel Clock Frequency Limitations (Any Pixel Format) – Active Matrix Display**

DISPC_CORE_CLK/LCDn_PCLK Minimum Ratio	Horizontal Resampling				
	Off	Up	1:1–1:2	1:2–1:3	1:3–1:4
	2 <sup>(1)</sup>	2 <sup>(1)</sup>	2	3	4

<sup>(1)</sup> The minimum ratio can be 1 if the data are output on the rising edge of the PCLK (DISPC\_POL\_FREQo.IPC = 0); otherwise, the minimum ratio must be 2.

**Table 10-42. Pixel Clock Frequency Limitations (Any Pixel Format) Passive Matrix Display – Mono4**

	8	8	16	24	32

**Table 10-44. Pixel Clock Frequency Limitations (Any Pixel Format) Passive Matrix Display – Color**

DISPC_CORE_CLK/LCDn_PCLK Minimum Ratio	Horizontal Resampling				
	Off	Up	1:1–1:2	1:2–1:3	1:3–1:4
	8	8	16	24	32

**10.2.4.11 Write-Back Pipeline**

The write-back pipeline is used to store in the system memory the capture of the overlay output or the output of one of the pipelines. The WB pipeline consists of a CSC unit, a scaler unit, and an RGB truncation logic. Because the overlay works on ARGB32-8888 format and the video accelerator works on YUV format, the color space conversion from RGB to YUV is used to directly output to memory the format that can be encoded with no extra processing.

The write-back pipeline is connected to all the pipeline outputs (GFX, VD1, VID2, and VID3 pipelines) and to the output of the three overlay managers ( LCD1, LCD2, and TV). The input is selected by setting the [DISPC\\_WB\\_ATTRIBUTES\[18:16\]](#) CHANNELIN bit field, and the capture frame rate is set in the [DISPC\\_WB\\_ATTRIBUTES\[26:24\]](#) CAPTUREMODE bit field.

Because the output format of the TV overlay manager is ARGB40, the graphics pipeline output is ARGB40, the video pipeline outputs are YUV4:2:2, YUV4:2:0, or ARGB40, and the WB input is ARGB32, the WB input does not consider the 2 LSBs of each ARGB component.

The WB pipeline is enabled by setting the [DISPC\\_WB\\_ATTRIBUTES\[0\]](#) ENABLE bit to 0x1.

Figure 10-65 shows the graphics pipeline.

**Figure 10-65. Write-Back Pipeline**

dispc-016

### 10.2.4.11.1 CSC Unit RGB to YUV

The RGB-to-YUV CSC unit converts the encoded pixel values from RGB24 into YUV4:4:4 format. For YUV4:2:0 or YUV4:2:2 formats, a chrominance subsampling is required after converting the RGB into YUV values. Because of the subsampling, the following limitations must be considered:

- When converting RGB into YUV4:2:0 NV12 format:
  - Maximum horizontal downscale = x0.5
  - Maximum vertical downscale = x0.5
- When converting RGB into YUV4:2:2 format:
  - Maximum horizontal downscale = x0.5
  - Maximum vertical downscale = x0.25

Figure 10-66 and Figure 10-67 show the 3 × 3 11-bit coefficients used to convert from RGB24 into YUV4:4:4. The user sets the coefficients according to the standard used to encode the pixel data in YUV color space. Table 10-45 resumes the coefficients with their respective bit fields.

**Table 10-45. CSC RGB to YUV Bit Field Setting**

Coefficients	Bit Fields
$Y_R$	DISPC_WB_CONV_COEF0[10:0] YR
$Y_G$	DISPC_WB_CONV_COEF0[26:16] YG
$Y_B$	DISPC_WB_CONV_COEF1[10:0] YB
$Cr_R$	DISPC_WB_CONV_COEF1[26:16] CRR
$Cr_G$	DISPC_WB_CONV_COEF2[10:0] CRG
$Cr_B$	DISPC_WB_CONV_COEF2[26:16] CRB
$Cb_R$	DISPC_WB_CONV_COEF3[10:0] CBR
$Cb_G$	DISPC_WB_CONV_COEF3[26:16] CBG
$Cb_B$	DISPC_WB_CONV_COEF4[10:0] CBB

If the active range for the luminance samples (Y) is [16:235] and [16:240] for the chrominance samples (Cb and Cr), the values of Y, Cb, and Cr output components are clipped to the range [0:255]. The range selection is done by setting the DISPC\_WB\_ATTRIBUTES[11] FULLRANGE bit to 0x0.

**Figure 10-66. RGB to YCbCr (FULLRANGE = 0)**

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} Y_R & Y_G & Y_B \\ Cb_R & Cb_G & Cb_B \\ Cr_R & Cr_G & Cr_B \end{bmatrix} * \begin{bmatrix} R_{IN} \\ G_{IN} \\ B_{IN} \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix}$$

dispc-017

If the active range for the luminance samples (Y) and or the chrominance samples (Cb and Cr) is [0:255], the values of Y, Cb, and Cr output components are clipped to the range [0:255]. The range selection is done by setting the DISPC\_WB\_ATTRIBUTES[11] FULLRANGE bit to 0x1.

**Figure 10-67. RGB to YCbCr (FULLRANGE = 1)**

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} Y_R & Y_G & Y_B \\ Cb_R & Cb_G & Cb_B \\ Cr_R & Cr_G & Cr_B \end{bmatrix} * \begin{bmatrix} R_{IN} \\ G_{IN} \\ B_{IN} \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix}$$

dispc-018

10.2.4.11.2 Scaler Unit

The functional aspect of the WB pipeline scaler unit is identical to the video pipeline scaler unit (see Section 10.2.4.10.4), except in the output width when scaling ARGB components. The resulting output format is ARGB32 instead of ARGB40. In addition, the scaling limitations described in Section 10.2.4.10.4.2, *Scaling Limitations*, are relevant only to the video pipelines scaler units. In WB memory-to-memory mode there are no limitations on the DISPC\_CORE\_CLK/LCDn\_PCLK ratio for horizontal resampling.

The programmable coefficients of the polyphase filters are signed 8-bit values (except for the central coefficient, which is unsigned). The WB scaler component has an 8-bit input and an 8-bit output.

Figure 10-68 and Figure 10-69 show the scaler macro-architecture for the component A, R, G, B, and Y. Figure 10-70 and Figure 10-71 show the scaler macro-architecture for component Cr and Cb.

The scaling output can be clipped to an output range of [0:255] or [16:240] by configuring the DISPC\_WB\_ATTRIBUTES[11] FULLRANGE bit.

Figure 10-68. Macro-Architecture of the Vertical Scaling for A, R, G, B, and Y Component

	Chc(-1)		FIRHC3	DISPC_WB_FIR_COEF_H2_i
	Chc(0)		FIRHC2	DISPC_WB_FIR_COEF_H2_i
	Chc(1)		FIRHC1	DISPC_WB_FIR_COEF_H2_i
	Chc(2)		FIRHC0	DISPC_WB_FIR_COEF_H2_i

The WB scaler unit vertical or/and horizontal sampling is defined by setting/resetting the [DISPC\\_WB\\_ATTRIBUTES\[6:5\] RESIZEENABLE](#) bit.

A set of configuration must be valid before enabling the video up/downsampling block.

The following fields define the configuration of the video up/downsampling block for WB:

- Vertical up/downsampling increments the value of the [DISPC\\_WB\\_FIR\[28:16\] FIRVINC](#) bit field. The unsigned integer value range is [1:4096]. Software calculates the value using the following equation:

$$FIRVINC = 1024 * \left( \frac{ORGSIZEY}{SIZEY} \right)$$

dispc-066

(12)

**NOTE:**

- If the value of the [DISPC\\_WB\\_FIR](#)[28:16] FIRVINC bit field is greater than 4096, it is clipped to 4096.
  - If the [DISPC\\_WB\\_SIZE](#)[26:16] SIZEY bit field equals 0x1, SIZEY is replaced by 0x2 in the previous equation.
  - The values of the [DISPC\\_WB\\_PICTURE\\_SIZE](#)[26:16] ORGSIZEY and [DISPC\\_WB\\_SIZE](#)[26:16] SIZEY bit fields must be programmed with the value desired minus 1.
-

- Horizontal up/downsampling increments the value of the [DISPC\\_WB\\_FIR\[12:0\]](#) FIRHINC bit field: The unsigned integer value range is [1:4096]. Software calculates the value using the following equation:

$$FIRHINC = 1024 * \left( \frac{ORGSIZEX}{SIZEX} \right) \tag{13}$$

dispc-067

**NOTE:**

- If the value of the [DISPC\\_WB\\_FIR\[12:0\]](#) FIRHINC bit field is greater than 4096, it is clipped to 4096.
  - If the [DISPC\\_WB\\_SIZE\[ 10:0\]](#) SIZEX bit field equals 1, the [DISPC\\_WB\\_SIZE\[ 10:0\]](#) SIZEX bit field is replaced by 2 in the previous equation.
  - The value of the [DISPC\\_WB\\_PICTURE\\_SIZE\[10:0\]](#) ORGSIZEX and [DISPC\\_WB\\_SIZE\[ 10:0\]](#) SIZEX bit fields must be programmed with the value desired minus 1.
- 
- Vertical up/downsampling accumulator value [DISPC\\_WB\\_ACCU\\_j\[26:16\]](#) VERTICALACCU bit field: The signed integer value range is [-1024:1023]. The accumulator value indicates on which phase the vertical filtering starts. The register [DISPC\\_WB\\_ACCU\\_0](#) is used for progressive output and for interlace output; the [DISPC\\_WB\\_ACCU\\_0](#) and [DISPC\\_WB\\_ACCU\\_1](#) registers are used. Similarly, [DISPC\\_WB\\_ACCU2\\_0](#) and [DISPC\\_WB\\_ACCU2\\_1](#) are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.
  - Vertical up/downsampling line buffer configuration [DISPC\\_WB\\_ATTRIBUTES\[21\]](#) VERTICALTAPS bit: The default value at reset time is 0x0 (3-tap configuration is used). If the bit field is reset, the 3-tap configuration is used.
  - Horizontal up/downsampling accumulator value [DISPC\\_WB\\_ACCU\\_j\[10:0\]](#) HORIZONTALACCU bit field: The signed integer value range is [-1024:1023]. The accumulator value indicates on which phase the horizontal filtering starts. The register [DISPC\\_WB\\_ACCU\\_0](#) is used for progressive output and for interlace output; the [DISPC\\_WB\\_ACCU\\_0](#) and [DISPC\\_WB\\_ACCU\\_1](#) registers are used. Similarly, [DISPC\\_WB\\_ACCU2\\_0](#) and [DISPC\\_WB\\_ACCU2\\_1](#) are used in progressive or interlace output to set the accumulator value of Cb and Cr components when scaling YUV format.

**Table 10-48. Vertical/Horizontal Accumulator Phase**

Accumulator Value	Phases f
0	0
128 or -896	1
256 or -768	2
384 or -640	3
512 or -512	4
640 or -384	5
768 or -256	6
896 or -128	7

- Vertical up/downsampling coefficients:
  - The 3-tap vertical up/downsampling coefficients are defined in the [DISPC\\_WB\\_FIR\\_COEF\\_HV\\_i](#) registers. There are 8 registers for the 8 phases with 3 coefficients for each, or a total of 24 programmable coefficients for the vertical up/downsampling block. Each register contains two 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one).
  - The 5-tap vertical up/downsampling coefficients: Two extra-tap vertical up/downsampling coefficients are defined in the [DISPC\\_WB\\_FIR\\_COEF\\_V\\_i](#) registers. There are 8 registers for the 8 phases with 2 coefficients for each of them, so a total of 16 programmable coefficients for the vertical up/downsampling block are used in addition to the 3-tap registers previously defined. Four YUV vertical up/downsampling coefficients are set in the [DISPC\\_WB\\_FIR\\_COEF\\_HV2\\_i](#) and [DISPC\\_WB\\_FIR\\_COEF\\_V2\\_i](#) registers. [Table 10-46](#) and [Table 10-47](#) resume all coefficients and their respective registers.
- Horizontal up/downsampling coefficients:

- The [DISPC\\_WB\\_FIR\\_COEF\\_H\\_i](#) and [DISPC\\_WB\\_FIR\\_COEF\\_HV\\_i](#) registers define the 5-tap horizontal up/downsampling coefficients. Each [DISPC\\_WB\\_FIR\\_COEF\\_H\\_i](#) register contains three 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one). Each [DISPC\\_WB\\_FIR\\_COEF\\_HV\\_i](#) register contains one 8-bit signed coefficient. A total of 40 programmable coefficients for the horizontal up/downsampling block are used. Four YUV horizontal up/downsampling coefficients are set in the [DISPC\\_WB\\_FIR\\_COEF\\_HV2\\_i](#) and [DISPC\\_WB\\_FIR\\_COEF\\_H2\\_i](#) registers. [Table 10-46](#) and [Table 10-47](#) resume all coefficients and their respective registers.

### 10.2.4.11.3 RGB Truncation Logic

Truncation logic is used to convert a pixel from ARGB 32-bit format into a lower color depth: 12-or 16-bit format based. Setting the [DISPC\\_WB\\_ATTRIBUTES\[10\]](#) TRUNCATIONENABLE bit to 0x1 enables the truncation to the pixel format defined by the [DISPC\\_WB\\_ATTRIBUTES\[4:1\]](#) FORMAT bit field. The truncation is done by removing the necessary LSB of each component to match the output format. [Table 10-49](#) describes the truncation done on each component of the pixel.

**Table 10-49. Truncation Logic**

Output Formats	A[7:0]	R[7:0]	G[7:0]	GB[7:0]
	MSB LSB	MSB LSB	MSB LSB	MSB LSB
xRGB12-4444	Ignored	R[7:4]	G[7:4]	B[7:4]
RGBx12-4444	Ignored	R[7:4]	G[7:4]	B[7:4]
RGB16-565	Ignored	R[7:3]	G[7:2]	B[7:3]
xRGB16-1555	Ignored	R[7:3]	G[7:3]	B[7:3]
ARGB16-4444	A[7:4]	R[7:4]	G[7:4]	B[7:4]
RGBA16-4444	A[7:4]	R[7:4]	G[7:4]	B[7:4]
ARGB16-1555	A[7]	R[7:3]	G[7:3]	B[7:3]

---

**NOTE:** If there is no alpha field in the pixel format description, 0s or 1s must fill the container. 0s must be used for transparent and 1s for opaque. For example, in xRGB12 pixel format, the upper 4 bits are set to 0s because the RGB value is only 12 bits inside a 16-bit container.

---

### 10.2.4.12 LCD Outputs

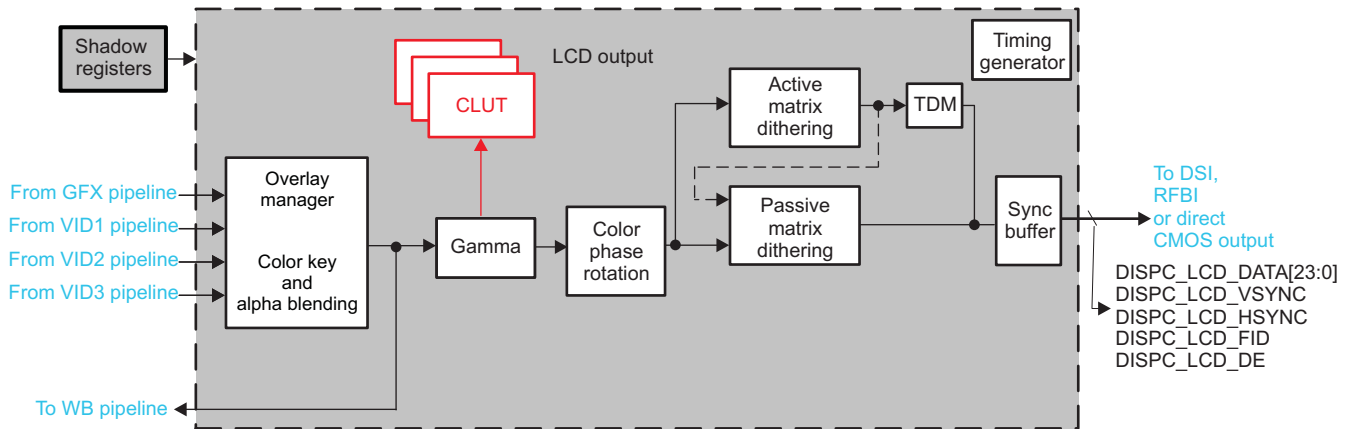

The LCD1 and LCD2 output paths consist of several processing blocks (see [Figure 10-72](#)):

- Overlay manager
- Gamma correction unit
- Color phase rotation (CPR) is also used for RGB-to-YUV conversion.
- Active matrix dithering with TDM
- Passive matrix dithering
- Synchronization buffer
- Timing generator

The display subsystem supports two types of display technologies (both monochrome and color modes):

- Passive matrix displays: supporting up to 16, 256, or 3375 colors to be displayed in each frame, depending on the color depth. The monochrome LCD has 15 grayscale levels available.
- Active matrix displays: the configuration of colors depends on the color depth:
  - 24 BPP supports 16,777,216 colors.
  - 18 BPP supports 262,144 colors.
  - 16 BPP supports 65,536 colors.
  - 12 BPP supports 4096 colors.

Figure 10-72. LCD Output Architecture

dispc-028

### 10.2.4.12.1 Overlay Manager

The overlay mechanism consists of displaying more than one layer (GFX, VID1 to VID3 layers) using:

- A priority rule based on a Z-order: Application can set the ordering layer of the frames.
- Transparency color keys: Destination and source transparency color keys can be set.
- Alpha blending values: Using the A component of a pixel or a blending set by the user for a layer, a level of transparency can be determined.

Each pipeline (GFX, VID1, VID2, and VID3) is assigned to a single overlay and, as a consequence, to a single display controller output, LCD1, LCD2, TV, or WB pipeline. An overlay manager can be connected to all four pipelines outputs simultaneously. The pipeline output is directed using the [DISPC\\_GFX\\_ATTRIBUTES\[8\]](#) CHANNELOUT bit and the [DISPC\\_VIDp\\_ATTRIBUTES\[31:30\]](#) CHANNELOUT2 bit field. [Table 10-50](#) resumes the bit field settings to direct a pipeline to an LCD/TV or WB output. The default value directs all pipelines to LCD1.

Table 10-50. Pipeline Connection to LCD, TV, or WB Output

Overlay Manager/Output	DISPC_GFX_ATTRIBUTES/DISPC_VIDp_ATTRIBUTES	
	CHANNELOUT Bit	CHANNELOUT2 Bit Field
LCD1	0x0	0x0
LCD2	0x0	0x1
WB	0x0	0x3
TV	0x1	0x0 (or 0x2 for VID2; see the following Note)

**NOTE:** The combination of settings CHANNELOUT = 0x1 and CHANNELOUT2 = 0x1, 0x2, or 0x3 is reserved for the VID1 and VID3 pipelines. For the VID2 pipeline, this combination is reserved when any TV format other than HDMI 1.4 3D 1080p is to be output. Setting the [DISPC\\_VID2\\_ATTRIBUTES](#) register bit fields CHANNELOUT to 0x1 and CHANNELOUT2 to 0x2, is used in case of HDMI 1.4 3D 1080p format. For more information, see [Section 10.2.4.13.4, Timing and TV Format Settings](#).

The output of each LCD overlay manager is connected to CPR block through the palette unit in the case of Gamma correction.

**NOTE:**

- When the pixel format is ARGB or RGBA, the color key match logic uses only the RGB value defined by ARGB or RGBA. The alpha blending factor is ignored.
- For LCD1 output, the same CLUT is used for BITMAP support by the graphics pipeline and for Gamma correction. In case of BITMAP format for graphics, Gamma correction is not available on the primary LCD output.

**10.2.4.12.1.1 Priority Rule**

The overlay manager is configured using the Z-order parameter. The Z-order value defined for each pipeline indicates the visibility order to the window on the screen. If the Z-order value of window A is lower than the Z-order to layer B, layer A is displayed below layer B. The transparency color keys and the alpha blending factors are then used to blend the layers together (see [Section 10.2.4.12.1.2](#) and [Section 10.2.4.12.1.3](#)). The Z-order is enabled by setting the `DISPC_GFX_ATTRIBUTES[25]` `ZORDERENABLE` bit or the `DISPC_VIDp_ATTRIBUTES[25]` `ZORDERENABLE` bit to 0x1 and by defining the Z-order in the `DISPC_GFX_ATTRIBUTES[27:26]` and `DISPC_VIDp_ATTRIBUTES[27:26]` `ZORDER` bit fields. [Table 10-51](#) resumes the register settings to enable and set the Z-order of a pipeline. [Table 10-51](#) shows the default Z-order values when `LCDALPHABLENDERENABLE` and `ZORDERENABLE` are disabled.

**Table 10-51. Z-Order Register Settings and Default Configuration**

Pipeline	LCDALPHA BLENDERENABLE <sup>(1)</sup>	ZORDERENABLE	ZORDER	Resulting Z-Order Number
GFX	0	0	Don't care	0
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	3
VID1	0	0	Don't care	1
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	0
VID2	0	0	Don't care	2
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	1
VID3	0	0	Don't care	3
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	2

<sup>(1)</sup> Applies only to LCD1

[Figure 10-73](#) shows the architecture of the priority rule.

**NOTE:**

- If `ZORDERENABLE` = 1, each Z-order must be different for each active pipeline. It is not possible to use the same value for more than one pipeline.
- Two modes are maintained for backward compatibility with OMAP3430:
  - `LCDALPHABLENDERENABLE` = 0 and `ZORDERENABLE` = 0 equivalent to the normal mode overlay settings
  - `LCDALPHABLENDERENABLE` = 1 equivalent to the alpha mode overlay settings
- When OMAP3430 backward compatibility mode is to be used, the following must be considered:
  - If Z-order is disabled for the VID1 and VID2 pipelines, the pipeline data is output on the LCD1/LCD2/TV overlay.
  - If Z-order is disabled for the VID3 pipeline, the pipeline data is output only on the LCD2 overlay.

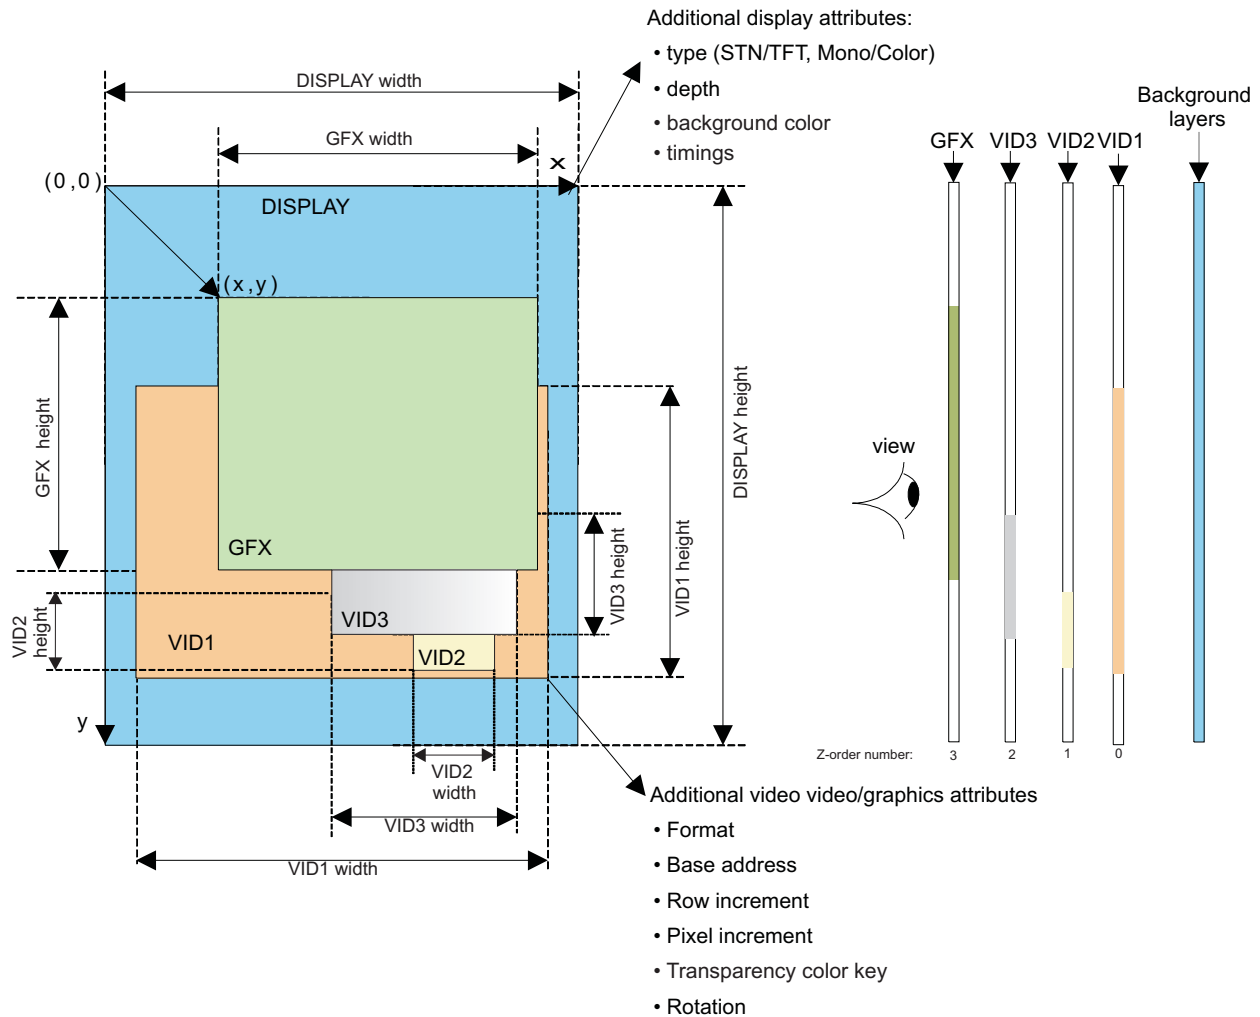

Figure 10-73. Priority Rule Architecture

The height and width of each enabled layer (pipeline) must be defined in the SIZEX and SIZEY bit fields [DISPC\\_GFX\\_SIZE\[26:16\]\[10:0\]](#)/[DISPC\\_VIDp\\_SIZE\[26:16\]\[10:0\]](#), and its x and y positions defined in the POSX and POSY bit fields [DISPC\\_GFX\\_POSITION\[26:16\]\[10:0\]](#)/[DISPC\\_VIDp\\_POSITION\[26:16\]\[10:0\]](#). If there are no graphics or video-encoded pixels at a specific position, the programmable, solid background color appears. The solid background color is set in the [DISPC\\_DEFAULT\\_COLOR\[23:0\]](#) DEFAULTCOLOR bit field. [Figure 10-74](#) is an example of priority rule.

The Z-order reordering block must always map the pipelines to the blender logic in the same order—from background to foreground.

**Figure 10-74. Example of Priority Rule: From Lower to Higher VID1, VID2, VID3, GFX**

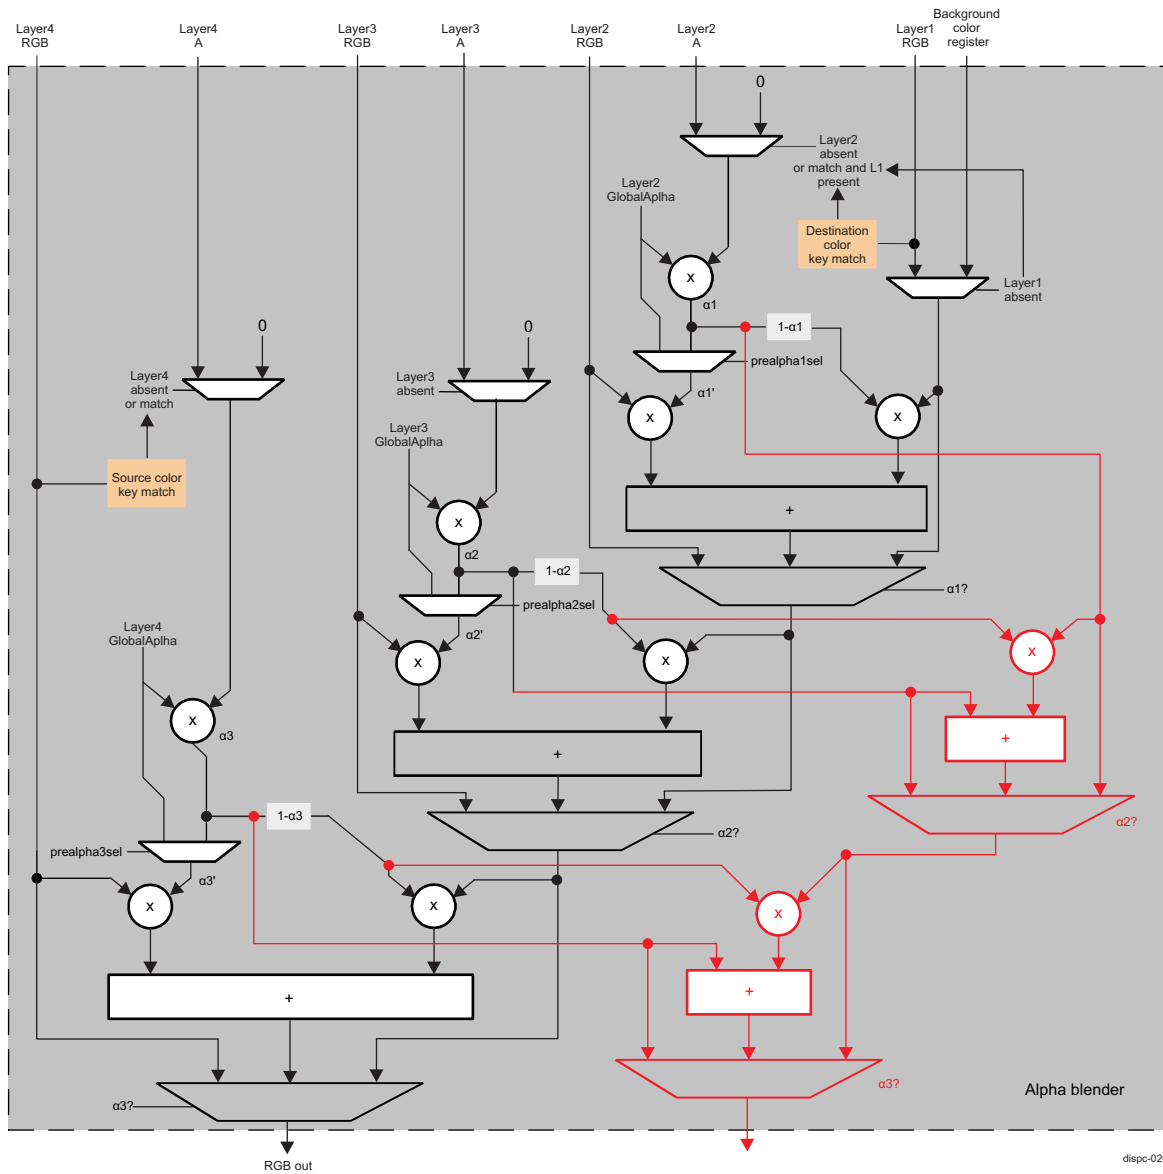

dispc-019

### 10.2.4.12.1.2 Alpha Blender

Figure 10-75 shows the alpha blending processing in detail.

Figure 10-75. Alpha Blending Architecture With Premultiplied Alpha Support

**NOTE:** "1-alpha" operator corresponds to the basic 1s-complement operation.

The alpha blending value is defined by:

- The component value A when using an ARGB or RGBA pixel format.
  - For ARGB-1555, the alpha blending is defined using a 1-bit value. It is converted into an 8-bit value by duplicating the 1-bit value (see [Table 10-52](#)).
  - For ARGB-4444, the alpha blending is defined using a 4-bit value. It is converted into an 8-bit value by duplicating the 4-bit value (see [Table 10-52](#)).
  - If the pixel format contains no alpha blending value, the pixel alpha value is considered to be 0xFF and if alpha is equal to 0xFF, there is no multiplication.
  - For BITMAP or YUV formats, there is no alpha blending factor associated with each pixel value. Only the global alpha blending factor associated with the window displaying the BITMAP or YUV format is used.
- The global alpha blending value set in the individual bit fields of the `DISPC_GLOBAL_ALPHA[31:0]`

register for LCD:

- VID3GLOBALALPHA
  - VID2GLOBALALPHA
  - VID1GLOBALALPHA
  - GFXGLOBALALPHA
- A total alpha blending value can be used when a combination of the pixel alpha blending value A and a global alpha blending is present. The resulting alpha value is determined as : Alpha = (Pixel Alpha \* Global Alpha) / 256.

Table 10-52 lists the percentage of alpha blending in the function of the alpha blending value on 8 bits.

**Table 10-52. Alpha Blending – ARGB**

Alpha Blending 1-Bit Value	Alpha Blending 4-Bit Value	Alpha Blending 8-Bit Value (Converted Value or Resulting Alpha)	% Blending
0x0	0x0	0x00	100% (transparent)
N/A	0x1	0x11	93.33%
N/A	0x2	0x22	86.6%
N/A	...	...	...
N/A	0xE	0xEE	6.6%
0x1	0xF	0xFF	0% (opaque)

### Premultiplied Alpha

The image ARGB may have its RGB component already premultiplied with the alpha (ARGB) where:

- $R = A * R$
- $G = A * G$
- $B = A * B$

In that case, the processing is as follows:

- Color component of premultiplied layers are multiplied with the Global Alpha, if Global Alpha is not equal to 0.
- Color component of the composed underlying layers are multiplied with  $(1-A) * \text{Global Alpha}$

The additional premultiplied alpha option is associated with the pipelines GFX, VID1, VID2, and VID3. The option is accessible through the [28] PREMULIPLYALPHA bit for the respective pipeline register:

- [DISPC\\_GFX\\_ATTRIBUTES](#)
- [DISPC\\_VID1\\_ATTRIBUTES](#)
- [DISPC\\_VID2\\_ATTRIBUTES](#)
- [DISPC\\_VID3\\_ATTRIBUTES](#)

The following settings are available:

- PREMULIPLYALPHA bit = 0: Source is not premultiplied with alpha. Full blending is done in the DISPC.
- PREMULIPLYALPHA bit = 1: Source is premultiplied with alpha. Partial blending is done.

---

**NOTE:** The *prealpha* controls in [Figure 10-75](#), correspond to the PREMULIPLYALPHA of the pipelines mapped on the respective layers.

---

The logic marked in red color in [Figure 10-75](#) corresponds to the alpha value, computed when the Write Back channel copies back to memory the premultiplied color component:  $A(\text{destination}) = A(\text{source}) + (1 - A(\text{source}) * A(\text{destination}))$

When `DISPC_WB_ATTRIBUTES[7]` ALPHAENABLE bit is cleared, or when the overlay channel is not selected for WB, the computation of the A(destination) is disabled. The default value for `DISPC_WB_ATTRIBUTES[7]` ALPHAENABLE bit is 0x0. When the WB is configured to copy back one of the output channels (output of overlay), the following configurations are available:

- ALPHAENABLE bit is set to 0x1: The WB pipe copies back to memory the premultiplied alpha calculated through the overlay.
- ALPHAENABLE bit is set to 0x0: The alpha value is not written back.

---

**NOTE:** The `DISPC_WB_ATTRIBUTES[7]` ALPHAENABLE bit is effective only when one of the output channels is written back, otherwise it is ignored.

---

### 10.2.4.12.1.3 Transparency Color Keys

The two transparency color keys are the source transparency color key and the destination transparency color key. The transparency color key can be used only with BITMAP formats (1-, 2-, 4-, and 8-bits per pixel) and RGB formats (ARGB, RGB, RGBA, and RGBx). In this case the A information is ignored for the comparison between the pixel value and the color key value. It is possible to use YUV formats with some care because the comparison is between the input pixel value of the overlay manager from pipeline (GFX or one of the VID pipelines depending on the Z-order) and the color key value. The YUV data is converted to RGB format. If the original format is YUV, the user must consider the color space conversion processing to define the RGB color key value used for the comparison.

The transparency color key is enabled by setting the following bits to 0x1:

- `DISPC_CONFIG1[10]` TCKLCDENABLE for LCD1
- `DISPC_CONFIG2[10]` TCKLCDENABLE for LCD2
- `DISPC_CONFIG1[12]` TCKTVENABLE for TV

The transparent color key is determined in the following bit fields.

- `DISPC_TRANS_COLOR0[23:0]` TRANSCOLORKEY for LCD1
- `DISPC_TRANS_COLOR2[23:0]` TRANSCOLORKEY for LCD2
- `DISPC_TRANS_COLOR1[23:0]` TRANSCOLORKEY for TV

---

**NOTE:**

- The video source transparency color key and graphics destination transparency color key cannot be active at the same time.
  - For CLUT bitmaps, the palette index is compared to the transparency color key and not to the palette value pointed out by the palette index.
- 

- Video source transparency color key

The video source transparency color key value defines the encoded pixel data considered as transparent pixel. The encoded pixel values with the source color key value are not visible and the under layers encoded pixel values or solid background color are visible (the pixel alpha blending value of layer 4 is forced to 0x00, fully transparent).

The scaler can be enabled as a preprocessing in the VID pipeline. But it is necessary to consider the pixel scaling preprocessing in order to define the color key value to be used after the rescaling for the comparison between the input pixel value to the overlay manager and the color key value.

The source transparency color key mode is selected by setting the following bits to 0x1:

- `DISPC_CONFIG1[11]` TCKLCDSELECTION bit for LCD1
- `DISPC_CONFIG2[11]` TCKLCDSELECTION bit for LCD2
- `DISPC_CONFIG1[13]` TCKTVENABLE bit for TV

Figure 10-76 shows an example of source color key. The pixels with the transparency color key are not displayed; instead, pixels of the resulting layer underneath are shown.

**Figure 10-76. Source Transparency Color Key Example**

dispc-021

- Graphics destination transparency color key value

The graphics destination transparency color key value defines the encoded pixels in layer 1 which are not displayed. Other layer 1 pixels (nonequal to destination transparency color key) are displayed over layer 2. The encoded pixel values with the destination color key value are pixels not visible on the screen because pixels at the same position in layer 2 are visible otherwise encoded pixels are visible above layer 2. The destination transparency color key is applicable only if layer 1 overlaps layer 2 (refer to the Z-order section for details on layer position depending on the Z-order parameter, [Section 10.2.4.12.1.1, Priority Rule](#)); otherwise, the destination transparency color key is ignored.

The scaler can be enabled as a preprocessor in the VID pipeline. It is necessary, however, to consider the pixel scaling preprocessing to define the color key value to be used after rescaling for the comparison between the input pixel value to the overlay manager and the color key value.

The destination transparency color key mode is selected by setting the following bits to 0x0:

- [DISPC\\_CONFIG1\[11\]](#) TCKLCDSELECTION bit for LCD
- [DISPC\\_CONFIG2\[11\]](#) TCKLCDSELECTION bit for LCD2
- [DISPC\\_CONFIG1\[13\]](#) TCKTVSELECTION bit for TV

[Figure 10-77](#) shows an example of the destination color key. The pixels, equal to the transparency color key, are not displayed and are replaced by layer 2 pixels. All other layer 1 pixels, different from the transparency color key, are displayed over layer 2.

**Figure 10-77. Destination Transparency Color Key Example**

dispcc-022

#### 10.2.4.12.1.4 Overlay Optimization

The overlay optimization consists in fetching only the required pixels meaning pixels that contribute to the final picture to be displayed (LCD1, LCD2, or TV). The decision to fetch the pixel from memory is based on the information available in the registers and on the following rules:

- The layer is enabled.
- The global alpha blending factor for the layer is different than 0x00.
- The current layer is behind a nonopaque layer (global alpha blending factor is different than 0xFF for the layer in the preceding).

The result of the overlay optimization is a reduction of the bandwidth by fetching only the mandatory pixels. The overlay mechanism is independent for each overlay: LCD1, LCD2, and TV. Because each layer (GFX, VID1, VID2, and VID3) can be associated to only one overlay at a time, it is possible to optimize the fetch of the pixels for each layer based on the overlay information. The overlay optimization must be run on the DMA engine time window and not on the display time window. The pixels are fetched by the DMA engine before the display processing.

The overlay optimization is enabled by setting the following bits to 0x1:

- [DISPC\\_CONTROL1](#)[12] OVERLAYOPTIMIZATION bit for LCD1
- [DISPC\\_CONTROL2](#)[12] OVERLAYOPTIMIZATION bit for LCD2
- [DISPC\\_CONTROL2](#)[13] TVOVERLAYOPTIMIZATION bit for TV

---

**NOTE:**

- The overlay optimization is not functional when a layer is using BITMAP1, BITMAP2, or BITMAP4 pixel formats.
  - The pixel alpha blending factor in case of ARGB and RGBA formats cannot be used to take advantage of the pixel fully transparent (alpha blending factor equals 0x00).
  - By default, the overlay optimization is disabled (OVERLAYOPTIMIZATION bits are set to 0x0 for all DISPC outputs), and all data for all enabled pipelines are fetched from memory regardless of the overlay or alpha-blending configuration.
-

### 10.2.4.12.2 Gamma Correction Unit

In gamma curve mode, the selected encoded pixel values based on the color keys by the overlay manager from the video or graphics paths are sent to the gamma curve table. Each component of encoded pixel value is used as a pointer to index one out of 256 24-bit gamma curve entries in the table. Each 8-bit component is replaced with the 8-bit table value corresponding to R, G, or B component. The table is loaded by software. It is possible to load only part of the table. For each access to the table, the 24-bit value is associated with index in the table by concatenating the 24-bit value (LSB of 32-bit access) and the 8-bit index value (MSB of the 32-bit access). [Figure 10-78](#) describes the format of one of the gamma curve values in the memory.

**NOTE:** If the CLUT is used in the GFX pipeline for palette, the gamma correction unit is not available on the primary LCD.

**Figure 10-78. Data Memory Organization for Gamma Mode in LCD Output**

### 10.2.4.12.3 CPR Unit

The CPR unit can be used to correct the LCD output colorimetry in case of nonpure white backlight.

The CPR is enabled by setting the DISPC\_CONFIG0[15] CPR bit to 0x1. The coefficients are programmed in the following registers:

- Red 10-bit signed coefficients in DISPC\_CPRo\_COEF\_R
- Green 10-bit signed coefficients in DISPC\_CPRo\_COEF\_G
- Blue 10-bit signed coefficients in DISPC\_CPRo\_COEF\_B

The color phase rotation can be selected for passive and active matrix panel. The logic is integrated after the LCD overlay manager or the palette while using the gamma correction and before the spatial/temporal dithering. The color phase rotation can be selected to correct the nonpure white backlight of the LCD module by using a programmable matrix to convert the 24-bit RGB pixel value into a new 24-bit RGB pixel value. The matrix is programmed through a set of nine 10-bit signed coefficients. The output of the calculation is clipped to [0:255]. The color phase rotation is processed by the equation shown in [Figure 10-79](#). [Table 10-53](#) lists all coefficients with their respective bit field registers for settings.

**Figure 10-79. Color Phase Rotation Matrix**

$$\begin{bmatrix} R_{out} \\ G_{out} \\ B_{out} \end{bmatrix} = \begin{bmatrix} R_r & R_g & R_b \\ G_r & G_g & G_b \\ B_r & B_g & B_b \end{bmatrix} * \begin{bmatrix} R_{in} \\ G_{in} \\ B_{in} \end{bmatrix}$$

dispc-023

**Table 10-53. CPR or RGB to YUV Coefficients With Associated Bit Fields**

Registers	Bit Field	Color Space Conversion	RGB to YUV
DISPC_CPRo_COEF_R	RR	Rr	Yr
	RG	Rg	Yg
	RB	Rb	Yb
DISPC_CPRo_COEF_G	GR	Gr	Cbr

DISPC_CPRo_COEF_B	BR	Br	Crr
	BG	Bg	Crg
	BB	Bb	Crb

Figure 10-80 shows the color phase rotation macro-architecture.

**Figure 10-80. Color Phase Rotation Macro-Architecture**

dispc-024

#### 10.2.4.12.4 Passive Matrix

The passive matrix display supports 16, 256, or 3375 colors to be displayed in each frame, depending on the color depth. The monochrome LCD has 15 grayscale levels available. To enable a passive matrix output, the DISPC\_CONTROLo[3] STNTFT bit must be set to 0x0.

Spatial/temporal dithering is performed when using the passive matrix data path. The spatial/temporal dithering logic can be selected to enhance the quality of the passive matrix. When selected, the pixels are preprocessed by the spatial/temporal dithering logic before the passive matrix display dithering logic. The output format of the spatial/temporal dithering logic is RGB 12-bit (not configurable). The dithering logic is integrated after the color phase rotation. The dithering algorithm is based on the frame rate control. The dithering logic can process the pixels one frame, two frames, or four frames. The number of frames is selected by setting the DISPC\_CONTROLo[31:30] SPATIALTEMPORALDITHERINGFRAMES bit field. The temporal dithering logic is enabled by setting the DISPC\_CONTROLo [7] STDITHERENABLE bit to 0x1. The output format of the dithering logic is RGB 12-bit (not configurable).

After the pixels, from GFX, VID pipelines, are merged depending on the transparency status and overlay, the result is sent to a color/grayscale temporal dither generator. The monochrome data or each RGB color component are encoded on 4 bits, which are the 4 MSBs of 8-bit pixel-encoded component defined by the merge of the graphics data and the video data.

These 4-bit values are used to select on the 16 intensity levels. The gray/color intensity is controlled by turning individual pixels on and off at varying period rates, making the average time the pixel is off longer than the average time the pixel is on, thus producing more intense grays/colors. The dithering generator also uses the intensity of adjacent pixels in the calculation to give the screen image a smooth appearance. The proprietary dither algorithm is optimized to provide a range of intensity values that matches the visual perception of color/gray graduations.

Single-panel monochrome screens use four or eight data lines; single-panel color screens use eight data pins. The output width is configured by setting the DISPC\_CONTROLo[4] M8B bit, and the monochrome or color mode is selected by the DISPC\_CONTROLo[2] MONOCOLOR bit.

#### 10.2.4.12.5 Active Matrix

Depending on the color depth, the active matrix output:

- 24 BPP supports 16,777,216 colors.
- 18 BPP supports 262,144 colors.

- 16 BPP supports 65,536 colors.
- 12 BPP supports 4096 colors.

When in active matrix path configuration, after setting the DISPC\_CONTROLo[3] STNTFT bit to 0x1, two submodules must be configured:

- Spatial/temporal dithering
- Multiple cycle output format (TDM)

#### 10.2.4.12.5.1 Spatial/Temporal Dithering

When the active matrix path is used, the spatial/temporal dithering logic can be selected to enhance the quality of the active matrix outputs. The encoded pixel values are used by spatial/temporal dithering logic to display the data in a lower color depth on the LCD panel. The dithering logic is integrated after the CPR and before the TDM. The spatial/temporal dithering algorithm is based on the (x,y) pixel position and frame rate control. The dithering logic can process the pixels over one frame, two frames, or four frames. The number of frames is selected by setting the DISPC\_CONTROLo[31:30]

SPATIALTEMPORALDITHERINGFRAMES bit field. In the case of a single frame, only spatial processing is applied, and in multiple frames, spatial and temporal processing are applied to the pixels. The spatial/temporal dithering logic is enabled by setting the DISPC\_CONTROLo[7] STDITHERENABLE bit to 0x1.

---

#### NOTE:

- If the interface data bus is smaller than the pixel format size and spatial/temporal dithering is not enabled, the MSBs of the pixel color components are output on the interface data bus.
  - If the interface data bus is wider than the pixel format size, by programming the pixel components replication active/inactive, the MSB is replicated to the LSB of the interface data bus or the LSB is filled with 0s.
- 

#### 10.2.4.12.5.2 Multiple Cycle Output Format (TDM)

The pixels, after the active matrix display processing, are formatted on one or multiple cycles (from one to three cycles). The number of bits for each cycle is set in the DISPC\_DATAo\_CYCLE1 for the first cycle, DISPC\_DATAo\_CYCLE2 for the second cycle, and DISPC\_DATAo\_CYCLE3 for the third cycle. The interface data bus width can be 8, 9, 12, or 16 bits. The configuration of the data bus is done in the DISPC\_CONTROLo[9:8] TFTDATALINES bit field.

When the TDM is disabled, the DISPC outputs the pixels using the conventional formats: Passive matrix display/active matrix display monochrome/color.

---

**NOTE:** The passive matrix dithering logic is always bypassed in active matrix display.

---

Figure 10-81 through Figure 10-84 show various examples of TDM settings in the function of pixel data formats and the interface data bus width.

### 10.2.4.12.6 Synchronized Buffer Update

A synchronization mismatch between the frame buffer and the display refreshes, named tearing effect, can lead to images that appear to be stretched on the screen. To avoid it, a synchronization mechanism is used between the DISPC and the process that updates the buffer. An interrupt is generated when the display reaches a predefined line number. The PROGRAMMEDLINENUMBER\_IRQ interrupt ([DISPC\\_IRQSTATUS](#) and [DISPC\\_IRQENABLE](#)) is a level signal and stays active during the programmed line of the display.

### 10.2.4.12.7 Timing Generator and Panel Settings

The size of and panel is defined by:

- Number of lines, DISPC\_SIZE\_LCD0[26:16] LPP bit field, with a value from 1 to 2048
- Number of pixels per line, DISPC\_SIZE\_LCD0[10:0]PPL bit field, with a value from 1 to 2048

Standard HSYNC/VSYNC timing generation are programmable for each LCD outputs independently:

- Horizontal front porch is set in the DISPC\_TIMING\_Ho[19:8] HFP bit field.
- Horizontal back porch is set in the DISPC\_TIMING\_Ho[31:20] HBP bit field.
- Horizontal synchronization pulse width is set in the DISPC\_TIMING\_Ho[7:0] HSW bit field.
- Vertical front porch is set in the DISPC\_TIMING\_Vo[19:8] VFP bit field.
- Vertical back porch is set in the DISPC\_TIMING\_Vo[31:20] VBP bit field.
- Vertical synchronization pulse width is set in the DISPC\_TIMING\_Vo[7:0] VSW bit field.

Horizontal/vertical synchronization and ACBIAS signals polarity are programmable by setting the DISPC\_POL\_FREQ0[12] IVS, DISPC\_POL\_FREQ0[13] IHS, and DISPC\_POL\_FREQ0[15] IEO bits. These signals can be gated by setting the DISPC\_CONFIG0[7] VSYNCGATED and DISPC\_CONFIG0[6] HSYNCGATED bits.

The latch of data can be driven on the rising or falling edge of the pixel clock by setting the DISPC\_POL\_FREQ0[14] IPC bit. The drive of the SYNC and VSYNC signals in the function of the pixel clock is done by setting the DISPC\_POL\_FREQ0[16] RF bit.

Table 10-54 describes the programming rules for LCD timing.

**Table 10-54. Programming Rules**

	No Downsampling	Downsampling H or V	Downsampling H + V
$(HBP + HSW + HFP) * PCD$	>8	>10	>20

Figure 10-85 shows the timing values description in the case of an active matrix display.

**Figure 10-85. Timing Values (Active Matrix Display)**

dispc-031

The 8-bit pixel clock divider (the `DISPC_DIVISOR[7:0]` PCD bit field) selects the pixel clock frequency. This bit field generates a range of pixel clock frequencies from LC/2 to LC/256, where LC is the logic clock from the divided functional clock of the DISPC by the `DISPC_DIVISOR[23:16]` LCD bit field.

The pixel clock is defined by the following equation:

$$\text{Pixel Clock} = (\text{FunctionalClock}/\text{LCD}[7:0])/\text{PCD}[7:0]$$

The pixel clock can be gated by setting the `DISPC_CONFIGo[5]` `PIXELCLOCKGATED` bit to 0x1.

The LCD output can be configured in progressive output or interlace output. The selection is done by writing into the `DISPC_CONFIGo[22]` `OUTPUTMODEENABLE` bit. The reset value is 0x0, which means progressive mode. When the progressive mode is selected, the FID signal associated to the LCD output is driven low (INACTIVE state). The selection can be changed only if the corresponding LCD output is disabled. The configuration is independent for each LCD output.

When in interlaced mode, the `DISPC_CONFIGo[23]` `FIDFIRST` bit indicates which field is output first:

- 0x0: Even field first (FID = 0)
- 0x1: Odd field first (FID = 1)

#### 10.2.4.12.8 Stall Mode

Stall mode is used to indicate when the DISPC must stop sending data on the corresponding LCD output interface to avoid an overflow on the interface level. Stall mode is available when RFBI and DSI interface are used. The Interface asserts the stall signal to stop data output by the DISPC. It is deasserted by the interface to indicate when new data must be output by the DISPC. [Figure 10-86](#) shows the RFBI data stall mode activated.

Stall mode is selected by setting the `DISPC_CONTROLo[11]` `STALLMODE` bit.

---

**NOTE:** The `DISPC_CONTROLo[5]` `GOLCD` bit must not be set, but the DISPC configuration (DMA engine, pipelines associated with the LCD output) must be set before enabling the LCD output by setting the `DISPC_CONTROLo[1]` `LCDENABLE` bit.

---

**Figure 10-86. RFBI Data Stall Signal Diagram**

dispc-081

To avoid an underflow of the DMA buffer, the DMA buffer handshake must be enabled by setting the `DISPC_CONFIGo[16]` `BUFFERHANDCHECK` bit. The fullness of the buffers associated to the pipelines used for the LCD output is checked before providing data to the pipeline when the STALL signal is inactive. It prevents emptying the DMA buffer when the RFBI or DSI module requests data and there is not enough data in the DMA buffer of the DISPC. This feature must be enabled only when stall mode is used (STALLMODE set to 0x1). When the DMA buffer handshake is activated, the pixel transfer to the RFBI or DSI module, outside a STALL period, can be stopped and restarted when there are enough data in the DMA buffer. The DMA buffer handshake ensures that the underflow does not occur for the pipelines associated with the LCD output when RFBI/DSI interfaces are used. The rate of the data transfer to the RFBI or DSI is, then, fully dependent on the state of the DMA buffer. [Figure 10-87](#) shows the RFBI data stall with FIFO handcheck mode activated.

**Figure 10-87. RFBI Data Stall Signal Diagram With Handcheck**

Stall mode is independently used when the RFBI or DSI protocol engines are connected to the LCD outputs and receive the pixels to reformat the data.

The STALL signals from the RFBI and DSI interfaces are merged into a single signal in the display subsystem. Only one signal for each LCD output is connected to the DISPC. [Figure 10-88](#) shows the STALL signal implementation.

One STALL signal is generated by the RFBI. The RFBI module asserts the stall signal when no more data must be output by the DISPC. It is deasserted to indicate when new data must be output by the DISPC.

Two STALL signals are generated by the DSI1 protocol engine IP. It is used by the DSI1 protocol engine when data are provided from the DISPC to the DSI1 protocol engine using the two video ports in command mode only. If one of the two video ports is in video mode, the STALL signal associated with the video port from the DSI1 protocol engine is not used (must be in INACTIVE state from the DSI1 protocol engine IP).

One STALL signal is generated by the DSI2 P\protocol engine IP. It is used by the DSI2 protocol engine when data are provided from the DISPC to the DSI2 protocol engine using the single video port in command mode only. If the video port is in video mode, the STALL signal associated with the video port from the DSI2 protocol engine is not used (must be in INACTIVE state from the DSI2 protocol engine IP).

**Figure 10-88. STALL Signal**

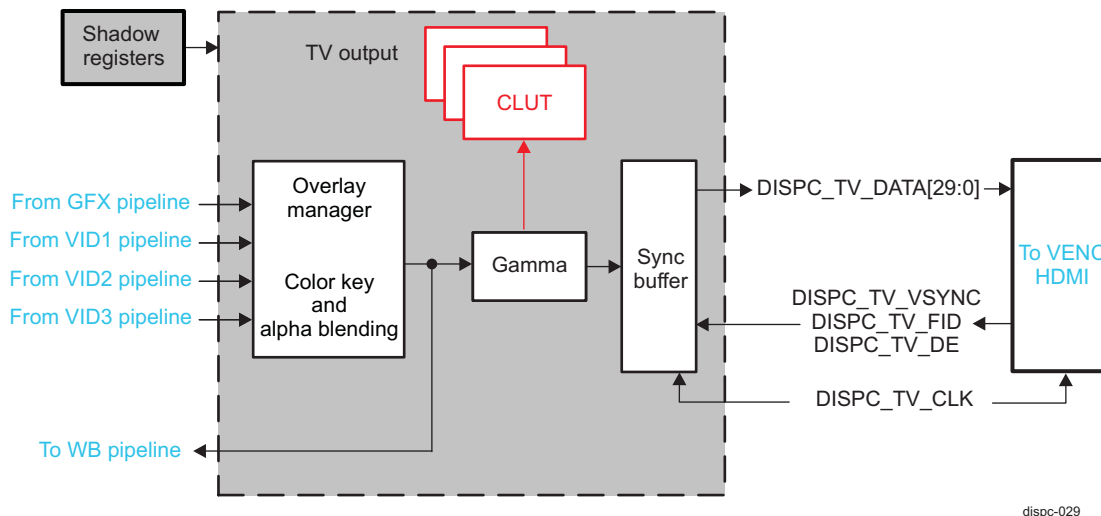

### 10.2.4.13 TV Output

The TV output paths consist of several processing blocks (see [Figure 10-89](#)):

- Overlay manager
- Gamma correction unit
- Synchronization buffer

Figure 10-89. TV Output Architecture

dispc-029

The TV output is connected to the VENC or HDMI. In analog output or HDMI, the DISPC TV output receives an external clock, DISPC\_TV\_CLK, and based on the VSYNC generated by the VENC or HDMI, hold time, vertical offset, and horizontal offset, outputs the pixels synchronously. The size of the field/frame to output defines the number of pixels to output on each line and the number of lines for each field/frame.

**NOTE:** The VDAC function is not supported.

#### 10.2.4.13.1 Overlay Manager

The overlay mechanism is identical in LCD1 and LCD2 (see [Section 10.2.4.12.1, Overlay Manager](#)).

#### 10.2.4.13.2 Gamma Correction Unit

The gamma correction unit works as described in [Section 10.2.4.12.2, Gamma Correction Unit](#). The only difference resides in the input pixel format RGB30. Each component of encoded pixel value is used as a pointer to index one out of 1024 30-bit gamma curve entries in the table. Each 10-bit component is replaced with the 10-bit table value corresponding to R, G, or B component. The table is loaded by software, through the DISPC\_GAMMA\_TABLE2 register. It is possible to load only part of the table. For each write access to the table, the 30-bit gamma value is associated with bit[31] INDEX to indicate that a new table is defined. Setting bit[31] INDEX to 0x1 for the first time, resets the internal index counter. All the following accesses are considered to be for incremented index addressing in the table (bit [31] INDEX set to 0 for each subsequent access). [Figure 10-90](#) shows the format of one of the gamma curve values in the memory.

Figure 10-90. Data Memory Organization for Gamma Mode in TV Output

dispc-084

#### 10.2.4.13.3 Synchronized Buffer Update

The synchronized buffer update is identical in LCD1 and LCD2 (see [Section 10.2.4.12.6, Synchronized Buffer Update](#)).

#### 10.2.4.13.4 Timing and TV Format Settings

[Figure 10-91](#) shows the TV formats supported.

Figure 10-91. TV Formats

dispc-061

The size of a TV output format is defined by:

- Number of lines, [DISPC\\_SIZE\\_TV\[26:16\]](#) LPP bit field, with a value from 1 to 2048
- Number of pixels per line, [DISPC\\_SIZE\\_TV\[10:0\]](#) PPL bit field, with a value from 1 to 2048
- Delta size between odd/even field, [DISPC\\_SIZE\\_TV\[15:14\]](#) DELTA\_LPP bit field. This bit field controls only the output channel and not the size of the data field fetched from the frame buffer in memory.

The hold time of the pixels on the data bus is determined in clock cycles by the [DISPC\\_CONTROL1\[19:17\]](#) HT bit field. The default value at reset time is 0x0 (one cycle).

- When connected to the video NTSC/PAL encoder in field mode, [Table 10-56](#) indicates the [DISPC\\_SIZE\\_TV](#) (PPL and LPP) value for each standard PAL and NTSC.

Table 10-55. PPL and LLP Value for TV Standard

Standards		Active Pixels/Line	Active Lines	Digital Clock	DISPC_SIZE_TV
ITU-R BT.601	NTSC(J, M, 4.43)	720	480	13.5 MHz	0x00EF02CF
	PAL(B, D, G, H, I, N)	720	576	13.5 MHz	0x011F02CF
	PAL(M)	720	480	13.5 MHz	0x00EF02CF
Square Pixel	NTSC(J, M, 4.43)	640	480	12.2727 MHz	0x00EF027F
	PAL(B, D, G, H, I, N)	768	576	14.75 MHz	0x011F02FF
	PAL(M)	640	480	12.2727 MHz	0x00EF027F

**NOTE:** The VDAC function is not supported.

- When connected to the HDMI encoder, [Table 10-56](#) indicates the [DISPC\\_SIZE\\_TV](#) (PPL and LPP) value for each HD standard.

**Table 10-56. PPL and LLP Value for HD Standard**

Standards		Active Pixels/Line	Active Lines	Digital Clock	DISPC_SIZE_TV
HD standard	720p	1280	720	74.25/74.125 MHz (60/59.99..frames/s)	0x02CF04FF
	1080i	1920	540	74.25/74.125 MHz (60/59.99..frames/s)	0x021B07FF
	1080p	1920	1080	148.5/148.25 MHz (60/59.99..frames/s)	0x043707FF

- When connected to the HDMI encoder, to output any of the 3D frame-packing formats (720p@50 Hz, 720p@ 60 Hz, and 1080p @24 Hz, as defined in the HDMI v1.4 specification) supported by the device, [Table 10-57](#) lists the [DISPC\\_SIZE\\_TV](#) (PPL and LPP) value for each 3D standard.

**Table 10-57. PPL and LLP Value for 3D Standard**

Standards		Active Pixels/Line	Active Lines	Digital Clock	DISPC_SIZE_TV
3D standard	720p	1280	1470	148.5 MHz (50; 60 frames/s)	5BD04FF
	1080p	1920	2205 <sup>(1)</sup>	148.5 MHz (24 frames/s)	9C0780

<sup>(1)</sup> See the following Note for information about configuring the 3D 1080p format.

**NOTE:** When configuring the DISPC for outputting any supported 3D frame-packing format, the following generic details must be considered:

- As defined by the HDMI v1.4 specification, Section 8.2.3.2, 3D frame-packing is a video format structure composed of two stereoscopic pictures: left and right.
- The stereoscopic pictures can be processed through the three video pipelines (VID1, VID2, or VID3). For more information about the configuration of video pipelines, see [Section 10.2.4.10, Video Pipelines](#).
- The 3D frame is generated by setting the TV overlay manager to combine the outputs of the selected video pipelines that hold the pictures. One video pipeline (VID1 or VID3) must carry the top field of the 3D frame (left stereoscopic picture), and the VID2 pipeline must always carry the bottom field of the frame (right stereoscopic picture). The top and bottom fields are separated by an active space area. For more information, see the HDMI v1.4 specification, Section 8.2.3.2.
- The pipeline carrying each field (top and bottom) of the 3D frame must have its height and width parameters defined in the [26:16] SIZEY and [10:0] SIZEX bit fields of DISPC\_VIDp\_SIZE register, and its Y and X positions defined in the [26:16] POSY and [10:0] POSX bit fields of the DISPC\_VIDp\_POSITION register. The active space area of the 3D frame can be encoded by setting the solid background color for the TV output ([DISPC\\_DEFAULT\\_COLOR1\[23:0\] DEFAULTCOLOR](#) bit field). For more information about the overlay mechanism, see [Section 10.2.4.13.1, Overlay Manager](#).
- If the 3D 1080p format must be output, the following specific settings must be applied:
  - [DISPC\\_VID2\\_ATTRIBUTES\[31:30\] CHANNELOUT2](#) bit-field = 0x2
  - [DISPC\\_SIZE\\_TV\[26:16\] LPP](#) bit-field = 0x9C

#### 10.2.4.14 Shadow Registers

Some DISPC registers are termed *shadow registers*. A shadow register change has no direct effect on the configuration of the DISPC. The registers are shadow registers to allow software to change the values of the registers at any time. When all the registers for a given configuration are into the registers, software must set 1 bit only in order to validate the configuration. When the hardware reaches the end of the current frame and sees that the bit field has been set by software, the new configuration is now the configuration used by the hardware.

The bits enabling the hardware to use the new configuration are:

- [DISPC\\_CONTROL1\[5\] GOLCD](#) bit for all the registers associated to the LCD1 output, and for all registers of WB and DMA, if the LCD1 channel is captured. The update of the registers of the WB and DMA is further delayed by the [DISPC\\_WB\\_ATTRIBUTES2\[7:0\] WBDELAYCOUNT](#) bit field or done

when the next frame is captured (the [DISPC\\_WB\\_ATTRIBUTES\[26:24\]](#) CAPTUREMODE bit field must be different from 0). The update of the registers occurs at the VFP start period.

- [DISPC\\_CONTROL1\[6\]](#) GOTV bit for all the registers associated to the TV output, and for all registers of WB and DMA, if the TV channel is captured. The update of the registers of the WB and DMA is further delayed by the [DISPC\\_WB\\_ATTRIBUTES2\[7:0\]](#) WBDELAYCOUNT bit field or done when the next frame is captured (the [DISPC\\_WB\\_ATTRIBUTES\[26:24\]](#) CAPTUREMODE bit field must be different from 0). The update of the registers occurs at the external EVSYNC.
- [DISPC\\_CONTROL2\[5\]](#) GOLCD bit for all the registers associated to the LCD2 output, and for all registers of WB and DMA, if the LCD2 channel is captured. The update of the registers of the WB and DMA is further delayed by the [DISPC\\_WB\\_ATTRIBUTES2\[7:0\]](#) WBDELAYCOUNT bit field or done when the next frame is captured (the [DISPC\\_WB\\_ATTRIBUTES\[26:24\]](#) CAPTUREMODE bit field must be different from 0). The update of the registers occurs at the VFP start period.
- [DISPC\\_WB\\_ATTRIBUTES\[0\]](#) ENABLE bit for all the registers associated to the WB, if the transfer memory-to-memory is not associated with a channel out.
- The [DISPC\\_CONTROL2\[6\]](#) GOWB bit and the [5]GOLCD and [6]GOTV bits in the [DISPC\\_CONTROL1/DISPC\\_CONTROL2](#) registers, combined with the synchronization event of the channel output selected for write back. This applies to all registers associated with the selected channel out and further delayed by the setting in the [DISPC\\_WB\\_ATTRIBUTES2\[7:0\]](#) WBDELAYCOUNT bit field for all registers of the write back and DMA. The GOWB bit is required to be set only in WB capture mode; it is not required when WB memory-to-memory mode is used.

---

**NOTE:** Before setting the GOLCD, GOTV, or GOWB bits, the user must ensure that the bits are cleared. The hardware resets the bit when the update completes.

---

[Table 10-58](#) lists the shadow registers. Registers that do not have a mark in any column are not shadowed.

**Table 10-58. Shadow Registers**

## 10.2.5 Display Controller Programming Guide

### 10.2.5.1 Display Controller Low-Level Programming Models

This section covers the low-level hardware programming sequences for the configuration and use of the module.

### 10.2.5.1.1 Global Initialization

#### 10.2.5.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the DISPC module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DISPC. See the DISPC Module Integration and Environment Sections for more information.

**Table 10-59. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	Module interface and functional clocks must be enabled. See <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Control Module	Module-specific pad muxing and configuration must be set in the control module. See <a href="#">Chapter 18, Control Module</a> .
MPU INTC or DSP INTC	MPU and/or DSP interrupt controller configuration must be done to enable the interrupts from DISPC module. See <a href="#">Chapter 17, Interrupt Controller</a> .
Interconnect	See <a href="#">Chapter 13, Interconnect</a> , for more information about the interconnect configuration.

### 10.2.5.1.2 Operational Modes Configuration

**Table 10-60. DISPC Configuration**

Step	Register / Bit Field / Programming Model
For a GFX pipeline configuration	
Configure the GFX DMA channel	Refer to <a href="#">Table 10-61</a>
Configure the GFX pipeline	Refer to <a href="#">Table 10-64</a>
Configure the LCD or TV output	For LCD output, refer to <a href="#">Table 10-82</a> For TV output, refer to <a href="#">Table 10-88</a>
For a Video pipeline configuration	
Configure the video DMA channel	Refer to <a href="#">Table 10-62</a>
Configure the video pipeline	Refer to <a href="#">Table 10-69</a>
Configure the LCD or TV output	For LCD output, refer to <a href="#">Table 10-82</a> For TV output, refer to <a href="#">Table 10-88</a>
For a WB pipeline configuration	
Configure the WB DMA channel	Refer to <a href="#">Table 10-63</a>
Configure the WB pipeline	For video pipelines, refer to <a href="#">Table 10-77</a>

#### 10.2.5.1.2.1 DMA Configuration

##### 10.2.5.1.2.1.1 Main Sequence - DISPC DMA Channel Configuration

This subsequence describes the parameters of the GFX, video, or WB DMA channel parameters.

**Table 10-61. Configure the GFX DMA Channel**

Step	Register / Bit Field / Programming Model	Value
Set the base address for RGB pixel format or BITMAP component format according to memory access type, rotation, mirroring (refer to section DMA)	DISPC_GFX_BA_j[31:0] BA	0x—
Set the rotation flag	DISPC_GFX_ATTRIBUTES[13:12] ROTATION	0x—
Set the number of bytes to increment at the end of the row	DISPC_GFX_ROW_INC[31:0] ROWINC	0x—
Set the number of bytes to increment between two pixels	DISPC_GFX_PIXEL_INC[7:0] PIXELINC	0x—
Determine the FIFO preload mode	DISPC_GFX_ATTRIBUTES[11] BUFPRELOAD	0x—
Set the preload value	DISPC_GFX_PRELOAD[11:0] PRELOAD	0x—
Determine the burst type	DISPC_GFX_ATTRIBUTES[29] BURSTTYPE	0x—
Set the burst size	DISPC_GFX_ATTRIBUTES[7:6] BURSTSIZE	0x—
Set the high level of DMA FIFO threshold	DISPC_GFX_BUF_THRESHOLD[31:16] BUFHIGHTRESHOLD	0x—
Set the low level of DMA FIFO threshold	DISPC_GFX_BUF_THRESHOLD[15:0] BUFLOWTRESHOLD	0x—
Enable Selfrefresh	DISPC_GFX_ATTRIBUTES[24] SELFREFRESH	0x—
Select priority over the other pipeline	DISPC_GFX_ATTRIBUTES[23] ARBITRATION	0x—

**Table 10-62. Configure the Video DMA Channel**

Step	Register / Bit Field / Programming Model	Value
Set the base address for RGB pixel format or Y component format according to memory access type, rotation, mirroring (refer to section DMA)	DISPC_VIDp_BA_j[31:0] BA	0x—

**Table 10-62. Configure the Video DMA Channel (continued)**

Step	Register / Bit Field / Programming Model	Value
Set the base address for Cb and Cr components according to memory access type, rotation, mirroring (refer to section DMA) <sup>(1)</sup>	DISPC_VIDp_BA_UV_j[31:0] BA	0x—
Set the rotation flag	DISPC_VIDp_ATTRIBUTES[13:12] ROTATION	0x—
Set the number of bytes to increment at the end of the row	DISPC_VIDp_ROW_INC[31:0] ROWINC	0x—
Set the number of bytes to increment between two pixels	DISPC_VIDp_PIXEL_INC[7:0] PIXELINC	0x—
Set the X original image size	DISPC_VIDp_PICTURE_SIZE[10:0] ORGSIZEX	0x—
Set the Y original image size	DISPC_VIDp_PICTURE_SIZE[26:16] ORGSIZEY	0x—
Determine the FIFO preload mode	DISPC_VIDp_ATTRIBUTES[19] BUFPRELOAD	0x—
Set the preload value	DISPC_VIDp_PRELOAD[11:0] PRELOAD	0x—
Determine the burst type	DISPC_VIDp_ATTRIBUTES[29] BURSTTYPE	0x—
Set the burst size	DISPC_VIDp_ATTRIBUTES[15:14] BURSTSIZE	0x—
Set the high level of DMA FIFO threshold	DISPC_VIDp_BUF_THRESHOLD[31:16] BUFHIGHTRESHOLD	0x—
Set the low level of DMA FIFO threshold	DISPC_VIDp_BUF_THRESHOLD[15:0] BUFLOWTRESHOLD	0x—
Enable Selfrefresh	DISPC_VIDp_ATTRIBUTES[24] SELFREFRESH	0x—
Select priority over the other pipeline	DISPC_VIDp_ATTRIBUTES[23] ARBITRATION	0x—

<sup>(1)</sup> Applicable only for YUV pixel format

**Table 10-63. Configure the WB DMA Channel**

Step	Register / Bit Field / Programming Model	Value
Set the base address for RGB pixel format or Y component format according to memory access type, rotation, mirroring (refer to section DMA)	DISPC_WB_BA_j[31:0] BA	0x—
Set the base address for Cb and Cr components according to memory access type, rotation, mirroring (refer to section DMA) <sup>(1)</sup>	DISPC_WB_BA_UV_j[31:0] BA	0x—
Set the stride of CbCr component <sup>(2)</sup>	DISPC_WB_ATTRIBUTES[22] DOUBLESTRIDE	0x—
Set the rotation flag	DISPC_WB_ATTRIBUTES[13:12] ROTATION	0x—
Set the number of bytes to increment at the end of the row	DISPC_WB_ROW_INC[31:0] ROWINC	0x—
Set the number of bytes to increment between two pixels	DISPC_WB_PIXEL_INC[7:0] PIXELINC	0x—
Set the X final image size in system memory	DISPC_WB_PICTURE_SIZE[10:0] ORGSIZEX	0x—
Set the Y final image size in system memory	DISPC_WB_PICTURE_SIZE[26:16] ORGSIZEY	0x—
Set the burst size	DISPC_WB_ATTRIBUTES[15:14] BURSTSIZE	0x—
Set the high level of DMA FIFO threshold	DISPC_WB_BUF_THRESHOLD[31:16] BUFHIGHTRESHOLD	0x—
Set the low level of DMA FIFO threshold	DISPC_WB_BUF_THRESHOLD[15:0] BUFLOWTRESHOLD	0x—
Select priority over the other pipeline	DISPC_WB_ATTRIBUTES[23] ARBITRATION	0x—

<sup>(1)</sup> Applicable only for YUV pixel format

<sup>(2)</sup> Applicable only for YUV pixel format

### 10.2.5.1.2.2 GFX Pipeline Configuration

#### 10.2.5.1.2.2.1 Main Sequence - Configure the GFX Pipeline

This procedure details the steps for a GFX pipeline configuration described in [Table 10-64](#)

**Table 10-64. Configure the GFX Pipeline**

Step	Register / Bit Field / Programming Model	Value
Configure the GFX Window	Refer to <a href="#">Table 10-65</a>	
Configure the GFX pipeline processing	Refer to <a href="#">Table 10-66</a>	
Configure the GFX pipeline layer output	Refer to <a href="#">Table 10-68</a>	
Validate the GFX configuration according to outputs associated to the pipeline	<a href="#">DISPC_CONTROL1</a> [5] GOLCD	
	<a href="#">DISPC_CONTROL2</a> [5] GOLCD	
	<a href="#">DISPC_CONTROL2</a> [6] GOWB	
	<a href="#">DISPC_CONTROL1</a> [6] GOTV	
Enable the GFX pipeline	<a href="#">DISPC_GFX_ATTRIBUTES</a> [0] ENABLE	0x1

#### 10.2.5.1.2.2.2 Subsequence - Configure the GFX Window

This subsequence describes the parameters of the image to be displayed on the LCD panel.

**Table 10-65. Configure the GFX Window**

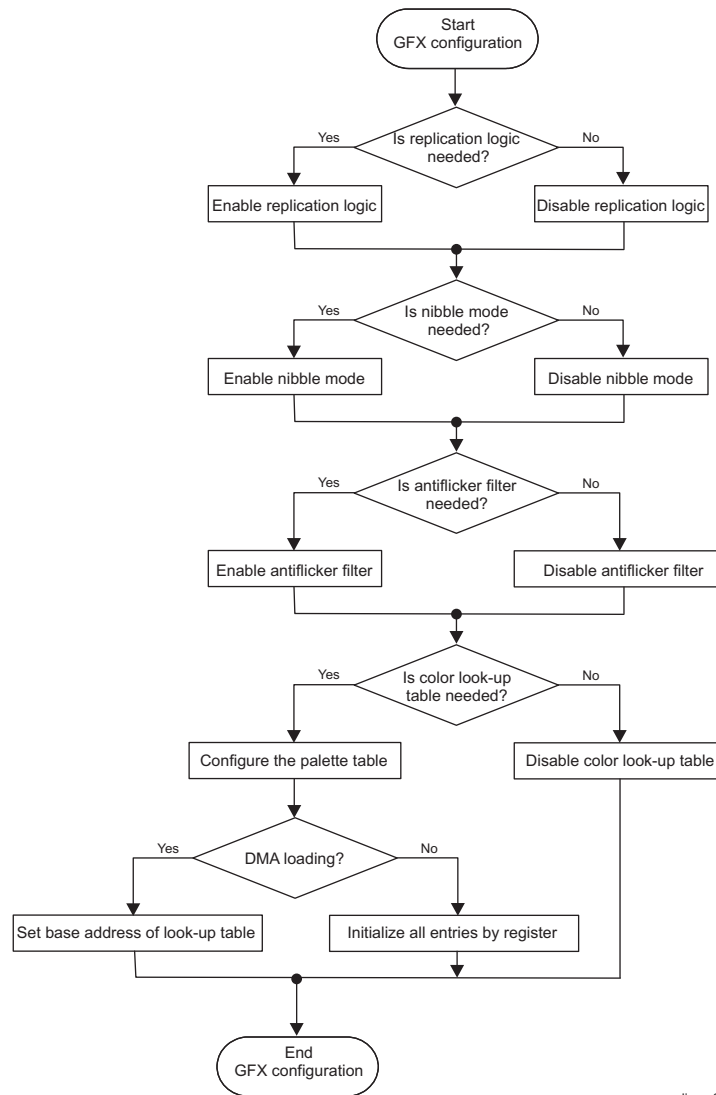

Step	Register / Bit Field / Programming Model	Value
Select the format of image	<a href="#">DISPC_GFX_ATTRIBUTES</a> [4:1] FORMAT	0x–
Set the X size of image to be displayed onto LCD panel	<a href="#">DISPC_GFX_SIZE</a> [10:0] SIZEX	0x–
Set the Y size of image to be displayed onto LCD panel	<a href="#">DISPC_GFX_SIZE</a> [26:16] SIZEY	0x–
Set the X position of image in respect to LCD panel	<a href="#">DISPC_GFX_POSITION</a> [10:0] POSX	0x–
Set the Y position of image in respect to LCD panel	<a href="#">DISPC_GFX_POSITION</a> [26:16] POSY	0x–

#### 10.2.5.1.2.2.3 Subsequence - Configure the GFX Pipeline Processing

**Table 10-66. Configure the GFX Pipeline Processing**

Step	Register / Bit Field / Programming Model	Value
Enable replication logic	<a href="#">DISPC_GFX_ATTRIBUTES</a> [5] REPLICATIONENABLE	0x1
Enable nibble mode	<a href="#">DISPC_GFX_ATTRIBUTES</a> [9] NIBBLEMODE	0x1
Enable anti flicker filter	<a href="#">DISPC_GFX_ATTRIBUTES</a> [24] ANTIFLICKER	0x1
Configure the palette table	Refer to <a href="#">Table 10-67</a>	0x–

Figure 10-92. Video Pipeline Processing Configuration

dispc-091

10.2.5.1.2.2.4 Subsequence - Configure the Palette Table

This subsequence resumes the settings for configuring the Color Look-Up table as palette for GFX pipeline,

NOTE:

- Software must ensure there is no visible effect when modifying the table since it is not under hardware control and the synchronization done using the DMA engine inside the DISPC to load the table when it is not used for displaying the picture on the screen is not present for this mode.
- If GFX pipeline is in BITMAP pixel format, gamma corrections is not available for LCD1.

Table 10-67. Configure the Palette Table

Step	Register / Bit Field / Programming Model	Value
Set look up table as palette table	DISPC_CONFIG1[3] PALETTEGAMMATALE	0x0
Select the load mode of the palette look-up table	DISPC_CONFIG1[2:1] LOADMODE	0x-

**Table 10-67. Configure the Palette Table (continued)**

Step	Register / Bit Field / Programming Model	Value
DMA loading		
Set base address of look-up table	DISPC_GFX_TABLE_BA[31:0] TABLEBA	0x–
Initialize all entries by register		
Initialize all entries for the palette table by setting the table index and the RGB values associated to this index	DISPC_GAMMA_TABLE0[31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B	0x–

#### 10.2.5.1.2.2.5 Subsequence - Configure the GFX Pipeline Layer Output

This subsequence resume the video layer settings available at the pipeline level necessary when using the overlay manager.

**Table 10-68. Configure the GFX Pipeline Layer Output**

Step	Register / Bit Field / Programming Model	Value
Set the LCD/TV output	DISPC_GFX_ATTRIBUTES[8] CHANNELOUT	0x–
If DISPC_GFX_ATTRIBUTES[8]=0, set the LCD output	DISPC_GFX_ATTRIBUTES[31:30] CHANNELOUT2	0x–
Set the Z-order priority of the layer for overlay manager	DISPC_GFX_ATTRIBUTES[27:26] ZORDER	0x–
Enable the video pipeline Z-order	DISPC_GFX_ATTRIBUTES[25] ZORDERENABLE	0x–
Set the Global Alpha value for the Alpha blender unit	DISPC_GLOBAL_ALPHA[7:0] GFXGLOBALALPHA	0x–

#### 10.2.5.1.2.3 Video Pipeline Configuration

##### 10.2.5.1.2.3.1 Main Sequence - Configure the Video Pipeline

This procedure details the steps for a video pipeline configuration described in [Table 10-69](#).

**Table 10-69. Configure the Video Pipeline**

Step	Register / Bit Field / Programming Model	Value
Configure the video window	Refer to <a href="#">Table 10-70</a>	
Configure the video pipeline processing	Refer to <a href="#">Table 10-71</a>	
Configure the video pipeline layer output	Refer to <a href="#">Table 10-76</a>	
Validate the video configuration according to outputs associated to the pipeline	DISPC_CONTROL1[5] GOLCD	
	DISPC_CONTROL2[5] GOLCD	
	DISPC_CONTROL2[6] GOWB	
	DISPC_CONTROL1[6] GOTV	
Enable video pipeline	DISPC_VIDp_ATTRIBUTES[0] ENABLE	0x1

##### 10.2.5.1.2.3.2 Subsequence - Configure the Video Window

This subsequence describes the parameters of the image to be displayed on the LCD panel.

**Table 10-70. Configure the Video Window**

Step	Register / Bit Field / Programming Model	Value
Select the format of image	DISPC_VIDp_ATTRIBUTES[4:1] FORMAT	0x–
Set the X size of image to be displayed onto LCD panel	DISPC_VIDp_SIZE[10:0] SIZEX	0x–

**Table 10-70. Configure the Video Window (continued)**

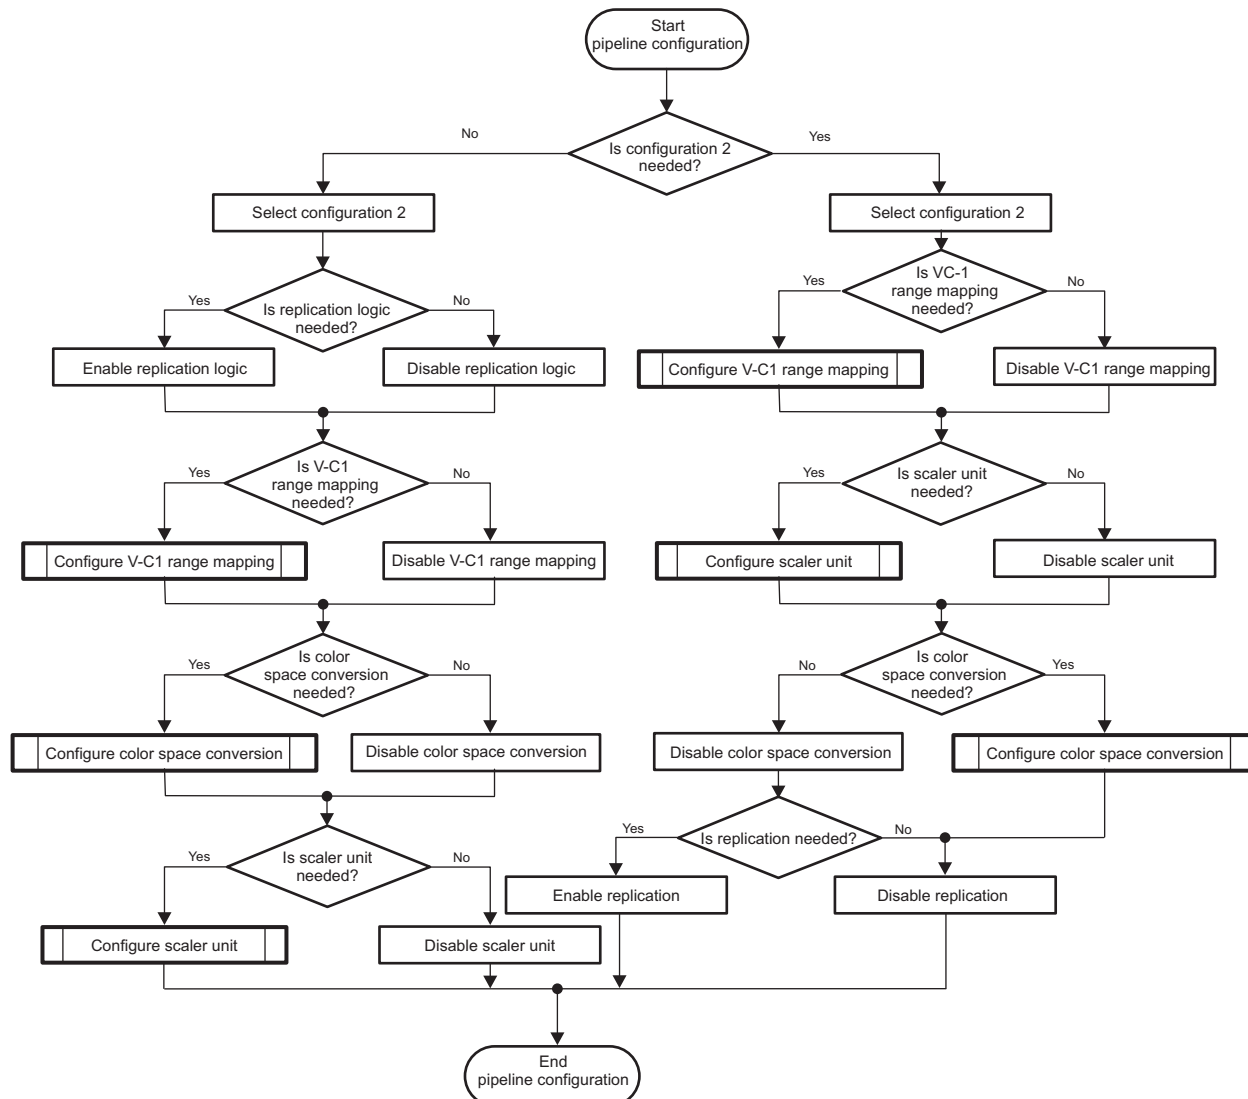

Step	Register / Bit Field / Programming Model	Value
Set the Y size of image to be displayed onto LCD panel	DISPC_VIDp_SIZE[10:0] SIZEY	0x–
Set the X position of image in respect to LCD panel	DISPC_VIDp_POSITION[10:0] POSX	0x–
Set the Y position of image in respect to LCD panel	DISPC_VIDp_POSITION[26:16] POSY	0x–

### 10.2.5.1.2.3.3 Subsequence - Configure the Video Pipeline Processing

**Table 10-71. Configure the Video Pipeline Processing**

Step	Register / Bit Field / Programming Model	Value
Select the video pipeline configuration 1 or 2	DISPC_VIDp_ATTRIBUTES2[8] YUVCHROMARESAMPLING	0x–
Enable/disable Replication Logic <sup>(1)</sup>	DISPC_VIDp_ATTRIBUTES[10] REPLICATIONENABLE	0x1
Configure the VC-1 range mapping <sup>(1)</sup>	Refer to <a href="#">Section 10.2.5.1.2.3.4</a>	
Configure the video Color Space Conversion <sup>(1)</sup>	Refer to <a href="#">Section 10.2.5.1.2.3.5</a>	
Configure the video Scaler Unit <sup>(1)</sup>	Refer to <a href="#">Section 10.2.5.1.2.3.6</a>	

- <sup>(1)</sup> This module configuration can be optional depending on:
- The video mode configuration selected, refer to [Figure 10-93](#)
  - The video format and application needs

**Figure 10-93. Video Pipeline Processing Configuration**

dispc-089

#### 10.2.5.1.2.3.4 Subsequence - Configure the VC-1 Range Mapping

**Table 10-72. Configure the VC-1 Range Mapping**

Step	Register / Bit Field / Programming Model	Value
Set the Y component VC-1 range mapping	DISPC_VIDp_ATTRIBUTES2[3:1] VC1_RANGE_Y	0x-
Set the Cb and Cr component VC-1 range mapping	DISPC_VIDp_ATTRIBUTES2[6:4] VC1_RANGE_CBCR	0x-
Enable VC-1 range mapping	DISPC_VIDp_ATTRIBUTES2[0] VC1ENABLE	0x1

#### 10.2.5.1.2.3.5 Subsequence - Configure the Video Color Space Conversion

**Table 10-73. Configure the Video Color Space Conversion**

Step	Register / Bit Field / Programming Model	Value
Select the range of the Color Space Conversion	DISPC_VIDp_ATTRIBUTES[11] FULLRANGE	0x–
Set the RCr and RY coefficients	DISPC_VIDp_CONV_COEF0[26:16][10:0] RCR, RY	0x–
Set the GY and RCB coefficients	DISPC_VIDp_CONV_COEF1[26:16][10:0] GY, RCB	0x–
Set the GCb and GCr coefficients	DISPC_VIDp_CONV_COEF2[26:16][10:0] GCB, GCR	0x–
Set the BCr and BY coefficients	DISPC_VIDp_CONV_COEF3[26:16][10:0] BCR, BY	0x–
Set the BCb coefficient	DISPC_VIDp_CONV_COEF4[10:0] BCB	0x–
Enable Color Space Conversion	DISPC_VIDp_ATTRIBUTES[9] COLORCONVENABLE	0x1

### 10.2.5.1.2.3.6 Subsequence - Configure the Video Scaler Unit

This subsequence configures the video scaler unit. [Table 10-74](#) is applicable for RGB pixel format. [Table 10-74](#) and [Table 10-75](#) are applicable for YUV pixel format.

**Table 10-74. Configure the Video Scaler Unit for RGB Pixel Formats or Y Component**

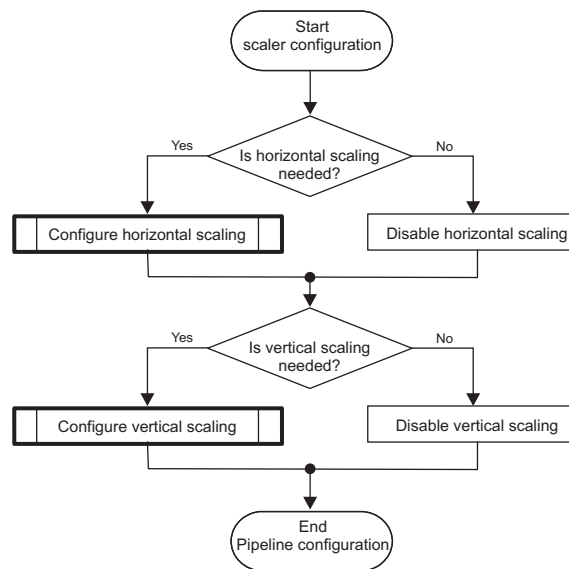

Step	Register / Bit Field / Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio	DISPC_VIDp_FIR[12:0] FIRHINC	0x–
Set the horizontal FIR coefficients	DISPC_VIDp_FIR_COEF_H_i[31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_VIDp_FIR_COEF_HV_i[7:0] FIRHC4	0x–
Set the horizontal accumulators value	DISPC_VIDp_ACCU_j[10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Select number of vertical taps	DISPC_VIDp_ATTRIBUTES[21] VERTICALTAPS	0x–
Set the vertical resizing ratio	DISPC_VIDp_FIR[28:16] FIRVINC	0x–
Set the vertical FIR coefficients for RGB pixel format or Y component	DISPC_VIDp_FIR_COEF_HV_i[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_VIDp_FIR_COEF_V_i[15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for RGB pixel format or Y component	DISPC_VIDp_ACCU_j[26:16] VERTICALACCU	0x–
Enable horizontal and vertical Scaler Unit	DISPC_VIDp_ATTRIBUTES[6:5] RESIZEENABLE	0x–

**Table 10-75. Configure the Video Scaler Unit for Cb and Cr Components**

Step	Register / Bit Field / Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio for Cb and Cr components	DISPC_VIDp_FIR2[12:0] FIRHINC	0x–
Set the horizontal FIR coefficients for Cb and Cr components	DISPC_VIDp_FIR_COEF_H2_i[31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_VIDp_FIR_COEF_HV2_i[7:0] FIRHC4	0x–
Set the horizontal accumulators value for Cb and Cr components	DISPC_VIDp_ACCU2_j[10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Set the vertical resizing ratio for Cb and Cr components	DISPC_VIDp_FIR2[28:16] FIRVINC	0x–

**Table 10-75. Configure the Video Scaler Unit for Cb and Cr Components (continued)**

Step	Register / Bit Field / Programming Model	Value
Set the vertical FIR coefficients for Cb and Cr components	DISPC_VIDp_FIR_COEF_HV2_i[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_VIDp_FIR_COEF_V2_i[15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for Cb and Cr components	DISPC_VIDp_ACCU2_j[26:16] VERTICALACCU	0x–

**Figure 10-94. Scaler Unit Programming Flow**

dispc-090

#### 10.2.5.1.2.3.7 Subsequence - Configure the Video Pipeline Layer Output

This subsequence resume the video layer settings available at the pipeline level necessary when using the overlay manager.

**Table 10-76. Configure the Video Pipeline Layer Output**

Step	Register / Bit Field / Programming Model	Value
Set the LCD/TV output	DISPC_VIDp_ATTRIBUTES[16] CHANNELOUT	0x–
If DISPC_VIDp_ATTRIBUTES[16]=0, set the LCD output	DISPC_VIDp_ATTRIBUTES[31:30] CHANNELOUT2	0x–
Set the Z-order priority of the layer for overlay manager	DISPC_VIDp_ATTRIBUTES[27:26] ZORDER	0x–
Enable the video pipeline Z-order	DISPC_VIDp_ATTRIBUTES[25] ZORDERENABLE	0x–
Set the Global Alpha value for the Alpha blender unit	DISPC_GLOBAL_ALPHA[31:24][23:16][15:8] VID3GLOBALALPHA, VID2GLOBALALPHA , VID1GLOBALALPHA	0x–

#### 10.2.5.1.2.4 WB Pipeline Configuration

##### 10.2.5.1.2.4.1 Main Sequence - Configure the WB Pipeline

This procedure details the steps for a WB pipeline configuration described in [Table 10-77](#).

**Table 10-77. Configure the WB Pipeline**

Step	Register / Bit Field / Programming Model	Value
Configure the Capture window	Refer to <a href="#">Table 10-78</a>	
Configure the WB Scaler unit	Refer to <a href="#">Table 10-79</a>	
Enable truncation logic to match pixel size defined in the format of image <a href="#">DISPC_WB_ATTRIBUTES</a> [4:1] FORMAT	<a href="#">DISPC_WB_ATTRIBUTES</a> [10] TRUNCATIONENABLE	0x–
if <a href="#">DISPC_WB_ATTRIBUTES</a> [10] != , Configure the WB Color Space Conversion unit	Refer to <a href="#">Table 10-81</a>	
Validate the configuration according to the registers modification. <sup>(1)</sup>	<a href="#">DISPC_CONTROL2</a> [6] GOWB	
Enable WB pipeline	<a href="#">DISPC_WB_ATTRIBUTES</a> [0] ENABLE	0x1

<sup>(1)</sup> Setting the GOWB bit is required only in WB capture mode; it is not required in WB memory-to-memory mode.

#### 10.2.5.1.2.4.2 Subsequence - Configure the Capture Window

This subsequence describes the parameters of the image to be captured in the system memory.

**Table 10-78. Configure the Capture Window**

Step	Register / Bit Field / Programming Model	Value
Set the input source	<a href="#">DISPC_WB_ATTRIBUTES</a> [18:16] CHANNELIN	0x–
Select the format of image	<a href="#">DISPC_WB_ATTRIBUTES</a> [4:1] FORMAT	0x–
Set the X size of image to be captured	<a href="#">DISPC_WB_SIZE</a> [10:0] SIZEX	0x–
Set the Y size of image to be captured	<a href="#">DISPC_WB_SIZE</a> [10:0] SIZEY	0x–

#### 10.2.5.1.2.4.3 Subsequence - Configure the WB Scaler Unit

This subsequence configures the scaler unit. [Table 10-74](#) is applicable for RGB pixel format. [Table 10-74](#) and [Table 10-75](#) are applicable for YUV pixel format.

**Table 10-79. Configure the WB Scaler Unit for RGB Pixel Formats or Y Component**

Step	Register / Bit Field / Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio	<a href="#">DISPC_WB_FIR</a> [12:0] FIRHINC	0x–
Set the horizontal FIR coefficients	<a href="#">DISPC_WB_FIR_COEF_H</a> [_i][31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	<a href="#">DISPC_WB_FIR_COEF_HV</a> [_i][7:0] FIRHC4	0x–
Set the horizontal accumulators value	<a href="#">DISPC_WB_ACCU</a> [_j][10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Select number of vertical taps	<a href="#">DISPC_WB_ATTRIBUTES</a> [21] VERTICALTAPS	0x–
Set the vertical resizing ratio	<a href="#">DISPC_WB_FIR</a> [28:16] FIRVINC	0x–
Set the vertical FIR coefficients for RGB pixel format or Y component	<a href="#">DISPC_WB_FIR_COEF_HV</a> [_i][31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: <a href="#">DISPC_WB_FIR_COEF_V</a> [_i][15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for RGB pixel format or Y component	<a href="#">DISPC_WB_ACCU</a> [_j][26:16] VERTICALACCU	0x–
Enable horizontal and vertical Scaler Unit	<a href="#">DISPC_WB_ATTRIBUTES</a> [6:5] RESIZEENABLE	0x–

**Table 10-80. Configure the WB Scaler Unit for Cb and Cr Components**

Step	Register / Bit Field / Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio for Cb and Cr components	DISPC_WB_FIR2[12:0] FIRHINC	0x–
Set the horizontal FIR coefficients for Cb and Cr components	DISPC_WB_FIR_COEF_H2_i[31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_WB_FIR_COEF_HV2_i[7:0] FIRHC4	0x–
Set the horizontal accumulators value for Cb and Cr components	DISPC_WB_ACCU2_j[10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Set the vertical resizing ratio for Cb and Cr components	DISPC_WB_FIR2[28:16] FIRVINC	0x–
Set the vertical FIR coefficients for Cb and Cr components	DISPC_WB_FIR_COEF_HV2_i[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_WB_FIR_COEF_V2_i[15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for Cb and Cr components	DISPC_WB_ACCU2_j[26:16] VERTICALACCU	0x–

#### 10.2.5.1.2.4.4 Subsequence - Configure the WB Color Space Conversion Unit

**Table 10-81. Configure the WB Color Space Conversion Unit**

Step	Register / Bit Field / Programming Model	Value
Select the range of the Color Space Conversion	DISPC_WB_ATTRIBUTES[11] FULLRANGE	0x–
Set the RCr and RY coefficients	DISPC_WB_CONV_COEF0[26:16][10:0] YG, YR	0x–
Set the GY and RCb coefficients	DISPC_WB_CONV_COEF1[26:16][10:0] CRR, YB	0x–
Set the GCb and GCr coefficients	DISPC_WB_CONV_COEF2[26:16][10:0] CRB, CRG	0x–
Set the BCr and BY coefficients	DISPC_WB_CONV_COEF3[26:16][10:0] CBG, CBR	0x–
Set the BCb coefficient	DISPC_WB_CONV_COEF4[10:0] CBB	0x–
Enable Color Space Conversion	DISPC_WB_ATTRIBUTES[9] COLORCONVENABLE	0x1

#### 10.2.5.1.2.5 LCD Output Configuration

##### 10.2.5.1.2.5.1 Main Sequence - Configure the LCD Output

This procedure details the LCD output configuration.

**Table 10-82. Configure the LCD Output**

Step	Register / Bit Field / Programming Model
Configure the LCD overlay manager	<a href="#">Table 10-83</a>
Configure the gamma table for gamma correction	<a href="#">Section 10.2.5.1.2.5.3</a>
Configure the Color Phase Rotation	<a href="#">Table 10-86</a>
Configure the LCD panel timings and parameters	<a href="#">Table 10-87</a>
Validate the LCD output configuration according	DISPC_CONTROL1[5] GOLCD
	DISPC_CONTROL2[5] GOLCD
Enable LCD output	DISPC_CONTROL1[0] LCDENABLE
	DISPC_CONTROL2[0] LCDENABLE

### 10.2.5.1.2.5.2 Subsequence - Configure the Overlay Manager

This subsequence resumes the overlay manager settings and transparency color key configuration.

**Table 10-83. Configure the LCD Overlay Manager**

Step	Register / Bit Field / Programming Model	Value
Set the LCD panel background color	DISPC_DEFAULT_COLORo[23:0] DEFAULTCOLOR	0x–
Enable/Disable overlay optimization	DISPC_CONTROLo[12] OVERLAYOPTIMIZATION	0x–
Enable the Alpha blender <sup>(1)</sup>	DISPC_CONFIG1[18] LCDALPHABLENDERENABLE	0x1
Configure the transparency color key		
Set source or destination transparency color key mode	DISPC_CONFIGo[11] TCKLCDSELECTION	0x–
Set the transparency color value	DISPC_TRANS_COLORo[23:0] TRANSCOLORKEY	0x–
Enable transparency color key mode	DISPC_CONFIGo[10] TCKLCDENABLE	0x–

<sup>(1)</sup> Backward compatibility with OMAP34xx only available for LCD1.

### 10.2.5.1.2.5.3 Subsequence - Configure the Gamma Table for Gamma Correction

This subsequence resumes the settings for configuring the gamma correction for LCD1, see [Table 10-84](#) and LCD2, see [Table 10-85](#).

**NOTE:**

- Software must ensure there is no visible effect when modifying the table because it is not under hardware control and the synchronization done using the DMA engine inside the DISPC to load the table when it is not used for displaying the picture on the screen is not present for this mode.
- If GFX pipeline is in BITMAP pixel format, gamma corrections is not available for LCD1.

**Table 10-84. Configure the Gamma Table for LCD1**

Step	Register / Bit Field / Programming Model	Value
Initialize all entries for the gamma table by setting the table index and the RGB values associated to this index	DISPC_GAMMA_TABLE0[31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B	0x–
Set look up table as gamma table	DISPC_CONFIG1[3] PALETTEGAMMatable	0x1
Select the load mode of the Gamma look-up table	DISPC_CONFIG1[2:1] LOADMODE	0x–

**Table 10-85. Configure the Gamma Table for LCD2**

Step	Register / Bit Field / Programming Model	Value
Enable Gamma table for LCD2 and TV	DISPC_CONFIG1[9] GAMATABLEENABLE	0x1
Initialize all entries for the gamma table by setting the table index and the RGB values associated to this index.	DISPC_GAMMA_TABLE1[31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B	0x–

### 10.2.5.1.2.5.4 Subsequence - Configure the Color Phase Rotation

[Table 10-86](#) resumes the settings for the Color Phase Rotation unit.

**Table 10-86. Configure the Color Phase Rotation**

Step	Register / Bit Field / Programming Model	Value
Set the Red coefficients	DISPC_CPRo_COEF_R [31:22][20:11][9:0] RR, RG, RB	0x–
Set the Green coefficients	DISPC_CPRo_COEF_G [31:22][20:11][9:0] GR, GG, GB	0x–

**Table 10-86. Configure the Color Phase Rotation (continued)**

Step	Register / Bit Field / Programming Model	Value
Set the Blue coefficients	DISPC_CPRo_COEF_B [31:22][20:11][9:0] BR, BG, BB	0x–
Disable Color Phase Rotation unit in RGB to YUV conversion	DISPC_CONFIGo[24] COLORCONVENABLE	0x0
Enable Color Phase Rotation unit	DISPC_CONFIGo[15] CPR	0x1

#### 10.2.5.1.2.5.5 Subsequence - Configure the LCD Panel Timings and Parameters

This subsequence resumes the setting for horizontal and vertical synchronization and also the signals polarity.

**Table 10-87. Configure the LCD Panel Timings and Parameters**

Step	Register / Bit Field / Programming Model	Value
Configure Spatial/Temporal Dithering		
Select Spatial/Temporal number of frames	DISPC_CONTROLo[31:30] SPATIALTEMPORALDITHERINGFRAMES	0x–
Enable Spatial/Temporal dithering	DISPC_CONTROLo[7] STDITHERENABLE	0x–
Configure AC-bias		
Configure the VSYNC, HSYNC and AC bias polarity	DISPC_POL_FREQo	0x–
Configure the gating of AC bias polarity	DISPC_CONFIGo[8] ACBIASGATED	0x–
Configure the AC bias polarity	DISPC_POL_FREQo[15] IEO	0x–
Set the AC bias frequency	DISPC_POL_FREQo[7:0] ACB	0x–
Set the number of AC bias transitions per interrupt	DISPC_POL_FREQo[11:8] ACBI	0x–
Configure the pixel clock		
Set the DISPC logic clock divisor	DISPC_DIVISORo[23:16] LCD	0x–
Set the pixel clock divisor	DISPC_DIVISORo[7:0] PCD	0x–
Configure the gating of Pixel clock	DISPC_CONFIGo[5] PIXELCLOCKGATED	0x–
Configure the data		
Set the pixel clock edge to drive data output	DISPC_POL_FREQo[14] IPC	0x–
Configure the gating of data output	DISPC_CONFIGo[4] PIXELDATAGATED	0x–
Set the data output mode	DISPC_CONFIGo[22] OUTPUTMODEENABLE	0x–
Configure the panel parameters		
Set the vertical TV size	DISPC_SIZE_LCDo[26:16] LPP	0x–
Set the horizontal TV size	DISPC_SIZE_LCDo[10:0] PPL	0x–
Set the panel type	DISPC_CONTROLo[3] STNTFT	0x–
Configure the refresh rate and horizontal and vertical parameters		
Set the vertical synchronization timing	DISPC_TIMING_Vo[31:20][19:8][7:0],VBP, VFP, VSW	0x–
Configure the VSYNC polarity	DISPC_POL_FREQo[12] IVS	0x–
Configure the gating of VSYNC	DISPC_CONFIGo[7] VSYNCGATED	0x–
Set the horizontal synchronization timing	DISPC_TIMING_Ho[31:20][19:8][7:0],HBP, HFP, HSW	0x–
Configure the HSYNC polarity	DISPC_POL_FREQo[13] IHS	0x–
Configure the gating of HSYNC	DISPC_CONFIGo[6] HSYNCGATED	0x–
Set the opposition of HSYNC and VSYNC driving	DISPC_POL_FREQo[17] ONOFF	0x–
If DISPC_POL_FREQo[17] = 1, set the pixel clock edge to drive HSYNC and VSYNC	DISPC_POL_FREQo[16] RF	0x–
Set the alignment of HSYNC and VSYNC	DISPC_POL_FREQo[18] ALIGN	0x–

### 10.2.5.1.2.6 TV Output Configuration

#### Main Sequence - Configure the TV Output

This procedure details the TV output configuration.

**Table 10-88. Configure the TV Output**

Step	Register / Bit Field / Programming Model
Configure the TV overlay manager	Refer to <a href="#">Table 10-89</a>
Configure the gamma table for gamma correction	Refer to <a href="#">Table 10-90</a>
Configure the TV panel timings and parameters	Refer to <a href="#">Table 10-91</a>
Validate the TV output configuration according	<a href="#">DISPC_CONTROL1[6]</a> GOTV
Enable TV output	<a href="#">DISPC_CONTROL1[1]</a> TVENABLE

#### 10.2.5.1.2.6.1 Subsequence - Configure the TV Overlay Manager

This subsequence resumes the overlay manager settings and transparency color key configuration.

**Table 10-89. Configure the TV Overlay Manager**

Step	Register / Bit Field / Programming Model	Value
Set the TV panel background color	<a href="#">DISPC_DEFAULT_COLOR1[23:0]</a> DEFAULTCOLOR	0x–
Enable/Disable overlay optimization	<a href="#">DISPC_CONTROL2[13]</a> TVOVERLAYOPTIMIZATION	0x–
Enable the Alpha blender <sup>(1)</sup>	<a href="#">DISPC_CONFIG1[19]</a> TVALPHABLENDERENABLE	0x1
Configure the transparency color key		
Set source or destination transparency color key mode	<a href="#">DISPC_CONFIG1[13]</a> TCKTVSELECTION	0x–
Set the transparency color value	<a href="#">DISPC_TRANS_COLOR1[23:0]</a> TRANSCOLORKEY	0x–
Enable transparency color key mode	<a href="#">DISPC_CONFIG1[10]</a> TCKTVENABLE	0x–

<sup>(1)</sup> Backward compatibility with OMAP34xx.

#### 10.2.5.1.2.6.2 Subsequence - Configure the Gamma Table for Gamma Correction

**NOTE:**

- Software must ensure there is no visible effect when modifying the table since it is not under hardware control and the synchronization done using the DMA engine inside the DISPC to load the table when it is not used for displaying the picture on the screen is not present for this mode.

**Table 10-90. Configure the Gamma Table for TV Output**

Step	Register / Bit Field / Programming Model	Value
Enable Gamma table for LCD2 and TV	<a href="#">DISPC_CONFIG1[9]</a> GAMATABLEENABLE	0x1
Initialize all entries for the gamma table by setting the table index and the RGB values. For more information, see <a href="#">Section 10.2.4.13.2, Gamma Correction Unit</a> .	<a href="#">DISPC_GAMMA_TABLE2[31][29:20][19:10][9:0]</a> , INDEX, VALUE_R, VALUE_G, VALUE_B	0x–

#### 10.2.5.1.2.6.3 Subsequence - Configure the TV Panel Timings and Parameters

This subsequence resumes the setting for horizontal and vertical synchronization and also the signals polarity.

**Table 10-91. Configure the TV Panel Timings and Parameters**

Step	Register / Bit Field / Programming Model	Value
Set the hold time for TV data outputs	DISPC_CONFIG1[19:17]	0x–
Set the vertical TV size	DISPC_SIZE_TV[26:16] LPP	See Table 10-92 for NTSC/PAL and HD standards
Set the horizontal TV size	DISPC_SIZE_TV[10:0] PPL	

**Table 10-92. DISPC\_SIZE\_TV Values NTSC/PAL and HD Standard**

Standards		Active Pixels/line (PPL)	Active Lines (LPP)	Digital clock (DISPC_CONTROL1. HT=0)	DISPC_SIZE_TV
ITU-R BT.601	NTSC(J, M, 4.43)	720	480	13.5 MHz	0x00EF02CF
	PAL(B, D, G, H, I, N)	720	576	13.5 MHz	0x011F02CF
	PAL(M)	720	480	13.5 MHz	0x00EF02CF
Square Pixel	NTSC(J, M, 4.43)	640	480	12.2727 MHz	0x00EF027F
	PAL(B, D, G, H, I, N)	768	576	14.75 MHz	0x011F02FF
	PAL(M)	640	480	12.2727 MHz	0x00EF027F
HDTV	720p	1280	720	74.25/74.125 MHz (60/59.99..frames/s)	0x02CF04FF
	1080i	1920	540	74.25/74.125 MHz (60/59.99..fields/s)	0x021B07FF
	1080p	1920	1080	148.5/148.25 MHz (60/59.99..frames/s)	0x043707FF

**NOTE:** The VDAC function is not supported.

## 10.2.6 Display Controller Use Cases and Tips

### 10.2.6.1 Hardware Cursor

The video layer or graphics layer can be used to display the hardware cursor. The encoded pixel data for the cursor image are in xRGB12-4444, ARGB16-4444, RGBx12-4444, RGBA16-4444, ARGB16-1555, RGB16-565, RGB24-888, xRGB24-88888, RGBA32-8888 or ARGB32-8888 formats if the source transparency color key is used; otherwise, any pixel format can be used for the cursor image considering the limitation in term of pixel supported by the pipeline used to display the cursor image. To display nonrectangle cursor, the transparency color key can be used or the alpha blending (pixel alpha blending); see Section 10.2.4.12.1.3. The global alpha blending can be used in addition to the transparency source color key to make some fading effect when the cursor (with a nonrectangle shape) appears and disappears on the screen. The image of the cursor can be stored totally inside the DMA buffer in order to use the self-refresh mode (see Section 10.2.4.6.6.2). In that case, the image is loaded once and then displayed without accessing the system memory for loading the image for each frame. This saves bandwidth on interconnect and memory.

## 10.2.7 Display Controller Register Manual

### CAUTION

The main access to all DISPC registers is through the L3 interconnect. The access through L4\_PER interconnect is provided for back software compatibility.

### 10.2.7.1 Display Controller Instance Summary

**Table 10-93. DISPC Instance Summary**

Module Name	L4_PER Base Address	L3 Base Address	Size
DISPC	0x4804 1000	0x5800 1000	4KB

### 10.2.7.2 Display Controller Logical Register Mapping

**Table 10-94. DISPC\_VIDp\_BA\_j Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_VID1_BA_j</a>	Base Address of Video Pipeline 1
<a href="#">DISPC_VID2_BA_j</a>	Base Address of Video Pipeline 2
<a href="#">DISPC_VID3_BA_j</a>	Base Address of Video Pipeline 3

**Table 10-95. DISPC\_VIDp\_BA\_UV\_j Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_VID1_BA_UV_j</a>	Base Address of UV components for Video Pipeline 1
<a href="#">DISPC_VID2_BA_UV_j</a>	Base Address of UV components for Video Pipeline 2
<a href="#">DISPC_VID3_BA_UV_j</a>	Base Address of UV components for Video Pipeline 3

**Table 10-137. DISPC\_SYSCONFIG**

<b>Address Offset</b>	0x0000 0010		
<b>Physical Address</b>	0x4804 1010 0x5800 1010	<b>Instance</b>	DISPC_PER_L4 DISPC_L3
<b>Description</b>	This register allows to control various parameters of the OCP interface.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																MIDLEMODE	RESERVED	CLOCKACTIVITY	RESERVED	WARMRESET	SIDLEMODE	ENWAKEUP	SOFTRESET	AUTOIDLE							

Bits	Field Name	Description	Type	Reset
31:14	RESERVED	Write 0s for future compatibility. Reads returns 0	R	0x00000
13:12	MIDLEMODE	Master interface power management, standby/wait control 0x0: Force-standby. MStandby is only asserted when the module is disabled. MStandby is only asserted when the module is disabled. 0x1: No-Standby: MStandby is never asserted. 0x2: Smart-Standby. MStandby is asserted based on the internal activity of the module 0x3: Reserved	RW	0x0
11:10	RESERVED	Write 0s for future compatibility. Reads returns 0	R	0x0

Bits	Field Name	Description	Type	Reset
9:8	CLOCKACTIVITY	<p>Clocks activity during wake up mode period</p> <p>0x0: OCP and Functional clocks can be switched off</p> <p>0x1: Functional clocks can be switched off and OCP clocks are maintained during wake up period</p> <p>0x2: OCP clocks can be switched off and Functional clocks are maintained during wake up period</p> <p>0x3: OCP and Functional clocks are maintained during wake up period</p>	RW	0x0
7:6	RESERVED	Write 0s for future compatibility. Reads returns 0	R	0x0
5	WARMRESET	<p>Warm reset. Set this bit to 1 triggers a module warm reset. The bit is automatically reset by the hardware. During reads, it always returns 0. The warm reset keep the configuration registers unchanged.</p> <p>0x0: Normal mode</p> <p>0x1: the warmreset is set</p>	RW	0
4:3	SIDLEMODE	<p>Slave interface power management, Idle req/ack control</p> <p>0x0: Force-idle. An idle request is acknowledged unconditionally</p> <p>0x1: No-idle. An idle request is never acknowledged</p> <p>0x2: Smart-idle. Acknowledgment to an idle request is given based on the internal activity of the module.</p> <p>0x3: Reserved</p>	RW	0x0
2	ENWAKEUP	<p>WakeUp feature control</p> <p>0x0: Wakeup is disabled</p> <p>0x1: Wakeup is enabled</p>	RW	0
1	SOFTRESET	<p>Software reset. Set this bit to 1 to trigger a module reset. The bit is automatically reset by the hardware. During reads, it always returns 0.</p> <p>0x0: Normal mode</p> <p>0x1: The module is reset</p>	RW	0
0	AUTOIDLE	<p>Internal OCP clock gating strategy</p> <p>0x0: OCP clock is free-running</p> <p>0x1: Automatic OCP L3 and L4 clocks gating strategy is applied, based on the OCP interface activity. Automatic functional clock gating is also applied to the functional clock based on the module activity (for instance DISPC_&lt;pipe&gt;_ATTRIBUTES.ENABLE)</p>	RW	1

RESERVED								WBUNCOMPLETEERROR_IRQ	WBUFFEROVERFLOW_IRQ	FRAMEDONETV_IRQ	FRAMEDONEWB_IRQ	FRAMEDONE2_IRQ	ACBIASCOUNTSTATUS2_IRQ	VID3BUFFERUNDERFLOW_IRQ	VID3ENDWINDOW_IRQ	VSYNC2_IRQ	SYNCLOST2_IRQ	WAKEUP_IRQ	SYNCLOSTTV_IRQ	SYNCLOST1_IRQ	VID2ENDWINDOW_IRQ	VID2BUFFERUNDERFLOW_IRQ	VID1ENDWINDOW_IRQ	VID1BUFFERUNDERFLOW_IRQ	OCERROR_IRQ	PALETTEGAMMALOADING_IRQ	GFXENDWINDOW_IRQ	GFXBUFFERUNDERFLOW_IRQ	PROGRAMMEDLINENUMBER_IRQ	ACBIASCOUNTSTATUS1_IRQ	EVSYNCOODD_IRQ	EVSYNCEVEN_IRQ	VSYNC1_IRQ	FRAMEDONE1_IRQ

Bits	Field Name	Description	Type	Reset
31:27	RESERVED	Write 0s for future compatibility. Reads returns 0	R	0x00
26	WBUNCOMPLETEER ROR_IRQ	Write-back DMA buffer is flushed before it is completely drained. In WB capture mode, if the new frame starts before the WB DMA buffers are fully drained (onto external memory), then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). This interrupt is an indication of that case and will trigger every frame.  0x0 READS: Event is false. 0x0 WRITES: Status bit unchanged. 0x1 READS: Event is true (Pending). 0x1 WRITES: Status bit is reset.	RW W1toClr	0
25	WBBUFFER OVERFLOW_IRQ	Write-back DMA Buffer Overflow. The DMA buffer is full.  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
24	FRAME DONETV_IRQ	Frame Done for the TV. The TV output has been disabled by user. All the data have been sent.  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
23	FRAME DONEWB_IRQ	Frame Done for the write-back channel. The write-back channel has output the frame. All the data of the frame have been sent to the memory. There is no pending data inside the DMA engine for the write-back channel to be transferred to memory. It is available only when the write-back pipeline transfers back to memory the output of one of the pipelines. In case of overlay capture, the interrupt is not generated and the user shall use the FrameDone for the corresponding captured output.  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
22	FRAME DONE2_IRQ	Frame Done for the secondary LCD. The secondary LCD output has been disabled by user. All the data have been sent.  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
21	ACBIASCOUNT STATUS2_IRQ	AC Bias Count Status for the secondary LCD  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
20	VID3BUFFER UNDERFLOW_IRQ	Video 3 DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses)  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
19	VID3END WINDOW_IRQ	The end of the video 3 Window has been reached. It is detected by the overlay manager when the full video 3 has been displayed.  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
18	VSYNC2_IRQ	Vertical Synchronization for the secondary LCD  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
17	SYNC LOST2_IRQ	Synchronization Lost on the secondary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the secondary LCD output.  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
16	WAKEUP_IRQ	Wake-up  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

## Display Controller

www.ti.com

Bits	Field Name	Description	Type	Reset
15	SYNCLOST TV_IRQ	Synchronization Lost on the TV output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the TV output.  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
14	SYNC LOST1_IRQ	Synchronization Lost on the primary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the primary LCD output.  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
13	VID2END WINDOW_IRQ	The end of the video 2 Window has been reached. It is detected by the overlay manager when the full video 2 has been displayed.  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
12	VID2BUFFER UNDERFLOW_IRQ	Video 2 DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses)  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
11	VID1END WINDOW_IRQ	The end of the video 1 Window has been reached. It is detected by the overlay manager when the full video 1 has been displayed.  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
10	VID1BUFFER UNDERFLOW_IRQ	Video 1 DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses)  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
9	OCPERROR_IRQ	OCP Error. L3 Interconnect has sent SResp=ERR.  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
8	PALETTEGAMMA LOADING_IRQ	Palette Gamma Loading status. The palette used as Color Look Up Table (CLUT) for the graphics BITMAP formats (1-, 2-, 4-, or 4-bpp) or as gamma table for the overlay output for the primary LCD output has been loaded successfully.  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
7	GFXEND WINDOW_IRQ	The end of the graphics Window has been reached. It is detected by the overlay manager when the full graphics has been displayed.  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
6	GFXBUFFER UNDERFLOW_IRQ	Graphics DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses)  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
5	PROGRAMMED LINENUMBER_IRQ	Programmed Line Number. It indicates that the scan of the primary LCD has reached the programmed user line number.  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
4	ACBIASCOUNT STATUS1_IRQ	AC Bias Count Status for the primary LCD  0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
3	EVSYNC_ODD_IRQ	VSYNC for odd field from the TV encoder (VENC or HDMI) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
2	EVSYNC_EVEN_IRQ	VSYNC for even field from the TV encoder (VENC or HDMI) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
1	VSYNC1_IRQ	Vertical Synchronization for the primary LCD. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
0	FRAME_DONE1_IRQ	Frame Done for the primary LCD. The primary LCD output has been disabled by user. All the data have been sent. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

26	WBUNCOMPLETEERR_OR_EN	The write back buffer has been flushed before it has been fully drained. Enable. 0x0: Interrupt is masked. 0x1: Interrupt is enabled.	RW	0

## Display Controller

www.ti.com

Bits	Field Name	Description	Type	Reset
25	WBBUFFER OVERFLOW_EN	Write-back DMA Buffer Overflow. The DMA buffer is full 0x0: WBBufferOverflow is masked 0x1: WBBufferOverflow generates an interrupt when it occurs	RW	0
24	FRAME DONETV_EN	Frame Done for the TV. The TV output has been disabled by user. All the data have been sent. 0x0: Frame Done for the TV output is masked 0x1: Frame Done for the TV output generates an interrupt when it occurs	RW	0
23	FRAME DONEYWB_EN	Frame Done for the write-back channel. The write-back channel has output the frame. All the data have been sent for the frame have been sent to the memory. There is no pending data inside the DMA engine for the write-back channel to be transferred to memory. 0x0: Frame Done for the write-back is masked 0x1: Frame Done for the write-back generates an interrupt when it occurs	RW	0
22	FRAME DONE2_EN	Frame Done for the secondary LCD. The secondary LCD output has been disabled by user. All the data have been sent. 0x0: Frame Done for the secondary LCD is masked 0x1: Frame Done for the secondary LCD generates an interrupt when it occurs	RW	0
21	ACBIASCOUNT STATUS2_EN	AC Bias Count Status for the secondary LCD 0x0: ACBiasCountStatus for the secondary LCD output is masked 0x1: ACBiasCountStatus for the secondary LCD output generates an interrupt when it occurs	RW	0
20	VID3BUFFER UNDERFLOW_EN	Video 3 DMA Buffer Underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: Vid3BufferUnderflow is masked 0x1: Vid3BufferUnderflow generates an interrupt when it occurs	RW	0
19	VID3END WINDOW_EN	The end of the video 3 Window has been reached. It is detected by the overlay manager when the full video 3 has been displayed. 0x0: Vid3EndWindow is masked 0x1: Vid3EndWindow generates an interrupt when it occurs	RW	0
18	VSYNC2_EN	Vertical Synchronization for the secondary LCD 0x0: VSYNC for the secondary LCD output is masked 0x1: VSYNC for the secondary LCD output generates an interrupt when it occurs	RW	0
17	SYNC LOST2_EN	Synchronization Lost on the secondary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the secondary LCD output. 0x0: Synchronization Lost on the secondary LCD output is masked 0x1: Synchronization Lost on the secondary LCD output generates an interrupt when it occurs	RW	0
16	WAKEUP_EN	Wake Up Mask 0x0: WakeUp is masked 0x1: WakeUp generates an interrupt when it occurs	RW	0
15	SYNC LOSTTV_EN	Synchronization Lost on the TV output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the TV output. 0x0: Synchronization Lost on the TV output is masked 0x1: Synchronization Lost on the TV output generates an interrupt when it occurs	RW	0
14	SYNC LOST1_EN	Synchronization Lost for the primary LCD 0x0: SyncLost for the primary LCD output is masked 0x1: SyncLost for the primary LCD output generates an interrupt when it occurs	RW	0

Bits	Field Name	Description	Type	Reset
13	VID2END WINDOW_EN	The end of the video 2 Window has been reached. It is detected by the overlay manager when the full video 2 has been displayed. 0x0: Vid2EndWindow is masked 0x1: Vid2EndWindow generates an interrupt when it occurs	RW	0
12	VID2BUFFER UNDERFLOW_EN	Video 2 DMA Buffer Underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: Vid2BufferUnderflow is masked 0x1: Vid2BufferUnderflow generates an interrupt when it occurs	RW	0
11	ENDVID1 WINDOW_EN	The end of the video 1 Window has been reached. It is detected by the overlay manager when the full video 1 has been displayed. 0x0: EndVid1Window is masked 0x1: EndVid1Window generates an interrupt when it occurs	RW	0
10	VID1BUFFER UNDERFLOW_EN	Video 1 DMA Buffer Underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: Vid1BufferUnderflow is masked 0x1: Vid1BufferUnderflow generates an interrupt when it occurs	RW	0
9	OCPERROR_EN	OCP Error. L3 Interconnect has sent SResp=ERR. 0x0: OCPErrror is masked 0x1: OCPErrror generates an interrupt when it occurs	RW	0
8	PALETTE GAMMA_EN	Palette Gamma Loading mask. The palette used as Color Look Up Table (CLUT) for the graphics BITMAP formats (1-, 2-, 4-, or 4-bpp) or as gamma table for the overlay output for the primary LCD output has been loaded successfully. 0x0: PaletteGamma is masked 0x1: PaletteGamma generates an interrupt when it occurs	RW	0
7	GFXEND WINDOW_EN	The end of the graphics Window has been reached. It is detected by the overlay manager when the full graphics has been displayed. 0x0: GfxEndWindow is masked 0x1: GfxEndWindow generates an interrupt when it occurs	RW	0
6	GFXBUFFER UNDERFLOW_EN	Graphics DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: GfxBufferUnderflow is masked 0x1: GfxBufferUnderflow generates an interrupt when it occurs	RW	0
5	PROGRAMMED LINENUMBER_EN	Programmed Line Number. It indicates that the scan of the primary LCD has reached the programmed user line number. 0x0: ProgrammedLineNumber is masked 0x1: ProgrammedLineNumber generates an interrupt when it occurs	RW	0
4	ACBIASCOUNT STATUS1_EN	AC Bias Count Status for the primary LCD 0x0: ACBiasCountStatus for the primary LCD output is masked 0x1: ACBiasCountStatus for the primary LCD output generates an interrupt when it occurs	RW	0
3	EVSYNC_ODD_EN	VSYNC for odd field from the TV encoder (VENC or HDMI) 0x0: EVSYNC_ODD for the TV output is masked 0x1: EVSYNC_ODD for the TV output generates an interrupt when it occurs	RW	0
2	EVSYNC_EVEN_EN	VSYNC for even field from the TV encoder (VENC or HDMI) 0x0: EVSYNC_EVEN for the TV output is masked 0x1: EVSYNC_EVEN for the TV output generates an interrupt when it occurs	RW	0

Bits	Field Name	Description	Type	Reset
1	VSYNC1_EN	Vertical Synchronization for the primary LCD. 0x0: VSYNC for the primary LCD output is masked 0x1: VSYNC for the primary LCD output generates an interrupt when it occurs	RW	0
0	FRAMEDONE_EN	Frame Done for the primary LCD. The primary LCD output has been disabled by user. All the data have been sent. 0x0: FrameDone for the primary LCD output is masked 0x1: FrameDone for the primary LCD output generates an interrupt when it occurs	RW	0

28	LCDENABLESIGNAL	Write 0s for future compatibility. Reads return 0.	R	0
27	PCKFREEENABLE	Write 0s for future compatibility. Reads return 0.	R	0

Bits	Field Name	Description	Type	Reset
26:25	TDMUNUSEDBITS	State of unused bits (TDM mode only) for the primary LCD output. wr: VFP start period of primary LCD  0x0: low level (0) 0x1: high level (1) 0x2: unchanged from previous state 0x3: reserved	RW	0x0
24:23	TDMCYCLEFORMAT	Cycle format (TDM mode only) for the primary LCD output wr: VFP start period of primary LCD  0x0: 1 cycle for 1 pixel 0x1: 2 cycles for 1 pixel 0x2: 3 cycles for 1 pixel 0x3: 3 cycles for 2 pixels	RW	0x0
22:21	TDMPARALLELMODE	Output Interface width (TDM mode only) for the primary LCD output wr: VFP start period of primary LCD  0x0: 8-bit parallel output interface selected 0x1: 9-bit parallel output interface selected 0x2: 12-bit parallel output interface selected 0x3: 16-bit parallel output interface selected	RW	0x0
20	TDMENABLE	Enable the multiple cycle format (TDM mode only used for TFT mode with the RFBI enable bit off) for the primary LCD output. wr: VFP start period of primary LCD  0x0: TDM disabled 0x1: TDM enabled	RW	0
19:17	HT	Hold Time for TV output wr: EVSYNC Encoded value (from 1 to 8) to specify the number of external digital clock periods to hold the data (programmed value = value minus 1)	RW	0x0
16	GPOUT1	General Purpose Output Signal wr:immediate  0x0: The GPout1 is reset 0x1: The GPout1 is set	RW	0
15	GPOUT0	General Purpose Output Signal wr:immediate  0x0: The GPout0 is reset 0x1: The GPout0 is set	RW	0
14	GPIN1	General Purpose Input Signal wr: immediately Read 0x0: The GPin1 has been reset Read 0x1: The GPin1 has been set	R	0
13	GPIN0	General Purpose Input Signal wr: immediately Read 0x0: The GPin0 has been reset Read 0x1: The GPin0 has been set	R	0
12	OVERLAYOPTIMIZATION	Overlay Optimization for the primary LCD output wr: VFP start period of the primary LCD  0x0: All the data for all the enabled pipelines are fetched from memory regardless of the overlay/alpha blending configuration. 0x1: The data not used by the overlay manager because of overlap between layers with no alpha blending between them shall not be fetched from memory in order to optimize the bandwidth.	RW	0
11	STALLMODE	STALL Mode for the primary LCD output wr: VFP start period of primary LCD  0x0: Normal mode selected 0x1: STALL mode selected. The Display Controller sends the data without considering the VSYNC/HSYNC. The LCD output is disabled at the end of the transfer of the frame. The S/W has to re-enable the LCD output in order to generate a new frame. The stall mode is used in RFBI and DSI command modes.	RW	0

## Display Controller

www.ti.com

Bits	Field Name	Description	Type	Reset
10	RESERVED	Reserved	R	0
9:8	TFTDATALINES	Number of lines of the primary LCD interface wr: VFP start period of primary LCD  0x0: 12-bit output aligned on the LSB of the pixel data interface 0x1: 16-bit output aligned on the LSB of the pixel data interface 0x2: 18-bit output aligned on the LSB of the pixel data interface 0x3: 24-bit output aligned on the LSB of the pixel data interface	RW	0x0
7	STDITHERENABLE	Spatial Temporal dithering enable for the primary LCD output wr: VFP start period of primary LCD  0x0: Spatial/Temporal dithering logic disabled 0x1: Spatial/Temporal dithering logic enabled	RW	0
6	GOTV	GO Command for the TV output. It is used to synchronized the pipelines (graphics and/or video ones) associated with the TV output. wr: immediate  0x0: The hardware has finished updating the internal shadow registers of the pipeline(s) associated with the TV output using the user values. The hardware resets the bit when the update is completed.  0x1: The user has finished to program the shadow registers of the pipeline(s) associated with the TV output and the hardware can update the internal registers at the external VSYNC.	RW	0
5	GOLCD	GO Command for the primary LCD output. It is used to synchronized the pipelines (graphics and/or video ones) associated with the primary LCD output. wr: immediate  0x0: The hardware has finished updating the internal shadow registers of the pipeline(s) connected to the LCD output using the user values. The hardware resets the bit when the update is completed.  0x1: The user has finished to program the shadow registers of the pipeline(s) associated with the LCD output and the hardware can update the internal registers at the VFP start period	RW	0
4	M8B	Mono 8-bit mode of the primary LCD wr: VFP start period of primary LCD output  0x0: Pixel data [3:0] is used to output four pixel values to the panel at each pixel clock transition. (only in Passive Mono 4-bit mode).  0x1: Pixel data [7:0] is used to output eight pixel values to the panel each pixel clock transition. (only in Passive Mono 8-bit mode).	RW	0
3	STNTFT	LCD Display type of the primary LCD wr: VFP start period of primary LCD output  0x0: Passive or STN display operation enabled. STN dither logic is enabled.  0x1: Active or TFT display operation enabled. STN Dither logic and output FIFO bypassed.	RW	0
2	MONOCOLOR	Monochrome/Color selection for the primary LCD wr: VFP start period of primary LCD output  0x0: Color operation enabled (STN mode only) 0x1: Monochrome operation enabled (STN mode only)	RW	0
1	TVENABLE	Enable the TV output wr: immediate effect only occurs at the end of the current frame.  0x0: TV output disabled (at the end of the current field if interlace output when the bit is reset) 0x1: TV output enabled	RW	0
0	LCDENABLE	Enable the primary LCD outputs wr: immediate Effect only occurs at the end of the current frame  0x0: LCD output disabled (at the end of the frame when the bit is reset) 0x1: LCD output enabled	RW	0

Bits	Field Name	Description	Type	Reset
31:26	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x00
25	FULLRANGE	Color Space Conversion full range setting. wr: VFP start of primary LCD 0x0: Limited range selected. 0x1: Full range selected.	RW	0
24	COLORCONV ENABLE	Enable the color space conversion. It shall be reset when CPR bit field is set to 0x1. wr: VFP start of primary LCD 0x0: Disable Color Space Conversion RGB to YUV 0x1: Enable Color Space Conversion RGB to YUV	RW	0
23	FIDFIRST	Selects the first field to output in case of interlace mode. In case of progressive mode, the value is not used. wr: VFP start of primary LCD 0x0: First field is even. 0x1: Odd field is first.	RW	0
22	OUTPUTMODE ENABLE	Selects between progressive and interlace mode for the primary LCD output. wr: VFP start of primary LCD 0x0: Progressive mode selected. 0x1: Interlace mode selected.	RW	0

Bits	Field Name	Description	Type	Reset
21:20	RESERVED	Write 0s for future compatibility. Reads return 0.	RW	0
19	TVALPHABLENDER ENABLE	<p>Selects the alpha blender overlay manager for the TV output instead of the color key alpha blender (LCD output). The bit field is deprecated. It is present for software backward compatibility only. When it is enabled, the Z-order defined in each ATTRIBUTES registers for only the pipelines associated pipeline connected to the TV output are invalid and replaced by the following: graphics z-order = 3, video3 z-order = 2, video2 z-order = 1 and video1 z-order=0 If it disabled, the z-order and z-order enable bit fields defined in each ATTRIBUTES register are used. wr: EVSYNC start of primary LCD</p> <p>0x0: Alpha blender is disabled. 0x1: The alpha blender is enabled.</p>	RW	0
18	LCDALPHABLENDER ENABLE	<p>Selects the alpha blender overlay manager for the primary LCD output instead of the color key alpha blender (LCD output). The bit field is deprecated. It is present for software backward compatibility only. When it is enabled, the Z-order defined in each ATTRIBUTES registers for only the pipelines associated with the primary LCD output are invalid and replaced by the following: graphics z-order = 3, video3 z-order = 2, video2 z-order = 1 and video1 z-order=0 If it disabled, the z-order and z-order enable bit fields defined in each ATTRIBUTES register are used. wr: VFP start of primary LCD</p> <p>0x0: Alpha blender is disabled. The color key alpha blending is used. 0x1: The alpha blender is enabled.</p>	RW	0
17	BUFFERFILLING	<p>Controls if the DMA buffers are refilled only when the LOW threshold is reached or if all DMA buffers are refilled when at least one of them reaches the LOW threshold. wr: immediate</p> <p>0x0: Each DMA buffer is refilled when it reaches LOW threshold. 0x1: All DMA buffers are refilled up to high threshold when at least one of them reaches the LOW threshold. (only active DMA buffers shall be considered and when reaching the end of the frame the DMA buffer goes to empty condition so no need to fill it again).</p>	RW	0
16	BUFFERHAND CHECK	<p>Controls the handcheck between DMA buffer and STALL signal in order to prevent from underflow. The bit shall be set to 0 when the module is not in STALL mode. (primary LCD output) wr: VFP start of primary LCD</p> <p>0x0: Only the STALL signal (generated by RFBI, DSI1 or DSI2 depending on which IP uses the LCD output) is used regardless of the DMA buffer fullness information in order to provide data to the RFBI,DSI1 or DS2 module. 0x1: The STALL signal (generated by RFBI, DSI1 or DSI2 depending on which IP uses the LCD output) is used in combination with the DMA buffer fullness information in order to provide data to the RFBI, DSI1 or DSI2 module only when it does not generated buffer underflow.</p>	RW	0
15	CPR	<p>Color Phase Rotation Control (primary LCD output). It shall be reset when ColorConvEnable bit field is set to 1 wr: VFP start period of primary LCD output</p> <p>0x0: Color Phase Rotation Disabled 0x1: Color Phase Rotation Enabled</p>	RW	0
14	BUFFERMERGE	<p>Buffer merge control wr: EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory or VFP When enabled, the <a href="#">DISPC_GLOBAL_BUFFER</a> register is ignored. This bit must be set to zero when the write back channel is used. When <a href="#">DISPC_CONTROL2.GOWB</a> is used BUFFERMERGE MUST be zero. When <a href="#">DISPC_CONTROL2.GOWB</a> is used BUFFERMERGE MUST be zero. wr: immediate</p> <p>0x0: DMA buffer merge disabled Each DMA buffer is dedicated to one pipeline. 0x1: DMA buffer merge enabled All the DMA buffers are merged into a single one to be used by the single active pipeline.</p>	RW	0

Bits	Field Name	Description	Type	Reset
13	TCKTV SELECTION	Transparency Color Key Selection (TV output) wr: EVSYNC 0x0: Destination transparency color key selected 0x1: Source transparency color key selected	RW	0
12	TCKTVENABLE	Transparency Color Key Enabled (TV output) wr: EVSYNC 0x0: Disable the transparency color key for the TV output 0x1: Enable the transparency color key for the TV output	RW	0
11	TCKLCD SELECTION	Transparency Color Key Selection (primary LCD output) wr: VFP start period of primary LCD output 0x0: Destination transparency color key selected 0x1: Source transparency color key selected	RW	0
10	TCKLCDENABLE	Transparency Color Key Enabled (primary LCD output) wr: VFP start period of primary LCD output 0x0: Disable the transparency color key for the LCD 0x1: Enable the transparency color key for the LCD	RW	0
9	GAMATABLE ENABLE	For backward compatibility, an enable bit has been added on the 2 additional gamma tables (secondary display and TV). Gamma table of LCD1 is always enabled. 0x0: Gamma table LDC2 and TV are bypassed 0x1: Gamma table LCD2 and TV are enabled	RW	0
8	ACBIASGATED	ACBias Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output 0x0: ACBias Gated Disabled 0x1: ACBias Gated Enabled	RW	0
7	VSYNCGATED	VSYNC Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output 0x0: VSYNC Gated Disabled 0x1: VSYNC Gated Enabled	RW	0

Bits	Field Name	Description	Type	Reset
31:20	HBP	Horizontal Back Porch. Encoded value (from 1 to 4096) to specify the number of pixel clock periods to add to the beginning of a line transmission before the first set of pixels is output to the display (program to value minus 1). When in BT mode and interlaced, this field corresponds to the vertical field blanking No 2 for Even Field.	RW	0x000
19:8	HFP	Horizontal front porch. Encoded value (from 1 to 4096) to specify the number of pixel clock periods to add to the end of a line transmission before line clock is asserted (program to value minus 1). When in BT mode and interlaced, this field corresponds to the vertical field blanking No 1 for Even Field.	RW	0x000
7:0	HSW	Horizontal synchronization pulse width Encoded value (from 1 to 256) to specify the number of pixel clock periods to pulse the line clock at the end of each line (program to value minus 1). When in BT mode, this field corresponds to the horizontal blanking	RW	0x00

CHANNELOUT2	BURSTTYPE	PREMULTIPLYALPHA	ZORDER	ZORDERENABLE	ANTIFLICKER	RESERVED						SELFREFRESHAUTO	RESERVED	SELFREFRESH	ARBITRATION	ROTATION	BUFPRELOAD	RESERVED	NIBBLEMODE	CHANNELOUT	BURSTSIZE	REPLICATIONENABLE	FORMAT			ENABLE					

Bits	Field Name	Description	Type	Reset
31:30	CHANNELOUT2	It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (should set to zero) wr: immediate  0x0: primary LCD output selected. 0x1: Secondary LCD output selected. 0x3: Write-back output to the memory selected.	RW	0x0
29	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. (It does not apply to the palette loading OCP requests using INCR burst only)  0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
28	PREMULTIPLYALPHA	The field configures the DISPC GFX to process incoming data as pre-multiplied alpha data or non pre-multiplied alpha data. Default setting is non pre-multiplied alpha data.  0x0: Non pre-multiplied alpha data color component 0x1: Pre-multiplied alpha data color component	RW	0

Bits	Field Name	Description	Type	Reset
27:26	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0.  0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values.  0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3  0x3: Z-order 3: layer above all the other layers  0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3	RW	0x0
25	ZORDERENABLE	Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled.  0x0: Z-order disabled. The Z-order of the layer is 0.  0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).	RW	0
24	ANTIFLICKER	Antiflicker filtering using a 3-tap filter with hardcoded coefficients (1/4, 1/2, 1/4)  0x0: Antiflicker disabled.  0x1: Antiflicker enabled.	RW	0
23:18	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x00
17	SELFREFRESHAUTO	Automatic self-refresh mode  0x0: The transition from Selfrefresh "disabled" to "enabled" is controlled by software  0x1: The transition from Selfrefresh "disabled" to "enabled" is controlled only by hardware	RW	0
16	RESERVED		R	0
15	SELFREFRESH	Enables the self refresh of the graphics window from its own DMA buffer. This bit should be set only after having set the GO bit of the channel and read back a zero in its field.  0x0: The graphics pipeline accesses the interconnect to fetch data from the system memory.  0x1: The graphics pipeline does not need anymore to fetch data from memory. Only the graphics DMA buffer is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0
14	ARBITRATION	Determines the priority of the graphics pipeline. When the graphics pipeline is one of the high priority pipelines. The arbitration wheel gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them.  0x0: The graphics pipeline is one of the normal priority pipeline.  0x1: The graphics pipeline is one of the high priority pipeline.	RW	0
13:12	ROTATION	Graphics Rotation Flag  0x0: No rotation  0x1: Rotation by 90 degrees  0x3: Rotation by 270 degrees  0x2: Rotation by 180 degrees	RW	0x0

## Display Controller

<b>Physical Address</b>	0x4804 10C8 0x5800 10C8	<b>Instance</b>	DISPC_PER_L4 DISPC_L3
<b>Description</b>	The register configures the size of the video window 1. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when <a href="#">DISPC_CONTROL2</a> .GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								SIZEY								RESERVED								SIZEX							

Bits	Field Name	Description	Type	Reset
31:27	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x00
26:16	SIZEY	Number of lines of the video 1 Encoded value (from 1 to 2048) to specify the number of lines of the video window 1. Program to value minus 1.	RW	0x000
15:11	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x00
10:0	SIZEX	Number of pixels of the video window 1 Encoded value (from 1 to 2048) to specify the number of pixels of the video window 1. Program to value minus 1.	RW	0x000

Bits	Field Name	Description	Type	Reset
27:26	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0.  0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values.  0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3  0x3: Z-order 3: layer above all the other layers  0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3	RW	0x0
25	ZORDERENABLE	Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled.  0x0: Z-order disabled. The Z-order of the layer is 0.  0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).	RW	0
24	SELFREFRESH	Enables the self refresh of the video window from its own DMA buffer only.  0x0: The video pipeline accesses the interconnect to fetch data from the system memory.  0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video1 is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0
23	ARBITRATION	Determines the priority of the video pipeline. The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them.  0x0: The video pipeline is one of the normal priority pipeline.  0x1: The video pipeline is one of the high priority pipeline.	RW	0
22	DOUBLESTRIDE	Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0.  0x0: The CbCr stride value is equal to the Y stride.  0x1: The CbCr stride value is double to the Y stride.	RW	0
21	VERTICALTAPS	Video Vertical Resize Tap Number. The vertical polyphase filter can be configured in 3-tap or 5-tap configuration. According to the number of taps, the maximum input picture width is double while using 3-tap compared to 5-tap.  0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. The associated bit fields for the 2 other taps coefficients do not need to be initialized.  0x1: 5 taps are used for the vertical filtering logic.	RW	0
20	DMAOPTIMIZATION	Write 0s for future compatibility. Reads return 0.	R	0
19	BUFPRELOAD	Video Preload Value  0x0: Hardware prefetches pixels up to the preload value defined in the preload register  0x1: Hardware prefetches pixels up to high threshold value	RW	0
18	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0

## Display Controller

www.ti.com

Bits	Field Name	Description	Type	Reset
17	SELFREFRESHAUTO	Automatic self-refresh mode  0x0: The transition from SELFREFRESH "disabled" to "enabled" is controlled by SW.  0x1: The transition from SELFREFRESH "disabled" to "enabled" is controlled only by hardware.	RW	0
16	CHANNELOUT	Video Channel Out configuration: LCD, WB or TV. wr: immediate  0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back).  0x1: TV output selected	RW	0
15:14	BURSTSIZE	Video DMA Burst Size  0x0: 2x128bit bursts  0x1: 4x128bit bursts  0x3: Reserved  0x2: 8x128bit bursts	RW	0x2
13:12	ROTATION	Video Rotation Flag  0x0: No rotation  0x1: Rotation by 90 degrees  0x3: Rotation by 270 degrees  0x2: Rotation by 180 degrees	RW	0x0
11	FULLRANGE	Color Space Conversion full range setting.  0x0: Limited range selected: 16 subtracted from Y before color space conversion  0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	REPLICATIONENABLE	Replication Enable  0x0: Disable Video replication logic  0x1: Enable Video replication logic	RW	1
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV.  0x0: Disable Color Space Conversion YUV to RGB  0x1: Enable Color Space Conversion YUV to RGB	RW	0
8	VRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
7	HRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
6:5	RESIZEENABLE	Video Resize Enable  0x0: Disable both horizontal and vertical resize processing  0x1: Enable the horizontal resize processing  0x3: Enable both horizontal and vertical resize processing  0x2: Enable the vertical resize processing	RW	0x0

Bits	Field Name	Description	Type	Reset
4:1	FORMAT	Video Format. It defines the pixel format when fetching the video 1 picture into memory.  0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444  0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	Video Enable  0x0: Video disabled (video pipeline inactive and window not present) 0x1: Video enabled (video pipeline active and window present on the screen)	RW	0

**Table 10-205. DISPC\_VID1\_ROW\_INC**

<b>Address Offset</b>	0x0000 00D8	<b>Instance</b>	DISPC_PER_L4 DISPC_L3
<b>Physical Address</b>	<a href="#">0x4804 10D8</a> <a href="#">0x5800 10D8</a>		
<b>Description</b>	The register configures the number of bytes to increment at the end of the row for the buffer associated with the video window 1. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ROWINC																															

Bits	Field Name	Description	Type	Reset
31:0	ROWINC	Number of bytes to increment at the end of the row Encoded signed value (from $2^{31}1$ to $2^{31}$ ) to specify the number of bytes to increment at the end of the row in the video buffer. The value 0 is invalid. The value 1 means next pixel. The value $1 + n * \text{bpp}$ means increment of n pixels. The value $1 (n + 1) * \text{bpp}$ means decrement of n pixels.	RW	0x0000 0001

<b>Address Offset</b>	0x0000 00DC	
<b>Physical Address</b>	0x4804 10DC 0x5800 10DC	<b>Instance</b> DISPC_PER_L4 DISPC_L3
<b>Description</b>	The register configures the number of bytes to increment between two pixels for the buffer associated with the video window 2. For more information, see <a href="#">Section 10.2.4.6.3, Predecimation</a> . The register is used only when the TILER is not present in the system in order to perform low performance rotation. When the TILER IP is present it is highly recommended to use it for performing the rotation. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory

BA																															

Bits	Field Name	Description	Type	Reset
31:0	BA	Video base address Base address of the video buffer (aligned on pixel size boundary except in case of RGB24 packed format, 4-pixel alignment is required; in case of YUV4:2:2, 2-pixel alignment is required, and YUV4:2:0, byte alignment is supported)). In case of YUV4:2:0 format, it indicates the base address of the Y buffer. When the TILER is addressed, the bits: [28:27] = 0x0 for 8-bit tiled [28:27] = 0x1 for 16-bit tiled [28:27] = 0x2 for 32-bit tiled [28:27] = 0x3 for page mode [31:29] = 0x0 for 0-degree view [31:29] = 0x1 for 180-degree view + mirroring [31:29] = 0x2 for 0-degree view + mirroring [31:29] = 0x3 for 180-degree view [31:29] = 0x4 for 270-degree view + mirroring [31:29] = 0x5 for 270-degree view [31:29] = 0x6 for 90-degree view [31:29] = 0x7 for 90-degree view + mirroring Otherwise the bits indicated the corresponding bit address to access the SDRAM.	RW	0x0000 0000

CHANNELOUT2		BURSTTYPE	PREMULTIPLYALPHA	ZORDER	ZORDERENABLE	SELFREFRESH	ARBITRATION	DOUBLESTRIDE	VERTICALTAPS	DMAOPTIMIZATION	BUFPRELOAD	RESERVED	SELFREFRESHAUTO	CHANNELOUT	BURSTSIZE		ROTATION		FULLRANGE	REPLICATIONENABLE	COLORCONVENABLE	VRESIZECONF	HRESIZECONF	RESIZEENABLE	FORMAT			ENABLE			

Bits	Field Name	Description	Type	Reset
31:30	CHANNELOUT2	Value 0x2 is reserved when [16] CHANNELOUT bit = 0. Values 0x1, 0x2 and 0x3 are reserved when CHANNELOUT bit = 1 and TV format other than HDMI 1.4 3D 1080p is to be output. wr: immediate.  0x0: primary LCD output selected. 0x2: TV output selected. Used only for HDMI 1.4 3D 1080p format. 0x1: Secondary LCD output selected. 0x3: Write-back output to the memory selected.	RW	0x0
29	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine.  0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0

Bits	Field Name	Description	Type	Reset
28	PREMULTIPLYALPHA	The field configures the DISPC VID2 to process incoming data as pre-multiplied alpha data or non pre-multiplied alpha data. Default setting is non pre-multiplied alpha data. 0x0: Non pre-multiplied alpha data color component 0x1: Pre-multiplied alpha data color component	RW	0
27:26	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0. 0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values. 0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3 0x3: Z-order 3: layer above all the other layers 0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3	RW	0x0
25	ZORDERENABLE	Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled. 0x0: Z-order disabled. The Z-order of the layer is 0. 0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).	RW	0
24	SELFREFRESH	Enables the self refresh of the video window from its own DMA buffer only. 0x0: The video pipeline accesses the interconnect to fetch data from the system memory. 0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video2 is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0
23	ARBITRATION	Determines the priority of the video pipeline. The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them. 0x0: The video pipeline is one of the normal priority pipeline. 0x1: The video pipeline is one of the high priority pipeline.	RW	0
22	DOUBLESTRIDE	Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0. 0x0: The CbCr stride value is equal to the Y stride. 0x1: The CbCr stride value is double to the Y stride.	RW	0
21	VERTICALTAPS	Video Vertical Resize Tap Number 0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. The associated bit fields for the 2 other taps coefficients do not need to be initialized. 0x1: 5 taps are used for the vertical filtering logic.	RW	0
20	DMAOPTIMIZATION	Write 0s for future compatibility. Reads return 0.	R	0
19	BUFPRELOAD	Video Preload Value 0x0: Hardware prefetches pixels up to the preload value defined in the preload register 0x1: Hardware prefetches pixels up to high threshold value	RW	0

Bits	Field Name	Description	Type	Reset
18	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0
17	SELFREFRESHAUTO	Automatic self-refresh mode  0x0: The transition from SELFREFRESH "disabled" to "enabled" is controlled by SW.  0x1: The transition from SELFREFRESH "disabled" to "enabled" is controlled only by hardware.	RW	0
16	CHANNELOUT	Video Channel Out configuration: LCD, WB or TV. wr: immediate  0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back).  0x1: TV output selected	RW	0
15:14	BURSTSIZE	Video DMA Burst Size  0x0: 2x128bit bursts  0x1: 4x128bit bursts  0x3: Reserved  0x2: 8x128bit bursts	RW	0x2
13:12	ROTATION	Video Rotation Flag  0x0: No rotation  0x1: Rotation by 90 degrees  0x3: Rotation by 270 degrees  0x2: Rotation by 180 degrees	RW	0x0
11	FULLRANGE	Color Space Conversion full range setting.  0x0: Limited range selected: 16 subtracted from Y before color space conversion  0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	REPLICATIONENABLE	Replication Enable  0x0: Disable Video replication logic  0x1: Enable Video replication logic	RW	1
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV.  0x0: Disable Color Space Conversion YUV to RGB  0x1: Enable Color Space Conversion YUV to RGB	RW	0
8	VRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
7	HRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
6:5	RESIZEENABLE	Video Resize Enable  0x0: Disable both horizontal and vertical resize processing  0x1: Enable the horizontal resize processing  0x3: Enable both horizontal and vertical resize processing  0x2: Enable the vertical resize processing	RW	0x0

Bits	Field Name	Description	Type	Reset
4:1	FORMAT	Video Format. It defines the pixel format when fetching the video 2 picture into memory.  0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444  0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	VidEnable  0x0: Video disabled (video pipeline inactive and window not present)  0x1: Video enabled (video pipeline active and window present on the screen)	RW	0

The size is limited to the size of the line buffer of the vertical sampling block in case the video picture is processed by the vertical filtering unit. (program to value minus 1). When predecimation is set, the value represents the size of the image after predecimation but the max size of the unpredecimated image size in memory is still bounded $2^{11}$ .	RW	0x000

<b>Physical Address</b>	0x4804 1178 + (0x4 * j) 0x5800 1178 + (0x4 * j)	<b>Instance</b>	DISPC_PER_L4 DISPC_L3
<b>Description</b>	The register configures the resize accumulator init values for horizontal and vertical up/downsampling of the video window 2 (DISPC_VID2_ACCU_0 and DISPC_VID2_ACCU_1 for ping-pong mechanism with external trigger, based on the field polarity). It is used for ARGB and Y setting. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory

**Table 10-297. DISPC\_VID3\_FIR\_COEF\_V\_i**

<b>Address Offset</b>	0x0000 0350 + (0x4 * i)	<b>Index</b>	i = 0 to 7
<b>Physical Address</b>	0x4804 1350 + (0x4 * i) 0x5800 1350 + (0x4 * i)	<b>Instance</b>	DISPC_PER_L4 DISPC_L3
<b>Description</b>	The bank of registers configure the down/up/down-scaling coefficients for the vertical resize of the video picture associated with the video window 3 for the phases from 0 to 7. It is used for ARGB and Y setting. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory		
<b>Type</b>	RW

<b>Address Offset</b>	0x0000 0370	<b>Instance</b>	DISPC_PER_L4 DISPC_L3
<b>Physical Address</b>	0x4804 1370 0x5800 1370		
<b>Description</b>	The register configures the attributes of the video window 3. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CHANNELOUT2		BURSTTYPE	PREMULTIPLYALPHA	ZORDER	ZORDERENABLE	SELFREFRESH	ARBITRATION	DOUBLESTRIDE	VERTICALTAPS	DMAOPTIMIZATION	BUFPRELOAD	RESERVED	SELFREFRESHAUTO	CHANNELOUT	BURSTSIZE		ROTATION		FULLRANGE	REPLICATIONENABLE	COLORCONVENABLE	VRESIZECONF	HRESIZECONF	RESIZEENABLE							ENABLE

Bits	Field Name	Description	Type	Reset
31:30	CHANNELOUT2	It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (should be set to zero) wr: immediate  0x0: primary LCD output selected. 0x1: Secondary LCD output selected. 0x3: Write-back output to the memory selected.	RW	0x0
29	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine.  0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
28	PREMULTIPLYALPHA	The field configures the DISPC VID3 to process incoming data as pre-multiplied alpha data or non pre-multiplied alpha data. Default setting is non pre-multiplied alpha data.  0x0: Non pre-multiplied alpha data color component 0x1: Pre-multiplied alpha data color component	RW	0

Bits	Field Name	Description	Type	Reset
27:26	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0.  0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values.  0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3  0x3: Z-order 3: layer above all the other layers  0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3	RW	0x0
25	ZORDERENABLE	Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled.  0x0: Z-order disabled. The Z-order of the layer is 0.  0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).	RW	0
24	SELFREFRESH	Enables the self refresh of the video window from its own DMA buffer only.  0x0: The video pipeline accesses the interconnect to fetch data from the system memory.  0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video3 is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0
23	ARBITRATION	Determines the priority of the video pipeline. The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them.  0x0: The video pipeline is one of the normal priority pipeline.  0x1: The video pipeline is one of the high priority pipeline.	RW	0
22	DOUBLESTRIDE	Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0.  0x0: The CbCr stride value is equal to the Y stride.  0x1: The CbCr stride value is double to the Y stride.	RW	0
21	VERTICALTAPS	Video Vertical Resize Tap Number  0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. The associated bit fields for the 2 other taps coefficients do not need to be initialized.  0x1: 5 taps are used for the vertical filtering logic.	RW	0
20	DMAOPTIMIZATION	Write 0s for future compatibility. Reads return 0.	R	0
19	BUFPRELOAD	Video Preload Value  0x0: Hardware prefetches pixels up to the preload value defined in the preload register  0x1: Hardware prefetches pixels up to high threshold value	RW	0
18	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0

Bits	Field Name	Description	Type	Reset
17	SELFREFRESHAUTO	Automatic self-refresh mode  0x0: The transition from SELFREFRESH "disabled" to "enabled" is controlled by SW.  0x1: The transition from SELFREFRESH "disabled" to "enabled" is controlled only by hardware.	RW	0
16	CHANNELOUT	Video Channel Out configuration: LCD, WB or TV. wr: immediate  0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back).  0x1: TV output selected	RW	0
15:14	BURSTSIZE	Video DMA Burst Size  0x0: 2x128bit bursts  0x1: 4x128bit bursts  0x3: Reserved  0x2: 8x128bit bursts	RW	0x2
13:12	ROTATION	Video Rotation Flag  0x0: No rotation  0x1: Rotation by 90 degrees  0x3: Rotation by 270 degrees  0x2: Rotation by 180 degrees	RW	0x0
11	FULLRANGE	Color Space Conversion full range setting.  0x0: Limited range selected: 16 subtracted from Y before color space conversion  0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	REPLICATIONENABLE	Replication Enable  0x0: Disable Video replication logic  0x1: Enable Video replication logic	RW	1
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV.  0x0: Disable Color Space Conversion YUV to RGB  0x1: Enable Color Space Conversion YUV to RGB	RW	0
8	VRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
7	HRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
6:5	RESIZEENABLE	Video Resize Enable  0x0: Disable both horizontal and vertical resize processing  0x1: Enable the horizontal resize processing  0x3: Enable both horizontal and vertical resize processing  0x2: Enable the vertical resize processing	RW	0x0

Bits	Field Name	Description	Type	Reset
4:1	FORMAT	Video Format. It defines the pixel format when fetching the video 3 picture into memory.  0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: RGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	Video Enable  0x0: Video disabled (video pipeline inactive and window not present) 0x1: Video enabled (video pipeline active and window present on the screen)	RW	0

<b>Address Offset</b>	0x0000 0398																																																													
<b>Physical Address</b>	0x4804 1398 0x5800 1398	<b>Instance</b> DISPC_PER_L4 DISPC_L3																																																												
<b>Description</b>	The register configures the number of bytes to increment between two pixels for the buffer associated with the video window 3. For more information, see <a href="#">Section 10.2.4.6.3, Predecimation</a> . The register is used only when the TILER is not present in the system in order to perform low performance rotation. When the TILER IP is present it is highly recommended to use it for performing the rotation. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory

## Display Controller

www.ti.com

Bits	Field Name	Description	Type	Reset
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV. 0x0: Disable Color Space Conversion RGB to YUV 0x1: Enable Color Space Conversion RGB to YUV	RW	0
8	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. 0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
7	ALPHAENABLE	Premultiplied alpha enable Read 0x1: Enabled Read 0x0: Disabled. This bit also disable the logic present in the associated channel out that compute the alpha component sent to the WB pipe. When the WB is configured to copy back one of the output channels (output of overlay), the following configurations are available: 0x1: The WB pipe copies back to memory the premultiplied alpha calculated through the overlay. 0x0: The alpha value is not written back.	RW	0
6:5	RESIZEENABLE	Resize Enable 0x0: Disable the resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0
4:1	FORMAT	Write-back Format. It defines the pixel format when storing the write-back picture into memory. 0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	Write-back Enable. wr: immediate 0x0: Write-back disabled 0x1: Write-back enabled	RW	0

**Table 10-433. DISPC\_VID3\_FIR2**

<b>Address Offset</b>	0x0000 0724		
<b>Physical Address</b>	0x4804 1724 0x5800 1724	<b>Instance</b>	DISPC_PER_L4 DISPC_L3
<b>Description</b>	The register configures the resize factors for horizontal and vertical up/downsampling of the video window 3. It is used for Crb and Cr setting. It is used only when the pixel format at the input of the filter is one of the YUV formats. If the pixel format at the input of the filter is ARGB (all ARGB, RGB, RGBA are converted to ARGB32-8888 by the color space conversion before going to the filter is the color space conversion is done before the filter). When the register is not used by the hardware, any value can be used for the bit fields. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory

### 10.3.1 MIPI DSI Overview

The display serial interface (DSI) module connects to a DSI display module directly or through an external DSI bridge. The DSI module is connected to DISPC and L3/L4\_PER interconnects

[Figure 10-95](#) is a block diagram of the DSI module.

Figure 10-95. DSI Overview

dsii-001

There are two DSI modules in the display subsystem (DSS) that provide the following main features:

- DSI 1 (primary)
  - Supports MIPI-DSI (up to four data lanes + one clock lane)
  - Supports video mode and command mode
  - Support multiple displays (one video mode and one command mode). In command mode, pixel data are provided from the level 3 (L3) interface or from one of the overlay manager outputs.
  - Bidirectional data link support for command mode (only one data lane is used in reverse direction)

- RGB16, RGB18 nonpacked, and RGB24 formats supported for command mode
- RGB16, RGB18 packed and nonpacked, and RGB24 formats supported for video mode
- Burst support for the video mode
- Supports up to four data-configurable lanes, in addition to the clock signaling
- Maximum data rate of 824 Mbps per data pair for four-data lane configuration, and 900 Mbps for up to three-data lane configuration
- Data splitter for 2-data, 3-data and 4-data lane configurations
- Data interleaving support for one synchronous stream (video mode) from the DISPC and up to three asynchronous streams (command mode) from the interconnect concurrently, or up to four asynchronous streams (command mode) from the interconnect
- Transfer of pixels and data received on the video port or L3 interconnect to the display through DSI DSI\_PHY
- Serial configuration port (SCP) for the DSI\_PHY complex input/output (I/O) and DSI phase-locked loop (PLL)
- Connection to the DSI\_PHY complex I/O through PPI
- Error-correction code (ECC) and checksum generation
- MIPI DCS support
- DSI 2 (secondary)
  - Supports MIPI-DSI (up to two data lanes + one clock lane)
  - Supports video mode and command mode
  - Support multiple displays (one video mode and one command mode). In command mode, pixel data are provided from the L3 interface or from one of the overlay manager outputs.
  - Bidirectional data link support for command mode (only one data lane is used in reverse direction)
  - RGB16, RGB18 nonpacked, and RGB24 formats supported for command mode
  - RGB16, RGB18 packed and nonpacked, and RGB24 formats supported for video mode
  - Burst support for the video mode
  - Supports one data-configurable lane, in addition to the clock signaling
  - Maximum data rate of 900 Mbps per data pair
  - Data splitter for 2-data lane configuration
  - Data interleaving support for one synchronous stream (video mode) from the DISPC and up to three asynchronous streams (command mode) from the interconnect concurrently, or up to four asynchronous streams (command mode) from the interconnect
  - Transfer pixels and data received on the video port or Interface interconnect to the display through DSI DSI\_PHY
  - Serial configuration port (SCP) for the DSI\_PHY complex I/O and DSI PLL
  - Connection to the DSI\_PHY complex I/O through the physical layer (PHY) protocol interface (PPI)
  - ECC and checksum generation
  - MIPI DCS support

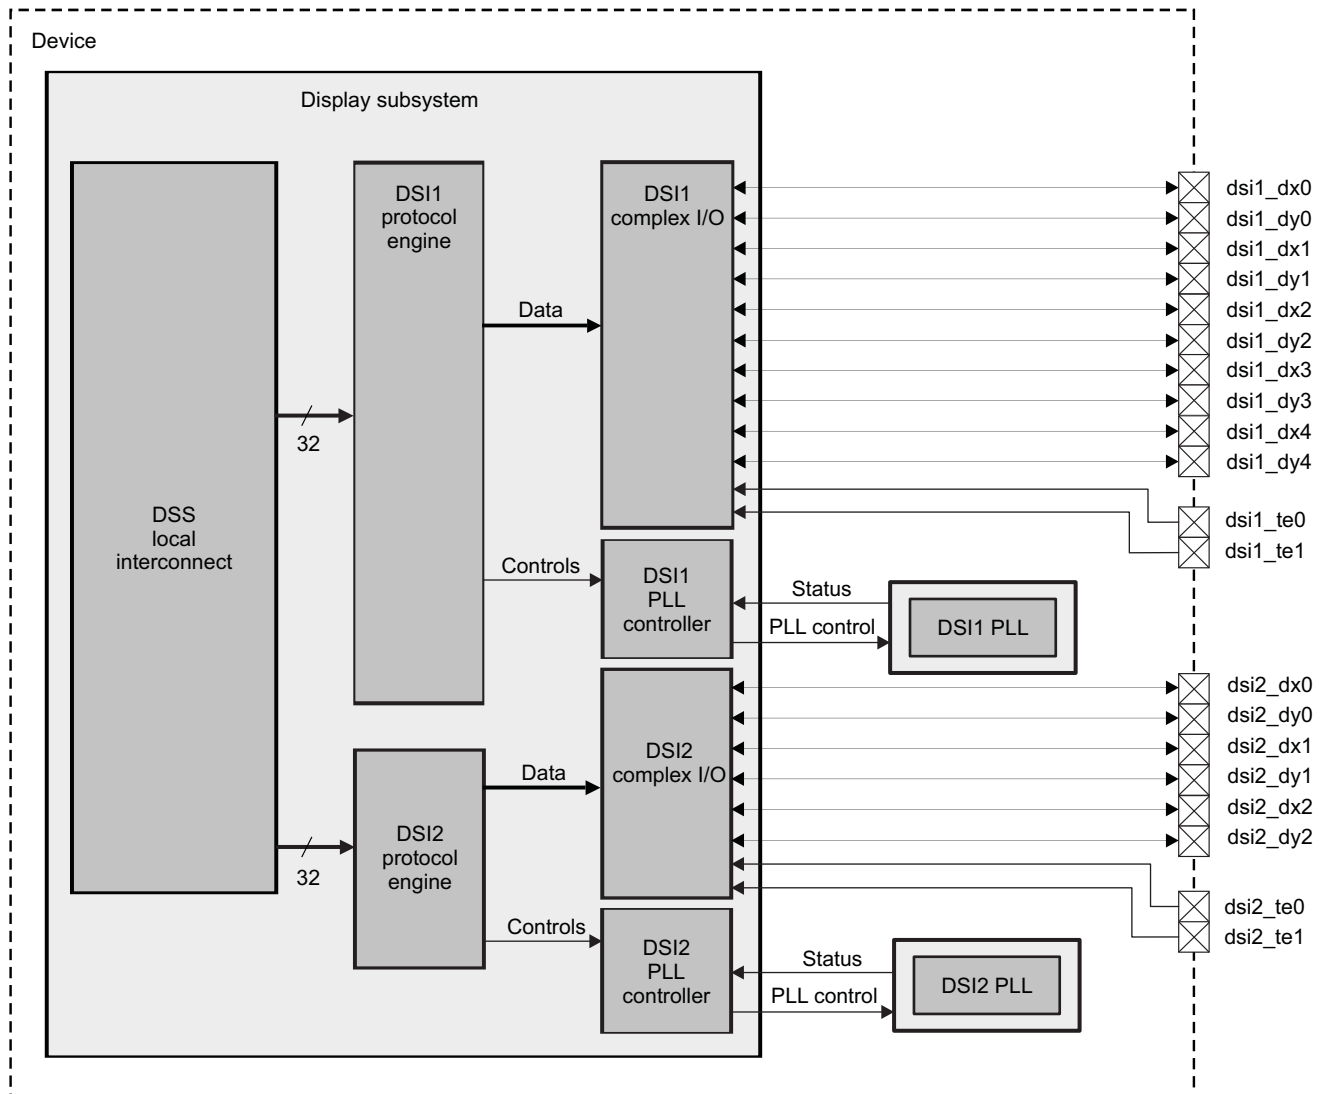

### 10.3.2 DSI Environment

**NOTE:** Copyright 2005-2008 MIPI Alliance, Inc. All rights reserved. MIPI Alliance Member Confidential.

This section describes the DSI application fields from an environment point of view (external connections). It describes the DSI connectivity options, lists all possible interfaces, and describes the protocol and data format used in each case.

Figure 10-96 is a block diagram of the DSI environment.

**Figure 10-96. DSI Environment**

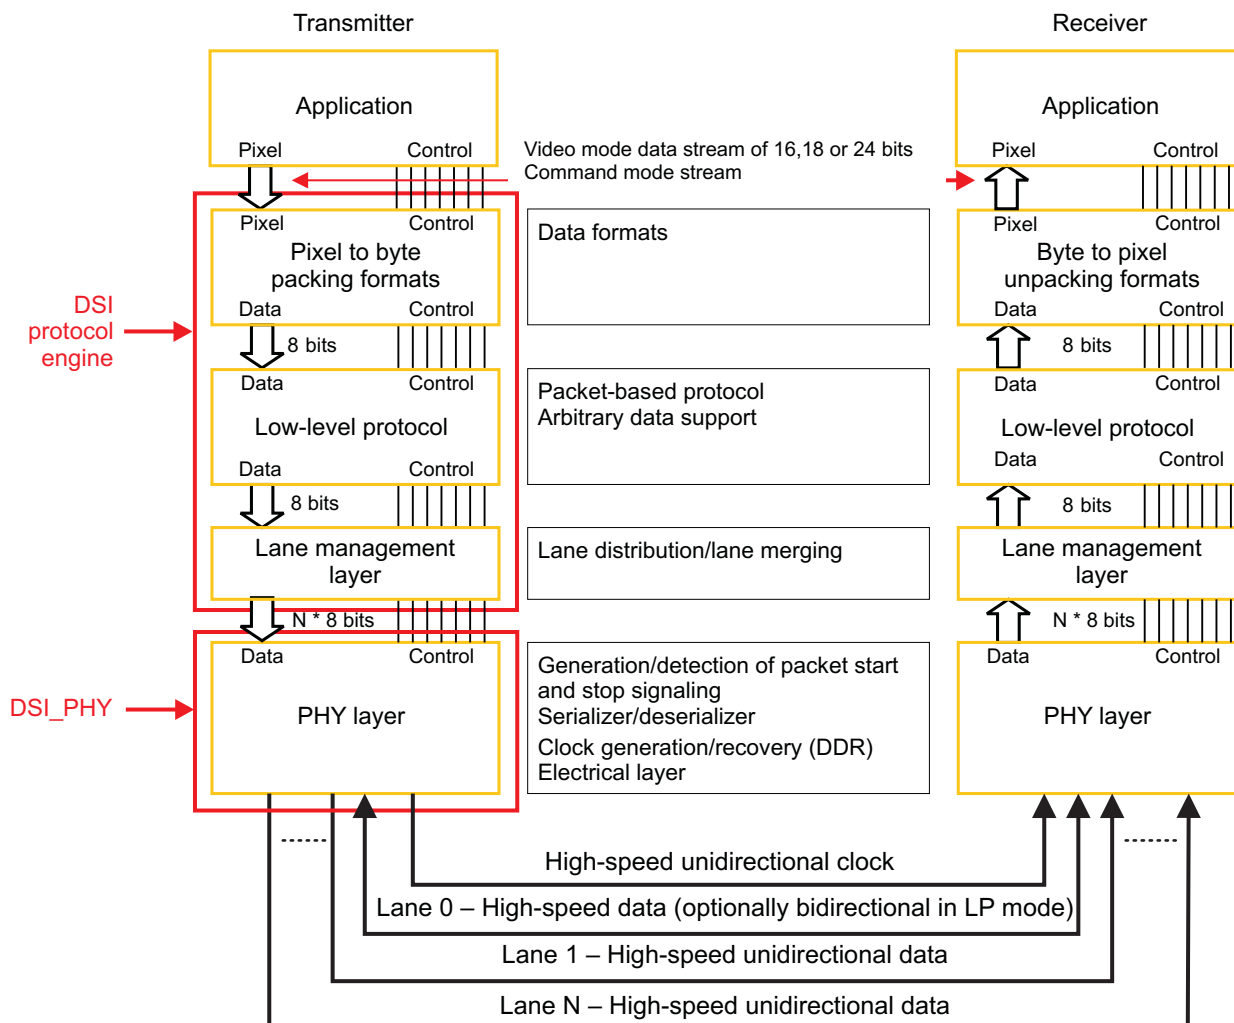

ds1-002

The DSI is a bidirectional differential serial interface with data/clock for the PHY (configured in unidirectional link in case the display module is only unidirectional). The maximum capacity of a DSI data transfer is 824 Mbps for four data lanes. The speed of the link can be configured by software only when the DSI\_PHY is in STOP state or ULTRALOW-POWER state (ULPS).

Figure 10-97 shows the high-level data flow of the DSI transmitter/receiver.

**Figure 10-97. DSI Transmitter/Receiver Data Flow**

dsii-032

### 10.3.2.1 DSI PHY

Table 10-459 lists the DSI1 I/Os.

**Table 10-459. I/O Description of DSI1**

Signal Name		I/O <sup>(1)</sup>	Description	Value at Reset
dsi1_dx0	lane 1	I/O	Serial data/clock lane	N/A
dsi1_dy0				
dsi1_dx1	lane 2	I/O	Serial data/clock lane	N/A
dsi1_dy1				
dsi1_dx2	lane 3	I/O	Serial data/clock lane	N/A
dsi1_dy2				
dsi1_dx3	lane 4	I/O	Serial data/clock lane	N/A
dsi1_dy3				
dsi1_dx4	lane 5	I/O	Serial data lane only	N/A
dsi1_dy4				
dsi1_te0	te0	I	DSI1 tearing effect (TE) input 0	N/A

<sup>(1)</sup> I = Input; O = Output; I/O = Bidirectional

**Table 10-459. I/O Description of DSI1 (continued)**

Signal Name		I/O <sup>(1)</sup>	Description	Value at Reset
dsi1_te1	te1	I	DSI1 TE input 1	N/A

**NOTE:** Each serial lane (lane 1 through lane 5) can be used as a data lane. Serial lanes 1 through 4 can be used as clock lanes (lane 5 can never be a clock lane). All polarities on all lanes are supported. The MIPI DSI 1.01 protocol requires at least one clock lane and one data lane.

Table 10-460 lists the DS2 I/Os.

**Table 10-460. I/O Description of DSI2**

Signal Name		I/O <sup>(1)</sup>	Description	Value at Reset
dsi2_dx0	lane 1	I/O	Serial data/clock lane	N/A
dsi2_dy0				
dsi2_dx1	lane 2	I/O	Serial data/clock lane	N/A
dsi2_dy1				
dsi2_dx2	lane 3	I/O	Serial data/clock lane	N/A
dsi2_dy2				
dsi2_te0	te0	I	DSI2 TE input 0	N/A
dsi2_te1	te1	I	DSI2 TE input 1	N/A

<sup>(1)</sup> I = Input; O = Output; I/O = Bidirectional

**NOTE:** Each serial lane (lane 1 through lane 3) can be used as a clock lane or a data lane. All polarities on all lanes are supported. The MIPI DSI 1.01 protocol requires at least one clock lane and one data lane.

Lanes support four operating modes:

- HS mode: High-speed transmit mode
- LP mode: Low-power transmit mode (also called low-power state [LPS])
- ULPS: ULTRALOW-POWER state used between two transmissions
- Off mode: Lane is off.

**NOTE:** The CONTROL\_DSIPHY register in the control module of the device provides the following control over the DSI lanes:

- Enable and disable each lane (the DSI2\_LANEENABLE[31:29] and DSI1\_LANEENABLE[28:24] bit fields).
- Pulldown enable and disable on each lane (the DSI1\_PIPD[23:19] and DSI2\_PIPD[18:14] bit fields)

For more information, see [Section 18.6.6, SYSCTRL\\_PADCONF\\_CORE Register Summary](#), in [Chapter 18, Control Module](#).

### 10.3.2.1.1 Data/Clock Configuration

Data-clock signaling consists of one to four data pairs and one clock pair. The minimum configuration is one data pair and one clock pair.

- The data signal carries the bit serial data. The DSI transmitter in the host sends the data in-quadrature with the dual data rate (DDR) clock in HS mode; otherwise, the clock is extracted from the received data in LS mode. The data is transmitted byte-wise LSB first.
- The clock signal carries the DDR clock signal in HS transmission.
- Software users must configure the order of the data lanes to indicate the byte order while splitting the

byte stream for each DSI\_PHY into bytes.

Table 10-461 lists some of the DSI lane configurations.

**NOTE:** All combinations for the order of the clock and data lanes are supported (except clock cannot be on lane 5) but not explicitly described in Table 10-461.

**Table 10-461. DSI Lane Configuration**

DSI_PHY Lane Configuration	Data/Clock Lane Position					Description
	1	2	3	4	5	
Mode CLK + DATA1						Single data lane
	CLK	DATA1				
	DATA1	CLK				
Mode CLK + DATA1 + DATA2						Two data lanes
	CLK	DATA1	DATA2			
	CLK	DATA2	DATA1			
	DATA1	CLK	DATA2			
	DATA2	CLK	DATA1			
	DATA1	DATA2	CLK			
	DATA2	DATA1	CLK			
Mode CLK + DATA1 + DATA2 + DATA3						Three data lanes
	CLK	DATA1	DATA2	DATA3		
	CLK	DATA3	DATA2	DATA1		
	DATA1	CLK	DATA2	DATA3		
	DATA1	CLK	DATA3	DATA2		
	DATA2	CLK	DATA1	DATA3		
	DATA2	CLK	DATA3	DATA1		
	DATA3	CLK	DATA1	DATA2		
	DATA3	CLK	DATA2	DATA1		
	DATA3	DATA1	CLK	DATA2		
	DATA3	DATA2	CLK	DATA1		
	DATA3	DATA2	CLK	DATA1		
	DATA1	DATA2	CLK	DATA3		
	DATA2	DATA3	CLK	DATA1		
	DATA1	DATA3	CLK	DATA2		
	DATA1	DATA2	DATA3	CLK		
	DATA3	DATA2	DATA1	CLK		
Mode CLK + DATA1 + DATA2 + DATA3 + DATA4						Four data lanes
	CLK	DATA1	DATA2	DATA3	DATA4	
	DATA3	DATA1	CLK	DATA2	DATA4	
	DATA4	DATA2	CLK	DATA1	DATA3	
	DATA2	DATA1	CLK	DATA3	DATA4	
	DATA4	DATA3	CLK	DATA1	DATA2	
	DATA3	DATA4	CLK	DATA2	DATA1	
	DATA1	DATA2	CLK	DATA4	DATA3	
	DATA1	DATA4	CLK	DATA3	DATA2	
	DATA1	DATA3	CLK	DATA4	DATA2	

**NOTE:**

- The byte on Dn is sent before the byte on Dn + 1; all the combinations of data and clock are supported through programming of the **DSI\_COMPLEXIO\_CFG1** register. The **CLOCK\_POSITION** and **CLOCK\_POL** bit fields configure which lane transmits the clock and define its polarity. Eight bit fields (**DATA1\_POSITION** and **DATA1\_POL**, through **DATA4\_POSITION** and **DATA4\_POL**) configure the data lanes and their polarity. The **DATA2\_POSITION** through **DATA4\_POSITION** bit fields can be set to 0; in this case, only the data lane defined in the **DATA1\_POSITION** bit field is used, and data is transmitted on only one clock lane and one data lane.
- Only **DATA1** is bidirectional in command mode. The low-power received information is always sent by the display panel using **DATA1**. Because any lane of the DSI complex I/O can be configured as data lane **DATA1**, all lanes of the complex I/O are bidirectional.

**10.3.2.1.2 ULPS**

Each lane can be put in ULPS by software configuration. The ULPS mode requires the following conditions:

- The lane must be in ULP state.
- For data lanes, no data must be pending in the DSI module.
- For data lane 1, no bus turnaround (BTA) should have been sent. The DSI module must have control of the bus.

For more information on ULPS configuration, see [Section 10.3.4.4.16, Ultralow-Power State Configuration](#).

**10.3.2.2 DSI Protocol Layer**

Low-level protocol (LLP) is a byte-oriented protocol. It supports short and long packet formats. The DSI protocol layer defines how the display data is transported onto the PHY. Packets can be sent using HS mode or low-speed (LS) mode. LLP is selected through DSI registers. The features of the DSI protocol layer are:

- Transport of arbitrary data (payload independent)
- 8-bit word size
- Support for up to four interleaved VCs on the same link
- Special packets for frame start, frame end, line start, and line end information
- Descriptor for the type, pixel depth, and format of application-specific payload data
- ECC for 1-bit or 2-bit error detection in the header
- 16-bit checksum code for error detection

Figure 10-98 shows the protocol layer with short and long packets.

**Figure 10-98. Protocol Layer With Short and Long Packets**

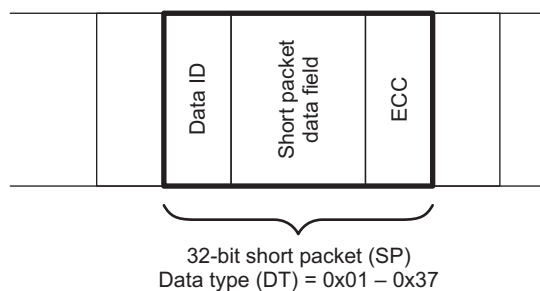

dsii-004

### 10.3.2.2.1 Short Packet

Figure 10-99 shows the structure of the short packet. A short packet must contain an 8-bit data ID followed by two command or data bytes and an 8-bit ECC. No packet footer (PF) should be present. Short packets must be 4 bytes long. The ECC byte allows correction of single-bit errors and detection of 2-bit errors in the short packet.

**Figure 10-99. Short Packet Structure**

dsi-005

**NOTE:** The short packets can be sent in LP mode or HS mode.

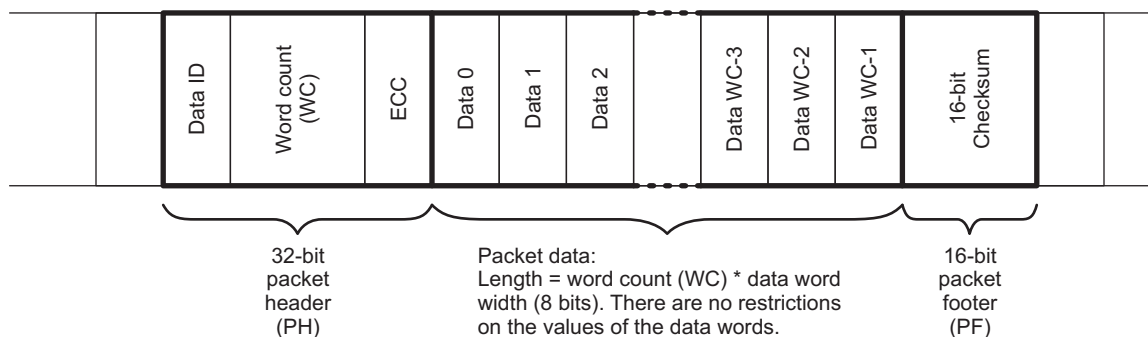

The [DSI\\_VC\\_SHORT\\_PACKET\\_HEADER\\_i](#) register is used to send only short packets (ECC can be calculated by hardware or by software users for debug purposes). This register is not used for video mode data because the short packets are generated by hardware based on the following events:

- Synchronization events received on the video port (assertion/deassertion of the HSYNC and VSYNC input signals)
- [DSI\\_CTRL\[18\]](#) VP\_HSYNC\_END
- [DSI\\_CTRL\[17\]](#) VP\_HSYNC\_START
- [DSI\\_CTRL\[16\]](#) VP\_VSYNC\_END
- [DSI\\_CTRL\[15\]](#) VP\_VSYNC\_START
- [DSI\\_CTRL\[11\]](#) VP\_VSYNC\_POL
- [DSI\\_CTRL\[10\]](#) VP\_HSYNC\_POL
- [DSI\\_VC\\_CTRL\\_i\[1\]](#) SOURCE

### 10.3.2.2.2 Long Packet

Figure 10-100 shows the structure of the long packet. A long packet must consist of three elements: 32-bit packet header (PH), application-specific data payload with a variable number of bytes, and 16-bit PF.

**Figure 10-100. Long Packet Structure**

dsi-006

The PH is further composed as follows:

- 8-bit data identifier: The data identifier defines the VC for the data and the DT for the application-

specific payload data.

- 16-bit word count: The word count defines the number of bytes in the data payload between the end of the PH and the start of the PF. The PH and the PF must not be included in the word count.
- 8-bit ECC: The ECC byte allows single-bit errors to be corrected and 2-bit errors to be detected in the PH. This includes the data identifier and the word count fields.

After the end of the PH, the receiver reads the next word count  $\times$  bytes of the data payload. There are no limitations on the value of a data word within the data payload block (that is, no embedded codes are used). Once the receiver has read the data payload, it reads the checksum in the PF. The host processor must always calculate and transmit a checksum in the PF. Peripherals are not required to calculate a checksum. In the special case of a 0-byte data payload, if the payload length is 0, the checksum calculation results in (0xFFFF). If the checksum is not calculated, the PF must consist of 2 bytes of 0s (0x0000). In the generic case, the length of the data payload must be a multiple of bytes. In addition, each data format can impose additional restrictions on the length of the payload data (that is, a multiple of 4 bytes). Each byte is transmitted LSB first. Payload data can be transmitted in any byte order, restricted only by data format requirements. Multibyte elements, such as word count and checksum, must be transmitted least-significant byte (LSByte) first.

---

**NOTE:** Long packets can be sent in LP or HS mode.

---

The [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register provides headers for long packets (ECC is always calculated by hardware). The register is used for video and command modes.

If video mode is enabled for a virtual channel, it is not possible to transfer data concurrently (interleaved in a frame) using long packets received on the video and L3 interconnect ports because the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register is used by the video mode. The register can be unprogrammed by the user to send long packets received on the L3 interconnect port only when there is no expected data on the video port. Software must program the register correctly to send sequentially long packets in video and command modes.

The word count (WC) defined in the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register for the VC associated with the video port indicates the number of bytes to receive (one line or two lines can be used, depending on the WC and the size of the line buffer). The total size defined in the WC of the header register cannot exceed the size of the line buffer multiplied by the number of buffer lines.

The [DSI\\_VC\\_LONG\\_PACKET\\_PAYLOAD\\_i](#) register is used to provide payload data for long packets (checksum is calculated by hardware when [DSI\\_VC\\_CTRL\\_i\[7\]](#) CS\_TX\_EN is set to 1; otherwise, the value is 0x00). The register is not used in video mode because payload data are provided by the video port.

Software must ensure that the following sequence for write accesses to the header and payload registers ([DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) and [DSI\\_VC\\_LONG\\_PACKET\\_PAYLOAD\\_i](#), respectively) is followed:

- A long PH value with WC = 0 written in the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register can be followed by any access.
- A long PH value with WC > 0 written in the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register must be followed by one or more writes to the [DSI\\_VC\\_LONG\\_PACKET\\_PAYLOAD\\_i](#) register defined by the WC value before writing again to the same [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register.

#### CAUTION

If this sequence is not followed, no error is generated. Access to other DSI registers during this sequence is allowed.

### 10.3.2.2.3 Data Identifier

The data identifier byte contains the values for the virtual channel ID and data type, as shown in [Figure 10-101](#). The virtual channel ID is contained in the 2 MSBs of the data identifier byte and identify the data as directed to one of four virtual channels. The value of the data type is contained in the 6 LSBs of the data identifier byte.

**Figure 10-101. Data Identifier Structure**

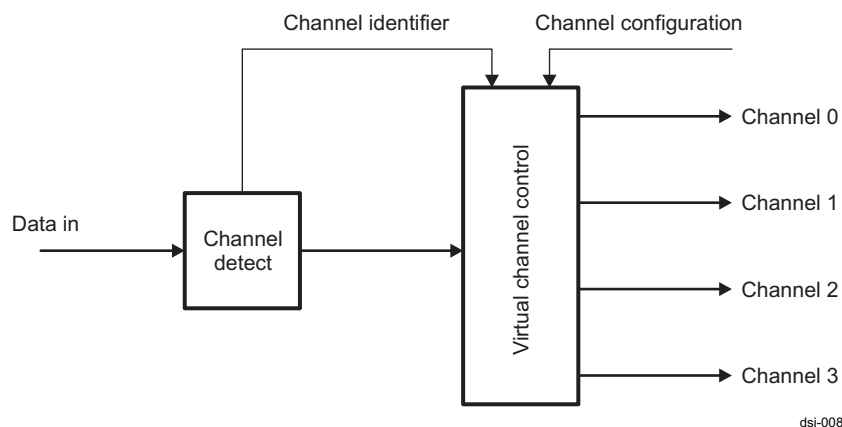

#### 10.3.2.2.3.1 VC ID – VC Field, DI[7:6]

The host can service up to four peripherals with tagged commands or blocks of data using the VC ID field of the header for packets targeted at different peripherals. The VC ID enables one serial stream to service two or more virtual peripherals by multiplexing packets onto a common transmission channel. Each packet sent in a single transmission has its own VC assignment and can be directed to different peripherals. The VC ID is defined in the [DSI\\_VC\\_SHORT\\_PACKET\\_HEADER\\_i](#) and [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) registers for short and long packets, respectively. It will not be modified by hardware. There is one set of registers for each VC. Each set of registers defines the characteristics of the traffic between the host and the display associated with the VC.

[Figure 10-102](#) shows the VC controller.

**Figure 10-102. VC Controller**

#### 10.3.2.2.3.2 Data Type Field DT[5:0]

The data type field specifies whether the packet is long or short and the packet format. The data type field, and the word count field for long packets, informs the receiver about how many bytes to expect in the rest of the packet. This is necessary because the beginning and end of a packet are not indicated by special packet start/end sync codes. This permits packets to convey arbitrary data, but it also requires the PH to specify the size of the packet.

#### 10.3.2.2.4 Synchronization Codes

Each frame can be identified by two synchronization codes:

- For the start of the vertical synchronization (VSS) pulse

- For the end of the vertical synchronization (VSE) pulse

Each line can be identified by two synchronization codes:

- For the start of the horizontal synchronization (HSS) pulse
- For the end of the horizontal synchronization (HSE) pulse

The synchronization events are not required by the display (peripheral): they are optional. Users can program which synchronization events are generated to the display from the timings received from the DISPC in video mode. When data are received on the L3 interconnect port, the synchronization codes are not automatically generated by the protocol engine. They can be provided on the L3 interconnect port by writing to the registers with limited timing control. It is highly recommended to use the video port from the DISPC to receive the synchronization events to automatically generate short synchronization packets to the peripheral.

When the DSI protocol engine detects that the VSYNC signal from the DISPC transitions from inactive to active state, the VSS short packet replaces the following HSS corresponding to the following HSYNC synchronization short packet (if the generation is enabled).

When the transition from active to inactive state is detected, the VSE short packet is generated (if the generation is enabled) replacing the HSE synchronization packet corresponding to the following HSYNC.

When the DSI protocol engine detects that the HSYNC signal from the DISPC transitions from inactive to active state, the HSS short packet is generated (if the generation is enabled).

When the transition from active to inactive state is detected, the HSE short packet is generated (if generation is enabled).

For the first frame, any HSYNC and data received on the video port before the first VSYNC must be ignored. Because the first VSYNC sent to the display is also recognized as an HSYNC for the first line, there is no HSYNC sent for the first line. To send the synchronization codes, the DSI protocol engine uses the short packets. [Table 10-462](#) lists the 6-bit DT synchronization code values.

**Table 10-462. Synchronization Codes**

Synchronization Code	Value	Comments
Vertical sync start code (VSS)	0x1	Optional
Vertical sync end code (VSE)	0x11	Optional
Horizontal sync start code (HSS)	0x21	Optional
Horizontal sync end code (HSE)	0x31	Optional

### 10.3.2.2.5 Blanking

To keep the DSI link in HS state while using video mode, during blanking periods, long blanking packets are sent to the display. The DSI\_VM\_TIMINGx (where x = 1 to 8) registers define the size of the long blanking packets after:

- Horizontal sync start code (short packet)
- Horizontal sync end code (short packet)
- Vertical sync start code (short packet)
- Vertical sync end code (short packet)
- Pixels (long packet)

[Table 10-463](#) defines the short packet values for the synchronization packets:

**Table 10-463. Sync Short Packet Values**

VC ID	Sync Code	Header (First Byte)	Header (Second Byte): Data Field LSB	Header (Third Byte): Data Field MSB	Header (ECC)
0x0	0x1	0x1	0x0	0x0	See Notes following this table.
	0x11	0x11			
	0x21	0x21			
	0x31	0x31			
0x1	0x1	0x41			
	0x11	0x51			
	0x21	0x61			
	0x31	0x91			
0x2	0x1	0x81			
	0x11	0x81			
	0x21	0xA1			
	0x31	0xB1			
0x3	0x1	0xC1			
	0x11	0xD1			
	0x21	0xC1			
	0x31	0xF1			

**NOTE:**

- If the ECC is enabled by setting the [DSI\\_VC\\_CTRL\\_i\[8\] ECC\\_TX\\_EN](#) bit to 1 for the VC in video mode, the ECC value is calculated; otherwise, 0x00 is used for the blanking long packets and sync short packets. If the CRC is enabled by setting the [DSI\\_VC\\_CTRL\\_i\[7\] CS\\_TX\\_EN](#) bit to 1 for the VC in video mode, the checksum value is calculated; otherwise, 0x00 is used for the blanking long packets.
- In other cases, when the [DSI\\_VC\\_CTRL\\_i\[7\] CS\\_TX\\_EN](#) bit is set to 0, the value 0x00 is always used for the CRC (long packets). When the [DSI\\_VC\\_CTRL\\_i\[8\] ECC\\_TX\\_EN](#) bit is set to 0, the value 0x00 is used for the ECC for short and long packets, except when the header is provided by the register, because the ECC field is available in the register. It can be used to generate invalid ECC values when the header is provided by the register.

The DSI link (lanes and clock separately) can be put in ULPS. While using the blanking values formerly defined, the packets (short and long) are considered in HS mode.

Timing parameters VSA, VBP, VFP, HSA, HBP, HFP, VACT, and  $t_L$  are defined in the [DSI\\_VM\\_TIMING1](#) through [DSI\\_VM\\_TIMING8](#) registers. HSA, HBP, HFP, and  $t_L$  are defined using the byte clock unit (TXBYTECLKHS - HS transmit byte clock generated by DSI\_PHY) and also in low-power clock cycles (TxClkEsc). VSA, VBP, VFP, and VACT are defined by the number of lines. When the HS blanking packets are sent during the blanking periods, the parameters are used to determine the blanking packet payload size (taking into account the 4-byte header and the 2-byte checksum).

The configuration of the DISPC timing generator must be used when the DISPC timings are used to generate DSI HS video mode transfer.

Special care must be taken in the case of the last line of the frame. The LPS transition is required when the link is in HS mode for the whole frame.

When BTA is sent for the data packets, the following blanking period cannot be used for sending any data from the TX FIFO. When the blanking period starts with one HS packet from one VC, it can be followed only by another HS packet from the same VC, or by a trigger (for example, BTA). When there is no more HS data to send for this VC, the lane is in LPS.

When the blanking period starts with one LP packet from one VC, it can be followed only by another LP packet from the same VC, by another VC, by trigger (BTA, for example), or by extra LP NULL packets. If the trigger is sent, it is not possible to send any more data. When there is no more data from the TX FIFO to send in LP mode or the trigger has been sent, the lane is put into LPS. If the lanes must be kept in HS mode during blanking periods (except for the last blanking period of the frame), the HS blanking packets must be used. If one trigger is sent at the beginning of the blanking period, the rest of the blanking period is in LPS.

Figure 10-103 and Figure 10-104 show a nonburst transfer in DSI video mode with and without VE and HE, respectively. Figure 10-105 shows a burst transfer in DSI video mode without VE and HE.

Figure 10-103. DSI Video Mode: Nonburst Transfer With VE and HE

ds1-009

Legend:

- VSS – DSI sync event packet: Vertical sync start
- VSE – DSI sync event packet: Vertical sync end
- BL LP – DSI packet: Arbitrary sequence of non-restricted DSI packets or low power mode including optional BTA
- HSS – DSI sync event packet: Horizontal sync start
- HSA – DSI blanking packet: Horizontal sync active or low power mode, no data
- HSE – DSI sync event packet: Horizontal sync end
- HFP – DSI blanking packet: Horizontal front porch or low power mode
- HBP – DSI blanking packet: Horizontal back porch or low power mode
- RGB – DSI packet: Arbitrary sequence of pixel stream and null packets
- LPM – Low power mode, including optional BTA

**Figure 10-104. DSI Video Mode: Nonburst Transfer Without VE and HE**

dsi-010

**NOTE:** HSA timing is not used and does not have to be programmed when HE short packet is not generated.

Figure 10-105. DSI Video Mode: Burst Transfer Without VE and HE

dsi-011

**NOTE:** HSA timing is not used and does not have to be programmed when HE short packet is not generated.

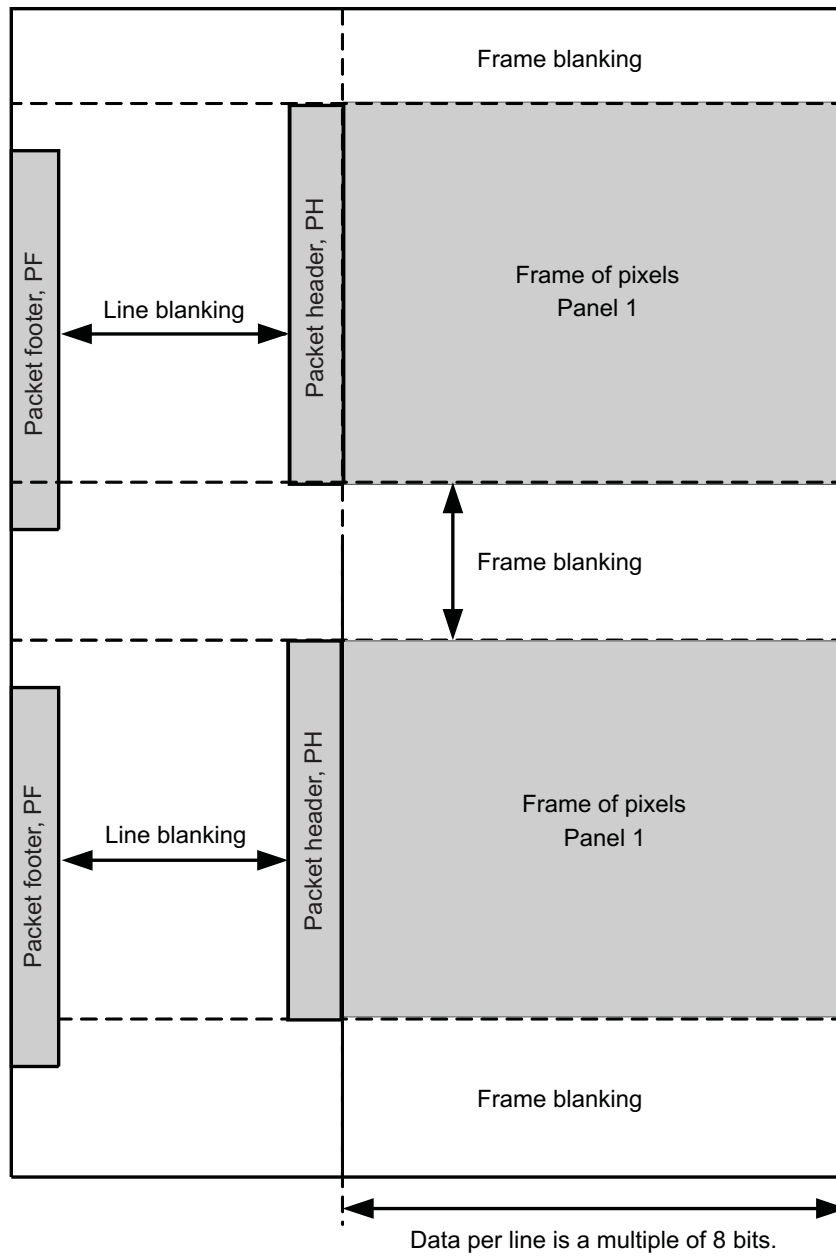

In Figure 10-104 and Figure 10-105, if HSYNC end short packet is not generated (HSA does not exist), HBP must not be 0.

### 10.3.2.2.6 Frame Structures

**NOTE:** The figures in this section show only pixel packets and blanking periods; they do not show synchronization packets.

Figure 10-106 shows the DSI general frame structure.

Figure 10-106. DSI General Frame Structure

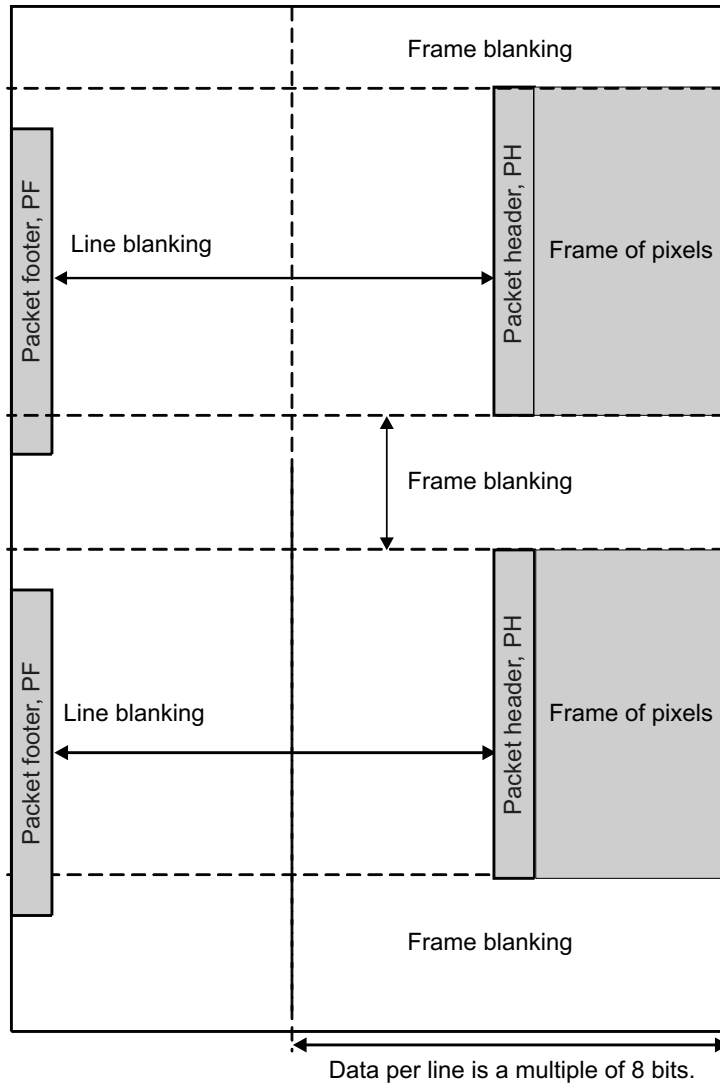

KEY: PH: Packet header PF: Packet footer Video mode

dsi-012

Figure 10-107 shows the general frame structure using burst mode.

Figure 10-107. DSI General Frame Structure Using Burst Mode

dsi-013

Figure 10-108 shows the general frame structure using burst mode and interleaving.

**Figure 10-108. DSI General Frame Structure Using Burst Mode and Interleaving**

dsi-014

### 10.3.2.2.7 VCs

The DSI protocol layer transports VCs. VCs separate different data flows, which are interleaved in the same data stream. Each VC is identified by a unique channel identification number in the PH. The channel identification number is encoded in 2 bits. The DSI protocol engine determines the channel identifier number to be used for generating the PH and multiplexes the interleaved data streams. The DSI protocol engine supports multiple (up to 4) concurrent VCs. [Table 10-464](#) summarizes the VC values used for each channel.

**Table 10-464. VC Values**

VC Number	Value
VC 0	0x0
VC 1	0x1
VC 2	0x2
VC 3	0x3

If multiple displays are connected to a single DSI port on the host, a hub can be used to route the data stream to the appropriate display based on the VC ID. Typically, VC ID 0x0 is used for the primary display and 0x1 for the secondary. The hub may have its own VC ID to provide communication capability between the host and the hub.

There is one set of registers for each VC. The attributes of the VC define the following characteristics:

- Transfer mode ([DSI\\_VC\\_CTRL\\_i\[4\]](#) MODE bit):
  - Video mode
  - Command mode
- Data type
- Source ([DSI\\_VC\\_CTRL\\_i\[1\]](#) SOURCE bit)
  - Video port
  - Slave interconnect port
- HS or LP forward transmission
- Automatic BTA generation
  - Short packets ([DSI\\_VC\\_CTRL\\_i\[2\]](#) BTA\_SHORT\_EN bit)
  - Long packets ([DSI\\_VC\\_CTRL\\_i\[3\]](#) BTA\_LONG\_EN bit)
- DMA request configurations for RX and TX
  - DMA request number ([DSI\\_VC\\_CTRL\\_i\[29:27\]](#) DMA\_RX\_REQ\_NB bit field for RX FIFO and [DSI\\_VC\\_CTRL\\_i\[23:21\]](#) DMA\_TX\_REQ\_NB bit field for TX FIFO)
  - DMA threshold ([DSI\\_VC\\_CTRL\\_i\[26:24\]](#) DMA\_RX\_THRESHOLD bit field for RX FIFO and [DSI\\_VC\\_CTRL\\_i\[19:17\]](#) DMA\_TX\_THRESHOLD bit field for TX FIFO)
- Mode speed ([DSI\\_VC\\_CTRL\\_i\[9\]](#) MODE\_SPEED bit)
- ECC transmission ([DSI\\_VC\\_CTRL\\_i\[8\]](#) ECC\_TX\_EN bit)
- CS transmission ([DSI\\_VC\\_CTRL\\_i\[7\]](#) CS\_TX\_EN bit)

---

**NOTE:** The VC ID is not calculated by the DSI module but is provided while writing into the [DSI\\_VC\\_SHORT\\_PACKET\\_HEADER\\_i](#) and [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) registers.

---

### 10.3.2.3 DSI Multilane Layer

A layer consists of lane splitter logic to split the incoming byte stream into a serial stream. The bits are sent with the LSB first. The number of active lanes is configurable through a register. The order of the lanes is configurable. The number of lanes can be changed only in ULPS or when all data lanes are in STOP state.

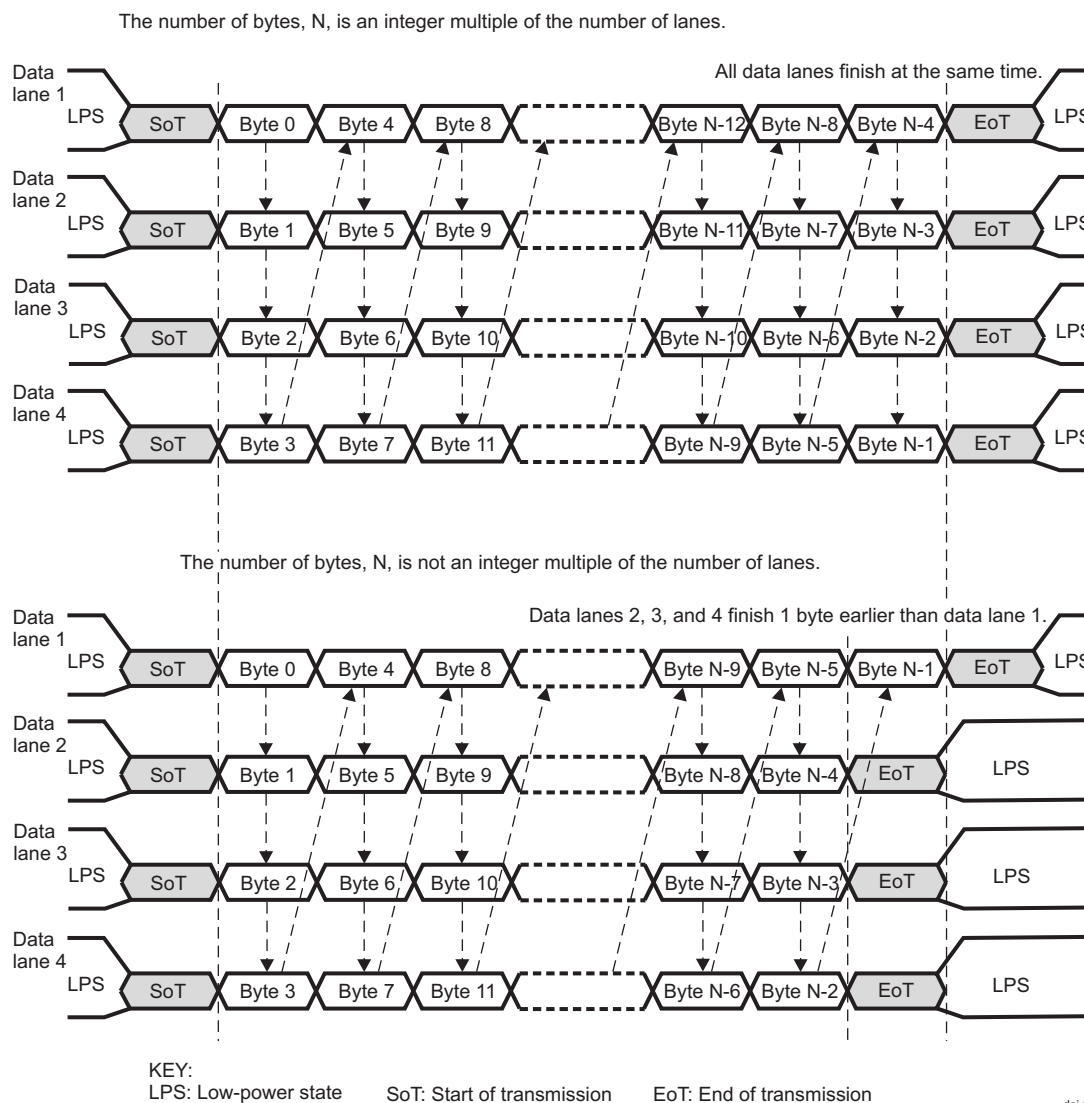

### 10.3.2.3.1 SoT and EoT in Multilane Configurations

Because a HS transmission is composed of an arbitrary number of bytes that may not be an integer multiple of the number of lanes, some lanes may run out of data before others. Therefore, the lane management layer, as it buffers up the final set of less-than-N bytes, deasserts its valid data signal into lanes for which there is no further data. Although all lanes start simultaneously with parallel start-of-transmissions (SoTs), each lane operates independently and may complete the HS transmission before the other lanes, sending an end-of-transmission (EoT) one cycle (byte) earlier.

### 10.3.2.3.2 Lane Splitter

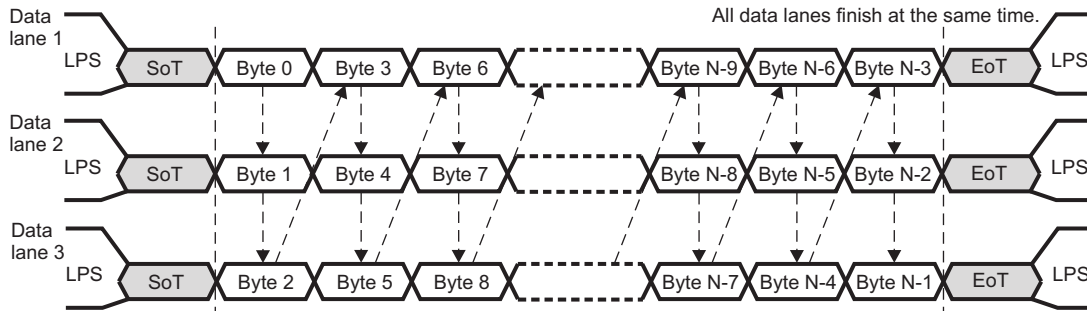

The lane splitter can split the byte stream into two, three, or four lanes (for one lane, the splitter is bypassed). Figure 10-109 through Figure 10-112 show the byte position in each serial link for one-, two-, three-, and four-data lane configurations. The byte stream always starts from lane 1. It finishes on one of the lanes, depending on the number of bytes to send and the number of lanes. The splitter module is used only when packets are sent using HS mode. In LS mode, only data lane 1 is used.

**Figure 10-109. Four-Data Lane Configuration**

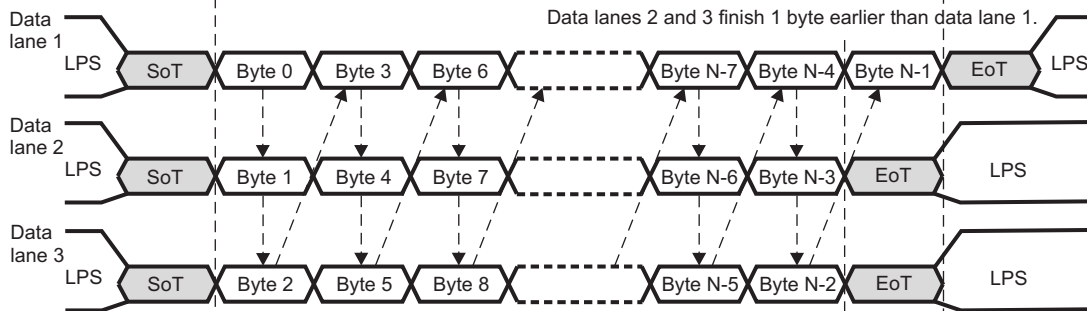

**Figure 10-110. Three-Data Lane Configuration**

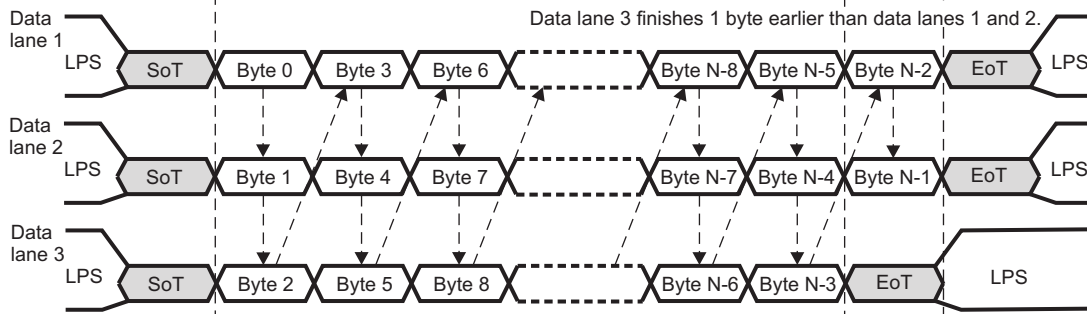

The number of bytes, N, is an integer multiple of the number of lanes.

The number of bytes, N, is not an integer multiple of the number of lanes (Example 1).

The number of bytes, N, is not an integer multiple of the number of lanes (Example 2).

Key:  
LPS: Low-power state    SoT: Start of transmission    EoT: End of transmission

dsi-015

**Figure 10-111. Two-Data Lane Configuration**

dsi-016

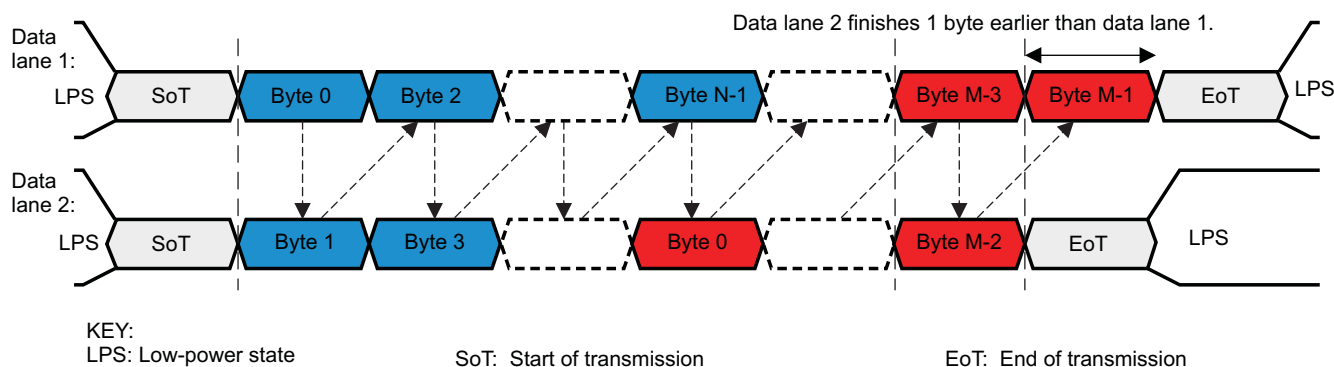

**Figure 10-112. One-Data Lane Configuration**

dsi-017

For back-to-back packets, the byte stream is considered as a single packet by the splitter module. [Figure 10-113](#) shows an example of two packets sent back-to-back. N bytes are used for the first packet and M bytes for the second packet.

**Figure 10-113. Two Packets Using Two-Data Lane Configuration (Example)**

dsi-019

### 10.3.2.4 DSI Pixel Data Formats

This section describes how the DSI-supported pixel data formats in video mode are transmitted over the serial interface. The DSI protocol engine can cope with all data formats if the data line length sent through the DSI physical protocol is a multiple of a pixel. This condition is required for the DSI protocol engine to work properly.

#### 10.3.2.4.1 Pixel Data Formats in Video Mode

The host can send different pixel formats in video mode. [Table 10-465](#) lists the pixel formats supported by the DSI in video mode.

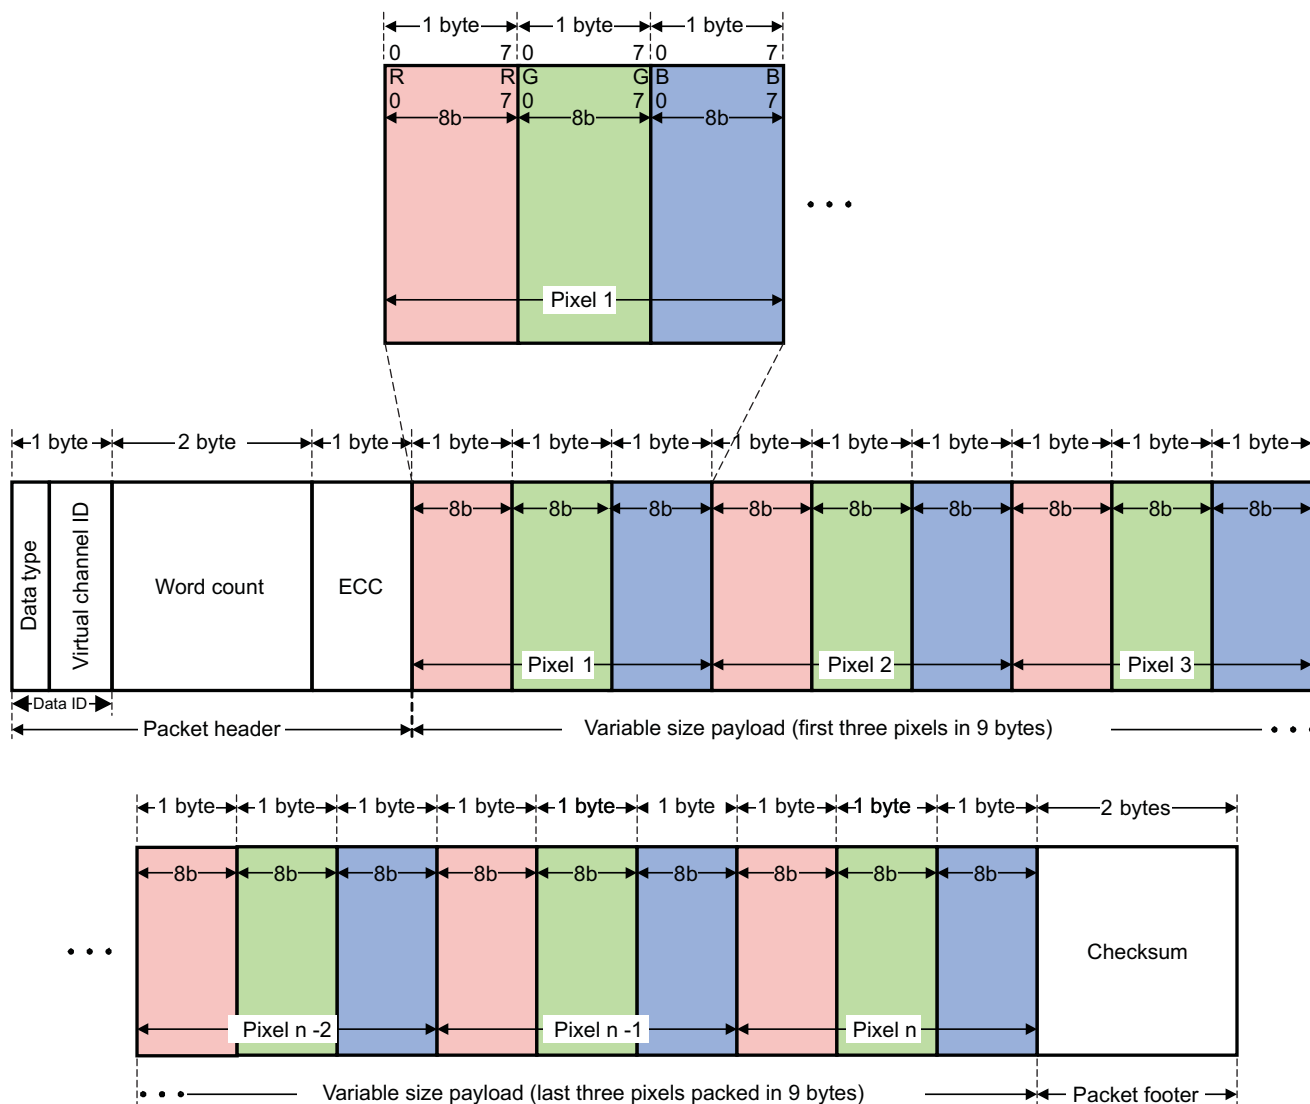

**Table 10-465. Pixel Data Format in Video Mode**

<b>Mode</b>	<b>Description</b>
RGB888 (using 24-bit container)	RGB888
RGB666 (using 24-bit container)	RGB666
RGB666 (18-bit packet using 18-bit container)	RGB666_PACKET
RGB565 (using 16-bit container)	RGB565

### 10.3.2.4.2 24 bpp – RGB Color Format, Long Packet (Video Mode)

Figure 10-114 shows the RGB888 format.

Figure 10-114. 24-bpp RGB Color Format, Long Packet (Video Mode)

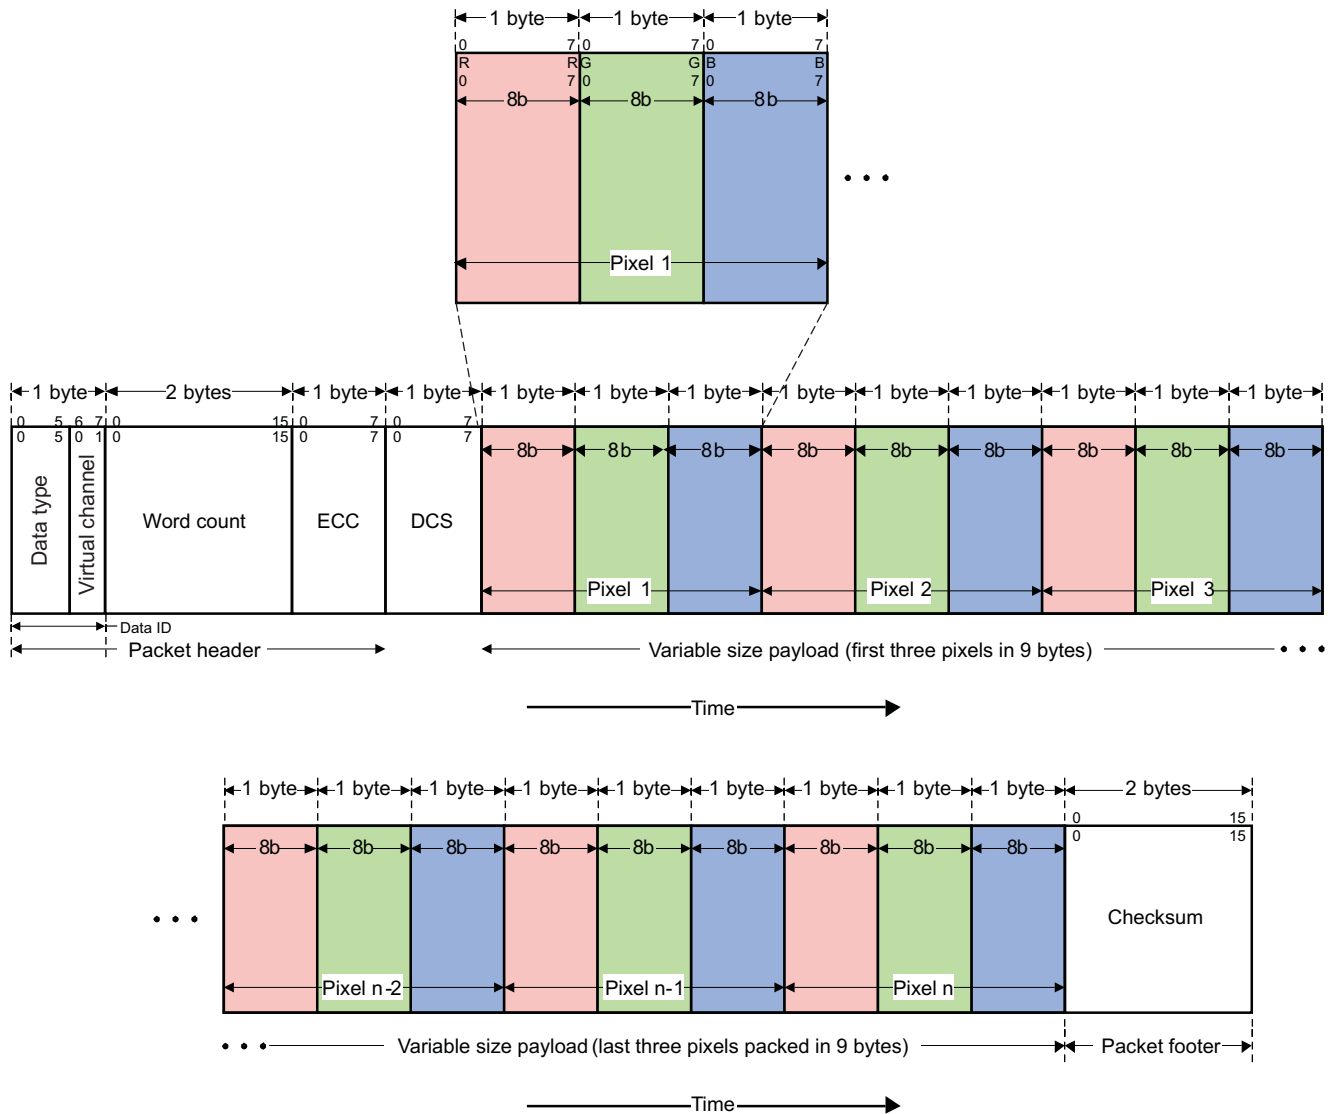

dsi-020

Packed-pixel stream, 24-bit format is a long packet used to transmit image data formatted as 24-bit pixels to a video-mode display module. The packet consists of the data ID byte, a 2-byte WC, an ECC byte, a payload of length WC bytes, and a 2-byte checksum. The pixel format is R (8 bits), G (8 bits), and B (8 bits), in that order. Each color component occupies 1 byte in the pixel stream; no components are split across byte boundaries. Within a color component, the LSB is sent first and the MSB last.

### 10.3.2.4.3 24 Bits per Pixel - RGB Color Format, Long Packet (Command Mode)

Figure 10-115 shows the RGB888 format.

Figure 10-115. 24-bpp RGB Color Format, Long Packet (Command Mode)

dsi-021

This format is the same as the packed pixel stream format.

**10.3.2.4.4 18 bpp (Loosely Packed) – RGB Color Format, Long Packet (Transparent for DSI Protocol Engine) (Video Mode)**

Figure 10-116 shows the RGB666 format.

**Figure 10-116. 18-bpp (Loosely Packed) RGB Color Format, Long Packet (Transparent for DSI Protocol Engine) (Video Mode)**

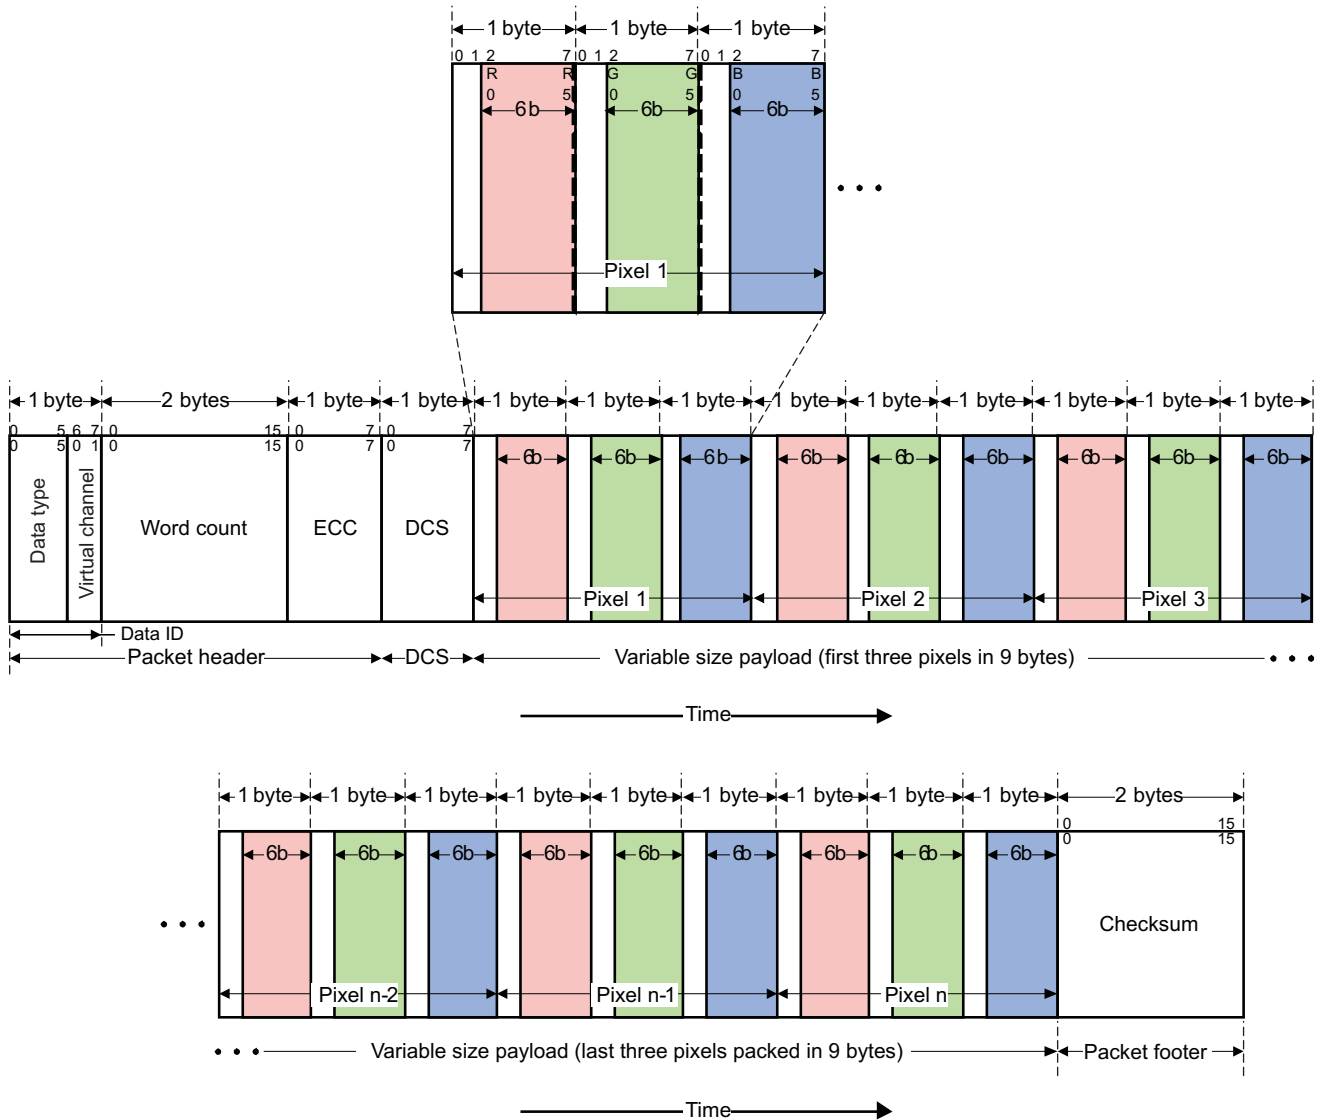

ds1-022

In 18-bit loosely packed pixel format, each R, G, and B color component is 6 bits but is shifted to the upper bits of the byte, such that the valid pixel bits occupy bits [7:2] of each byte. Bits [1:0] of each payload byte representing active pixels are ignored. As a result, each pixel requires 3 bytes as it is transmitted across the link. This requires more bandwidth than packed format but requires less shifting and multiplexing logic in the packing and unpacking functions on each end of the link. This format is used to transmit RGB image data formatted as pixels to a video mode display module that displays 18-bit pixels. The packet consists of the data ID byte, a 2-byte WC, an ECC byte, a payload of length WC bytes, and a 2-byte checksum. The pixel format is R (6 bits), G (6 bits), and B (6 bits), in that order. Within a color component, the LSB is sent first and the MSB last.

#### 10.3.2.4.5 18-bpp (Loosely Packed) – RGB Color Format, Long Packet (Command Mode)

Figure 10-117 shows the RGB666 format.

Figure 10-117. 18-bpp (Loosely Packed) RGB Color Format, Long Packet (Command Mode)

dsi-023

This format is the same as the packed-pixel stream format.

10.3.2.4.6 18-bpp (Packed) – RGB Color Format, Long Packet (Video Mode)

Figure 10-118 shows the RGB666\_PACKED format.

**Figure 10-118. 18-bpp (Packed) RGB Color Format, Long Packet (Video Mode)**

dsi-024

Packed pixel stream 18-bit format is a long packet. It is used to transmit RGB image data formatted as pixels to a video mode display module that displays 18-bit pixels. The packet consists of the data ID byte, a 2-byte WC, an ECC byte, a payload of length WC bytes, and a 2-byte checksum. The pixel format is R (6 bits), G (6 bits), and B (6 bits), in that order. Within a color component, the LSB is sent first and the MSB last. With this format, it is strongly recommended that the total line width be a multiple of 4 pixels (9 bytes). This format is not supported in command mode.

**10.3.2.4.7 16 bpp – RGB Color Format, Long Packet (Video Mode)**

Figure 10-119 shows the RGB565 format.

**Figure 10-119. 16-bpp RGB Color Format, Long Packet (Video Mode)**

dsi-025

Packed-pixel stream, 16-bit format is a long packet used to transmit image data formatted as 16-bit pixels to a video mode display module. The packet consists of the data ID byte, a 2-byte WC, an ECC byte, a payload of length WC bytes, and a 2-byte checksum. The pixel format is R (5 bits), G (6 bits; split across 2 bytes), and B (5 bits), in that order. Within a color component, the LSB is sent first and the MSB last.

**10.3.2.4.8 16 bpp – RGB Color Format, Long Packet (Command Mode)**

Figure 10-120 shows the RGB565 format.

**Figure 10-120. 16-bpp RGB Color Format, Long Packet (Command Mode)**

dsi-026

This is the opposite byte order from the packed pixel stream format. To retain flexibility, the byte order is made programmable using `DSI_VC_CTRL_i[12] RGB565_ORDER` bit, with this order the default for command mode through the video port.

### 10.3.3 DSI Integration

This section describes the integration of the DSI in the device, including information about clocks, resets, and hardware requests.

Figure 10-121 shows the integration of the DSI in the device.

Figure 10-121. DSI Integration

ds1-027

**NOTE:** For more information about the wake-up request, see [Section 3.1.1.1, Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

Table 10-466 through Table 10-469 summarize the integration of the DSI module in the device.

**Table 10-466. Integration Attributes**

Module Instance	Attributes	
	Power Domain	Interconnect
MIPI DSI1	PD_DSS	L3 for data L4_PER for configuration
MIPI DSI2	PD_DSS	L3 for data L4_PER for configuration

**NOTE:** L3 interconnect is used primarily for data.

L4\_PER interconnect is used primarily for configuration but is also used for backward software compatibility.

**Table 10-467. Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
	SYS_CLK	DSS_ALWON_SYS_CLK	PRCM module	Functional clock for the DSI PLLs
MIPI DSI1	DSI1_FCLK	DSS_FCLK PLL1_CLK2	PRCM module DSI1 PLL	Functional clock
	DSI1_ICLK	DSS_L3_ICLK	PRCM module	Interface clock
MIPI DSI2	DSI2_FCLK	DSS_FCLK PLL2_CLK2	PRCM module DSI2 PLL	Functional clock
	DSI2_ICLK	DSS_L3_ICLK	PRCM module	Interface clock
Resets				
MIPI DSI1	DSI1_RST	DISPSS_RST	PRCM module	Nonretention reset
MIPI DSI2	DSI2_RST	DISPSS_RST	PRCM module	Nonretention reset

**NOTE:** If video mode is used, the VPn\_PCLK and VPn\_CLK clocks must be generated using a CLKIN4DDR clock.

**NOTE:** For information about clock distribution and configuration inside the module, see [Section 10.3.4.2, DSI Clock Configuration](#).

**Table 10-468. Interrupt Requests**

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
MIPI DSI1	DSS_DSI1_IRQ	D_IRQ_95	DSP INTC	Display DSI1 interrupt request
	DSS_DSI1_IRQ	MA_IRQ_53	Cortex-A9 INTC	Display DSI1 interrupt request
	DSS_DSI1_IRQ	MM_IRQ_8	Cortex-M3 INTC	Display DSI1 interrupt request
MIPI DSI2	DSS_DSI2_IRQ	D_IRQ_96	DSP INTC	Display DSI2 interrupt request
	DSS_DSI2_IRQ	MA_IRQ_84	Cortex-A9 INTC	Display DSI2 interrupt request
	DSS_DSI2_IRQ	MM_IRQ_9	Cortex-M3 INTC	Display DSI2 interrupt request

**NOTE:** For a description of the interrupt source, see [Section 10.3.4.3, DSI Interrupt Requests](#).

**Table 10-469. DMA Requests**

DMA Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
MIPI DSI1	DSS_DSI1_DMA0	S_DMA_71	sDMA	DSI1 DMA request 0
	DSS_DSI1_DMA1	S_DMA_72	sDMA	DSI1 DMA request 1
	DSS_DSI1_DMA2	S_DMA_73	sDMA	DSI1 DMA request 2
	DSS_DSI1_DMA3	S_DMA_74	sDMA	DSI1 DMA request 3
MIPI DSI2	DSS_DSI2_DMA0	S_DMA_80	sDMA	DSI2 DMA request 0
	DSS_DSI2_DMA1	S_DMA_81	sDMA	DSI2 DMA request 1
	DSS_DSI2_DMA2	S_DMA_82	sDMA	DSI2 DMA request 2
	DSS_DSI2_DMA3	S_DMA_83	sDMA	DSI2 DMA request 3

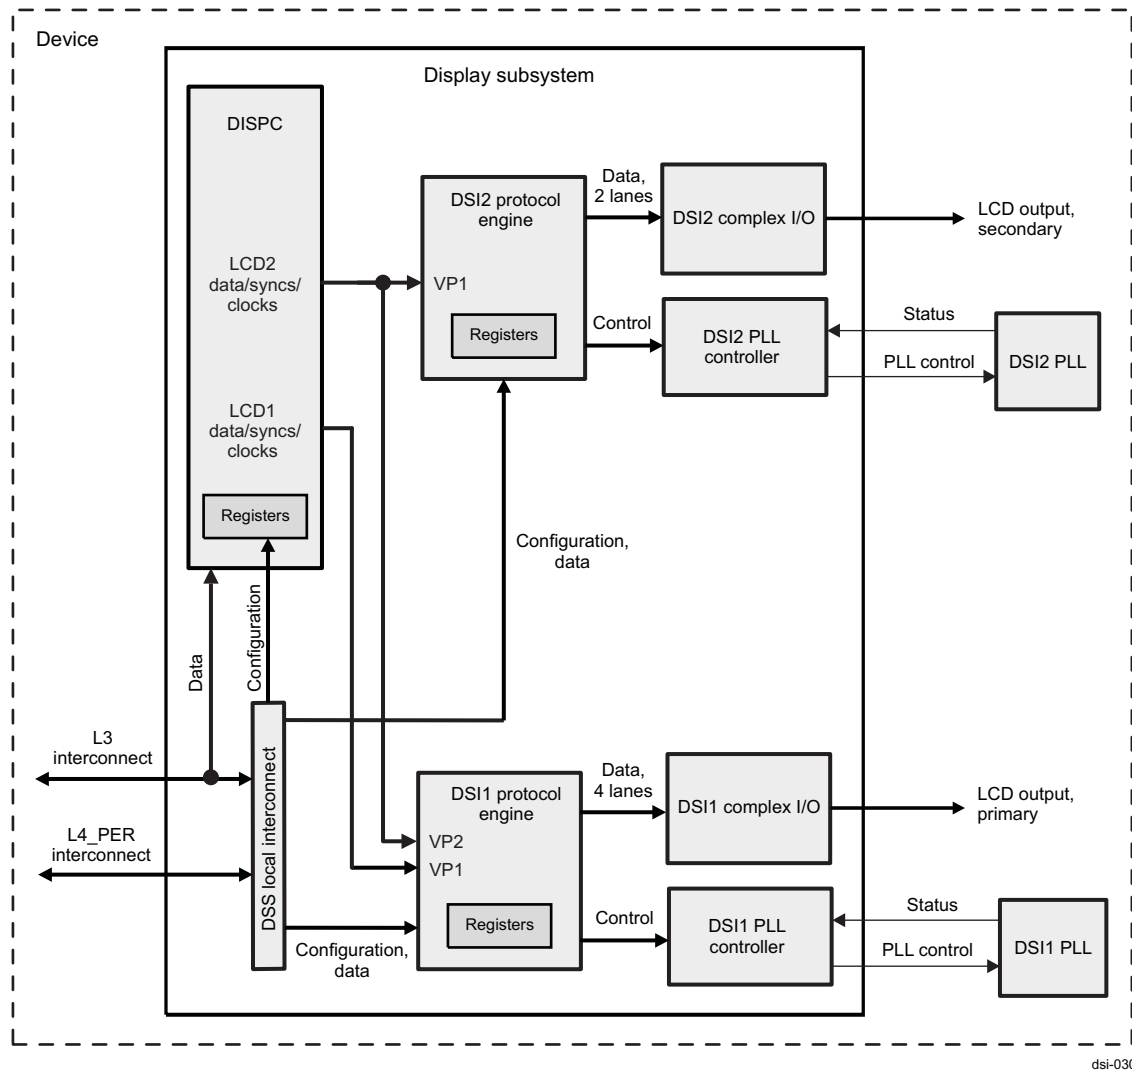

### 10.3.4 DSI Functional Description

This section describes the functions of the DSI1 and DSI2 modules.

#### 10.3.4.1 DSI Block Diagram

Figure 10-122 is a schematic of DSI1 and DSI2.

**Figure 10-122. DSI Schematic**

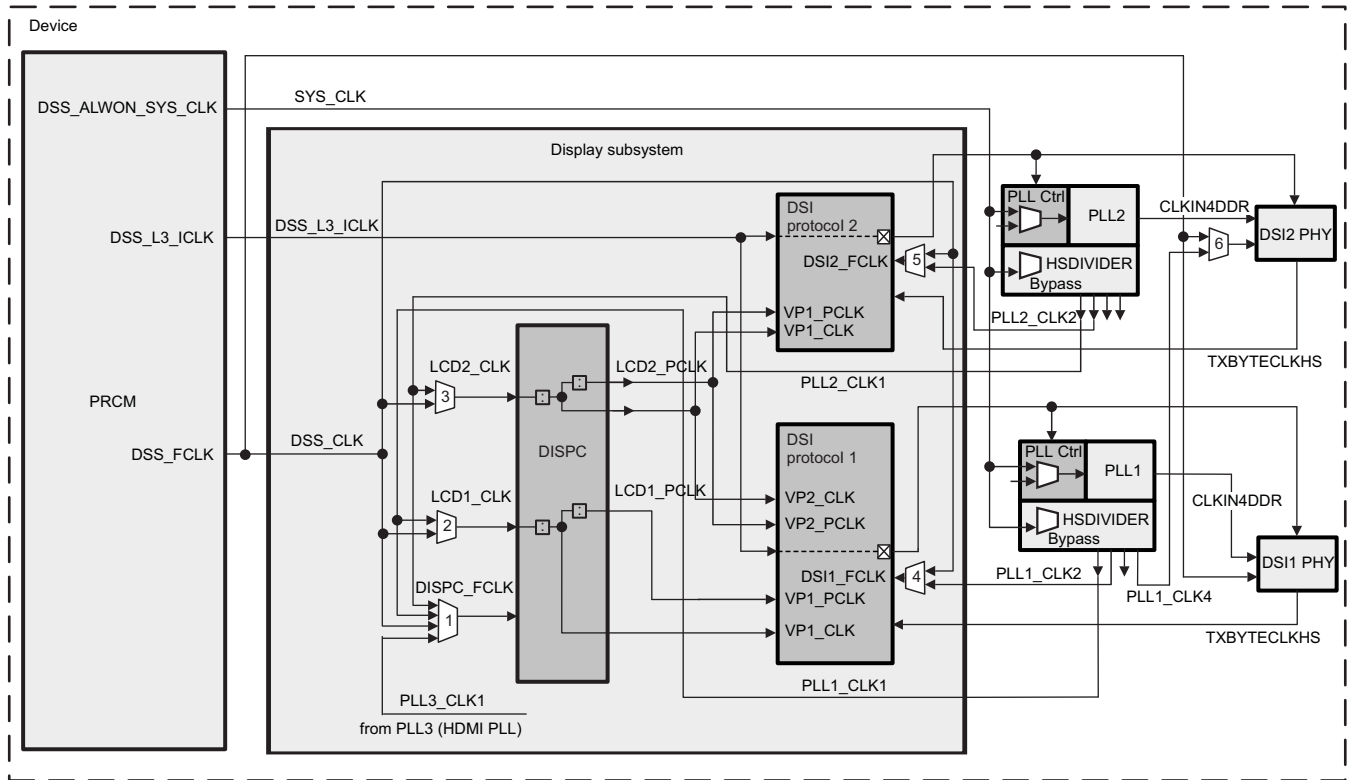

dsi-030

#### 10.3.4.2 DSI Clock Configuration

Figure 10-123 shows the clock tree for DSI1 and DSI2.

Figure 10-123. DSI Clock Tree

dsi-028

Table 10-470 shows the controls for clock multiplexers.

Table 10-470. DSI Multiplexer Controls

Destination	Source Signal Name	Source	Multiplexer Number	DSS Register Bit Field
DISPC functional clock (DISPC_FCLK)	DSS_CLK	DPLL_PER (PRCM)	1	For more information, see <a href="#">Section 10.1.2</a> , <i>DSS Integration</i> .
	PLL1_CLK1	PLL1	1	
	PLL2_CLK1	PLL2	1	
	PLL3_CLK1	PLL3	1	
DSI1 functional clock (LCD1_CLK)	DSS_CLK	DPLL_PER (PRCM)	2	For more information, see <a href="#">Section 10.1.2</a> , <i>DSS Integration</i> .
	PLL1_CLK1	PLL1	2	
DSI2 functional clock (LCD2_CLK)	DSS_CLK	DPLL_PER (PRCM)	3	For more information, see <a href="#">Section 10.1.2</a> , <i>DSS Integration</i> .
	PLL2_CLK1	PLL2	3	
DSI1 protocol engine functional clock (DSI1_FCLK)	DSS_CLK	DPLL_PER (PRCM)	4	For more information, see <a href="#">Section 10.1.2</a> , <i>DSS Integration</i> .
	PLL1_CLK2	PLL1	4	
DSI2 protocol engine functional clock (DSI2_FCLK)	DSS_CLK	DPLL_PER (PRCM)	5	For more information, see <a href="#">Section 10.1.2</a> , <i>DSS Integration</i> .
	PLL2_CLK2	PLL2	5	

---

**NOTE:** For more information about the DSI1 and DSI2 video port clocks (VPn\_CLK and VPn\_PCLK, where n = 1 or 2), see [Section 10.3.4.4.5, Video Port Interface](#).

---

**NOTE:** For the frequency ratings of the various DSI clocks, see [Section 10.1.2.1, DSS Clocks](#).

---

**NOTE:** Multiplexer 6, shown in [Figure 10-123](#), allows the DSS\_FCLK or PLL1\_CLK4 clock to be sent on DSI2 PHY bypass input. The use of the bypassed clock allows both DSI modules to run on DSS\_FCLK or on a single PLL (DSI1 PLL).

- To select the clock source for the DSI2 PHY bypass input, configure the CONTROL.CONTROL\_DSS\_CONTROL[0] DSS\_MUX6\_SELECT bit in the device control module. See [Chapter 18, Control Module](#).
  - To enable the bypass input for the DSI1 PHY or DSI2 PHY module, set the DSI\_PLL\_CONFIGURATION2[15] BYPASSEN bit to 1.
- 

### 10.3.4.3 DSI Interrupt Requests

The DSI protocol engine requires a single interrupt line. The [DSI\\_IRQSTATUS](#) register indicates the general interrupt events. Each VC and complex I/O has a dedicated interrupt register: [DSI\\_VC\\_IRQSTATUS\\_i](#) and [DSI\\_COMPLEXIO\\_IRQSTATUS](#), respectively.

[Table 10-471](#) lists the DSI global interrupt events.

**Table 10-471. DSI Global Interrupts**

IRQ Name	Description
Resynchronization_IRQ	Resynchronization in video mode
TA_TO_IRQ	Turnaround timer expired
SYNC_LOST_IRQ	Synchronization with video port is lost (video mode only).
ACK_TRIGGER_IRQ	Acknowledge trigger is received.
TE_TRIGGER_IRQ	TE PHY trigger is received.
WAKEUP_IRQ	Occurs when the SWakeUp signal is asserted.
HS_TX_TO_IRQ	HS TX time-out Interrupt
LP_RX_TO_IRQ	LS RX time-out Interrupt
COMPLEXIO_ERR_IRQ	Error signaling from complex I/O: The interrupt is triggered when an error is received from the complex I/O (events are defined in <a href="#">DSI_COMPLEXIO_IRQSTATUS</a> ).
PLL_RECAL_IRQ	PLL recalibration event (assertion of DSIRecal signal from the DSI PLL control module)
PLL_UNLOCK_IRQ	PLL un-lock event (deassertion of DSILock signal from the DSI PLL control module)
PLL_LOCK_IRQ	PLL lock event (assertion of DSILock signal from the DSI PLL control module)
VIRTUAL_CHANNEL3_IRQ	VC 3 error signaling from DSI VC 3: The interrupt is triggered when an error is received from DSI VC 3 (events are defined in <a href="#">DSI_VC_IRQENABLE_i</a> register, where i = 3).
VIRTUAL_CHANNEL2_IRQ	VC 2 error signaling from DSI VC 2: The interrupt is triggered when an error is received from DSI VC 2 (events are defined in <a href="#">DSI_VC_IRQENABLE_i</a> register, where i = 2).
VIRTUAL_CHANNEL1_IRQ	VC 1 error signaling from DSI VC 1: The interrupt is triggered when an error is received from DSI VC 1 (events are defined in <a href="#">DSI_VC_IRQENABLE_i</a> register, where i = 1).
VIRTUAL_CHANNEL0_IRQ	VC 0 error signaling from DSI VC 0: The interrupt is triggered when an error is received from DSI VC 0 (events are defined in <a href="#">DSI_VC_IRQENABLE_i</a> register, where i = 0).
TE0_LINE_IRQ	TE detected on TE0 CMOS input signal
TE1_LINE_IRQ	TE detected on TE1 CMOS input signal

**NOTE:** For information about other internal DSI interrupt events, see [Table 10-489](#) and [Table 10-496](#).

### 10.3.4.4 DSI Protocol Engine

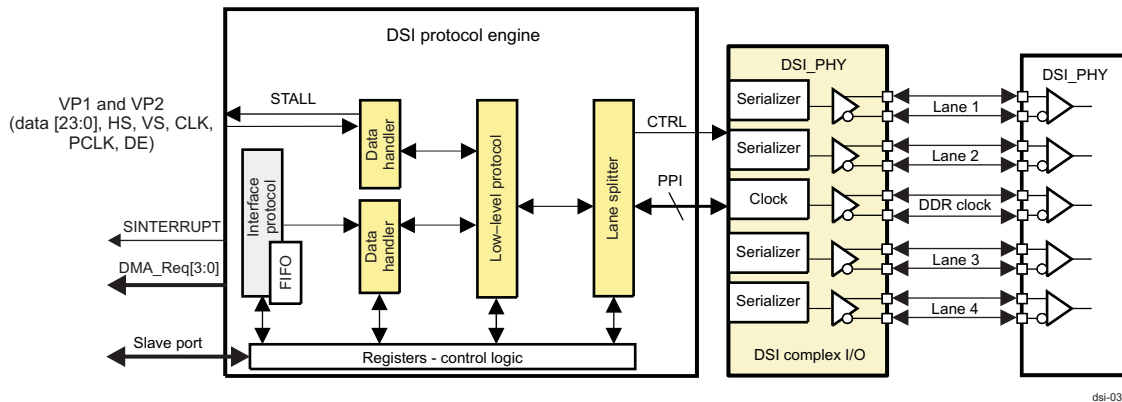

**NOTE:** Copyright 2005-2008 MIPI Alliance, Inc. All rights reserved. MIPI Alliance Member Confidential.

The DSI protocol engine integrates the DSI with the display through the DSI\_PHY module, local interconnect interface, and video interface from the DISPC. The DSI\_PHY or complex I/O module is described in [Section 10.3.4.6, DSI Complex I/O](#). The DSI transmitter (protocol engine + PHY) port can be connected to multiple displays using a single DSI host port. The DSI protocol engine controls the DSI PLL control module described in [Section 10.3.4.5, DSI PLL Controllers](#). The DSI transmitter port can be used in video mode or/and command mode.

#### 10.3.4.4.1 DSI Protocol Overview

The DSI protocol engine receives data from the DISPC video port and/or the L3 interconnect slave port, encapsulates them with the VC ID, generates the ECC and checksum, and splits the data into byte streams to the DSI\_PHY to be sent using LS or HS protocol. The DSI protocol engine receives data and acknowledges from the panel using the same DSI link in case of bidirectional panel. Multiple data streams can be interleaved to support multiple panels connected to the same host DSI port. [Figure 10-124](#) shows the DSI protocol engine, with an example of data lane and clock lane ordering. It is possible to configure other orders through registers as described in [Section 10.3.2.1.1, Data/Clock Configuration](#).

**Figure 10-124. DSI Protocol Engine**

**NOTE:** [Figure 10-124](#) gives information for DSI1 with its four data lanes. DSI2 has only two data lanes.

**NOTE:** The order of the PHY pairs (clock and data lanes) is informative. Each PHY pair can be clock or data. DSI complex I/O receives the configuration for the pin order and the differential  $\pm$  in a pair from the settings in the [DSI\\_COMPLEXIO\\_CFG1](#) register.

#### 10.3.4.4.2 DSI Global Register Controls

Before receiving data from the DSI complex I/O, the DSI\_PHY SCP registers in the DSI complex I/O must be configured. [Table 10-472](#) lists the register access width limitations for all the DSI modules.

**Table 10-472. Register Access Width Limitations**

Register Name	Register Access Width
All DSI complex I/O registers (DSI_PHY SCP)	32-bit only
All DSI PLL control module registers	32-bit only
<a href="#">DSI_VC_LONG_PACKET_HEADER_i</a>	32-bit only
<a href="#">DSI_VC_SHORT_PACKET_HEADER_i</a>	32-bit only
<a href="#">DSI_VC_LONG_PACKET_PAYLOAD_i</a>	16- and 32-bit
All other DSI protocol engine registers	8-, 16-, and 32-bit

**CAUTION**

If a different access width than listed in [Table 10-472](#) is used, an interface error is generated in response to the write using SResp = ERR.

The DSI protocol engine is globally controlled by the [DSI\\_CTRL](#) register. The interface to the complex I/O is enabled by setting the [DSI\\_CTRL\[0\] IF\\_EN](#) bit. When the interface is disabled, it is possible to provide data to the TX FIFO and read pending data in the RX FIFO. When the [DSI\\_CTRL\[0\] IF\\_EN](#) bit is set to 1, the pending packets are sent to the DSI complex I/O, and the data transfer from the video port is ignored until the first vertical sync event is received.

When the [DSI\\_CTRL\[0\] IF\\_EN](#) bit is reset by software, the DSI protocol engine must finish the transfer of the pending data in the TX FIFO and wait for a response if BTA has been sent (the protocol engine is in receive mode); hardware then resets the [DSI\\_CTRL\[0\] IF\\_EN](#) bit. When using video mode, the VC associated with the video port must be enabled before enabling the interface according to the following sequence:

1. The [DSI\\_CTRL\[0\] IF\\_EN](#) bit is equal to 0.
2. Enable the VC associated with video mode by setting the [DSI\\_VC\\_CTRL\\_i\[0\] VC\\_EN](#) bit.
3. Set the [DSI\\_CTRL\[0\] IF\\_EN](#) bit to 1.

**10.3.4.4.3 DSI Transfer Modes**

Two main transfer modes are supported by the DSI modules:

- Video mode: Pixels are received from the video port (VP1 or VP2.) There are some real-time constraints (pixels must be sent at the pixel frequency required by the panel module).
- Command mode: Pixels can be received from the video port or from the L3 interconnect slave port. There are no real-time constraints except that the TE must be avoided by starting the transfer at the correct time during the scan of the display and that it must be fast enough.

**10.3.4.4.3.1 Video Mode**

Video mode refers to the MIPI display pixel interface (DPI) standard. The sync events and pixels must be sent according to the display mode timings. Data is received from the video ports. The DISPC fetches the data from the system memory and provides it to the DSI protocol engine through VP1 or VP2. The short packets used for the sync event use precalculated 32-bit values. The long packets are constructed using the header defined in the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) registers. In case of synchronization short packets for video mode, because hardware generates short packets without using the [DSI\\_VC\\_SHORT\\_PACKET\\_HEADER\\_i](#) register, if the [DSI\\_VC\\_CTRL\\_i\[8\] ECC\\_TX\\_EN](#) bit is set, the ECC is calculated; otherwise, 0 is used. The feature is used to generate incorrect ECC for debug purpose and to ease the check of the link and peripheral error detection and correction.

The [DSI\\_VM\\_TIMING1](#) through [DSI\\_VM\\_TIMING8](#) registers define the timings of the video mode.

The [DSI\\_VM\\_TIMING2\[27:24\] WINDOW\\_SYNC](#) bit field defines the synchronization period. The recommended value is 0x4 based on the implementation of the resynchronization scheme.

The [DSI\\_CTRL\[20\] BLANKING\\_MODE](#) bit defines whether long blanking packets or LPS are used during the blanking periods (except HFP, HBP, and HSA defined by other bits) when there is no pending data in TX FIFO ready to be sent. Software must ensure that there is no data in the TX FIFO, no BTA, no RESET trigger sent, and the [DSI\\_VC\\_CTRL\\_i\[9\] MODE\\_SPEED](#) bit is set to 1 (HS mode) to keep the video mode transfer in HS mode during blanking periods (except for the last blanking period, because it is required to go to LPS at least once per frame).

The [DSI\\_CTRL\[21\] HFP\\_BLANKING\\_MODE](#), [DSI\\_CTRL\[22\] HBP\\_BLANKING\\_MODE](#), and [DSI\\_CTRL\[23\] HSA\\_BLANKING\\_MODE](#) bits define whether during these blanking packets data from TX FIFO or long blanking packets are sent.

To ensure that the writes to the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register are handled correctly as header information for video mode long packets, the following registers must be programmed:

- [DSI\\_VC\\_CTRL\\_i\[0\] VC\\_EN](#) bit set to 0
- [DSI\\_VC\\_CTRL\\_i\[4\] MODE](#) bit set to 1
- [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register access
- [DSI\\_VC\\_CTRL\\_i\[0\] VC\\_EN](#) bit set to 1

---

**NOTE:** The hardware ignores [DSI\\_VC\\_CTRL\\_i\[1\] SOURCE](#) and [DSI\\_VC\\_CTRL\\_i\[9\] MODE\\_SPEED](#) bits when video mode is selected (the [DSI\\_VC\\_CTRL\\_i\[4\] MODE](#) bit set to 1).

---

The [SYNC\\_LOST\\_IRQ](#) and [RESYNCHRONIZATION\\_IRQ](#) interrupt events indicate whether the DSI protocol engine has not been able to resynchronize the video port timing to its own timing base or if it has been done. The [RESYNCHRONIZATION\\_IRQ](#) indicates to the software user that the video port works but the configuration of the timings for the DISPC and for DSI protocol engine may need to be modified to avoid the resynchronization. The [SYNC\\_LOST\\_IRQ](#) and [RESYNCHRONIZATION\\_IRQ](#) events can be respectively monitored in [DSI\\_IRQSTATUS\[18\] SYNC\\_LOST\\_IRQ](#) and [DSI\\_IRQSTATUS\[5\] RESYNCHRONIZATION\\_IRQ](#) status bits.

#### 10.3.4.4.3.2 Command Mode

The command mode refers to the MIPI display command set (DCS) standard. The commands, parameters, and pixels are sent to the display module with limited real-time constraints (as defined in [Section 10.3.4.4.3.1, Video Mode](#)). The pixels can be provided on one of the two video ports by the DISPC or on the L3 interconnect slave port.

The [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) registers are used for the header of long packets; the [DSI\\_VC\\_SHORT\\_PACKET\\_HEADER\\_i](#) registers are used for the short packets.

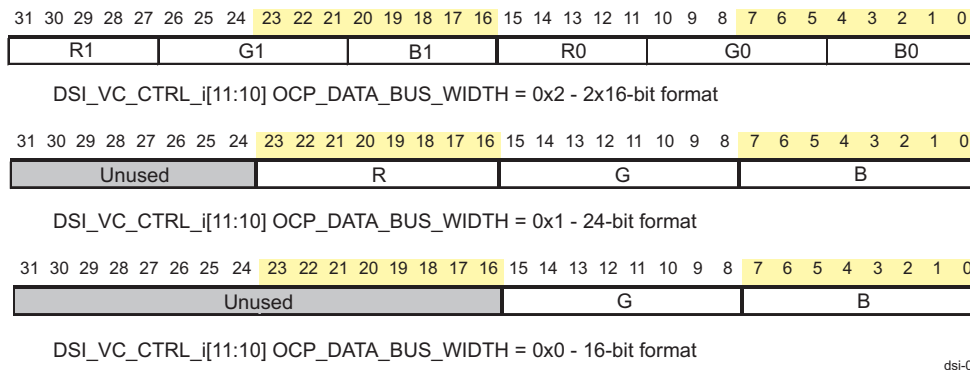

For the payload, the [DSI\\_VC\\_LONG\\_PACKET\\_PAYLOAD\\_i](#) register is used. Each 32-bit payload data is written to the [DSI\\_VC\\_LONG\\_PACKET\\_PAYLOAD\\_i](#) register from the MPU subsystem or sDMA. It is buffered to send packets with higher rate than the L3 interconnect frequency can provide. If [DSI\\_VC\\_CTRL\\_i\[30\] DCS\\_CMD\\_ENABLE = 1](#), the word count defined in the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register is used to determine the number of bytes to be sent using the [DSI\\_VC\\_LONG\\_PACKET\\_PAYLOAD\\_i](#) register minus the size of the DCS command header added by the protocol engine at the beginning of the payload (also sent using the [DSI\\_VC\\_LONG\\_PACKET\\_PAYLOAD\\_i](#) register). If [DSI\\_VC\\_CTRL\\_i\[30\] DCS\\_CMD\\_ENABLE = 0](#), the word count defined in the register [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register is used to determine the number of bytes to be sent using the [DSI\\_VC\\_LONG\\_PACKET\\_PAYLOAD\\_i](#) register.

The [DSI\\_VC\\_CTRL\\_i\[11:10\] OCP\\_DATA\\_BUS\\_WIDTH](#) bit field is used to define the size of the data on the L3 interconnect slave port for the write access (read access to the RX FIFO is not affected by the bit field value):

- 0x0: 16-bit data width (LSB of the 32-bit interface port data bus)
- 0x1: 24-bit data width (LSB of the 32-bit interface port data bus)
- 0x2: 2x16-bit data width (first pixel on the LSB of the 32-bit Interface port data bus and second pixel on the MSB of the 32-bit interface port data bus for the same interface access)
- 0x3: 32-bit data width (no bit, no byte, no pixel manipulation)

Figure 10-125 shows the different data width configurations of the L3 interconnect slave port.

**Figure 10-125. Interface Data Configuration**

**NOTE:** To provide 18-bit pixel loosely packed format to the L3 interconnect slave port, the [DSI\\_VC\\_CTRL\\_i\[11:10\] OCP\\_DATA\\_BUS\\_WIDTH](#) bit field must be set to 0x1. The 18-bit pixel packed format is not supported in case of command mode on the L3 interconnect slave port.

The write into the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register is required before accessing the [DSI\\_VC\\_LONG\\_PACKET\\_PAYLOAD\\_i](#) register. The DSI protocol engine must extract the length of the payload and discard the extra data sent using the [DSI\\_VC\\_LONG\\_PACKET\\_PAYLOAD\\_i](#) register. Writes into the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register are valid only if the VC is enabled; otherwise, the write is ignored. When receiving pixels on the video port, only the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register is used. The video port pixels are used for the payload.

#### 10.3.4.4.3.2.1 Command Mode TX FIFO

The single TX FIFO is used to store data from the L3 interconnect before sending it to the panel. The configuration of the FIFO for a specific VC must be done only when the VC is disabled.

The VC must not be enabled when data is still pending in the TX FIFO for the corresponding space allocated for the VC from the previous active period. When the VC space in the TX FIFO is empty, the VC can be enabled.

For each VC, two dedicated registers ([DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) and [DSI\\_VC\\_LONG\\_PACKET\\_PAYLOAD\\_i](#)) are used to provide data for long packets. The [DSI\\_VC\\_SHORT\\_PACKET\\_HEADER\\_i](#) register is used to provide data for short packets (32 bits long).

For each long packet, the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register must be written first, and then the [DSI\\_VC\\_LONG\\_PACKET\\_PAYLOAD\\_i](#) register. The only exception is when the word count defined in the header equals 0. In that case, it is not required to write into the payload register. For consecutive long packets, the header must be written into the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register even if the value remains the same.

The TX FIFO stores all the pending bytes to be sent to the peripheral(s). Multiple receivers can be addressed using the VC capability.

The 32-bit write requests for each VC to the TX FIFO are kept in order while sending the data to the DSI\_PHY inside the VC requests. The only exception is the last 32-bit write for the last bytes of the payload data, because it can be 1, 2, 3, or 4 bytes.

When the last transfer is a 32-bit write, but the number of valid bytes is only 1, 2, or 3 (calculated using the header word count and the number of bytes are received for the payload), hardware stores the 32-bit value into the TX FIFO but the invalid bytes are not sent and are discarded.

When the word count defined in the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register is not a multiple of the request threshold value defined in the [DSI\\_VC\\_CTRL\\_i\[19:17\] DMA\\_TX\\_THRESHOLD](#) bit field, 32-bit requests and/or bytes are discarded by hardware to store in FIFO only the exact number of valid bytes.

The triggering event to send data to the DSI link is one of the following events:

- All bytes have been received in the FIFO (header + payload).
- The space of the FIFO allocated for the VC is full.
- The space of the FIFO allocated for the VC is not enough to request more data using DMA request (the threshold value is bigger than the space left in the TX FIFO for the VC).
- When the VC is disabled, the remaining bytes in the FIFO are sent to the DSI link.

---

**NOTE:** In case video mode is active, the blanking period must be large enough to allow the transfer of the packet(s).

Sequential arbitration must be set ([DSI\\_CTRL\[3\]](#) bit TX\_FIFO\_ARBITRATION = 0x1) if only one VC is used to send multiple packets during the same blanking period.

---

When consecutive packets should be sent in HS mode, to ensure that there is no LP transition between them, at least one of the following conditions must be valid:

- Packets from the same VC
- Short packets or long packets with a payload size multiple of 4 bytes

To stop a transfer immediately when packets are being transferred from the TX FIFO to DSI\_PHY, a flush of the FIFO is necessary. It can be required in a dead-lock situation to flush the FIFO even if bytes are still in the FIFO. In that case, it is necessary to ensure having a known state of the whole DSI protocol engine module (software reset may be required) to start of new transfer through the TX FIFO.

To flush the FIFO (discard the data) for some pending bytes:

1. Change the size of the space of FIFO to 0 by writing [DSI\\_TX\\_FIFO\\_VC\\_SIZE](#) [VCi\\_FIFO\\_SIZE](#) bit fields (where i is the VC number from 0 to 3).
2. Disable the VC by resetting the [DSI\\_VC\\_CTRL\\_i\[0\]](#) VC\_EN bit to 0.
3. Wait for [DSI\\_VC\\_CTRL\\_i\[15\]](#) VC\_BUSY = 0 (VC\_BUSY is set to 0 after TX FIFO flush is done).

It is necessary to check that there is no pending request before changing the size of the allocated FIFO for the VC by reading the relevant [DSI\\_VC\\_CTRL\\_i\[15\]](#) VC\_BUSY bit or by using the interrupt PACKET\_SENT\_IRQ. This interrupt is monitored by reading the [DSI\\_VC\\_IRQSTATUS\\_i\[2\]](#) PACKET\_SENT\_IRQ status bit.

The [DSI\\_CTRL\[3\]](#) TX\_FIFO\_ARBITRATION bit defines the arbitration scheme:

- Round-robin between enabled VCs with pending ready requests (that is, all bytes for the packets are in the FIFO or the space of the FIFO for the VC is full) starting from the VC that has the lowest VC ID number.
- Sequential: All the pending ready requests for one VC are sent before moving to another VC. The condition of "space of the FIFO is full" is evaluated after the end of each packet.

To use in-order for all requests for all channels, a single VC must be used. (The VC ID defined in the header provided to hardware using the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) or [DSI\\_VC\\_SHORT\\_PACKET\\_HEADER\\_i](#) register is not used and not modified by the DSI protocol engine.)

The [DSI\\_TX\\_FIFO\\_VC\\_SIZE](#) register defines the allocated number of 33-bit values for each VC in the TX FIFO and the start address for each VC. The size of the space allocated in the TX FIFO is defined by the [DSI\\_TX\\_FIFO\\_VC\\_SIZE](#) register - [VCi\\_FIFO\\_SIZE](#) bit fields. It must be a multiple of the threshold defined in the [DSI\\_VC\\_CTRL\\_i\[19:17\]](#) DMA\_TX\_THRESHOLD bit field. To change the size of the space of the memory allocated for a specific VC, the VC must be disabled by setting the [DSI\\_VC\\_CTRL\\_i\[0\]](#) VC\_EN bit to 0. The whole FIFO cannot be used by all the VCs at the same time because a VC can be disabled to change one or multiple parameters. Software users must configure the start address and size for each VC correctly.

[Table 10-473](#) lists the corresponding values for the size of the space allocated in the FIFO.

**Table 10-473. VC TX FIFO Size Values**

<a href="#">DSI_TX_FIFO_VC_SIZE.VCi_FIFO_SIZE</a> (where i = 0, 3)	Space Size (up to the Size of the FIFO)
0	0 x 33 bits
1	32 x 33 bits
2	64 x 33 bits
3	96 x 33 bits
4	128 x 33 bits

**NOTE:** TX FIFO is 128 x 33 bits. Therefore, the sum of all VC FIFO allocations cannot exceed 128 x 33 bits.

**CAUTION**

Bit 32 of each location in the FIFO is used by the DSI protocol engine to tag the data in the TX FIFO. It is for internal use only.

Table 10-474 lists the start address of the space in the FIFO.

**Table 10-474. VC TX FIFO Start Address**

<a href="#">DSI_TX_FIFO_VC_SIZE.VCx_FIFO_ADD</a> (where x = 0, 2)	Start Address
0	0
1	32
2	64
3	96
4	128

**CAUTION**

The different VC spaces must not overlap.

When the TX FIFO is full:

- The overflow interrupt (FIFO\_TX\_OVF\_IRQ) is generated in the [DSI\\_VC\\_IRQSTATUS\\_i\[3\]](#) FIFO\_TX\_OVF\_IRQ status bit.
- There is no L3 interconnect error generated.
- The interface commands are accepted but the data are not written into the FIFO.

To ensure that all writes are stored correctly in the TX FIFO, the FIFO must not be full. The room in the space allocated for the VC in the TX FIFO is given in the [DSI\\_TX\\_FIFO\\_VC\\_EMPTYNESS](#) register. When there is no space allocated in the TX FIFO for the VC, the [DSI\\_TX\\_FIFO\\_VC\\_EMPTYNESS](#) register indicates a value of 0 for the VC space emptiness.

While waiting to receive the first VSYNC event on the video port to start video mode on the DSI link, no command data from TX FIFO is sent on the interface. This is required to ensure that, when receiving the VSYNC event, there is no ongoing command mode transfer that could delay the start of video mode on the the DSI link.

**10.3.4.4.3.2 Command Mode RX FIFO**

The RX FIFO stores the data received from the DSI complex I/O. The data are always packed in the RX FIFO (single or multiple packets received during single or multiple BTA periods).

The read requests (single or burst) can be less than, equal to, or greater than the packet size. If the packet size is smaller than the read request, the following packet(s) is also transferred. If the packet size is longer than the read request, only part of the packet is transferred. In that case, the logic keeps the VC information to provide the rest of the data during the next read request(s).

The [DSI\\_RX\\_FIFO\\_VC\\_SIZE](#) register defines the allocated number of 33-bit values for each VC in the RX FIFO and the start address for each VC. Only the enabled VCs are considered.

To change the size of the memory space allocated for a specific VC, the VC must be disabled by resetting the [DSI\\_VC\\_CTRL\\_i\[0\]](#) VC\_EN bit to 0. The entire FIFO cannot be used by the entire VC at the same time because a VC can be disabled to change one or multiple parameters. Software users must configure the start address and size for each VC correctly.

[Table 10-475](#) lists the corresponding values for the size of the space allocated in the FIFO:

**Table 10-475. VC RX FIFO Size Values**

<a href="#">DSI_RX_FIFO_VC_SIZE</a> .VCi_FIFO_SIZE (where i = 0, 3)	Space Size (up to the size of the FIFO)
0	0 x 33 bits
1	32 x 33 bits
2	64 x 33 bits
3	96 x 33 bits
4	128 x 33 bits

**NOTE:** RX FIFO is 128 x 33 bits. Therefore, the sum of all VC FIFO allocations cannot exceed 128 x 33 bits.

**CAUTION**

Bit 32 of each location in the FIFO is used by the DSI protocol engine to tag the data in the RX FIFO. It is for internal use only.

[Table 10-476](#) lists the start address of the space in the FIFO.

**Table 10-476. VC RX FIFO Start Address**

<a href="#">DSI_RX_FIFO_VC_SIZE</a> .VCx_FIFO_ADD (where x = 0, 2)	Start Address
0	0
1	32
2	64
3	96
4	128

**CAUTION**

The different VC spaces must not overlap.

While reading the received bytes in the RX FIFO, only the [DSI\\_VC\\_SHORT\\_PACKET\\_HEADER\\_i](#) register is used, because hardware does not keep track of the header position for long packets and the start/end of each packet. Software must extract the information from the bytes read from the RX FIFO. There is no specific hardware to track the received bytes in the RX FIFO. The [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) and [DSI\\_VC\\_LONG\\_PACKET\\_PAYLOAD\\_i](#) registers are not used.

The ECC is used only by the first header when receiving multiple packets during the same LP RX transfer from the peripheral because the DSI protocol engine does not parse the header to identify the length of the packets. In case of multiple packets, the checksum is not enabled because hardware checks the checksum considering a single packet. The ECC in the first header is used to correct and check the header. For the following headers in the same LP RX transfer, hardware does not detect a header and cannot check and/or detect errors in the headers of the packets except for the first packet.

When the RX FIFO is empty:

- No interface error is generated.
- Commands are accepted and the data for the responses are 0s.

#### 10.3.4.4.3.2.3 Command Mode DMA Requests

The DMA requests (DSI\_DMA\_REQ) are used to allow automatic transfer by the sDMA or MPU (with less efficiency and throughput capability) from the DSI RX FIFO to the system memory and from the system memory to the DSI TX FIFO. Two independent DMA requests for RX FIFO and TX FIFO for the same VC are supported. The read and write accesses can use burst structure.

The thresholds used for requests for the TX FIFO and RX FIFO are programmable through the [DSI\\_VC\\_CTRL\\_i\[19:17\] DMA\\_TX\\_THRESHOLD](#) and [DSI\\_VC\\_CTRL\\_i\[26:24\] DMA\\_RX\\_THRESHOLD](#) bit fields for TX FIFO and RX FIFO, respectively. DMA requests are asserted on the threshold value. The size of the space allocated in TX FIFO for each VC must be a multiple of the value of the [DSI\\_VC\\_CTRL\\_i\[19:17\] DMA\\_TX\\_THRESHOLD](#) bit field.

In the case of TX FIFO, if all the bytes defined by the word count field in the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register are received, the DMA request is no longer asserted. Even during the last transfer, less than the DMA\_TX\_THRESHOLD number of bytes are received because the word count is not a multiple of the DMA\_TX\_THRESHOLD value.

In the case of RX FIFO, while the DMA request is used to transfer the data from the RX FIFO to the system memory, the sDMA must be programmed to read the exact number of received bytes in the FIFO. If users do not know the size of the received bytes, the direct access of the RX FIFO through the [DSI\\_VC\\_SHORT\\_PACKET\\_HEADER\\_i](#) register is performed until the [DSI\\_VC\\_CTRL\\_i\[20\] RX\\_FIFO\\_NOT\\_EMPTY](#) bit goes to 0.

The only exception is when the LP data transfer finishes and the threshold value is not reached. In this case, the DMA request is asserted. The drain of the FIFO is supported in that configuration to empty the FIFO even if the number of data received is not a multiple of the threshold value.

The use of each DMA request is programmable by software. The [DSI\\_VC\\_CTRL\\_i\[23:21\] DMA\\_TX\\_REQ\\_NB](#) bit field is dedicated to DMA request numbering for the TX FIFO. The [DSI\\_VC\\_CTRL\\_i\[29:27\] DMA\\_RX\\_REQ\\_NB](#) bit field is dedicated to DMA request numbering for the RX FIFO.

When the DMA request is used to indicate the number of 32-bit values ready in the RX FIFO that BTA has received from the peripheral, which indicates an end of the transfer from the peripheral to the host for a transfer to the system memory, the DMA request that corresponds to the VC ID is generated.

The sDMA transfers the number of 32-bit values defined in the threshold register or the exact number of bytes received from the peripheral (the user must know the number of expected received bytes to program the sDMA correctly). When the sDMA transfers a multiple number of threshold values, the DSI protocol engine sends 0s for the data when there is no more received data in the RX FIFO for the VC. Software users must parse the data and determine the valid bytes.

The size of the DMA transfer can be determined by reading the [DSI\\_RX\\_FIFO\\_VC\\_FULLNESS](#) register. The BTA interrupt (BTA\_IRQ) must be used to know when to read the number of received bytes. The BTA interrupt must be monitored by reading the [DSI\\_VC\\_IRQSTATUS\\_i\[5\] BTA\\_IRQ](#) status bit. The DMA request must not be enabled until the sDMA is programmed with the correct number of data to read from RX FIFO.

This method must also be used when the RX FIFO space for the VC is expected to overflow because the expected number of data to be received is greater than the space allocated for the VC. Instead, the DMA request is asserted as soon as the threshold is reached or when BTA is received.

When the DMA request is used to indicate the number of 33-bit entries empty in the TX FIFO for a transfer from the system memory, the DMA request corresponding to the VC ID is generated.

---

**NOTE:** For the most efficient transfer, the size of the request (read or write, single or burst) must be aligned with the threshold value.

---

Concurrent access using interlaced requests (read/write) to the TX and RX FIFO is supported for the same VC ID or different VC IDs.

#### **10.3.4.4.3.3 Video + Command Mode**

The two modes can be interlaced to send two DSI streams to two types of panels: video or command. The number of concurrent video streams is limited to one. The number of concurrent command mode streams is limited to four when there is no video stream, and three when there is a video stream.

- For DSI1, which has two video ports (see [Section 10.3.4.4.5, Video Port Interface](#)), it is possible to send video or command mode streams from DISPC to DSI1 primary video port (VP1), and a command stream on the secondary VP (VP2) for interleaving. In addition, it is also possible to send concurrently a command mode stream on the L3 Interconnect slave port for interleaving.
- For DSI2, which has one video port, it is possible to send a video stream or a command mode stream from DISPC to DSI2 primary VP (VP1). There is no secondary VP. Interleaving of command mode transfers is only possible through L3 Interconnect slave port.

#### **10.3.4.4.3.4 Burst Mode**

Frequency and transparent burst modes are supported:

- Frequency burst mode is used to reduce the HS period by increasing the clock frequency on the DSI link. In some cases, it reduces power consumption on the link. The non-HS period used typically to drive the main panel can be used to send data to the secondary panel or to allow feedback (acknowledge) from the primary and secondary panels. The DSI protocol engine must buffer a full line before sending the HS packets for the line. A double-buffering mechanism is required to send a line while the following one is being received on the video port. For more information about double-buffering, see [Section 10.3.4.4.5.4, Ping-Pong Buffer](#).
- The transparent burst mode is used by increasing the pixel clock frequency generated by the DISPC with an increase of the horizontal blanking period.

#### **10.3.4.4.3.5 Interleaving Mode**

Video mode can output command mode packets, which are provided to DSI through the L3 interconnect, during the blanking periods of the video stream sequence on the PPI link. These command mode packets can be programmed as HS packets or low-power packets.

During a video stream sequence on the PPI link, four types of gap exist:

- BLLP gap: Blanking period during VSA, VBP, and VFP lines
- HSA gap: Blanking period during VACT lines; always between HS and HE short packet
- HBP gap: Blanking period during VACT lines; always between HS/HE short packet and data pixel long packet
- HFP gap: Blanking period during VACT lines; always between data pixel long packet and the end of the current VACT line

To perform interleaving in a particular gap, video mode must be set to go into LPS during the blanking gap. Each type of gap has separate configurable register bits that determine whether a blanking long packet will be sent or the link will go into LPS during the gap on the PPI link. If LPS is set during a gap, the DSI module performs interleaving during that period.

Two set of registers are available for:

- HS interleaving (when HS command mode packets must be sent during a video stream on the PPI link)
- Low-power interleaving (when low-power command mode packets must be sent during a video stream)

on the PPI link)

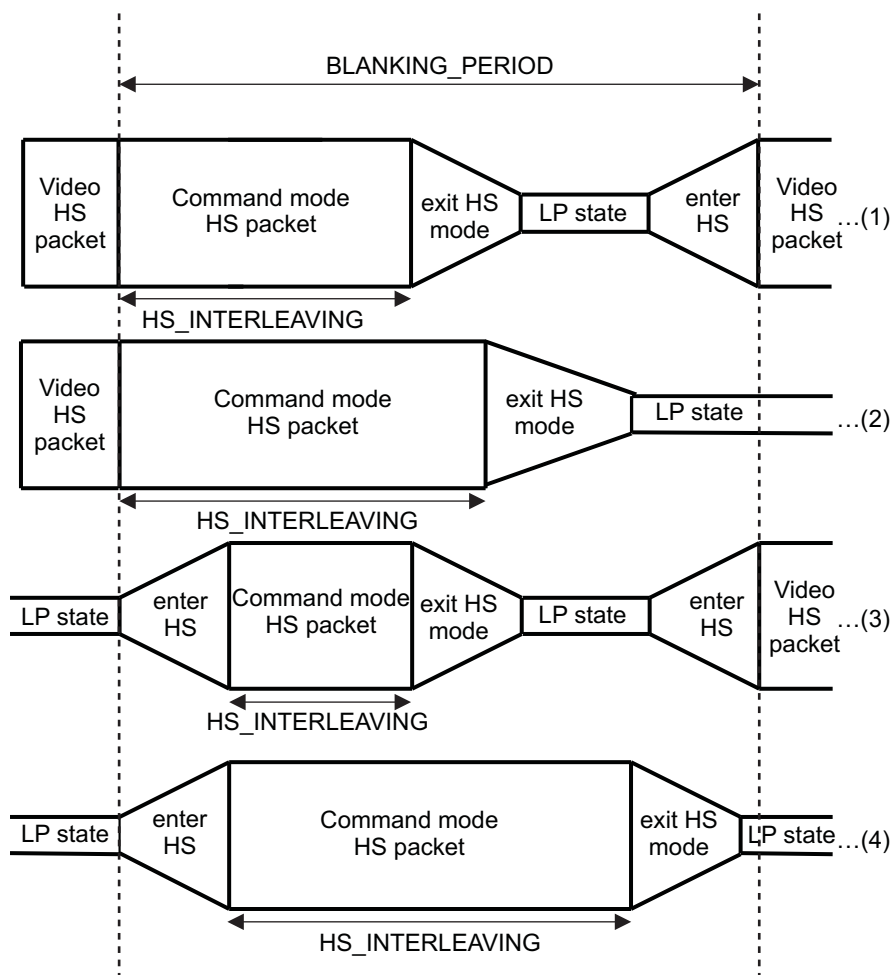

#### 10.3.4.4.3.5.1 HS Command Mode Interleaving

Figure 10-126 shows the various HS mode scenarios in interleaving mode during a blanking gap. For each type of blanking gap, a dedicated bit field determines the number of TXBYTECLKHS clock cycles used for interleaving in HS command mode packets.

- The `DSI_VM_TIMING6[31:16]` `BL_HS_INTERLEAVING` bit field defines the number of TXBYTECLKHS clock cycles used to interleave HS command mode packets during a BLLP gap.
- The `DSI_VM_TIMING4[7:0]` `HBP_HS_INTERLEAVING` bit field defines the number of TXBYTECLKHS clock cycles used to interleave HS command mode packets during an HBP gap.
- The `DSI_VM_TIMING4[15:8]` `HFP_HS_INTERLEAVING` bit field defines the number of TXBYTECLKHS clock cycles used to interleave HS command mode packets during an HFP gap.
- The `DSI_VM_TIMING4[23:16]` `HSA_HS_INTERLEAVING` bit field defines the number of TXBYTECLKHS clock cycles used to interleave HS command mode packets during an HSA gap.

These programmable values must be programmed to satisfy the timings for the clock and data lane to enter and exit HS mode latency. According to the scenario, different equations must be considered when calculating the register values.

**Figure 10-126. HS Command Mode Interleaving**

dsi-327

**NOTE:** For calculations and equations, the following abbreviations are used: EXIT\_CLK\_HS\_MODE represents the exit HS mode latency for the clock lane. There is no dedicated register for this value but the programmer must know this value for further calculations:

$$\text{EXIT\_CLK\_HS\_MODE} = T_{\text{CLK-TRAIL}} + T_{\text{HS-EXIT}}$$

**NOTE:** For more information about other timing parameters used in the following equations, see [Section 10.3.4.4.4.1, Timing Parameters for an LP to HS Transaction](#), and [Section 10.3.4.4.4.2, Timing Parameters for an HS to LP Transaction](#).

For the following equations, BLANKING\_PERIOD represents the BLLP, HSA, HBP, or HFP blanking periods. The HS\_INTERLEAVING period represents the maximal period HS command mode packets. Its value is set in the BL\_HS\_INTERLEAVING, HSA\_HS\_INTERLEAVING, HBP\_HS\_INTERLEAVING, or HFP\_HS\_INTERLEAVING bit fields, depending on the blanking type.

In each scenario, two calculations are present, depending on the value of the [DSI\\_CLK\\_CTRL\[13\]](#) DDR\_CLK\_ALWAYS\_ON bit:

- DDR\_CLK\_ALWAYS\_ON = 1: Clock lane is always active.
- DDR\_CLK\_ALWAYS\_ON = 0: Clock lane is activated only when there are HS packets to be sent on the PPI link.

#### CAUTION

When the DDR\_CLK\_ALWAYS\_ON bit is programmed to 1, the following must be considered:

- LP state can be achieved on the PPI link only if the data lane has enough time to go out from HS mode and enter a new HS mode during a period inside which the PPI link is meant to be in LP state.
- This can be expressed with the following equation:  

$$\text{EXIT\_HS\_MODE\_LATENCY} + \max\{\text{ENTER\_HS\_MODE\_LATENCY}, 2\} + 1 \leq \text{BLANKING\_PERIOD}$$
- If the equation cannot be satisfied, because the LP state period is too short, software must program the DSI module in a way that during this blanking period a HS blanking packet is sent.

When the DDR\_CLK\_ALWAYS\_ON bit is programmed to 0, the following must be considered:

- LP state can be achieved on the PPI link only if the data and clock lanes have enough time to go out from HS mode and enter a new HS mode during a period inside which the PPI link is meant to be in LP state.
- This can be expressed with the following equations:  

$$\text{EXIT\_HS\_MODE\_LATENCY} + \max\{\text{ENTER\_HS\_MODE\_LATENCY}, 2\} + 1 \leq \text{BLANKING\_PERIOD}$$

$$\text{DDR\_CLK\_POST} + \text{EXIT\_CLK\_HS\_MODE} + \text{DDR\_CLK\_PRE} + \text{ENTER\_HS\_MODE\_LATENCY}(\text{data lane}) + 1 \leq \text{BLANKING\_PERIOD}$$
- If both equations cannot be satisfied, because the LP state period is too short, software must program the DSI module in a way that during this blanking period a HS blanking packet is sent.

- Scenario 1: The gap for interleaving starts and ends with a regular video stream HS packet.
  - DDR\_CLK\_ALWAYS\_ON = 1  

$$\text{HS\_INTERLEAVING} = \text{BLANKING\_PERIOD} - (\text{EXIT\_HS\_MODE\_LATENCY} + \max\{\text{ENTER\_HS\_MODE\_LATENCY}, 2\} + 1)$$
  - DDR\_CLK\_ALWAYS\_ON = 0

$$\text{HS\_INTER1} = \text{BLANKING\_PERIOD} - (\text{EXIT\_HS\_MODE\_LATENCY} + \max\{\text{ENTER\_HS\_MODE\_LATENCY}, 2\} + 1)$$

$$\text{HS\_INTER2} = \text{BLANKING\_PERIOD} - (\text{DDR\_CLK\_POST} + \text{EXIT\_CLK\_HS\_MODE} + \text{DDR\_CLK\_PRE} + \text{ENTER\_HS\_MODE\_LATENCY} + 1)$$

$$\text{HS\_INTERLEAVING} = \min\{\text{HS\_INTER1}, \text{HS\_INTER2}\}$$

- Scenario 2: The gap for interleaving starts with a regular video stream HS packet and ends in LPS.
  - $\text{DDR\_CLK\_ALWAYS\_ON} = 1$   
 $\text{HS\_INTERLEAVING} = \text{BLANKING\_PERIOD} - (\text{EXIT\_HS\_MODE\_LATENCY} + 3)$
  - $\text{DDR\_CLK\_ALWAYS\_ON} = 0$   
 $\text{HS\_INTER1} = \text{BLANKING\_PERIOD} - (\text{EXIT\_HS\_MODE\_LATENCY} + 3)$   
 $\text{HS\_INTER2} = \text{BLANKING\_PERIOD} - (\text{DDR\_CLK\_POST} + \text{EXIT\_CLK\_HS\_MODE} + 3)$   
 $\text{HS\_INTERLEAVING} = \min\{\text{HS\_INTER1}, \text{HS\_INTER2}\}$
- Scenario 3: The gap for interleaving starts with the LPS and ends with a regular video stream HS packet.
  - $\text{DDR\_CLK\_ALWAYS\_ON} = 1$   
 $\text{HS\_INTERLEAVING} = \text{BLANKING\_PERIOD} - (\text{ENTER\_HS\_MODE\_LATENCY} + \text{EXIT\_HS\_MODE\_LATENCY} + \max\{\text{ENTER\_HS\_MODE\_LATENCY}, 2\} + 1)$
  - $\text{DDR\_CLK\_ALWAYS\_ON} = 0$   
 $\text{HS\_INTER1} = \text{BLANKING\_PERIOD} - (\text{DDR\_CLK\_PRE} + \text{ENTER\_HS\_MODE\_LATENCY} + \text{EXIT\_HS\_MODE\_LATENCY} + \max\{\text{ENTER\_HS\_MODE\_LATENCY}, 2\} + 1)$   
 $\text{HS\_INTER2} = \text{BLANKING\_PERIOD} - (\text{DDR\_CLK\_PRE} + \text{ENTER\_HS\_MODE\_LATENCY} + \text{DDR\_CLK\_POST} + \text{EXIT\_CLK\_HS\_MODE} + \text{DDR\_CLK\_PRE} + \text{ENTER\_HS\_MODE\_LATENCY} + 1)$   
 $\text{HS\_INTERLEAVING} = \min\{\text{HS\_INTER1}, \text{HS\_INTER2}\}$
- Scenario 4: The gap for interleaving starts with the LPS and ends with a regular video stream HS packet.
  - $\text{DDR\_CLK\_ALWAYS\_ON} = 1$   
 $\text{HS\_INTERLEAVING} = \text{BLANKING\_PERIOD} - (\text{ENTER\_HS\_MODE\_LATENCY} + \text{EXIT\_HS\_MODE\_LATENCY} + 3)$
  - $\text{DDR\_CLK\_ALWAYS\_ON} = 0$   
 $\text{HS\_INTER1} = \text{BLANKING\_PERIOD} - (\text{DDR\_CLK\_PRE} + \text{ENTER\_HS\_MODE\_LATENCY} + \text{EXIT\_HS\_MODE\_LATENCY} + 3)$   
 $\text{HS\_INTER2} = \text{BLANKING\_PERIOD} - (\text{DDR\_CLK\_PRE} + \text{ENTER\_HS\_MODE\_LATENCY} + \text{DDR\_CLK\_POST} + \text{EXIT\_CLK\_HS\_MODE} + 1)$   
 $\text{HS\_INTERLEAVING} = \min\{\text{HS\_INTER1}, \text{HS\_INTER2}\}$

#### 10.3.4.4.3.5.2 LP Command Mode Interleaving

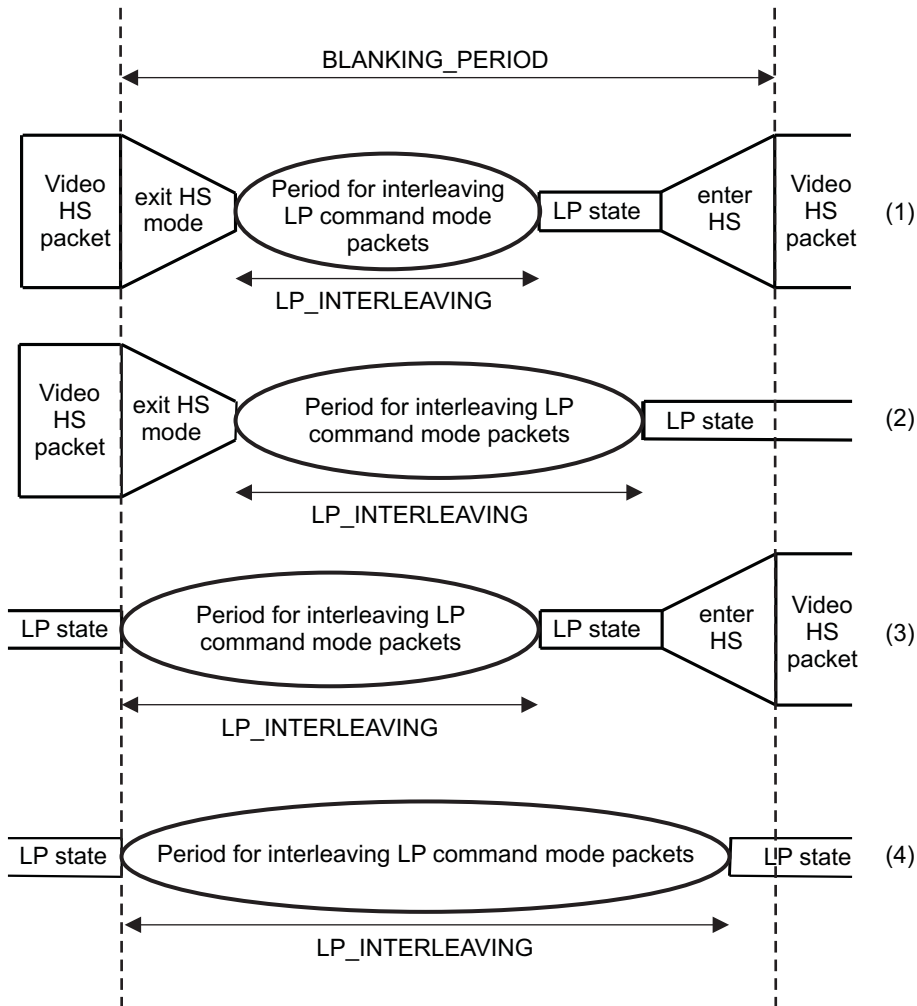

Figure 10-127 shows the various LP mode scenarios in interleaving mode during a blanking gap. For each type of blanking gap, a dedicated bit field determines the number of bytes of LP command mode packets that can be sent during a blanking period.

- The [DSI\\_VM\\_TIMING6](#)[15:0]  $\text{BL\_LP\_INTERLEAVING}$  bit field defines the number of bytes of LP command mode packets that can be sent during a BLLP gap.
- The [DSI\\_VM\\_TIMING5](#)[7:0]  $\text{HBP\_LP\_INTERLEAVING}$  bit field defines the number of bytes of LP command mode packets that can be sent during an HBP gap.
- The [DSI\\_VM\\_TIMING5](#)[15:8]  $\text{HFP\_LP\_INTERLEAVING}$  bit field defines the number of bytes of LP command mode packets that can be sent during an HFP gap.
- The [DSI\\_VM\\_TIMING5](#)[23:16]  $\text{HSA\_LP\_INTERLEAVING}$  bit field defines the number of bytes of LP command mode packets that can be sent during an HSA gap.

These values must be programmed to satisfy the timings for clock and data lane enter and exit LP mode latency. Clock lane timings do not affect LP command mode interleaving, because the clock lane can be controlled separately, compared with the data lane HS and low-power mutually exclusive control. Clock lanes can be in HS mode while the data lanes are in HS data transfer mode, low-power data transfer mode, or in LPS.

According to this scenario, different equations must be considered for calculating register values.

**Figure 10-127. LP Command Mode Interleaving**

dsi-328

For the following equations, BLANKING\_PERIOD represents the BLLP, HSA, HBP, or HFP blanking periods. The LP\_INTERLEAVING period represents the maximal period in LP command mode packets. Its value is set in the BL\_LP\_INTERLEAVING, HSA\_LP\_INTERLEAVING, HBP\_LP\_INTERLEAVING, or HFP\_LP\_INTERLEAVING bit fields, depending on the blanking type.

ALLOWED\_HSBYTE\_CLOCKS\_FOR\_LP represents the number of TXBYTECLKHS clock cycles during which LP interleaving can appear.

To calculate the LP\_INTERLEAVING value:

1. Calculate how many TXBYTECLKHS clock cycles can be reserved for LP interleaving during the appropriate blanking video mode gap.
2. Calculate the value of LP\_INTERLEAVING according to the results of Step 1.

Step 1:

- Scenario 1: The gap for interleaving starts and ends with a regular video stream HS packet.

ALLOWED\_HSBYTE\_CLOCKS\_FOR\_LP = BLANKING\_PERIOD – (EXIT\_HS\_MODE\_LATENCY + max{ENTER\_HS\_MODE\_LATENCY, 2} + 1)

- Scenario 2: The gap for interleaving starts with a regular video stream HS packet and ends in LPS.  
ALLOWED\_HSBYTE\_CLOCKS\_FOR\_LP = BLANKING\_PERIOD – (EXIT\_HS\_MODE\_LATENCY + 1)

- Scenario 3: The gap for interleaving starts with the LPS and ends with a regular video stream HS packet.

ALLOWED\_HSBYTE\_CLOCKS\_FOR\_LP = BLANKING\_PERIOD – (max{ENTER\_HS\_MODE\_LATENCY, 2} + 1)

- Scenario 4: The gap for interleaving starts with the LPS and ends with a regular video stream HS packet.

ALLOWED\_HSBYTE\_CLOCKS\_FOR\_LP = BLANKING\_PERIOD – 1

After finishing Step 1, the time period available for LP interleaving is known:

$$T_{lp\_available} = \text{ALLOWED\_HSBYTE\_CLOCKS\_FOR\_LP} * T_{TXBYTECLKHS}$$

Step 2:

The resulting value must be programmed in the appropriate video mode register for LP interleaving.

$$LP\_INTERLEAVING < \left[ \frac{T_{lp\_available} - 8 * T_{hsbyte\_clk} - 5 * T_{dsif\_clk} - 26}{T_{txclkesc}} \right]_{16}$$

dsi-E124

T<sub>hsbyte\_clk</sub>: Period of TXBYTECLKHS clock of DSI\_PHY module

T<sub>dsif\_clk</sub>: Period of DSI functional clock

T<sub>txclkesc</sub>: Period of LP transmit escape clock

#### 10.3.4.4.4 Clock Requirements

The serial clock generated by the DSI host and sent to the display can be a continuous clock. The clock lane supports clock transmission even if there is no data to send for displays that require continuous clock. It is software-programmed through the [DSI\\_CLK\\_CTRL\[13\] DDR\\_CLK\\_ALWAYS\\_ON](#) bit: This bit can be programmed only when the interface is disabled (the [DSI\\_CTRL\[0\] IF\\_EN](#) bit set to 0).

The peripheral can use two different kinds of clocks. The first one is the DDR clock provided on the clock lane. The second clock is some transitions on the data lane 1 even if there is no valid data to send using LP mode.

The LP clock (TxClkEsc) frequency provided to the DSI complex I/O is in the range of 67 percent to 150 percent of the peripheral low-power (LP) clock frequency. It is generated internally by the DSI protocol engine module using the DSI functional clock. The DSI functional clock is divided by 1, 2, 3, up to 8191 using the value programmed in the [DSI\\_CLK\\_CTRL\[12:0\] LP\\_CLK\\_DIVISOR](#) bit field. The LP clock generated from the DSI functional clock must be in the range of 20 MHz to 32 kHz. The duty cycle must be 50/50 (minimum high time = 24ns). LP clock frequency visible on the pads (DP x or DN) is half the frequency of TxClkEsc.

The [DSI\\_CLK\\_CTRL\[20\] LP\\_CLK\\_ENABLE](#) bit is used to enable or disable the clock. When disabled, the value of the [DSI\\_CLK\\_CTRL\[12:0\] LP\\_CLK\\_DIVISOR](#) bit field is ignored and does not have to be programmed by software users.

##### 10.3.4.4.4.1 Timing Parameters for an LP to HS Transaction

[Figure 10-128](#) shows the timing requirement when switching the data and clock lane state from LP to HS. [Table 10-1](#) lists the LP to HS timing parameters.

Figure 10-128. LP to HS Timing

dsi-325

**Table 10-477. LP to HS Timing Parameters**

Timings	Description	Registers/Associated Bit Fields	Register Settings	Timing Seen on the Line
$T_{LPX}$	Length of any low-power state period	DSI_PHY_REGISTER1[20:16] REG_TLPXBY2  The value set in this bit field is half of the $T_{LPX}$	CEIL (25 ns / DDR_Clock_Period)	CEIL (2 * REG_TLPXBY2/4) * 4 * DDR_Clock_Period
$T_{CLK-PREPARE}$	Time to drive the CLK lane to LP-00 state, to prepare for HS clock transmission	DSI_PHY_REGISTER2[7:0] REG_TCLKPREPARE	CEIL (65 ns / DDR_Clock_Period)	REG_TCLKPREPARE * DDR_Clock_Period + (~- 25 ns - +5 ns)
$T_{CLK-ZERO}$	Time to drive the CLK lane to HS-0 state, before starting the clock	DSI_PHY_REGISTER1[7:0] REG_TCLKZERO	CEIL (265 ns / DDR_Clock_Period)	{CEIL [(REG_TCLKZERO + 3)/4] * 4 + CEIL (REG_TCLKPREPARE/4) * 4 - REG_TCLKPREPARE + 2} * DDR_Clock_Period + (~ 0 ns - +5 ns)
$T_{CLK-PRE}$	Time that the HS clock must be driven before any associated data lane begins the transition from LP to HS mode	N/A	N/A	DDR_CLK_PRE - $T_{LPX}$ - $T_{CLK-PREPARE}$ - $T_{CLK-ZERO}$
$T_{HS-PREPARE}$	Time to drive the data lane to LP-00 state, to prepare for HS packet transmission	DSI_PHY_REGISTER0[31:24] REG_THSPREPARE	CEIL (70 ns / DDR_Clock_Period) + 2	REG_THSPREPARE * DDR_Clock_Period + (-26.5 ns - + 4 ns)
$T_{HS-ZERO} + T_{HS-PREPARE}$	$T_{HS-ZERO}$ : Time to drive the data lane to HS-0 state before the synchronous sequence.	DSI_PHY_REGISTER0[23:16] REG_THSPRPR_THSZERO	CEIL (175 ns / DDR_Clock_Period) + 2	{CEIL [(N + 3)/4] * 4 + CEIL (M/4) * 4 + 3} * DDR_Clock_Period + (~ - 29 ns - 0 ns).  Where N = REG_THSPREPARE_THSZERO - REG_THSPREPARE M = REG_THSPREPARE
$T_{DDR\_CLK\_PRE}$	Time between the CLK lane request assertion and the data request assertion to switch the data lanes to HS	DSI_CLK_TIMING[15:8] DDR_CLK_PRE	CEIL [( $T_{LPX} + T_{CLK-PREPARE} + T_{CLK-ZERO} + T_{CLK-PRE}$ ) / $T_{TXBYTECLKHS}$ ] <sup>(1)(2)</sup>	
$T_{ENTER\_HS\_MODE\_LATENCY}$ <sup>(3)</sup>	Time to enter data lane into HS mode.	DSI_VM_TIMING7[31:6] ENTER_HS_MODE_LATENCY	CEIL [( $T_{LPX} + T_{HS-PREPARE} + T_{HS-ZERO}$ ) / $T_{TXBYTECLKHS}$ ] <sup>(1)</sup>	

<sup>(1)</sup> The timings seen on the line should be used to determine the register value.

<sup>(2)</sup> See the MIPI D-PHY specification for the  $T_{CLK-PRE}$  value.

<sup>(3)</sup> ENTER\_HS\_MODE\_LATENCY timing applies only to video mode. It does not need to be programmed in command mode.

In the example in [Table 10-478](#), the DDR clock = 400 MHz; TxByteClkHS = 100 MHz.

**Table 10-478. LP to HS Timing Parameters Example for 400-MHz DDR Clock**

Timings	Registers/Associated Bit Fields	Default Register Settings (Programmed at Reset)	Timing Seen on the Line
$T_{LPX}$	DSI_PHY_REGISTER1[20:16] REG_TLPXBY2	10	50 ns
$T_{CLK-PREPARE}$	DSI_PHY_REGISTER2[7:0] REG_TCLKPREPARE	26	40–70 ns

**Table 10-478. LP to HS Timing Parameters Example for 400-MHz DDR Clock (continued)**

Timings	Registers/Associated Bit Fields	Default Register Settings (Programmed at Reset)	Timing Seen on the Line
$T_{\text{CLK-ZERO}}$	DSI_PHY_REGISTER1[7:0] REG_TCLKZERO	106	280–285 ns
$T_{\text{CLK-PRE}}^{(1)}$	N/A	N/A	80 ns
$T_{\text{HS-PREPARE}}$	DSI_PHY_REGISTER0[31:24] REG_THSPREPARE	30	48.5–79 ns
$T_{\text{HS-ZERO}}$	DSI_PHY_REGISTER0[23:16] REG_THSPRPR_THSZERO	72	178.5–207.5 ns
$T_{\text{DDR-CLK-PRE}}$	DSI_CLK_TIMING[15:8] DDR_CLK_PRE	45–49 <sup>(2)</sup>	450–490 ns
$T_{\text{ENTER_HS_MODE_LATENCY}}$	DSI_VM_TIMING7[31:16] ENTER_HS_MODE_LATENCY	24 * $T_{\text{TXBYTECLKHS}}$ or 96 * DDR_CLOCK  34 * $T_{\text{TXBYTECLKHS}}$ or 136 * DDR_CLOCK <sup>(2)</sup>	277–336.5 ns

<sup>(1)</sup> See the MIPI D-PHY specification for the  $T_{\text{CLK-PRE}}$  value.

<sup>(2)</sup> Register setting calculated based on the values in the Timing Seen on the Line column.

#### 10.3.4.4.2 Timing Parameters for an HS to LP Transaction

Figure 10-129 shows the timing requirement when switching the state of the data and clock lanes from HS to LP. lists the HS to LP timing parameters.

**Figure 10-129. HS to LP Timing**

dsi-326

**Table 10-479. HS to LP Timing Parameters**

Timings	Description	Registers/Associated Bit Fields	Register Settings	Timing Seen on the Line
$T_{HS-EOT}$	If EoT is enabled, a delay is added to EXIT_HS_MODE_LATE_NCY to send the EoT packet. The EoT period depends on the number of data lanes.	N/A	N/A	DIVROUNDUP (4, NB_DATA_LANES)  Thus: One data lane = Four DDR clocks Two data lanes = Two DDR clocks
$T_{HS-TRAIL}$	Time to drive flipped differential state after last payload data bit of an HS transmission burst	DSI_PHY_REGISTER0[15:8] REG_THSTRAIL	CEIL (60 ns / DDR_Clock_Period) + 5	{CEIL [(REG_THSTRAIL + 3)/4] * 4 - 2.75} * DDR_Clock_Period + (-0 ns - 5 ns)
$T_{HS-EXIT}$	Time to drive data lane to LP-11 state, after HS burst	DSI_PHY_REGISTER0[7:0] REG_THSEXIT	CEIL (145 ns / DDR_Clock_Period)	{CEIL (REG_THSEXIT/4) * 4} * DDR_Clock_Period - (-3 ns - 45 ns)
$T_{CLK-POST}$	Time that the transmitter must continue sending HS clock after the last associated data lane has transitioned to LP mode	N/A	N/A	DDR_CLK_POST - $T_{HS-EOT} - T_{HS-TRAIL}$
$T_{CLK-TRAIL}$	Time to drive HS differential state after last payload clock bit of an HS transmission burst	DSI_PHY_REGISTER1[15:8] REG_TCLKTRAIL	CEIL (60 ns / DDR_Clock_Period) + 2	{CEIL [(REG_TCLKTRAIL + 3)/4] * 4 - 1.5} * DDR_Clock_Period + (-0 ns - 5 ns)
$T_{DDR\_CLK\_POST}$	Time between the data lane request deassertion and the CLK request deassertion to switch the data lanes into LP mode. The DDR_CLK_POST value must follow the rule: $T_{DDR\_CLK\_POST} \geq T_{HS-TRAIL} + T_{HS-EOT} + T_{CLK-POST}$	DSI_CLK_TIMING[7:0] DDR_CLK_POST	CEIL [( $T_{HS-TRAIL} + T_{HS-EOT}$ ) + $T_{CLK-POST}$ ] / $T_{TXBYTECLKHS}$ (2) (3)	
$T_{EXIT\_HS\_MODE\_LATENCY}$ (4)	Time to exit HS mode	DSI_VM_TIMING7[15:0] EXIT_HS_MODE_LATE_NCY	CEIL [( $T_{HS-TRAIL} + T_{HS-EXIT} + T_{HS-EOT}$ ) / $T_{TXBYTECLKHS}$ ] (2)	

(1) If  $T_{HS-EOT}$  is enabled

(2) The timings seen on the line should be used to determine the register value.

(3) See the MIPI D-PHY specification for the  $T_{CLK-POST}$  value.

(4) EXIT\_HS\_MODE\_LATENCY timing applies only to video mode. It does not need to be programmed in command mode.

In the example in [Table 10-480](#), the DDR clock = 400 MHz; TxByteClkHS = 100 MHz; two data lanes.

**Table 10-480. HS to LP Timing Parameters Example for 400-MHz DDR Clock and Two Data Lanes**

Timings	Registers/Associated Bit Fields	Default Register Settings (Programmed at Reset)	Timing Seen on the Line ( $T_{HS-EOT}$ Enabled)	Timing Seen on the Line ( $T_{HS-EOT}$ Disabled)
$T_{HS-EOT}$	N/A	N/A	5 ns	N/A
$T_{HS-TRAIL}$	DSI_PHY_REGISTER0[15:8] REG_THSTRAIL	29	73.125–78.125 ns	73.125–78.125 ns

**Table 10-480. HS to LP Timing Parameters Example for 400-MHz DDR Clock and Two Data Lanes (continued)**

Timings	Registers/Associated Bit Fields	Default Register Settings (Programmed at Reset)	Timing Seen on the Line (T <sub>HS-EOT</sub> Enabled)	Timing Seen on the Line (T <sub>HS-EOT</sub> Disabled)
T <sub>HS-EXIT</sub>	DSI_PHY_REGISTER0[7:0] REG_THSEXIT	58	105–147 ns	105–147 ns
T <sub>CLK-POST</sub> <sup>(1)</sup>	N/A	N/A	585 ns	580 ns
T <sub>CLK-TRAIL</sub>	DSI_PHY_REGISTER1[15:8] REG_TCLKTRAIL	26	76.25–81.25 ns	76.25–81.25 ns
DDR_CLK_POST	DSI_CLK_TIMING[7:0] DDR_CLK_POST	66 * TxByteClkHS or 264 * DDR_CLOCK  67 * TxByteClkHS or 268 * DDR_CLOCK <sup>(2)</sup>	658.125–663.125 ns	653.125–658.125 ns
EXIT_HS_MODE_LATE_NCY	DSI_VM_TIMING7[15:0] EXIT_HS_MODE_LATE_NCY	19 * TxByteClkHS or 76 * DDR_CLOCK  24 * TxByteClkHS or 96 * DDR_CLOCK <sup>(2)</sup>	183.125–230.125 ns	178.125–225.125 ns

<sup>(1)</sup> See the MIPI D-PHY specification.

<sup>(2)</sup> Register setting calculated based on the values in Timing Seen on the Line (T<sub>HS-EOT</sub> Enabled) column.

#### 10.3.4.4.3 Extra LP Transitions

Some DSI receivers require extra clock cycles in LP mode to process the data. The DSI protocol engine can be programmed to send automatically one NULL long packet. It applies only when no more data are ready to be sent from the internal FIFO to the peripheral on the last LS transfer. The same value is used for all the VCs sending packets in LS mode.

The size of the payload is defined by the DSI\_CLK\_CTRL[17:16] LP\_CLK\_NULL\_PACKET\_SIZE bit field. The header value depends on the size of the payload as described in Table 10-481 and Table 10-482.

**NOTE:** In Table 10-481 and Table 10-482, ECC and checksum are enabled.

**Table 10-481. Extra NULL PH**

VC ID	Payload size (DSI_CLK_CTRL[17:16] LP_CLK_NULL_PACKET_SIZE)	Header (1st Byte)	Header (2nd Byte): WC LSB	Header (3rd Byte): WC MSB	Header (ECC)

#### 10.3.4.4.5 Video Port Interface

**NOTE:** The signals described in this section are internal and not bounded outside the device. This section describes the internal connections between the DISPC and the DSI protocol engine.

[Table 10-483](#) and [Table 10-484](#) summarize the video interface signals.

- DSI1 has two video ports (VP1 and VP2):
  - VP1 is connected to the LCD1 output of DISPC.
  - VP2 is connected to the LCD2 output of DISPC.
- DSI2 has one video port (VP1):
  - VP1 is connected to the LCD2 output of DISPC.

These interfaces are used to connect the DISPC outputs to the DSI protocol engine to send real-time data streams. For video mode, only the active matrix timings are supported by DSI protocol engine.

When the two video ports of DSI1 are used for two video mode transfers, only the synchronization signals on video port 1 are used by the DSI protocol engine. The synchronization signals on video port 2 are ignored. When only one video mode is enabled, it must be connected to video port 1. It is not possible to enable video mode on video port 2 without enabling video mode on video 1 (dual-video mode). The HSYNC/VSYNC/DE/DATA signals are driven on the rising or falling edge of the pixel clock (VP\_PCLK).

**Table 10-483. Video Port 1 Signals for DSI1 and DSI2 Protocol Engines**

Signal Name	Type <sup>(1)</sup>	Description
VP1_HSYNC	I	Horizontal synchronization signal
VP1_VSYNC	I	Vertical synchronization signal
VP1_DATA[23:0]	I	Parallel output data: Bits 0 to 23
VP1_PCLK	I	Pixel clock. In case of STALL configuration, it is used to indicate when new data is on the data bus during the clock period of VP1_CLK. The VP1_PCLK is generated from VP1_CLK through division inside the DISPC. The clock ratio is indicated in the <a href="#">DSI_CTRL</a> [4] VP_CLK_RATIO bit and must be aligned with the configuration of the clock divisor in the display controller (DISPC_DIVISOR1[7:0] PCD bit field for DISPC LCD1 output, and the DISPC_DIVISOR2[7:0] PCD bit field for DISPC LCD2 output). The source of the VP1_PCLK for DSI1 is the LCD1_PCLK. The source of the VP1_PCLK for DSI2 is LCD2_PCLK. For more information, see <a href="#">Section 10.2.4.1, Clock Configuration</a> , and <a href="#">Section 10.3.4.2, DSI Clock Configuration</a> .

<sup>(1)</sup> I = Input; O = Output

**Table 10-483. Video Port 1 Signals for DSI1 and DSI2 Protocol Engines (continued)**

Signal Name	Type <sup>(1)</sup>	Description
VP1_DE	I	Data enable
VP1_STALL	O	The stall signal must be deasserted to receive pixel and asserted to stop receiving pixel. (It can be used only while the DISPC is configured in STALL mode; in that mode, HSYNC and VSYNC are not generated).
VP1_CLK	I	DISPC internal clock. It is a free-running clock. The source of VP1_CLK for DSI1 is LCD1_CLK, divided down. The source of VP1_CLK for DSI2 is LCD2_CLK, divided down. For more information, see <a href="#">Section 10.2.4.1, Clock Configuration</a> , and <a href="#">Section 10.3.4.2, DSI Clock Configuration</a> .

**Table 10-484. Video Port 2 Signals for DSI1 Protocol Engine**

Signal Name	Type <sup>(1)</sup>	Description
VP2_HSYNC	I	Horizontal synchronization signal
VP2_VSYNC	I	Vertical synchronization signal
VP2_DATA[23:0]	I	Parallel output data: Bits 0 to 23
VP2_PCLK	I	Pixel clock. In case of STALL configuration, it is used to indicate when new data is on the data bus during the clock period of VP2_CLK. The VP2_PCLK is generated from VP2_CLK through division inside the DISPC. The clock ratio is indicated in the <a href="#">DSI_CTRL2[4] VP_CLK_RATIO</a> bit and must be aligned with the configuration of the clock divisor in the display controller (DISPC_DIVISOR2[7:0] PCD bit field for DISPC LCD2 output). The source of the VP2_PCLK for DSI1 is LCD2_PCLK. For more information, see <a href="#">Section 10.2.4.1, Clock Configuration</a> , and <a href="#">Section 10.3.4.2, DSI Clock Configuration</a> .
VP2_DE	I	Data enable
VP2_STALL	O	The stall signal must be deasserted to receive pixel and asserted to stop receiving pixel. (It can be used only while the DISPC is configured in STALL mode; in that mode, HSYNC and VSYNC are not generated).
VP2_CLK	I	DISPC internal clock. It is a free-running clock. The source of the VP2_CLK for DSI1 is LCD2_CLK, divided down. For more information, see <a href="#">Section 10.2.4.1, Clock Configuration</a> , and <a href="#">Section 10.3.4.2, DSI Clock Configuration</a> .

<sup>(1)</sup> I = Input; O = Output

**NOTE:**

- The polarities of VP\_HSYNC and VP\_VSYNC are programmable by setting the [DSI\\_CTRL](#) and [DSI\\_CTRL2](#) registers.
- Clocks VP\_CLK and VP\_PCLK can have the same frequency.
- The number of bits to be captured on the video port (the width of the data bus) is defined in the [DSI\\_CTRL\[7:6\] VP\\_DATA\\_BUS\\_WIDTH](#) bit field for DSI1 and the [DSI\\_CTRL2\[7:6\] VP\\_DATA\\_BUS\\_WIDTH](#) for DSI2. The supported formats are 16, 18, and 24 bits.
- For the 18-bit pixel format using 24 bits on the DSI link, the format to be used by the DSI protocol engine is 24-bit because the DISPC must convert the 18-bit pixels into 24-bit pixels. There is no logic inside the DSI protocol engine to convert from 18-bit format to 24-bit format.

The data received on the video port can be stored in the line buffer memories or sent directly on the DSI interface in two cases:

- The line buffer size is too small compared to the line from the DISPC.
- There is no line buffer instantiated. If there is no line buffer, the burst mode, defined as frequency burst mode, cannot be used. Only transparency burst mode is supported.

**NOTE:** The [DSI\\_CTRL\[13:12\] LINE\\_BUFFER](#) and [DSI\\_CTRL2\[13:12\] LINE\\_BUFFER](#) bit fields define the number of lines to be used for transferring data from the video port to the DSI1 and DSI2 link.

### 10.3.4.4.5.1 Video Port Used for Video Mode

If the video port is used for video mode, VP\_STALL is not used. [Table 10-485](#) and [Table 10-486](#) list the active signals on the video port.

**Table 10-485. Video Port 1 for DSI1 and DSI2 in the Context of Video Mode**

Signal Name	Type <sup>(1)</sup>	Description
VP1_HSYNC	I	Horizontal synchronization signal
VP1_VSYNC	I	Vertical synchronization signal
VP1_DATA[23:0]	I	Parallel output data: Bits 0 to 23
VP1_PCLK	I	Pixel clock
VP1_DE	I	Data enable
VP1_CLK	I	It is a free-running clock used as the DISPC functional clock.

<sup>(1)</sup> I = Input; O = Output

**Table 10-486. Video Port 2 for DSI1 in the Context of Video Mode**

Signal Name	Type <sup>(1)</sup>	Description
VP2_HSYNC	I	Horizontal synchronization signal
VP2_VSYNC	I	Vertical synchronization signal
VP2_DATA[23:0]	I	Parallel output data: Bits 0 to 23
VP2_PCLK	I	Pixel clock
VP2_DE	I	Data enable
VP2_CLK	I	It is a free-running clock used as the DISPC functional clock.

<sup>(1)</sup> I = Input; O = Output

Three video modes are available:

- No-line buffer: The data received on the video port are directly outputted to the DSI port without buffering. The ratio of VP\_PCLK and the DSI HS clock period must ensure the same throughput on the two ports (the two clocks must be generated using the same PLL; the subsystem must provide this configuration).
- One-line buffer:
  - The data can be transferred as described in the no-line buffer configuration.
  - The data are first stored in the line buffer; and then when all the data for one line are received, the DSI protocol engine sends the entire line. Software must adjust timings to let enough time for storing all line data into the line buffer before sending to DSI outputs. The synchronization packets are never stored in the line buffer.
- Two-line buffers:
  - The data can be transferred as described in the one-line buffer configuration.
  - One line is stored when the second line is output on the DSI port. This allows burst capability. While receiving the first line of the frame, no RGB packets are sent, because the line buffers are empty. To send the last line of the frame, a dummy line must be provided by the display controller to flush the line buffers. The synchronization packets are never stored in the line buffer.

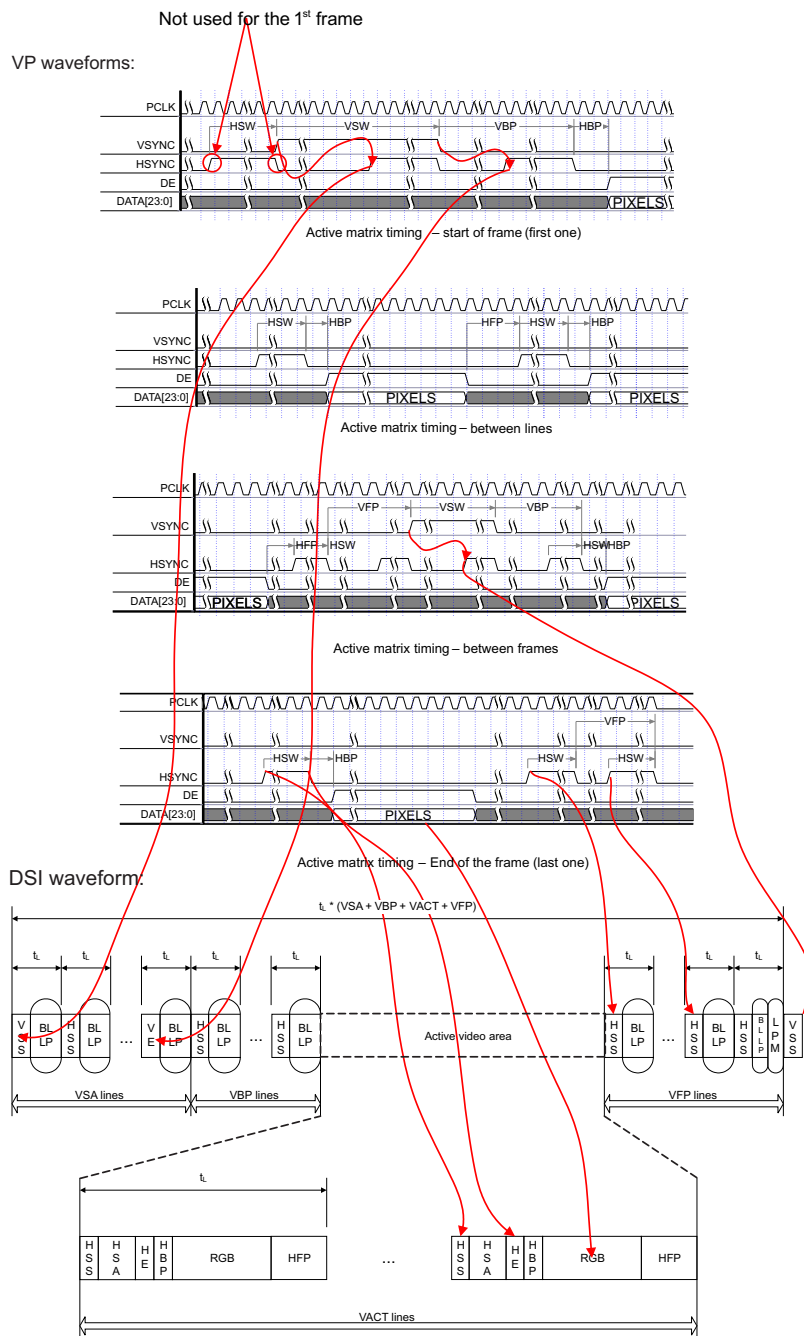

---

**NOTE:** If more active lines are received on the video port than the number of lines defined in the [DSI\\_VM\\_TIMING3\[15:0\]](#) VACT bit field, the extra lines are discarded by the DSI protocol engine. These lines are treated as blanking lines.

---

[Figure 10-130](#) through [Figure 10-132](#) show these three video modes.

**Figure 10-130. DSI Video Mode Without Burst (No-Line Buffer)**

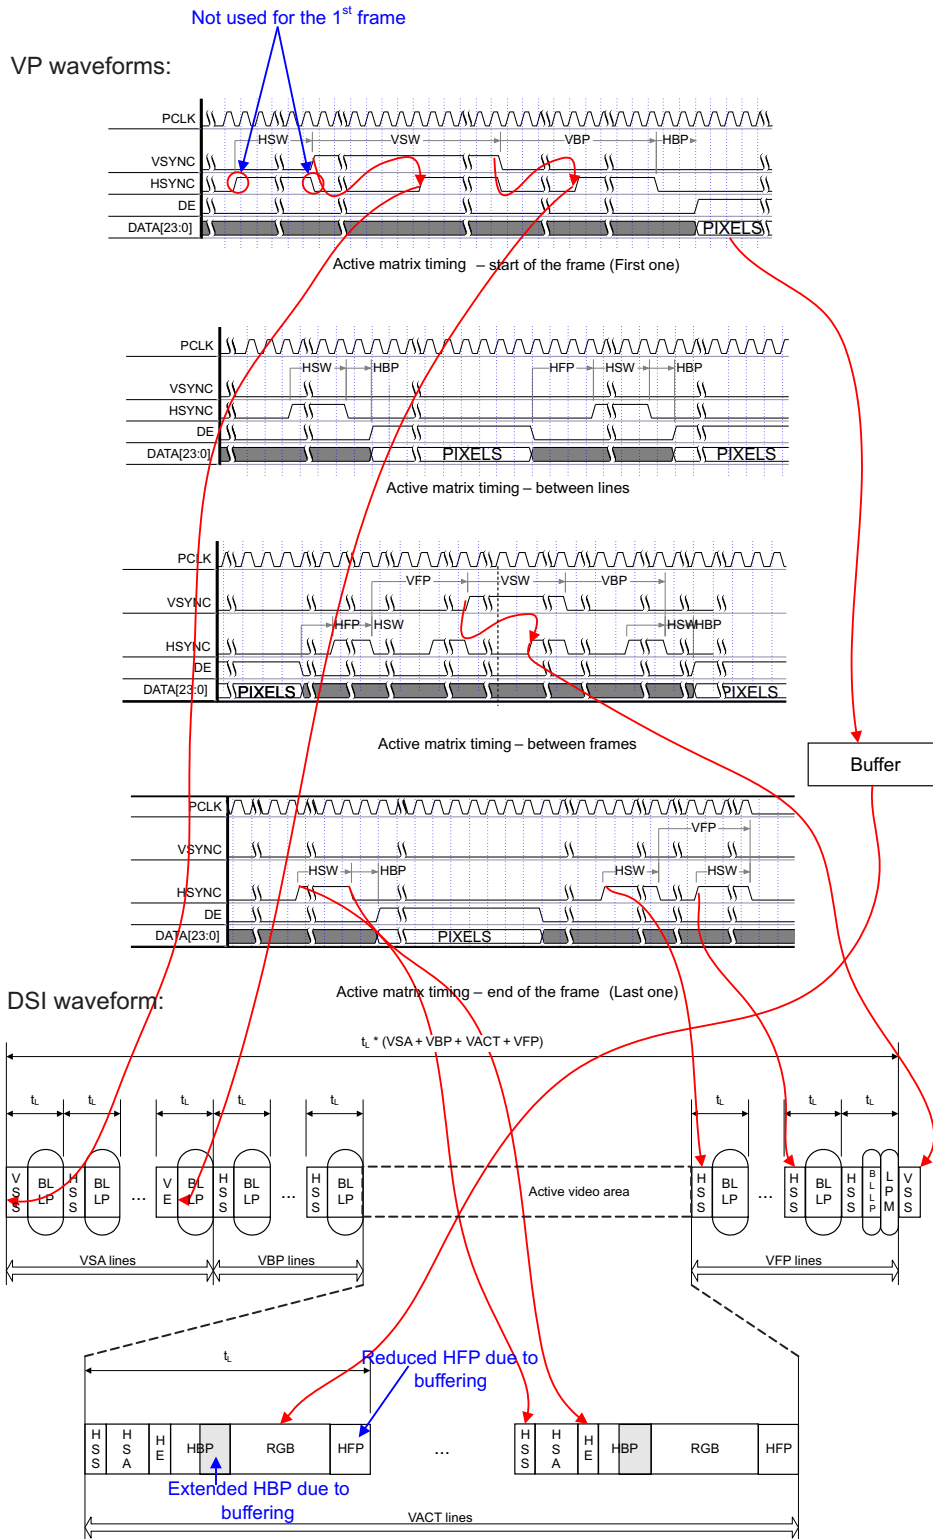

dsi-035

**Legend:**

- VSS – DSI sync event packet: Vertical sync start
- VSE – DSI sync event packet: Vertical sync end
- BL LP – DSI packet: Arbitrary sequence of non-restricted DSI packets or low power mode including optional BTA
- HSS – DSI sync event packet: Horizontal sync start
- HSA – DSI blanking packet: Horizontal sync active or low power mode, no data
- HSE – DSI sync event packet: Horizontal sync end
- HFP – DSI blanking packet: Horizontal front porch or low power mode
- HBP – DSI blanking packet: Horizontal back porch or low power mode
- RGB – DSI packet: Arbitrary sequence of pixel stream and null packets
- LPM – Low power mode, including optional BTA

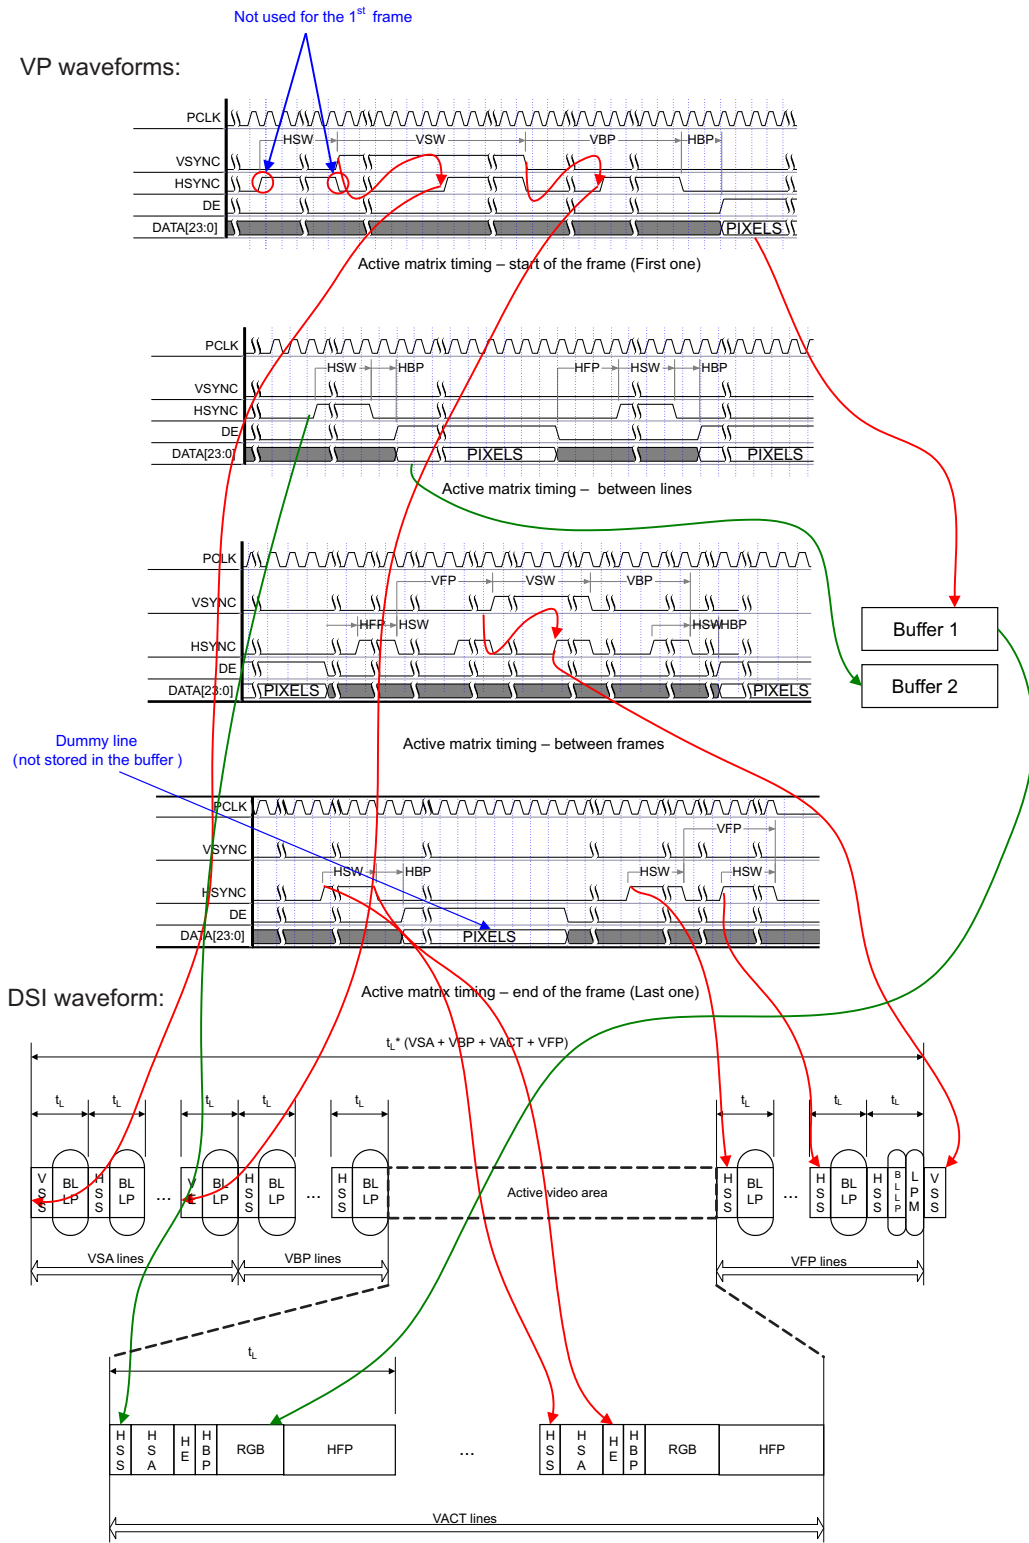

Figure 10-131. DSI Video Mode Without Burst (One-Line Buffer)

dsi-036

**Figure 10-132. DSI Video Mode With Burst (Two-Line Buffers)**

dsi-037

**NOTE:** In [Figure 10-130](#) through [Figure 10-132](#):

- When HSYNC start and HSYNC end short packets are not generated (HSA does not exist), the HBP signal must not be 0.
- Software must ensure that VBP is always defined so that there is at least one HSYNC during VBP.
- In blanking low-power mode (BL-LP), two options are possible:
  - The lane remains in ULPS, and the [DSI\\_CTRL\[20\]](#) BLANKING\_MODE bit is set to 0x0.
  - Dummy bytes are sent during LP with the [DSI\\_CTRL\[20\]](#) BLANKING\_MODE bit set to 0x1; the number of sent bytes is determined by the [DSI\\_VM\\_TIMING6\[15:0\]](#) BL\_LP\_INTERLEAVING bit field.

In DSI video mode, if the VSA bit field in [DSI\\_VM\\_TIMING2](#) is set to 0x0, no vertical synchronization packet will be sent even if VP\_VSYNC\_START is set to 0x1 in [DSI\\_CTRL](#).

If the signal VP\_DE is not asserted during enough VP\_PCLK cycles to be able to capture the number of bytes defined in the word count of the header, the module must send the valid data received on the video port followed by bytes of 0s to match the required number of bytes to transmit. The VP\_PCLK must be present during all extra cycles where the DSI protocol engine is expecting pixels.

If the VP\_DE signal is asserted for too many VP\_PCLK cycles, the module stops capturing the data on the video port while the number of bytes to capture, as defined in the word count field of the header, is reached.

The HS checks that the received synchronization events on the video port (VSYNC and HSYNC) are within the synchronization window based on expected timings. If the timings (internal and received) are out of sync, the interrupt for out-of-sync is generated and the interface is disabled (the [DSI\\_CTRL\[0\]](#) IF\_EN bit is automatically reset by hardware). The unsynchronization window is defined by the [DSI\\_VM\\_TIMING2\[27:24\]](#) WINDOW\_SYNC bit field.

#### 10.3.4.4.5.2 Video Port Used for Command Mode

If the video port is used for command mode, the VP\_HSYNC, VP\_VSYNC, and VP\_DE signals are not used. [Table 10-487](#) and [Table 10-488](#) describe the active signals on video port 1 and video port 2, respectively .

**Table 10-487. Video Port 1 for DSI1 and DSI2 in the Context of Command Mode**

Signal Name	Type <sup>(1)</sup>	Description
VP1_DATA[23:0]	I	Parallel output data: Bits 0 to 23
VP1_PCLK	I	One pulse is generated every time new data is output on the data bus.
VP1_STALL	O	The stall signal must be deasserted to receive pixel and asserted to stop receiving pixel. (It can be used only while the DISPC is configured in stall mode; in that mode, HSYNC and VSYNC are not generated).
VP1_CLK	I	DISPC internal clock: It is a free-running clock used as the DISPC functional clock.

<sup>(1)</sup> I = Input; O = Output

**Table 10-488. Video Port 2 for DSI1 in the Context of Command Mode**

Signal Name	Type <sup>(1)</sup>	Description
VP2_DATA[23:0]	I	Parallel output data: Bits 0 to 23
VP2_PCLK	I	One pulse is generated every time new data is output on the data bus.
VP2_STALL	O	The stall signal must be deasserted to receive pixel and asserted to stop receiving pixel. (It can be used only while the DISPC is configured in stall mode; in that mode, HSYNC and VSYNC are not generated).
VP2_CLK	I	DISPC internal clock: It is a free running-clock used as the DISPC functional clock.

<sup>(1)</sup> I = Input; O = Output

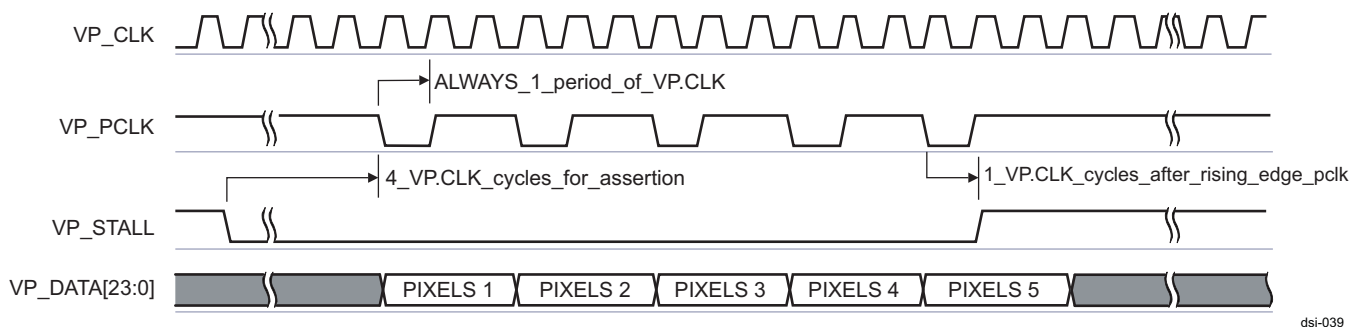

**NOTE:** The stall signal must be deasserted to receive pixels and asserted to stop receiving pixels.

Figure 10-133 and Figure 10-134 show the VP\_STALL signal assertion and deassertion on rising and falling edges, respectively.

**Figure 10-133. Stall Timing With Pixel on Rising Edge**

**Figure 10-134. Stall Timing With Pixel on Falling Edge**

The VP\_STALL signal is asserted to stop the transfer when the last data is output. The data can be output on the rising or falling edge of the VP\_PCLK through registers in the DISPC module. Data output on the falling edge of VP\_PCLK is supported by the DSI protocol engine.

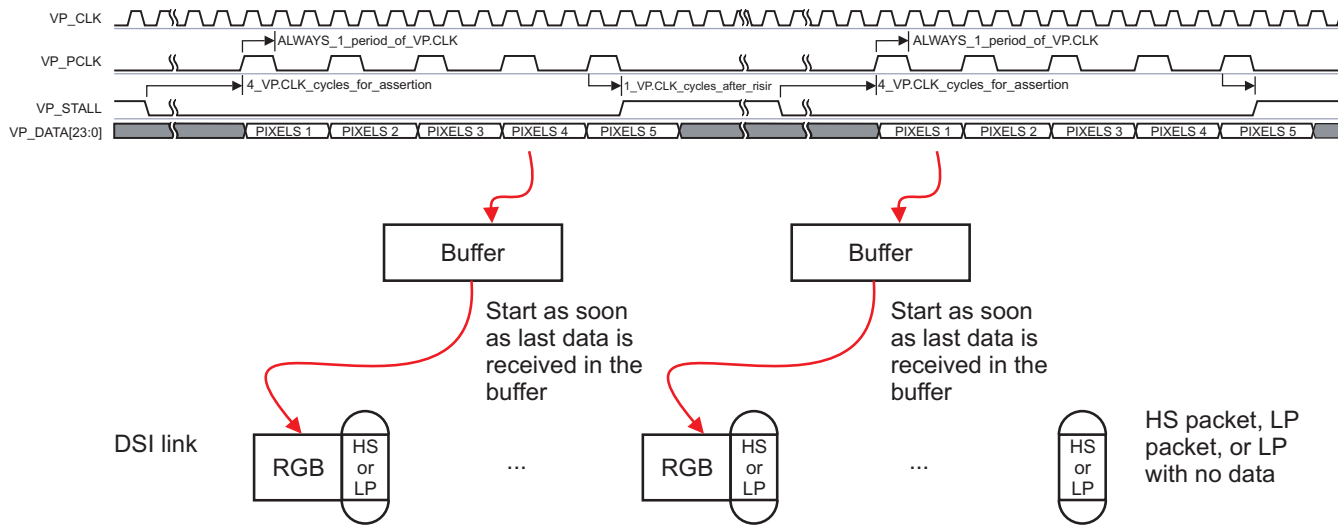

The VP\_PCLK clock is generated from VP\_CLK; these two clocks are balanced. Assertion and deassertion of VP\_PCLK is done on the rising edge of VP\_CLK. The width of the VP\_PCLK pulse depends on the configuration of the clock divisor in the DISPC. For more information, see [Section 10.2, Display Controller](#). In the DSI protocol engine, the information is defined in the [DSI\\_CTRL\[4\] VP\\_CLK\\_RATIO](#) bit and must be aligned with the DISPC configuration.

Deassertion of the VP\_STALL signal occurs at least four VP\_CLK cycles before assertion of VP\_PCLK. Assertion of VP\_STALL occurs one cycle VP\_CLK after deassertion of VP\_PCLK for the last pixel to be transferred. The VP\_CLK clock is generated by the DISPC under software control. It can be kept running between assertion and deassertion of VP\_STALL.

The stall assertion/deassertion depends on the number of bytes to be received considering the size of the video port bus defined in the [DSI\\_CTRL\[7:6\] VP\\_DATA\\_BUS\\_WIDTH](#) bit field for video port 1 and the [DSI\\_CTRL2\[7:6\] VP\\_DATA\\_BUS\\_WIDTH](#) bit field for video port 2.

Figure 10-135 shows the data flow in command mode using the video port.

**Figure 10-135. Data Flow in Command Mode Using the Video Port**

dsi-040

Two command modes are available:

- One-line buffer: The data are stored in the line buffer before being sent.
- Two-line buffers: The two lines are used if the word count defined in the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register is bigger than the line size; otherwise, one-line buffer must be used.

---

**NOTE:** In command mode, the video port can be used only in one- or two-line buffer configuration. No-line buffer configuration is not allowed.

---

The packets can be sent using high speed or low speed.

The DCS command in the payload can be inserted automatically using the [DSI\\_VC\\_CTRL\\_j\[30\]](#) DCS\_CMD\_ENABLE bit. If TE is used, hardware automatically inserts the DCS Write Start command for the first packet of the frame transfer and DCS Write Continue command for all subsequent packets. The [DSI\\_VC\\_CTRL\\_j\[31\]](#) DCS\_CMD\_CODE bit is ignored.

### 10.3.4.4.5.3 Burst Mode

When burst mode is enabled, the video port receives data from the DISPC at the pixel clock. The DSI protocol engine buffers the data in its own line FIFO (double-line buffer size). The read speed of the line can be twice the pixel clock to increase the blanking time of the video mode and to allow command mode traffic to be interleaved during the blanking period. Burst mode uses a dual-line buffer.

The DSI port can output data from one line buffer while the second line buffer is accessed by the video port. The two processes are concurrent but they do not access the same line at the same time. The DSI transfer can start only when the entire video port line is transferred into a line buffer. The switch is controlled by the VP\_HS signal on the video port side and by an internal signal on the DSI port indicating that the last data for the current line has been written into the line buffer.

---

**NOTE:** The line buffers are used to store only the pixels. The synchronization codes are not stored in the line buffers; they must be sent according to the video port timings.

---

---

**NOTE:** The number of line buffers to be used while receiving data on the video port can be selected by setting the [DSI\\_CTRL\[13:12\]](#) LINE\_BUFFER bit field.

---

#### 10.3.4.4.5.4 Ping-Pong Buffer

The ping-pong buffer stores data incoming from the DISPC in one of the two line buffers. When one line buffer is used to store the pixels received on the video port, the second line buffer is used to provide data on the DSI link. The ping-pong buffer is supported in command mode, provided the size of the packet defined in the header register is less than the size of each line buffer (768 x 32 bits for VP1 of DSI2 and VP2 of DSI1, and 960 x 32bits for VP1 of DSI1). If the size of the packet is greater than the size of the line buffer, the ping-pong mechanism cannot be used (both lines are used as a single line).

Figure 10-136 shows the video port used in ping-pong mode .

The ping-pong buffer status can be checked by the [DSI\\_VC\\_CTRL\\_i\[14\]](#) PP\_BUSY bit.

- When PP\_BUSY equals 1, the ping-pong buffer is active and the line buffers are not ready to receive data; therefore, a new header cannot be updated.
- When PP\_BUSY equals 0, at least one line buffer is empty; therefore, a new header can be updated. PP\_BUSY is then set to 0x1. If both line buffers are empty, two headers can be written, one following the other. PP\_BUSY remains at 0x0 after the first header is written, and is set to 0x1 after second header is written.

An IRQ is available to update header on events. The IRQ is enabled by setting the [DSI\\_VC\\_IRQENABLE\\_i\[8\]](#) PP\_BUSY\_CHANGE\_IRQ bit to 0x1, and its status is accessible on the [DSI\\_VC\\_IRQSTATUS\\_i\[8\]](#) PP\_BUSY\_CHANGE\_IRQ bit.

#### 10.3.4.4.6 SCP Interface

The SCP interface is used to transfer register values from the DSI protocol engine to the DSI PLL control module and to the DSI complex I/O. It spends several cycles to serialize the data to be sent. Software users must consider the delay in processing the transfer of the data from/to the L3 Interconnect slave port to/from the module.

##### 10.3.4.4.6.1 Shadowing Register

The first three SCP registers for the DSI complex I/O address map must be implemented as shadow registers. The shadowing mechanism is enabled and disabled using the [DSI\\_COMPLEXIO\\_CFG1\[31\]](#) SHADOWING bit:

- When setting the [DSI\\_COMPLEXIO\\_CFG1\[31\]](#) SHADOWING bit to 1, the transfer of the values from the three first local interconnect port registers into the three first registers of the DSI complex I/O ([DSI\\_PHY\\_REGISTER0](#) through [DSI\\_PHY\\_REGISTER2](#)) is done only when the DISPC\_UPDATE\_SYNC signal from the DISPC is active and the [DSI\\_COMPLEXIO\\_CFG1\[30\]](#) GOBIT bit is set to 1. If there is no pending update for the three registers when the DISPC\_UPDATE\_SYNC signal is asserted, the [DSI\\_COMPLEXIO\\_CFG1\[30\]](#) GOBIT bit is reset by hardware and there is no SCP transfer.
  - If there is only one register to update, only the corresponding new value is transferred. The second

and third registers in the DSI complex I/O are not updated. When the transfer completes, the [DSI\\_COMPLEXIO\\_CFG1\[30\]](#) GOBIT bit is reset by hardware.

- If the two registers need to be updated, the register with the lower address is transferred first, followed by the second register. When the transfers complete, the [DSI\\_COMPLEXIO\\_CFG1\[30\]](#) GOBIT bit is reset by hardware.
- If the three registers need to be updated, the register with the lowest address is transferred first, and then the other registers are transferred according to incremental address. When the transfers complete, the GOBIT bit is reset by hardware.

When there is an on-going transfer (read or write) to any SCP register, the transfer must complete before updating the shadowing registers.

- When unsetting the [DSI\\_COMPLEXIO\\_CFG1\[31\]](#) SHADOWING bit to 0, if the transfer into the first two DSI complex I/O registers has already started, it should be finished.

---

**NOTE:** When reading the shadow registers, the local value stored in the DSI protocol engine is returned if the update is pending; otherwise, the values stored in the DSI complex I/O are returned.

---

#### 10.3.4.4.6.2 *Busy Signal*

The SCPBusy signal indicates there is still activity using the SCPClk clock provided by the PRCM module. The SCPClk clock is the divided DSS\_L3\_ICLK/4 clock.

#### 10.3.4.4.7 *Timers*

---

**NOTE:** Among the timers described in this section, only the HS TX, LP RX, and TurnRequests timers generate interrupts immediately when the timer value is null. The ForceTxStopMode timer ends counting instantly and ForceTxStopMode is not asserted.

---

##### 10.3.4.4.7.1 *T<sub>wakeup</sub> Timer*

The T<sub>wakeup</sub> timer is not implemented in the DSI protocol engine. The general-purpose (GP) timer must be used to handle wakeup. This timer is used for exiting ULP status mode for the active lanes (clock and/or data lanes). The sequence to exit ULP state is:

1. Change the state of TxULPSExit for each lane to ACTIVE.
2. Wait for the interrupt that indicates all lanes with TxULPSExit ACTIVE have acknowledged by asserting ULPSActiveNot. This is done by reading the [DSI\\_COMPLEXIO\\_IRQSTATUS](#) register - ULPSACTIVENOT\_ALLi\_IRQ bit fields (where i = 0, 1).
3. Start the application wake-up timer (GP timer).
4. Wait for the time-out.
5. Change the TxUlpsClk signals to INACTIVE state for the clock lane and/or TxRequestEsc INACTIVE state for the data lane(s).

---

**NOTE:** The minimum time for the wake-up period is 1 ms.

---

To enter ULPS mode for clock lane, TxUlpsClk state must be changed to ACTIVE state. To enter ULPS mode for data lane, TxRequestEsc state must be changed to ACTIVE state (also TxUlpsEsc, if it is not in ACTIVE state already).

##### 10.3.4.4.7.2 *ForceTxStopMode FSM*

The ForceTxStopMode signal is used at initialization time (DSI complex I/O). [Figure 10-137](#) shows the ForceTxStopMode finite state-machine (FSM) to assert and deassert the ForceTxStopMode signal.

**Figure 10-137. ForceTxStopMode FSM**

The DSI protocol engine asserts the ForceTxStopMode signal by setting the [DSI\\_TIMING1\[15\] FORCE\\_TX\\_STOP\\_MODE\\_IO](#) bit to 1. Asserting the FORCE\_TX\_STOP\_MODE\_IO bit allows the lanes to be initialized. The lanes are in STOP state when the ForceTxStopMode signal is high.

No data can be sent before the ForceTxStopMode signal is deasserted. The deassertion time is defined by the STOP\_STATE\_COUNTER\_IO, STOP\_STATE\_X4\_IO and STOP\_STATE\_X16\_IO bit fields in [DSI\\_TIMING1\[14:0\]](#) register. The [DSI\\_TIMING1\[15:0\] FORCE\\_TX\\_STOP\\_MODE\\_IO](#) bit is reset by hardware when the time is reached.

This bit can be reset by software.

The calculation of the number of DSI\_CLK functional clock cycles assertion period is defined by:

$$\text{Total period in DSI\_FCLK cycles} = \text{STOP\_STATE\_COUNTER\_IO} \times ((\text{STOP\_STATE\_X16\_IO} \times 15) + 1) \times ((\text{STOP\_STATE\_X4\_IO} \times 3)).$$

#### 10.3.4.4.7.3 TurnRequest FSM

The TurnRequest signal is used to request a turnaround. It is valid only for the data lane 1 because the other data lanes cannot be used in reverse direction to receive data from the DSI receiver. When the TurnRequest signal is asserted, the TA\_TO timer is started. [Figure 10-138](#) shows the TurnRequest FSM to assert and deassert the TurnRequest signal.

Figure 10-138. TurnRequest FSM

dsi-049

The DSI protocol engine asserts the TurnRequest signal during one TxClkEsc cycle when turnaround is enabled through the `DSI_VC_CTRL_i[6] BTA_EN` bit (for more information, see [Section 10.3.4.4.8, Bus Turnaround](#)). The `DSI_TIMING1[31] TA_TO` bit is set/reset by software to enable or disable the timer for turnaround procedure failure. It can be reset by software or automatically by hardware when the time-out occurs.

The timer is loaded with the value in the number of DSI\_FCLK cycles:

$$DSI\_TIMING1[28:16] TA\_TO\_COUNTER \times ((DSI\_TIMING1[30] TA\_TO\_X16 \times 15) + 1) \times ((DSI\_TIMING1[29] TA\_TO\_X8 \times 7) + 1).$$

When the `TA_TO_IRQ` interrupt is generated (the turnaround timer expired and the procedure failed), hardware automatically resets the `DSI_TIMING1[31] TA_TO` bit and asserts the `ForceTXStopMode` signal (see [Section 10.3.4.4.7.2, ForceTxStopMode FSM](#)) for the DSI\_PHY to drive the LP-11 STOP state. The `ForceTXStopMode` timer is used to define the minimum duration of the LP-11 state. The STOP state can be longer if there is no activity.

Hardware resets the `DSI_TIMING1[15] FORCE_TX_STOP_MODE_IO` bit, followed by an internal logic reset except for all register values and TX FIFO content, and then resets the `DSI_CTRL[0] IF_EN` bit. Software must take action to recover (for example, by resetting the peripheral if it is not responding). It must wait for the `DSI_CTRL[0] IF_EN` bit to be reset to 0 before starting the recovery sequence.

#### 10.3.4.4.7.4 Peripheral Reset Timer

The peripheral reset timer is not implemented in the DSI protocol engine module. Instead, a GP timer must be used in case of reset of the peripheral to determine when the peripheral is ready to operate again.

#### 10.3.4.4.7.5 HS TX Timer

The HS TX timer is used to detect when the host has been in TX mode for too long. When time-out occurs, the EOT is forced. The timer is reloaded when a start of HS transmission occurs. It is enabled and disabled by software through the `DSI_TIMING2[31] HS_TX_TO` bit. The interrupt `HS_TX_TO_IRQ` is generated when the timer expires. The `DSI_IRQSTATUS[14] HS_TX_TO_IRQ` bit is set to 1 when the HS TX time-out occurs.

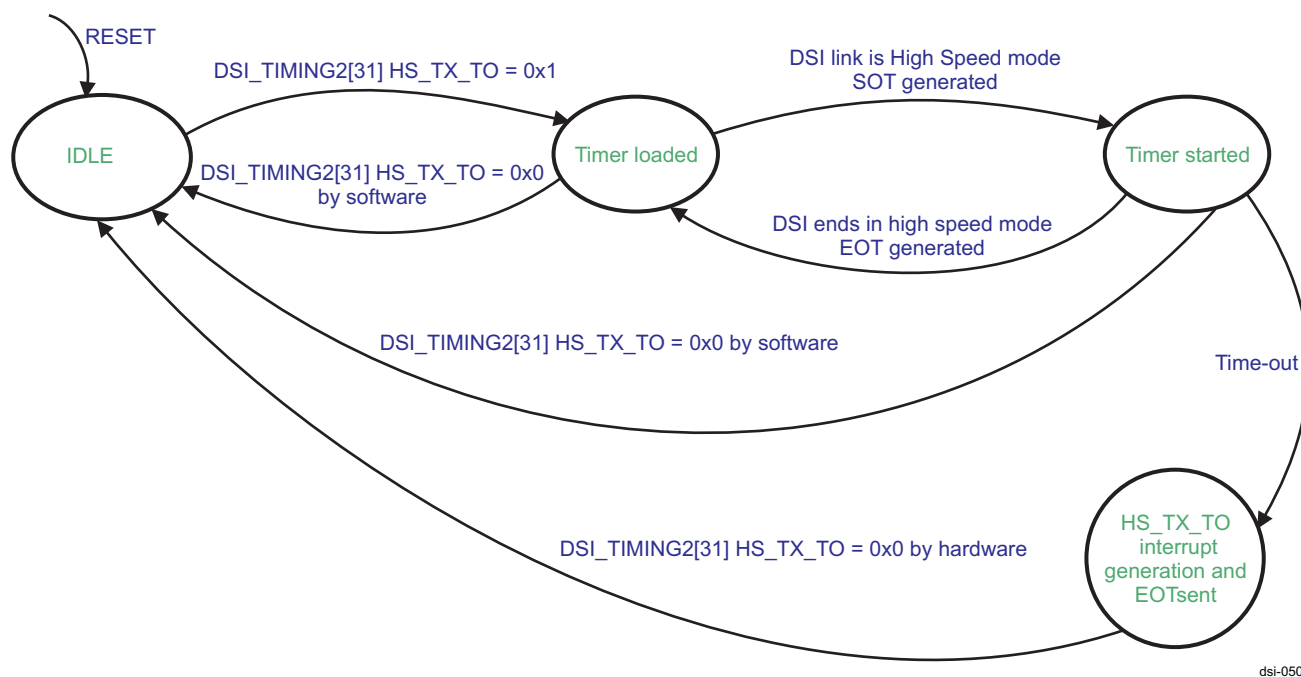

The maximum time supported is 20 ms. It can be used to determine that at least once per frame in video mode, the HS mode is stopped to enter ULPS.

The timer is loaded with the value in the number of TXBYTECLKHS:

$$\text{DSI\_TIMING2}[28:16] \text{ HS\_TX\_TO\_COUNTER} \times (1 + (\text{DSI\_TIMING2}[30] \text{ HS\_TX\_TO\_X64} \times 63)) \times (1 + (\text{DSI\_TIMING2}[29] \text{ HS\_TX\_TO\_X16} \times 15))$$

Figure 10-139 shows the HS TX timer FSM.

**Figure 10-139. HS TX Timer FSM**

When the time-out occurs, hardware sends an EOT request for the DSI complex I/O to drive LP-11 STOP state. This is followed by the generation of the interrupt. Hardware performs an internal logic reset including the TX FIFO content but excluding the register values, and then resets the [DSI\\_CTRL\[0\] IF\\_EN](#) bit.

Software must take action to recover (for example, by resetting the peripheral if it is not responding). It must wait for the [DSI\\_CTRL\[0\] IF\\_EN](#) bit to be reset to 0 before taking any recovery action.

#### 10.3.4.4.7.6 LP RX Timer

When the host is in low-power receive mode after a BTA, the LP RX timer is loaded. When the timer expires, the host requests the DSI complex I/O to drive LP-11. The interrupt [LP\\_RX\\_TO\\_IRQ](#) is generated when the timer expires. The [DSI\\_IRQSTATUS\[15\] LP\\_RX\\_TO\\_IRQ](#) bit is set to 1 when the LP RX time-out occurs.

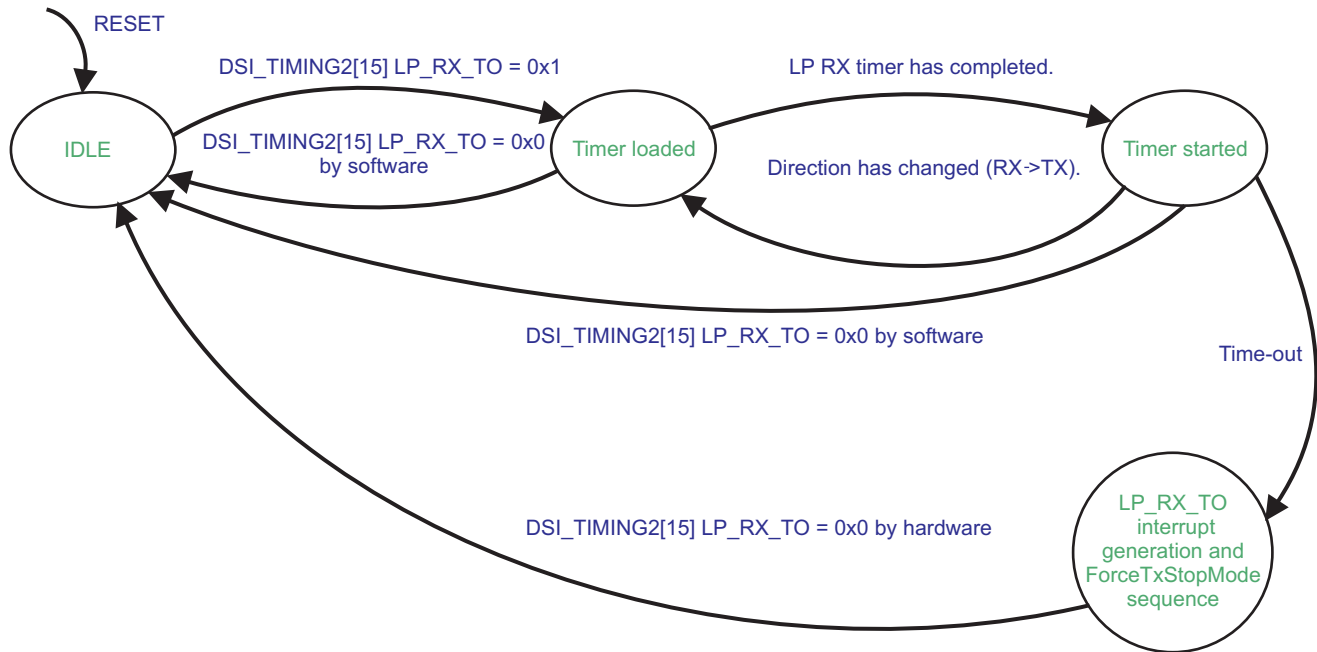

The [DSI\\_TIMING2\[15\] LP\\_RX\\_TO](#) bit is set/reset by software to enable or disable the timer.

The timer is loaded with the value in the number of DSI\_CLK functional clock cycles:

$$\text{DSI\_TIMING2}[12:0] \text{ LP\_RX\_TO\_COUNTER} \times ((\text{DSI\_TIMING2}[14] \text{ LP\_RX\_TO\_X16} \times 15) + 1) \times ((\text{DSI\_TIMING2}[13] \text{ LP\_RX\_TO\_X4} \times 3) + 1)$$

Figure 10-140 shows the LP RX timer FSM.

Figure 10-140. LP RX Timer FSM

dsi-051

When the interrupt is generated, hardware automatically resets the `DSI_TIMING2[15] LP_RX_TO` bit and then asserts `ForceTXStopMode` for the DSI complex I/O to drive LP-11 STOP state. The `ForceTXStopMode` timer is used to define the minimum duration of the LP-11 state. The STOP state can be longer if there is no activity.

Hardware resets the `ForceTXStopMode` bit, followed by an internal logic reset except for all register values and TX FIFO content, and then resets the `DSI_CTRL[0] IF_EN` bit. Software must take action to recover (for example, by resetting the peripheral if it is not responding). It must wait for the `DSI_TIMING1[15] FORCE_TX_STOP_MODE_IO` and `DSI_CTRL[0] IF_EN` bits to be reset before starting the recovery sequence. The TX FIFO is not flushed (the FIFO is flushed only when `DSI_VC_CTRL_i[0] VC_EN` is set to 1).

#### 10.3.4.4.8 Bus Turnaround

The bus turnaround (BTA) is not automatically sent by default after each packet is sent to the panel(s). It is programmable independently for each VC ID. BTA generation can be enabled when the `DSI_VC_CTRL_i[6] BTA_EN` bit is set to 1 by software. Software must ensure that when the BTA is sent to the peripheral, enough time is allocated for the response and for the BTA from the peripheral to the host. For more information about possible DSI PHY timing adjustments during the turnaround procedure, see [Section 10.3.4.6.5.3, Turnaround Request in Transmit Mode](#), and [Section 10.3.4.6.5.4, Turnaround Request in Receive Mode](#).

When setting the `DSI_VC_CTRL_i[6] BTA_EN` bit to 1, one BTA is sent manually to the peripheral. This manual mode can be used for packets in command or video mode.

Acknowledgment from the peripheral for successful BTA is indicated by asserting the `BTA_IRQ` interrupt, if it is enabled in the `DSI_VC_IRQENABLE_i[5] BTA_IRQ_EN` bit. To monitor the BTA interrupt, the user must read the `DSI_VC_IRQSTATUS_i[5] BTA_IRQ` status bit.

#### CAUTION

The BTA should be sent when the RX FIFO is empty. Users must empty the RX FIFO before sending BTA to the peripheral to ensure that when receiving new data from the peripheral, the allocated spaces for all the VCs are empty.

In automatic mode, the BTA is sent automatically at the end of short or long packet transmission, if the [DSI\\_VC\\_CTRL\\_j\[2\]](#) BTA\_SHORT\_EN or [DSI\\_VC\\_CTRL\\_j\[3\]](#) BTA\_LONG\_EN bit is set to 1.

Two modes can be used for each VC ID:

- Automatic: After each packet, a BTA is sent. To determine the size of the long packet, the protocol engine on the host side reads the word count defined in the header (in the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_j](#) register) and uses it to determine the last data to be sent on the DSI link. For short packets, the size is always 4 bytes. The BTA is then sent to the peripheral. The word count is also used to determine how many bytes are to be transferred from the 32-bit write access to the payload register ([DSI\\_VC\\_LONG\\_PACKET\\_PAYLOAD\\_j](#)).
- Manual:
  - Data transfer through L3 interconnect: When transferring data using the L3 interconnect port, while all data have been provided to the DSI protocol engine, users can select the BTA for the last packet provided to the L3 interconnect port only by setting the [DSI\\_VC\\_CTRL\\_j\[6\]](#) BTA\_EN bit, or for the last packets and the following ones by setting automatic mode.
  - Data transfer through video port: In the case of data transfer using the video port, the [DSI\\_VC\\_CTRL\\_j\[6\]](#) BTA\_EN bit can be selected at any time during the transfer of the packet.
- For video mode packets (data and synchronization events), it is not possible to determine when the BTA is sent; therefore, it is highly recommended to use manual BTA mode only in command mode. It is possible, however, to use the BTA for a VC in video mode.

For data provided on the video port, an interrupt for end of packet transfer `PACKET_SENT_IRQ` is provided to indicate when the packet is completely sent by the DSI complex I/O. `PACKET_SENT_IRQ` can be monitored in the [DSI\\_VC\\_IRQSTATUS\\_j\[2\]](#) `PACKET_SENT_IRQ` status bit. The BTA is available even if the space allocated in the TX FIFO for the corresponding VC is empty. It must be sent later even if no packet was sent before the BTA request. The [DSI\\_VC\\_CTRL\\_j\[6\]](#) BTA\_EN bit must be reset if the BTA request was sent, even if automatic mode for this specific type of packets is enabled.

The BTA is supported for video and command mode packets. It is not possible to send the BTA during the blanking periods of video mode when HS blanking packets should be sent; that is, when one of the following bits is set to 1:

- [DSI\\_CTRL\[20\]](#) `BLANKING_MODE`
- [DSI\\_CTRL\[21\]](#) `HFP_BLANKING_MODE`
- [DSI\\_CTRL\[22\]](#) `HBP_BLANKING_MODE`
- [DSI\\_CTRL\[23\]](#) `HSA_BLANKING_MODE`

Therefore, in video mode, the BTA request is delayed until there is a blanking period without HS blanking packets.

When the TurnRequest signal is asserted (always only for data lane 1), the `TA_TO` timer is started. If the direction signal is not changed according to the turnaround request, the `TA_TO` interrupt is generated. When the direction signal is in output mode, any data on the input data bus is ignored because the DSI is in transmission mode (data and triggers must be ignored). For more information about the `TA_TO` timer, see [Section 10.3.4.4.7.3](#), *TurnRequest FSM*.

#### 10.3.4.4.9 PHY Triggers

The DSI protocol engine uses three triggers that are supported only for data lane 1:

- Reset trigger from host to display
- Tearing effect (TE) trigger from display to host
- Acknowledge trigger from display to host

### CAUTION

Each trigger is associated with a dedicated user-configurable receive or transmit pattern, which is loaded in the [DSI\\_PHY\\_REGISTER3](#) or [DSI\\_PHY\\_REGISTER4](#) bit fields. The default (reset) values of the bit fields are aligned with the *MIPI D-PHY Specification v1.0*. If any of these values need to be changed, the following must be considered:

- If any of the bit fields is written with a nondefault value, the other bit fields in the same register must also be configured with different values. This is to ensure that two different trigger bit fields are not programmed with the same pattern.
- If two or more bit fields are written with equal values, unpredictable behavior of the DSI PHY module may occur.

#### 10.3.4.4.9.1 Reset

The DSI protocol engine can use one of the triggers of the DSI\_PHY to send a reset to the display. The reset trigger pattern is configurable through the [DSI\\_PHY\\_REGISTER3](#)[31:24] REG\_TXTRIGGERESC3 bit field. To send the reset pattern to the peripheral, the [DSI\\_CTRL](#)[5] TRIGGER\_RESET bit must be set to 1. When software requires the trigger reset pattern to be sent, the DSI protocol engine resets its own logic, but not the registers. Software can select between two reset modes:

- Immediate reset: All pending requests in TX FIFO not already considered for transfer scheduling, the RX FIFO requests, and the data from video port are ignored. Only the current transfer on the DSI link and those already scheduled are transmitted. All the other transfers are discarded.
- Synchronized reset: The mode is valid only if there is VC using the video mode and if it is active. The principle is to wait for the current video frame to be transferred on the link. Any data on the video port after the current frame are ignored.

To select reset mode, the [DSI\\_CTRL](#)[14] TRIGGER\_RESET\_MODE bit must be programmed.

### CAUTION

For both reset modes, the DSI protocol engine flushes the FIFOs, synchronization buffers, and line buffers before resetting the [DSI\\_CTRL](#)[0] IF\_EN bit.

#### 10.3.4.4.9.2 Tearing Effect

TE on the display is avoided by having synchronization information from the display. It is used only in command mode and is not functional in video mode.

There are two types of TE triggers:

- DSI PHY TE trigger
- CMOS TE line (one of the two input signals can be selected for the TE trigger of a VC; the signal is asynchronous).

Software must set and send the appropriate sequence to receive the TE trigger pattern from the peripheral on the DSI link, or use the CMOS TE line. The value of the expected TE trigger pattern can be configured through the [DSI\\_PHY\\_REGISTER4](#)[23:16] REG\_RXTRIGGERESC2 bit field.

When the TE PHY trigger pattern is received, the DSI protocol engine generates the TE\_TRIGGER\_IRQ interrupt with a TE event, if the interrupt is enabled. To enable the interrupt, the [DSI\\_IRQENABLE](#)[16] TE\_TRIGGER\_IRQ\_EN bit must be set to 1. The [DSI\\_IRQSTATUS](#)[16] TE\_TRIGGER\_IRQ status bit indicates whether the interrupt event has been generated.

When using the TE CMOS signal, the DSI protocol engine generates the TE0\_LINE or TE1\_LINE interrupt, if it is enabled, depending on which line is used. One or multiple VCs can be synchronized using the same TE line. Both lines can be active at the same time for different VCs.

The [DSI\\_VC\\_TE\\_i\[30\]](#) TE\_EN bit must be set and the [DSI\\_VC\\_TE\\_i\[29\]](#) TE\_LINE bit must be reset to indicate that hardware must use the TE PHY trigger to start the transfer of the data from the related VC. TE\_EN is reset when all the data are sent to the peripheral.

The [DSI\\_VC\\_TE\\_i\[30\]](#) TE\_EN, [DSI\\_VC\\_TE\\_i\[29\]](#) TE\_LINE, and [DSI\\_VC\\_TE\\_i\[28\]](#) TE\_LINE\_NB bits must be set to select between the TE0 and TE1 line to indicate that hardware must use the TE0 line or TE1 line to start the transfer of the data from the related VC. The bits are reset when all the data are sent to the peripheral.

The [DSI\\_TE\\_VSYNC\\_WIDTH\\_j](#), [DSI\\_TE\\_HSYNC\\_WIDTH\\_j](#), and [DSI\\_TE\\_HSYNC\\_NUMBER\\_j](#) registers indicate which mode is used to detect the start of the transfer:

- If [DSI\\_TE\\_HSYNC\\_NUMBER\\_j\[10:0\]](#) LINE\_NUMBER = 0, [DSI\\_TE\\_HSYNC\\_WIDTH](#) is ignored. When a pulse on the TE line is detected to be wider than the [DSI\\_TE\\_VSYNC\\_WIDTH\\_j\[19:8\]](#) MIN\_VSYNC\_PULSE\_WIDTH bit field, data transfer starts from the protocol engine to the peripheral at the falling edge of the TE CMOS line.
- If the [DSI\\_TE\\_HSYNC\\_NUMBER\\_j\[10:0\]](#) LINE\_NUMBER bit field is greater than 0, [DSI\\_TE\\_HSYNC\\_WIDTH\\_j](#) is used. The DSI protocol engine waits until it detects a pulse wider than the [DSI\\_TE\\_VSYNC\\_WIDTH\\_j\[19:8\]](#) MIN\_VSYNC\_PULSE\_WIDTH bit field, and then counts each pulse wider than [DSI\\_TE\\_HSYNC\\_WIDTH\\_j\[19:8\]](#) MIN\_HSYNC\_PULSE\_WIDTH but smaller than [DSI\\_TE\\_VSYNC\\_WIDTH\\_j\[19:8\]](#) MIN\_VSYNC\_PULSE\_WIDTH. When the number of HSYNC pulses is reached, data transfer from the DSI protocol engine to the peripheral starts. In case the number of HSYNC pulses is not reached due to a new VSYNC pulse being detected, the counter of HSYNC pulses restarts from 0.

---

**NOTE:** [DSI\\_TE\\_HSYNC\\_WIDTH\\_j\[19:8\]](#) MIN\_HSYNC\_PULSE\_WIDTH is always programmed with a value smaller than [DSI\\_TE\\_VSYNC\\_WIDTH\\_j\[19:8\]](#) MIN\_VSYNC\_PULSE\_WIDTH.

---

**NOTE:** The following must always be set before [DSI\\_VC\\_TE\\_i\[30\]](#) TE\_EN is enabled:

- [DSI\\_TE\\_HSYNC\\_WIDTH\\_j\[19:8\]](#) MIN\_HSYNC\_PULSE\_WIDTH
  - [DSI\\_TE\\_VSYNC\\_WIDTH\\_j\[19:8\]](#) MIN\_VSYNC\_PULSE\_WIDTH
  - [DSI\\_VC\\_TE\\_i\[29\]](#) TE\_LINE
  - [DSI\\_VC\\_TE\\_i\[28\]](#) TE\_LINE\_NB
- 

The [DSI\\_VC\\_TE\\_i\[31\]](#) TE\_START bit must be used when automatic mode is disabled ( [DSI\\_VC\\_TE\\_i\[30\]](#) TE\_EN bit = 0). It allows users to start the transfer manually based on application events or based on the TE trigger interrupt (TE\_TRIGGER\_IRQ).

The number of bytes to be transferred is defined by using the [DSI\\_VC\\_TE\\_i\[23:0\]](#) TE\_SIZE bit field. The TE\_SIZE bit field is decremented for each payload byte (it does not include checksum) sent on the DSI link. The register content must not be modified by software during a transfer. The [DSI\\_VC\\_TE\\_i\[23:0\]](#) TE\_SIZE bit field must be set first to indicate that the following accesses to the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register must be used for TE transfer.

The data can be provided from two sources (select by setting the [DSI\\_VC\\_CTRL\\_i\[1\]](#) SOURCE bit):

- L3 interconnect slave port using DMA request: The DMA request [DSI\\_DMA\\_REQ\\_i](#) must be asserted only when the TE trigger is received or when the [DSI\\_VC\\_TE\\_i\[31\]](#) TE\_START bit is set by the user and must no longer be asserted when all the bytes defined in the [DSI\\_VC\\_TE\\_i\[23:0\]](#) TE\_SIZE bit field are sent on the DSI link. The VC is associated with a DMA request by programming the number in the [DSI\\_VC\\_CTRL\\_i\[23:21\]](#) DMA\_TX\_REQ\_NB bit field. The [DSI\\_VC\\_LONG\\_PACKET\\_PAYLOAD\\_i](#) register is used to provide the number of bytes defined by the [DSI\\_VC\\_TE\\_i\[23:0\]](#) TE\_SIZE bit field (the checksum value is not provided in the [DSI\\_VC\\_LONG\\_PACKET\\_PAYLOAD\\_i](#) register). The size of the header is not considered in the number of bytes to transfer. The [DSI\\_VC\\_SHORT\\_PACKET\\_HEADER\\_i](#) register is not used.
- 

**NOTE:** All DMA requests associated to a VC must be disabled when they are not used ([DSI\\_VC\\_CTRL\\_i\[23:21\]](#) DMA\_TX\_REQ\_NB = 0x4).

---

- Video port: The DMA request is not asserted. The data are captured in the line buffer using the STALL mechanism. If no line buffer is instantiated (that is, the [DSI\\_CTRL\[13:12\] LINE\\_BUFFER](#) bit field is set to 0), it is not possible to use the video port to provide data. The line buffer is filled according to the word count defined in the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register header. The value must be written before the TE trigger event is received or before the [DSI\\_VC\\_TE\\_i\[31\] TE\\_START](#) bit is set to 1 by software. If the total number of bytes defined by the [DSI\\_VC\\_TE\\_i\[23:0\] TE\\_SIZE](#) bit field is not a multiple of the word count defined in the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) register, all the packets are the same size defined by the WC of the header, except the last transfer. The size of the last transfer is defined by the remaining bytes to send. Because the [DSI\\_VC\\_TE\\_i\[23:0\] TE\\_SIZE](#) bit field is modified after each packet transfer, the size of the last packet is equal to the value of the [DSI\\_VC\\_TE\\_i\[23:0\] TE\\_SIZE](#) bit field before the last transfer (the header and the payload checksum sizes are not included in the [DSI\\_VC\\_TE\\_i\[23:0\] TE\\_SIZE](#) bit field).

When the transfer completes, the value of the [DSI\\_VC\\_TE\\_i\[23:0\] TE\\_SIZE](#) bit field is equal to 0. Software must ensure that the pending data in the TX FIFO for the corresponding VC using TE are related to the TE transfer. Any data in the TX FIFO that must be sent before the reception of the TE trigger must be sent before the TE. This is done by not enabling the TE trigger until all data for the corresponding VC are sent to the peripheral. Software can check that the space allocated for the VC in the TX FIFO is empty by reading the [DSI\\_VC\\_CTRL\\_i\[5\] TX\\_FIFO\\_NOT\\_EMPTY](#) status bit.

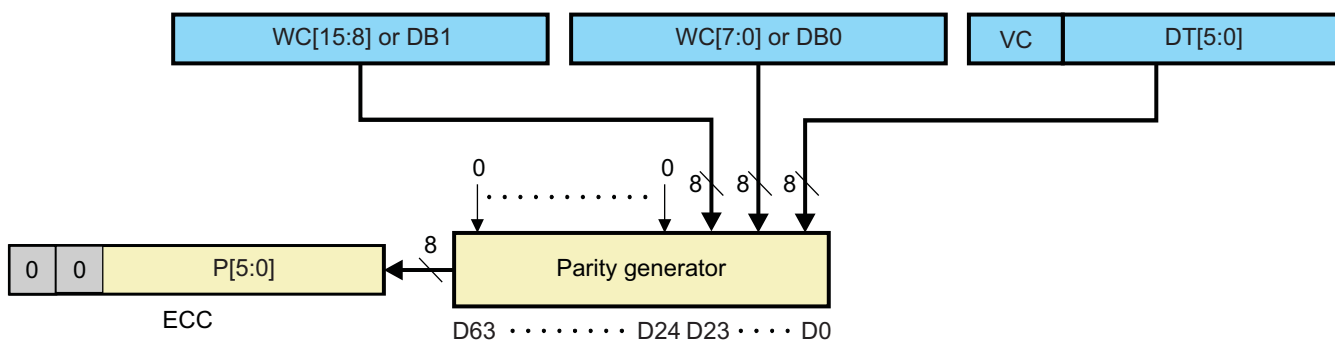

#### 10.3.4.4.9.3 Acknowledge

The corresponding acknowledge interrupt (ACK\_TRIGGER\_IRQ) is generated when the acknowledge trigger is received. The value of the expected acknowledge trigger pattern can be configured through the [DSI\\_PHY\\_REGISTER4\[15:8\] REG\\_RXTRIGGERESC1](#) bit field. To enable the acknowledge interrupt, set the [DSI\\_IRQENABLE\[17\] ACK\\_TRIGGER\\_IRQ\\_EN](#) bit to 1. When the interrupt is generated, the [DSI\\_IRQSTATUS\[17\] ACK\\_TRIGGER\\_IRQ](#) status bit is set to 1.

#### 10.3.4.4.10 ECC Generation

The DSI protocol uses a 4-byte PH. Because ECC generation requires a fixed word length of 64-bits, the packet headers must be padded with additional bits to form a full 8-byte value for ECC generation and checking. The PH minus the ECC byte should occupy bits D[23:0], and the pad bits should occupy bits D[63:24]. All padding bits must be 0 to generate the ECC byte. ECC can be generated using a parallel approach, as shown in [Figure 10-141](#).

Figure 10-141. 64-Bit ECC Generation on TX Side

dsii-052

The ECC generation/check can be enabled and disabled by software. It is defined by a common bit for all the VCs:

- The [DSI\\_CTRL\[2\] ECC\\_RX\\_EN](#) bit enables and disables ECC generation in the receive direction.
- The [DSI\\_VC\\_CTRL\\_i\[8\] ECC\\_TX\\_EN](#) bit enables and disables ECC generation in the transmit direction

The ECC can be provided while writing the ECC value directly into the [DSI\\_VC\\_LONG\\_PACKET\\_HEADER\\_i](#) and [DSI\\_VC\\_SHORT\\_PACKET\\_HEADER\\_i](#) registers. The [DSI\\_VC\\_CTRL\\_i\[8\] ECC\\_TX\\_EN](#) bit indicates whether the ECC value will be calculated or whether the value written in the register will be used instead for command and video modes.

#### 10.3.4.4.11 Checksum Generation for Long Packet Payloads

Long packets are comprised of a PH protected by an ECC byte and a payload of 0 to  $2^{16} - 1$  bytes. To detect the errors during the transmission of long packets, a checksum is calculated over the payload portion of the data packet. For the special case of a 0-length payload, the 2-byte checksum is set to 0xFFFF. The checksum can only indicate the presence of one or more errors in the payload. Unlike ECC, the checksum does not enable error correction. For this reason, checksum calculation is not useful for some unidirectional DSI implementations, because the peripheral has no way to report errors to the host processor. Checksum generation and transmission is mandatory for host processors sending long packets to peripherals; it is optional for peripherals transmitting long packets to the host processor. However, the format of long packets is fixed; the peripherals that do not support checksum generation must transmit 2 bytes with a value of 0x0000 in place of the checksum bytes when sending long packets to the host processor. The host processor must disable checksum checking for received long packets from peripherals that do not support checksum generation.

Checksum must be realized as a 16-bit CRC with a generator polynomial of  $x^{16}+x^{12}+x^5+x^0$ . The LSByte is sent first, followed by the MSByte. Within the byte, the LSB is sent first.

Figure 10-142 shows the checksum transmission.

**Figure 10-142. Checksum Transmission**

dsi-053

Figure 10-143 shows the CRC implementation. The CRC shift register is initialized to 0xFFFF before packet data enters. Packet data not including the PH then enters as a bitwise data stream from the left, LSB first. Each bit is fed through the CRC shift register before it is passed to the output for transmission to the peripheral. After all bytes in the packet payload have passed through the CRC shift register, the shift register contains the checksum. C15 contains the MSB of the checksum, and C0 contains the LSB of the 16-bit checksum. The checksum is then appended to the data stream and sent to the receiver.

**Figure 10-143. 16 Bit CRC Generation Using a Shift Register**

dsi-054

Checksum generation/check can be enabled and disabled by software. It is defined by a common bit for all the VCs:

- The **DSI\_CTRL[1]** CS\_RX\_EN bit enables and disables checksum generation in the receive direction.
- The **DSI\_VC\_CTRL\_i[7]** CS\_TX\_EN bit enables and disables checksum generation in the transmit direction

#### 10.3.4.4.12 EOT Packet

A new packet type allows the DSI protocol (rather than the DSI\_PHY) at the display to detect the HS EOT. This is a fixed short packet (4 bytes) that is added at every HS to LP transition. This function is enabled by the **DSI\_CTRL[19]** EOT\_ENABLE bit.

The EOT packet has a fixed format:

- Data Type = DI [5:0] = 0b001000
- Virtual Channel = DI [7:6] = 0b00
- Payload Data [15:0] = 0x0F0F
- ECC [7:0] = 0x01

When more than one data lane is used, the EOT packet bytes are distributed across the multiple lanes. EOT packet generation is supported only for the end of HS transmissions. No EOT packet is added at the end of LP transmissions. For LP reception, any EOT packet received is simply passed through as any other packet, but no internal decode or use is made of the EOT information.

#### 10.3.4.4.13 Software Reset

The DSI protocol engine can be reset by software. This reset can be done for debug purposes or after a protocol error and has the same effect as the hardware reset. The DSI protocol engine can be reset by setting the [DSI\\_SYSCONFIG\[1\] SOFT\\_RESET](#) bit to 1. Software can monitor the [DSI\\_SYSSTATUS\[0\] RESET\\_DONE](#) status bit to wait for the reset to complete. If after five reads the [DSI\\_SYSSTATUS\[0\] RESET\\_DONE](#) status bit still returns 0, it can be assumed that an error occurred during the reset stage.

---

**NOTE:** This software reset is optional because a hardware reset is always performed on the DSI protocol engine at device reset.

---

#### 10.3.4.4.14 Power Management

The power-management behavior of the DSI protocol engine is controlled by the [DSI\\_SYSCONFIG](#) register. This register controls the way the module interacts with the PRCM module. The [DSI\\_SYSCONFIG\[0\] AUTO\\_IDLE](#) bit must be set to 1 (default value) to enable automatic clock gating in the module.

The DSI protocol engine implements a handshake protocol on the L3 interconnect slave port with the PRCM module. The protocol engine provides control signal [CIO\\_CLK\\_ICG](#) to gate the [SCPClk](#) ([DSS\\_L3\\_ICLK/4](#)). It allows reduction of the power consumption of the complex I/O while the DSI link is not in use ([DSI\\_CLK\\_CTRL\[14\] CIO\\_CLK\\_ICG](#)).

#### 10.3.4.4.15 Power Control of DSI PHY Complex I/O and DSI PLL

The DSI protocol engine can control and send power commands for the DSI complex I/O and DSI PLL controller modules.

##### 10.3.4.4.15.1 Complex I/O Power Control Commands

###### 10.3.4.4.15.1.1 Complex I/O Power Control Commands

The DSI complex I/O can be set in three modes:

- OFF: In this power state, the complete DSI\_PHY circuit is powered down. The internal LDO is OFF.
- ON: In this power state, the complete DSI\_PHY circuit is powered on and functional.
- ULPS: In this power state, the ULPS exit detection circuit power switch is ON for the lanes that are in receive ULPS. For the lanes that are in transmit ULPS, the circuitry for weak pulldown is ON. The ULTRALOW POWER state must be used only when all the three lanes are in ULPS (transmit or receive).

###### 10.3.4.4.15.1.2 Complex I/O Power FSM

[Figure 10-144](#) shows the FSM to control the power state of the complex I/O.

**Figure 10-144. Complex I/O Power FSM**

dsi-045

The PwrCmdOff, PwrCmdUlp, and PwrCmdOn commands control the state transition of the DSI complex I/O. The [DSI\\_COMPLEXIO\\_CFG1\[28:27\] PWR\\_CMD](#) bit field allows the state to be modified. The allowed transitions are: OFF - ON, and ON - ULPS, and ULPS - OFF. The [DSI\\_COMPLEXIO\\_CFG1\[26:25\] PWR\\_STATUS](#) bit field gives a status on the current state of the DSI complex I/O.

**CAUTION**

- In automatic mode, software must ensure that the DSI complex I/O is in ON state (that is, ON command already sent) before sending requests to the complex I/O.
- In a command request to change to a state that is the current one (acknowledge has been received), the command is ignored (nothing is sent to the DSI complex I/O).
- To change the state to ULPS, all ULPSActiveNot signals must be low. The ULPSActiveNot\_ALL0\_IRQ interrupt indicates the state of the ULPSActiveNot signals. The change from ULPS to ON state is required before starting the ULP exit sequence (for information, see [Section 10.3.4.4.7.1, \*T<sub>wakeup</sub> Timer\*](#)).

**10.3.4.4.15.2 DSI PLL Power Control Commands**

The DSI PLL controller module can be set in four modes:

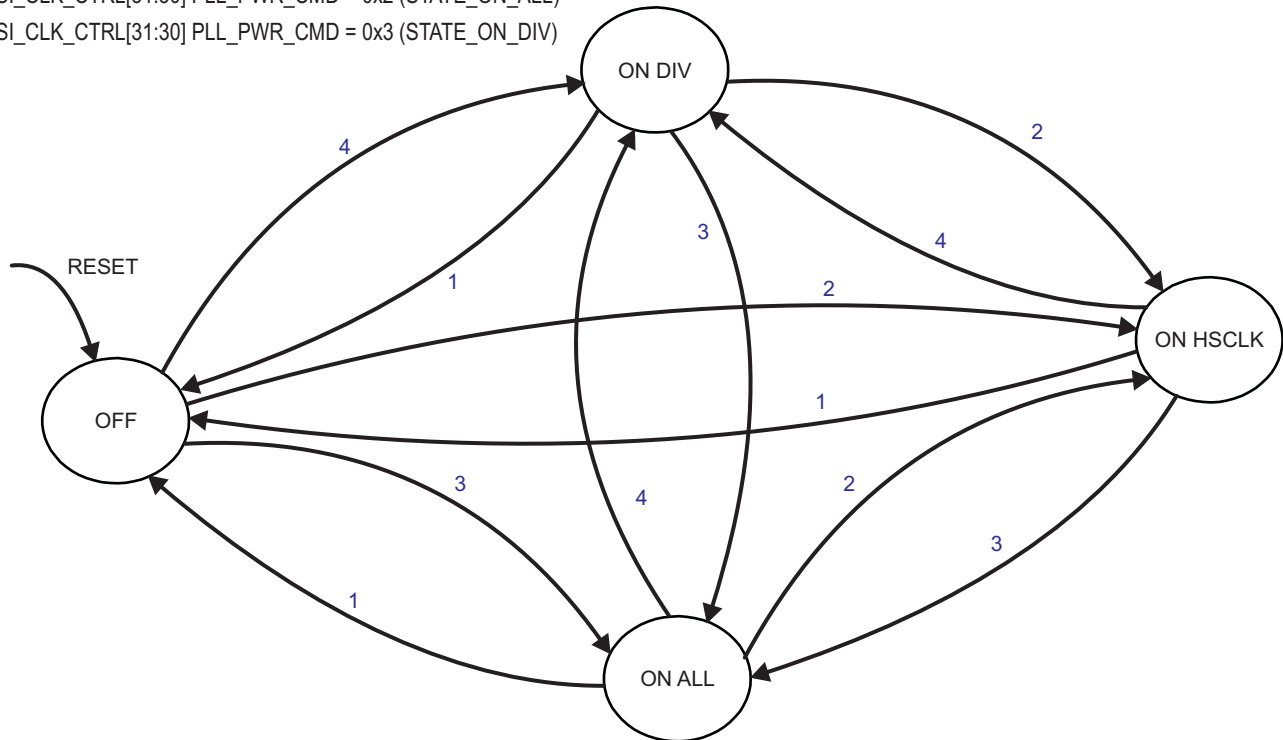

- OFF: DSI PLL and HSDIVIDER are OFF.
- ON ALL: Both DSI PLL and HSDIVIDER are ON. The CLKIN4DDR clock is provided to the DSI complex I/O and the second clock output is provided to the HSDIVIDER.
- ON HSCLK: The DSI PLL is ON. The HSDIVIDER is OFF. The CLKIN4DDR clock is provided to the DSI complex I/O, but the second clock output is not provided to the HSDIVIDER.
- ON DIV: DSI PLL and HSDIVIDER are ON. The CLKIN4DDR clock is not provided to the DSI complex I/O, but the second clock output is provided to the HSDIVIDER.

**10.3.4.4.15.2.1 DSI-PLL Power FSM**

[Figure 10-145](#) shows the DSI PLL power FSM.

**Figure 10-145. DSI PLL Power FSM**

- 1 = DSI\_CLK\_CTRL[31:30] PLL\_PWR\_CMD = 0x0 (STATE\_OFF)
- 2 = DSI\_CLK\_CTRL[31:30] PLL\_PWR\_CMD = 0x1 (STATE\_ON\_HSCLK)
- 3 = DSI\_CLK\_CTRL[31:30] PLL\_PWR\_CMD = 0x2 (STATE\_ON\_ALL)
- 4 = DSI\_CLK\_CTRL[31:30] PLL\_PWR\_CMD = 0x3 (STATE\_ON\_DIV)

dsi-046

The following commands control the state transition of the DSI PLL control module:

- PLLPwrCmdOff
- PLLPwrCmdOnAll
- PLLPwrCmdOnDIV
- PLLPwrCmdOnHSClk

Setting the [DSI\\_CLK\\_CTRL\[31:30\] PLL\\_PWR\\_CMD](#) bit field modifies the state. The [DSI\\_CLK\\_CTRL\[29:28\] PLL\\_PWR\\_STATUS](#) bit field gives a status on the current state of the DSI PLL controller.

---

**NOTE:** If a command requests to change to a state that is the current one (acknowledge has been received), the command is ignored (nothing is sent to the DSI PLL control module).

---

#### 10.3.4.4.15.2.1.1 DSI PLL HS Clock Signals

The DSIStopClk signal is provided to the DSI PLL control module. It indicates when the DSI protocol engine does not need to use the HS mode and the PLL HS output (CLKIN4DDR clock) can be stopped. The following conditions must also be met when DISPC\_UPDATE\_SYNC may be generated by the DISPC, because that must result in the PLL HS output being stopped.

When the interface is disabled ([DSI\\_CTRL\[0\] IF\\_EN](#) bit set to 0) and the clock lane is stopped ([DSI\\_CLK\\_CTRL\[13\] DDR\\_CLK\\_ALWAYS\\_ON](#) = 0), the signal DSIStopClk is asserted.

Assertion of the DSIStopClk depends on the following conditions:

- Clock lane TxRequestHS is deasserted (the DDR clock on the clock lane is no longer required). For TxRequestHS deassertion, the following conditions are required:

- The [DSI\\_CLK\\_CTRL\[13\]](#) `DDR_CLK_ALWAYS_ON` bit must be reset to 0 and no HS data transfer must be on-going or already scheduled.
- No VC ACTIVE in video mode. No VC using the video mode is enabled. If the VC is enabled, the mode is command mode only (the [DSI\\_VC\\_CTRL\\_i\[0\]](#) `VC_EN` bit set to 1 and [DSI\\_VC\\_CTRL\\_i\[4\]](#) `MODE` bit set to 0).
- No command mode requiring HS transfer (one or more VCs using command mode can be active)
- Or [DSI\\_CTRL\[0\]](#) `IF_EN` bit is reset to 0 (the previous conditions are not all required, except the [DSI\\_CLK\\_CTRL\[13\]](#) `DDR_CLK_ALWAYS_ON` bit must be set to 0 after resetting the [DSI\\_CTRL\[0\]](#) `IF_EN` bit)

The deassertion of the `DSIStopClk` depends on one of the following conditions (the DSI interface is enabled by setting the [DSI\\_CTRL\[0\]](#) `IF_EN` bit to 1):

- Clock lane `TxRequestHS` must be asserted (the DDR clock on the clock lane is required).
- One video mode VC ACTIVE
- At least one VC in command mode requiring HS transfer
- The [DSI\\_CLK\\_CTRL\[13\]](#) `DDR_CLK_ALWAYS_ON` bit is set to 1 by software users (the [DSI\\_CTRL\[0\]](#) `IF_EN` bit must be reset to 0 for updating the value of the `DDR_CLK_ALWAYS_ON` bit).

Automatic assertion/deassertion is enabled by using the [DSI\\_CLK\\_CTRL\[18\]](#) `HS_AUTO_STOP_ENABLE` bit.

Manual mode can be used by setting/resetting the [DSI\\_CLK\\_CTRL\[19\]](#) `HS_MANUAL_STOP_CTRL` bit to assert/deassert the `DSIStopClk` signal.

---

**NOTE:** Setting the [DSI\\_CTRL\[24\]](#) `DISPC_UPDATE_SYNC` bit to 0x1 enables the use of the `Dispc_Update_Sync` signal to synchronize.

---

#### 10.3.4.4.15.2.1.2 DSI-PLL HS Clock FSM

Figure 10-146 shows the DSI PLL HS clock FSM.

**Figure 10-146. DSI PLL HS Clock FSM**

dsii-047

When `DSIStopClk` is used there is a latency through other modules (DSI PLL controller and `DSI_PHY`) before `TXBYTECLKHS` is stopped. This latency must be considered to prevent any issue when `DSIStopClk` is deasserted soon after being asserted. This is done using a hardware timer programmed using the [DSI\\_STOPCLK\\_TIMING\[7:0\]](#) `DSI_STOPCLK_LATENCY` bit field. This timer is programmed in number of periods of the DSI protocol functional clock (`DSI_FCLK`). At reset value, the timer is programmed with value 0x80 (128).

**CAUTION**

The programmed value in the [DSI\\_STOPCLK\\_TIMING\[7:0\]](#) [DSI\\_STOPCLK\\_LATENCY](#) bit field must be greater than  $((3 \times L3\_ICLK \text{ period}) + (5 \times CLKIN4DDR \text{ period})) / (DSI\_FCLK \text{ period})$ .

**10.3.4.4.16 Ultralow-Power State Configuration**

This section describes how to enter/exit to/from ULTRALOW-POWER state (ULPS).

---

**NOTE:** The [DSI\\_COMPLEXIO\\_CFG2\[9:0\]](#) [LANEx\\_ULPS\\_SIGy](#) bits ( $x$  range is 1 to 5, corresponding to lane 1 to lane 5 for DSI1, and 1 to 3, corresponding to lane 1 to lane 3 for DSI2;  $y$  range is 1 to 2) must be read back after writing to verify that the write operations are effective before proceeding to the next step. This is to take latency at low TxClkEsc frequencies into account.

---

**10.3.4.4.16.1 Entering ULPS**

To enter into ULPS for a clock lane, the following sequence is required:

1. Wait for [DSI\\_COMPLEXIO\\_CFG2\[16\]](#) [HS\\_BUSY](#) and [DSI\\_COMPLEXIO\\_CFG2\[17\]](#) [LP\\_BUSY](#) bits to be reset to 0 and ensure that the [DSI\\_CLK\\_CTRL\[13\]](#) [DDR\\_CLK\\_ALWAYS\\_ON](#) bit is 0.
2. TxUlpsClk state should change from inactive to active by setting the [DSI\\_COMPLEXIO\\_CFG2\[9:5\]](#) [LANEx\\_ULPS\\_SIG2](#) bit to 1.

To enter into ULPS for a data lane, the following sequence is required:

1. Wait for all TX\_FIFOs for all VCs working in HS are empty, for video mode is not active, and for [DSI\\_COMPLEXIO\\_CFG2\[16\]](#) [HS\\_BUSY](#) bit is reset to 0 (in addition for data lane 1, [DSI\\_COMPLEXIO\\_CFG2\[17\]](#) [LP\\_BUSY](#) bit is reset to 0)
2. TxRequestEsc state should change from inactive to active by setting the [DSI\\_COMPLEXIO\\_CFG2\[9:5\]](#) [LANEx\\_ULPS\\_SIG2](#) bit to 1.

**10.3.4.4.16.2 Exiting ULPS**

To exit from ULPS for a clock lane, the following sequence is required:

1. Change the state of TxUlpsExit for each lane to ACTIVE by setting the [DSI\\_COMPLEXIO\\_CFG2\[4:0\]](#) [LANEx\\_ULPS\\_SIG1](#) bit to 1.
2. Wait for the [ULPSACTIVENOT\\_ALL1\\_IRQ](#) interrupt indicating that all lanes with TxUlpsExit active have acknowledged by asserting [UlpsActiveNot](#). This is performed by monitoring the [DSI\\_COMPLEXIO\\_IRQSTATUS\[31\]](#) [ULPSACTIVENOT\\_ALL1\\_IRQ](#) status bit.
3. Start the wake-up timer (GPTimer).
4. Wait for the time-out.
5. Change TxUlpsClk signals to INACTIVE state for the clock lane by resetting the [DSI\\_COMPLEXIO\\_CFG2\[9:5\]](#) [LANEx\\_ULPS\\_SIG2](#) bit to 0.
6. Reset the [DSI\\_COMPLEXIO\\_CFG2\[4:0\]](#) [LANEx\\_ULPS\\_SIG1](#) bit to 0.

---

**NOTE:** When the [DSI\\_COMPLEXIO\\_CFG2\[9:5\]](#) [LANEx\\_ULPS\\_SIG2](#) and [DSI\\_COMPLEXIO\\_CFG2\[4:0\]](#) [LANEx\\_ULPS\\_SIG1](#) bits are both being written to 0, they can be combined into one write. Both bits must be read back to confirm they are effective before proceeding.

---

To exit from ULPS for a clock lane, in case the complex I/O is in OFF state (the DSI protocol engine sends the complex I/O to OFF state (PWROFF command) by setting [DSI\\_COMPLEXIO\\_CFG1\[28:27\]](#) [PWR\\_CMD = 0x0](#)), the sequence is:

1. Change TxUlpsClk signals to INACTIVE state for the clock lane by resetting the

[DSI\\_COMPLEXIO\\_CFG2\[9:5\]](#) LANEx\_ULPS\_SIG2 bit to 0.

2. Change the state of TxUlpsExit for clock lane to INACTIVE state by resetting the [DSI\\_COMPLEXIO\\_CFG2\[4:0\]](#) LANEx\_ULPS\_SIG1 bit to 0. This step is necessary only in case a PWROFF command (the command for power control of the complex I/O) is issued while the sequence for exiting is in progress (TxUlpsExit signal is already in ACTIVE state).

---

**NOTE:** When the [DSI\\_COMPLEXIO\\_CFG2](#) LANEx\_ULPS\_SIG2[9:5] and [DSI\\_COMPLEXIO\\_CFG2](#) LANEx\_ULPS\_SIG1[4:0] bits are both being written to 0, they can be combined into one write. Both bits must be read back to confirm they are effective before proceeding.

---

To exit from ULPS for a data lane, the following sequence is required:

1. Change the state of TxUlpsExit for each lane to ACTIVE by setting the [DSI\\_COMPLEXIO\\_CFG2\[4:0\]](#) LANEx\_ULPS\_SIG1 bit to 1.
2. Wait for the ULPSACTIVENOT\_ALL1\_IRQ interrupt indicating that all lanes with TxUlpsExit active have acknowledged by asserting UlpsActiveNot. This is performed by monitoring the [DSI\\_COMPLEXIO\\_IRQSTATUS\[31\]](#) ULPSACTIVENOT\_ALL1\_IRQ status bit.
3. Start the application wake-up timer (GPTimer).
4. Wait for the time-out.
5. Change TxRequestEsc signals to INACTIVE state for the data lane by resetting the [DSI\\_COMPLEXIO\\_CFG2\[9:5\]](#) LANEx\_ULPS\_SIG2 bit to 0.
6. Reset the [DSI\\_COMPLEXIO\\_CFG2\[4:0\]](#) LANEx\_ULPS\_SIG1 bit to 0.

---

**NOTE:** When the [DSI\\_COMPLEXIO\\_CFG2\[9:5\]](#) LANEx\_ULPS\_SIG2 and [DSI\\_COMPLEXIO\\_CFG2\[4:0\]](#) LANEx\_ULPS\_SIG1 bits are both being written to 0, they can be combined into one write. Both bits must be read back to confirm they are effective before proceeding.

---

To exit from ULPS for a data lane, in case the complex I/O is in OFF state (the DSI protocol engine sends the complex I/O into OFF state by setting [DSI\\_COMPLEXIO\\_CFG1\[28:27\]](#) PWR\_CMD = 0x0), the sequence is:

1. Change TxRequestEsc signals to INACTIVE state by resetting the [DSI\\_COMPLEXIO\\_CFG2\[9:5\]](#) LANEx\_ULPS\_SIG2 bit to 0.
2. Change the state of TxUlpsExit to INACTIVE state by resetting the [DSI\\_COMPLEXIO\\_CFG2\[4:0\]](#) LANEx\_ULPS\_SIG1 bit to 0. This step is necessary only in case a PWROFF command is issued while the sequence for exiting is in progress (TxUlpsExit signal is already in ACTIVE state).

---

**NOTE:** When the [DSI\\_COMPLEXIO\\_CFG2\[9:5\]](#) LANEx\_ULPS\_SIG2 and [DSI\\_COMPLEXIO\\_CFG2\[4:0\]](#) LANEx\_ULPS\_SIG1 bits are both being written to 0, they can be combined into one write. Both bits must be read back to confirm they are effective before proceeding.

---

When the sequence for entering/exiting into/from ULP state is started for specific lanes, users should wait for the completion of the sequence before changing the state of the same or other lanes.

#### 10.3.4.4.17 Interrupts

There is a single interrupt request generated by each DSI: DSI\_IRQ. This interrupt line is merged with another interrupt line from the DISPC\_IRQ into a single interrupt request IRQ. The DSI\_IRQ events are generated only for the enabled VC(s). Two registers are used to enable and monitor the DSI interrupt events:

- **DSI\_IRQENABLE:** This register enables and disables interrupt event reporting for the VCs. Each event for the VC is configured in the [DSI\\_VC\\_IRQENABLE\\_i](#) register dedicated to the VC number. In addition, it includes 1 bit to enable error reporting for the complex I/O. The interrupt is triggered when any error is received from the complex I/O.

- **DSI\_IRQSTATUS:** The register flags which VC(s) have generated an interrupt. Based on the VC number, the **DSI\_VC\_IRQSTATUS\_i** register indicates the event generating the interrupt. In addition, it includes 1 bit for the status of error reporting for the complex I/O.

Table 10-489 lists the DSI VC interrupt events

**Table 10-489. DSI VC Interrupts**

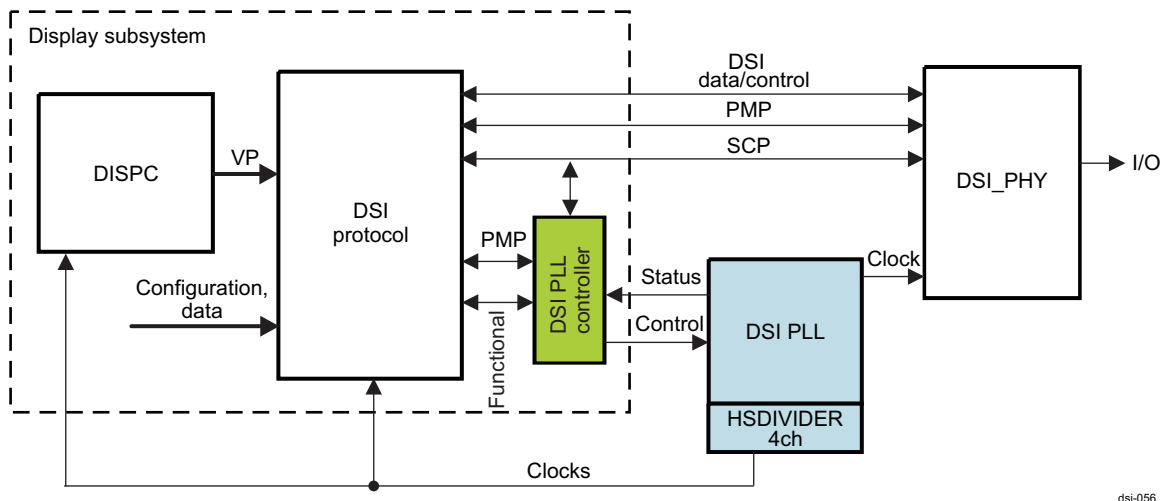

IRQ Name	Description
ECC_CORRECTION_IRQ	Indicates whether a 1-bit error correction has occurred using ECC (short and long packets).
PACKET_SENT_IRQ	Indicates that a packet has been sent. It is used when BTA manual mode is used.
CS_IRQ	Virtual channel. Checksum of the payload mismatch detection.
FIFO_RX_OVF_IRQ	RX FIFO overflow. The FIFO used on the L3 interconnect slave port for buffering the data received on the DSI link has overflowed.
FIFO_TX_OVF_IRQ	TX FIFO overflow. The FIFO used on the L3 interconnect slave port for buffering the data received on the interface slave port has overflowed.
BTA_IRQ	BTA is received from the peripheral (the VC ID used for the last BTA request transfer to the peripheral will be used to determine which VC will be used to flag the interrupt).
ECC_NO_CORRECTION_IRQ	ECC error (short and long packets). No correction of the header because of more than 1-bit error.
FIFO_TX_UDF_IRQ	TX FIFO underflow. The FIFO used on the slave port for buffering the data received on the L3 interconnect slave port has underflowed in the middle of a packet transfer.

### 10.3.4.5 DSI PLL Controllers

#### 10.3.4.5.1 DSI PLL Controllers Overview

Two DSI PLL controller modules are part of the DSS. They use the SCP (see Section 10.3.4.4.6, *Serial Configuration Port Interface*) and power-management port (PMP) as the primary interfaces to the DSI protocol engines. The SCP interface is used to set the configuration of the digital phase-locked loop (DPLL) and HSDIVIDER modules, primarily the various counter values. The PMP is used to control the power state of the DPLL and HSDIVIDER modules. Figure 10-147 is an overview of a single DSI PLL controller module in the display subsystem.

**Figure 10-147. DSI PLL Controller Overview**

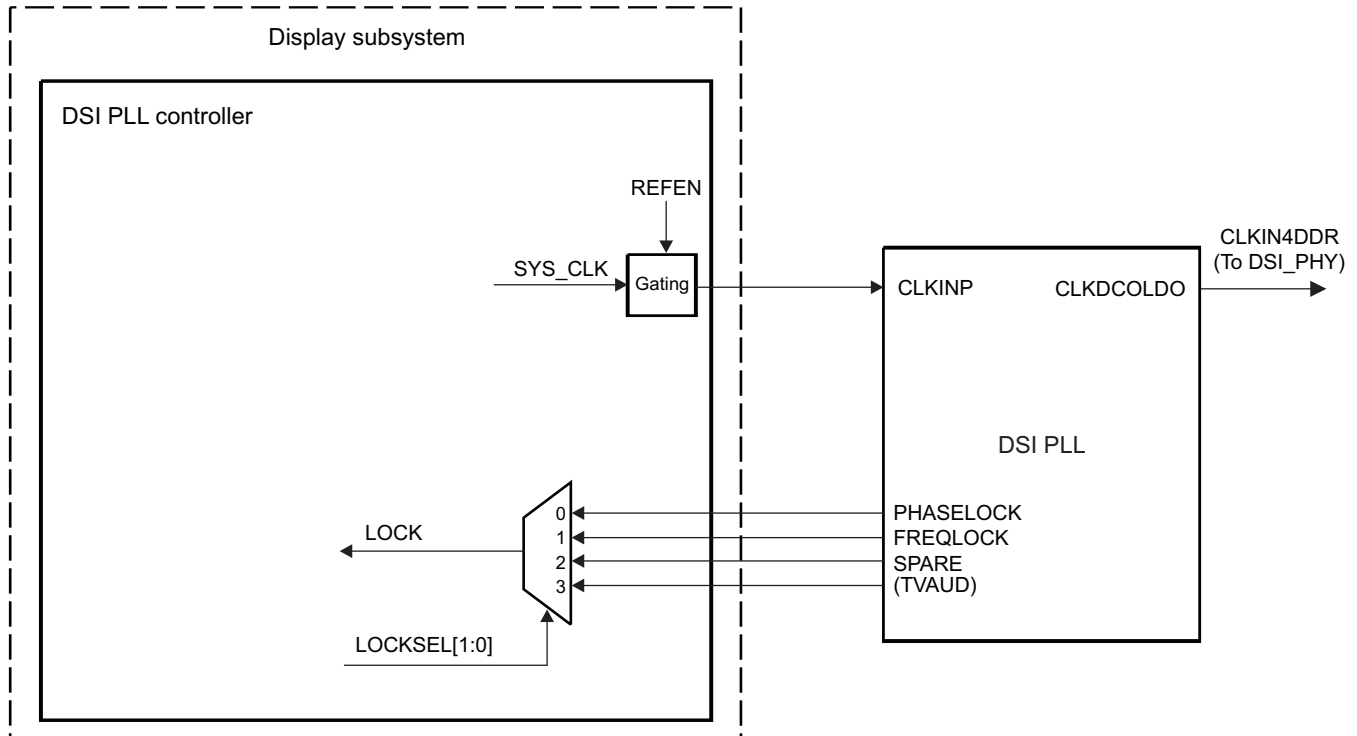

**NOTE:** The DSI PLL controller modules do not have an interface to L3/L4\_PER interconnects. The programmable features are managed by registers mapped into the DSI protocol engines.

### 10.3.4.5.2 DSI PLL Controllers Architecture

The DSI PLLs use instances of the DPLL modules of type A. For more information regarding various DPLL types within the device, see , *Generic DPLL Overview*, in [Chapter 3, Power, Reset, and Clock Management](#).

[Figure 10-148](#) shows the internal reference diagram of a single DSI PLL.

**Figure 10-148. DSI PLL Reference Diagram**

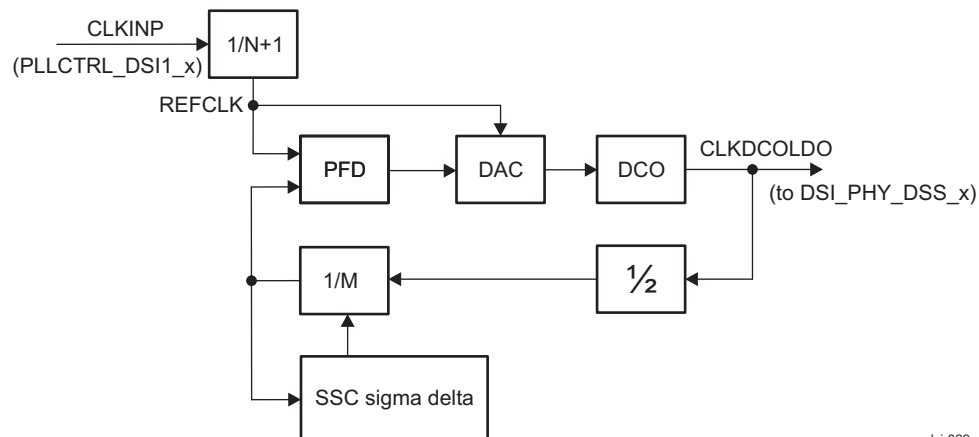

dsi-057

The DSI PLL clock output (CLKDCOLDO) corresponds to the CLKIN4DDR clock of a DSI complex I/O (DSI\_PHY) module.

Only the SYS\_CLK clock is used as an input reference clock for the DSI PLL. The DSI PLL controller can gate this clock by setting the [DSI\\_PLL\\_CONFIGURATION2\[13\]](#) PLL\_REFEN bit.

[Figure 10-149](#) is a simplified block diagram of the DSI PLL instance used for the DSI modules.

**Figure 10-149. DSI PLL Functional Block Diagram**

dsi-029

The input clock CLKINP goes to a predivider  $N + 1$ . The entire loop runs on the REFCLK clock after this predivider. The value of  $N + 1$  is controlled through the [DSI\\_PLL\\_CONFIGURATION1\[8:1\] PLL\\_REGN](#) bit field. The frequency range for the CLKINP and REFCLK clocks is 0.032 MHz to 52 MHz.

The output clock CLKDCOLDO is synthesized by a digitally controlled oscillator (the DCO block), that automatically detects the frequency range. The CLKDCOLDO frequency can be given with  $CLKDCOLDO = CLKINP * 2 * M / (N + 1)$ . For that purpose the feedback multiplier  $M$  must be configured through the [DSI\\_PLL\\_CONFIGURATION1\[20:9\] PLL\\_REGM](#) bit field.

The module also supports spread spectrum clocking (SSC) on its output clocks. SSC is used to spread the spectral peaking of the clock to reduce electromagnetic interference (EMI). When SSC is enabled, the clock spectrum is spread by the amount of frequency spread, and the attenuation is given by the ratio of the frequency spread ( $df$ ) and the modulation frequency ( $fm$ ); that is,  $\{10 * \log_{10}(df/fm)\} - 10$  dB.

The SSC is performed by changing the feedback divider ( $M$ ) in a triangular pattern, which means the frequency of the output clock varies in a triangular pattern. The frequency of the triangular pattern is modulation frequency ( $fm$ ). The peak ( $dM$ ) or the amplitude of the triangular pattern as a percent of  $M$  is equal to the percent of the frequency spread ( $df$ ) (that is,  $dM/M = df/Fout$ ).

Because this is in band modulation for the DSI PLL, the modulation frequency ( $fm$ ) must be within the bandwidth of the PLL (lowest BW of REFCLK/70; that is, REFCLK must be  $> fm * 70$ ). A higher modulation frequency results in less spreading in the output clock.

The SSC can be enabled and disabled by asserting the [DSI\\_PLL\\_SSC\\_CONFIGURATION1\[0\] EN\\_SSC](#) bit. The acknowledge signal SSCACK, observed by the [DSI\\_PLL\\_STATUS\[12\] SSC\\_EN\\_ACK](#) bit, notifies the exact start and end of SSC. When EN\_SSC is deasserted, SSC is disabled only after completion of one full cycle of the triangular pattern given by the modulation frequency. This is done to maintain the average frequency.

The modulation frequency ( $fm$ ) can be programmed as a ratio of REFCLK/4; that is, the value of ModFreqDivider programmed in the [DSI\\_PLL\\_SSC\\_CONFIGURATION2\[29:20\] MODFREQDIVIDER](#) bit field must be  $= REFCLK / (4 * fm)$ . The ModFreqDivider is split into Mantissa and  $2^{Exponent}$  ( $ModFreqDivider = ModFreqDividerMantissa * 2^{ModFreqDividerExponent}$ ).

- The Mantissa is controlled by bits [29:23] of the MODFREQDIVIDER bit field.
- The Exponent is controlled by bits [22:20] of the MODFREQDIVIDER bit field.

Although the same value of ModFreqDivider can be obtained by different combinations of Mantissa and Exponent values, it is preferred to get the target ModFreqDivider by programming maximum Mantissa and minimum Exponent values.

To define the frequency spread ( $df$ ),  $M$  must be controlled as explained previously. To define  $M$ , the step size of  $M$  for each REFCLK during the triangular pattern must be programmed (that is,  $M = ModFreqDivider * DeltaMStep$ ). DeltaMStep is controlled by the [DSI\\_PLL\\_SSC\\_CONFIGURATION2\[19:0\] DELTAM](#) bit field. DeltaMStep is split into an integer part and a fractional part:

- The integer part is controlled by bits [19:18] of the DELTAM bit field.
- The fractional part is controlled by bits [17:0] of the DELTAM bit field.

The frequency spread achieved, however, has an overshoot of 20% or an inaccuracy of +20%.

If the [DSI\\_PLL\\_SSC\\_CONFIGURATION1\[2\] DOWNSPREAD](#) bit is set to 1, the frequency spread on the lower side is twice the programmed value. The frequency spread on the higher side is 0 (except for the overshoot, as described above).

---

**NOTE:** There is a restriction in the range of  $M$  values. The restriction is that  $(M - dM)$  must be  $\geq 20$ . Also,  $M + dM$  must be  $\leq 2045$ . If the [DSI\\_PLL\\_SSC\\_CONFIGURATION1\[2\] DOWNSPREAD](#) bit is set to 1, then  $(M - 2 * dM)$  must be  $\geq 20$  and  $M \leq 2045$ .

---

### 10.3.4.5.3 DSI PLL Operations

The DSI PLL configuration signals operate according to [Table 10-490](#), which indicates the operation when the PLLs are not locked.

**Table 10-490. DSI PLL Operation Modes When Not Locked**

DSI PLL Operation Mode	Stop Mode Low Power <sup>(1)</sup>	Stop Mode Fast Relock <sup>(1)</sup>	Idle Bypass
Mode Description	Output clocks stopped Lowest power standby	Output clocks stopped Fastest start-up time	Selects when PLLs and HSDIVIDERS bypass clocks are used
DSI_PLL_CONFIGURATION2[0] PLL_IDLE	0	0	1
DSI_PLL_CONFIGURATION2[6] PLL_LOWCURRSTBY	1	0	1
DSI_PLL_CONFIGURATION1[0] PLL_STOPMODE	1	1	x

<sup>(1)</sup> This mode must be used for better performance.

When locked, the PLL output frequency is: Input frequency \* 2 \* M/(N + 1), where:

- M multiplier is programmed in the [DSI\\_PLL\\_CONFIGURATION1\[20:9\]](#) PLL\_REGM bit field.
- N divider is programmed in the [DSI\\_PLL\\_CONFIGURATION1\[8:1\]](#) PLL\_REGN bit field.

#### 10.3.4.5.4 DSI PLL Controllers Shadowing Mechanism

The configuration registers are accessed through the DSI protocol engine register spaces using the SCP interface. This includes all the configuration signals and returning status signals.

#### CAUTION

All writes must be 32-bit operations, because the SCP interface always transfers 32 bits; 16-or 8-bit operations may lead to unpredictable errors.

A shadow mechanism is implemented for appropriate register values so that configurations can optionally be updated in synchronization with the DISPC and DSI protocol engines. The front porch time from the DISPC indicates the time when making the update of the value. All the required updated values must be written before this signal is asserted. For more information, see [Section 10.3.4.4.6.1, Shadowing Register](#).

#### 10.3.4.5.5 Error Handling

The PLL lock and recalibration signals can be monitored to detect the loss of lock or the requirement to recalibrate (caused by a large temperature change since the last lock request):

- The [DSI\\_PLL\\_STATUS\[1\]](#) PLL\_LOCK status bit gives the DSI PLL lock state.
- The [DSI\\_PLL\\_STATUS\[2\]](#) PLL\_RECAL status bit informs whether the PLL must be uncalibrated.

These signals can also generate interrupts at the DSI protocol engine level:

- The PLL\_LOCK\_IRQ interrupt indicates that the DSI PLL control module has sent a lock request to the DSI PLL. To monitor this event, read the [DSI\\_IRQSTATUS\[7\]](#) PLL\_LOCK\_IRQ bit. Set this bit to 1 to clear the status bit.
- The PLL\_UNLOCK\_IRQ interrupt indicates that the DSI PLL control module has sent an unlock request to the DSI PLL. To monitor this event, read the [DSI\\_IRQSTATUS\[8\]](#) PLL\_UNLOCK\_IRQ bit. Set this bit to 1 to clear the status bit.
- The PLL\_RECAL\_IRQ interrupt indicates that the DSI PLL control module has sent a recalibration request to the DSI PLL. To monitor this event, read the [DSI\\_IRQSTATUS\[9\]](#) PLL\_RECAL\_IRQ bit. Set this bit to 1 to clear the status bit.

The PLL reference loss and limp status signals can also be monitored:

- The [DSI\\_PLL\\_STATUS\[3\]](#) PLL\_LOSSREF status bit informs whether the DSI PLL has lost the reference.
- The [DSI\\_PLL\\_STATUS\[4\]](#) PLL\_LIMP bit informs about the DSI PLL limp status.

**10.3.4.5.6 Software Reset**

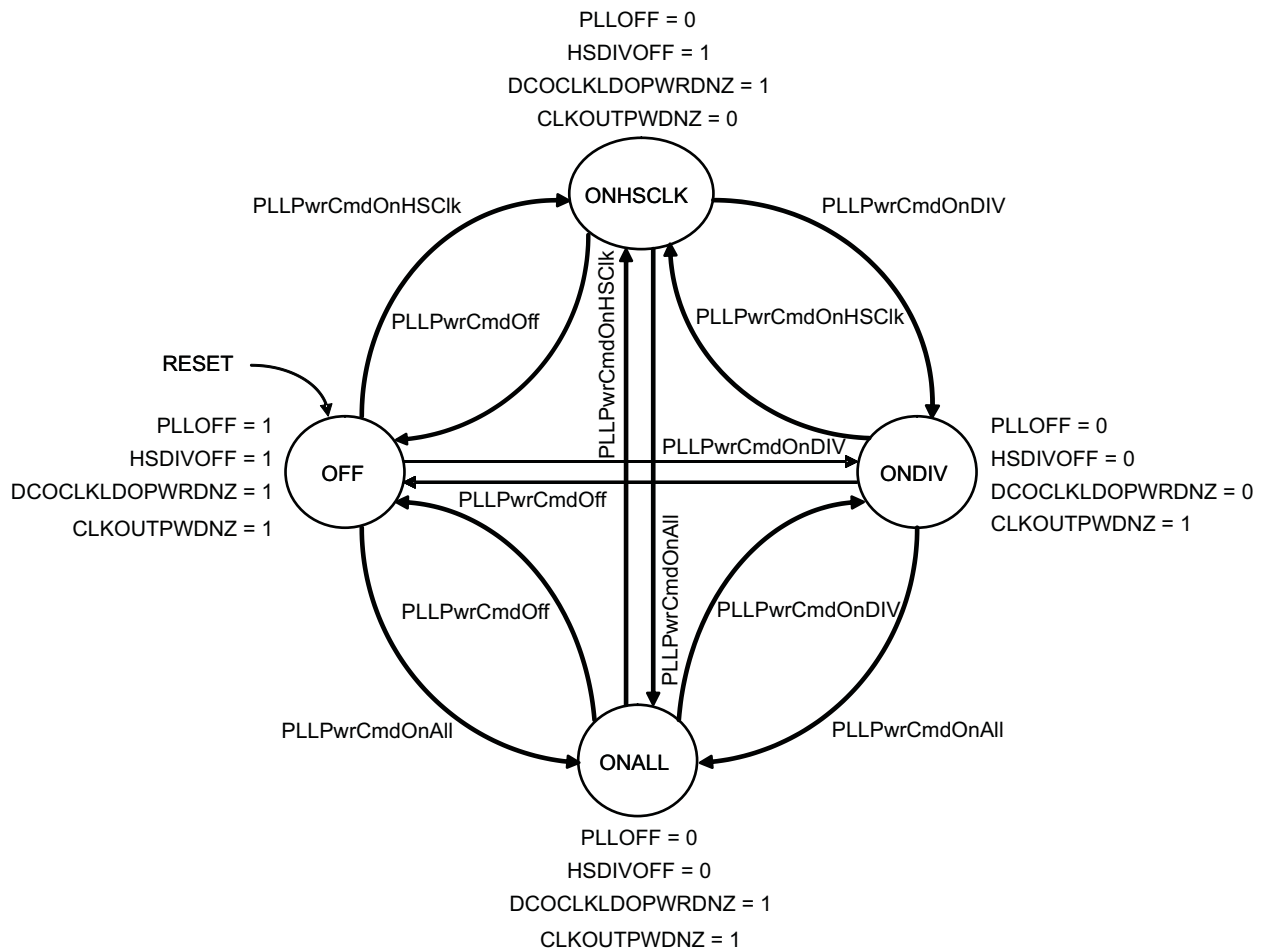

The DSI PLL control modules do not have their own software reset. They are reset by the global DSS\_RST signal at PRCM module level. See Section 10.1.2.2, DSS Resets. Nevertheless, software users can monitor the reset statuses of the DSI PLL control modules by reading the DSI\_PLL\_STATUS[0] PLLCTRL\_RESET\_DONE status bits.

**10.3.4.5.7 Power Management**

The PLLCTRL manages only the LDO power of the DSI PLL and HSDIVIDER; this is done by overriding the SYSRESET signals. All other power-management signals are integrated with the display subsystem power management..

Figure 10-150 shows the power states that are controlled through the PMP.

**Figure 10-150. Power State Diagram**

dsi-058

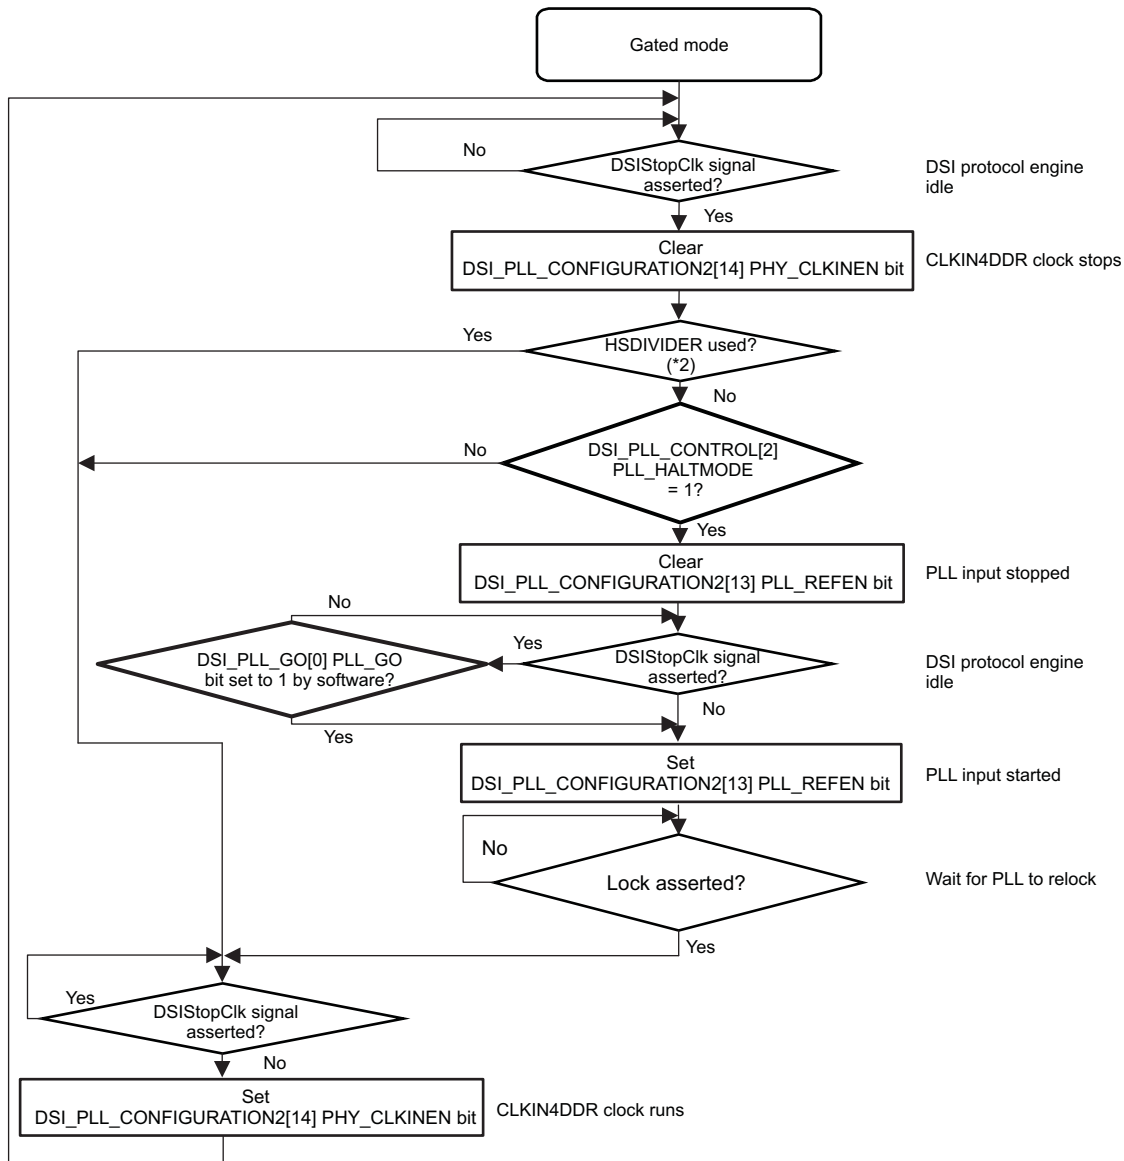

**10.3.4.5.8 DSI PLL Clock-Gating Sequence**

Clock gating can be used to reduce system power consumption when the DSI protocol engine indicates that it does not need the clock. If the HSDIVIDER is not used, the PLL can also be stopped (at the cost of additional unstarting latency).

The DSI protocol engines must verify when the PLLs have unstarted by inspecting the LOCK signal (the DSI\_PLL\_STATUS[1] PLL\_LOCK status bit), because the TXBYTECLKHS clocks are stopped when the CLKIN4DDR clocks generated by the DSI PLL are stopped. This eliminates the need for any explicit feedback that the clock has been unstarted. This flow chart should run even if the DSI\_PLL\_GO[0] PLL\_GO bit is not set.

Figure 10-151 shows the DSI PLL gated mode sequence.

**Figure 10-151. Gated Mode Sequence**

dsi-064

(1) All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

(2) HSDIVIDER is used if any of the following bits is set to 1:

- DSS\_CTRL[12] LCD2\_CLK\_SWITCH
- DSS\_CTRL[0] LCD1\_CLK\_SWITCH
- DSS\_CTRL[1] DSI1\_CLK\_SWITCH
- DSS\_CTRL[10] DSI2\_CLK\_SWITCH

(3) For more information, see [Section 10.1 Display Subsystem Overview](#).

**Table 10-491. Register Call Summary for Gated Mode Sequence**

Register Name	Register Name	Register Name
<a href="#">DSI_PLL_CONFIGURATION2</a>	<a href="#">DSI_PLL_CONTROL</a>	<a href="#">DSI_PLL_GO</a>

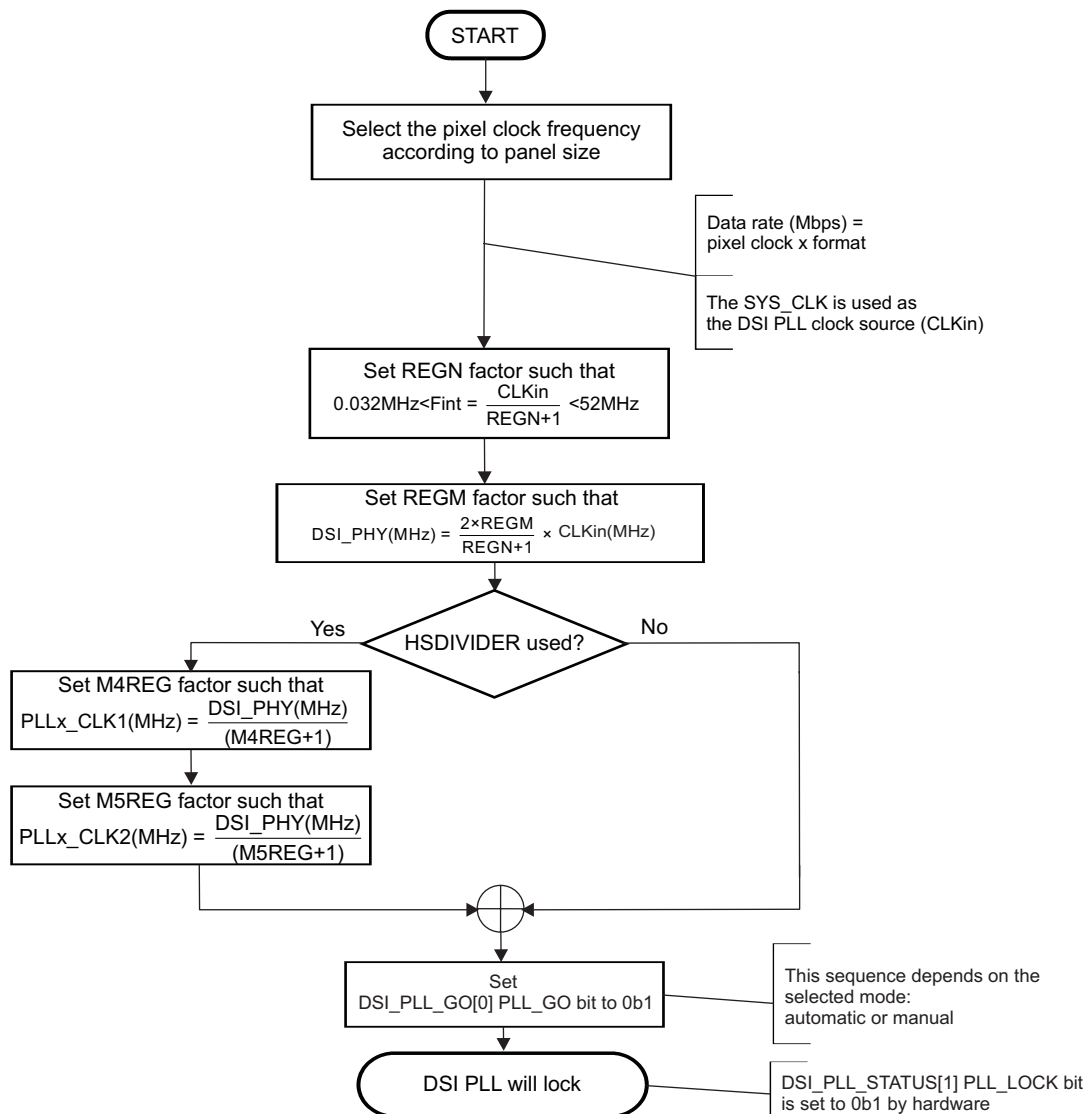

#### **10.3.4.5.9 DSI PLL Clock Sequence**

The two DSI PLLs generate the CLKIN4DDR clocks. Each HSDIVIDER outputs two clocks: PLLx\_CLK1, connected to the DISPC; and PLLx\_CLK2, connected to the DSI protocol engine (where x is the number of the dedicated DSI PLLs [1 or 2]). If these two clocks are not used, the HSDIVIDER functions are not required. In addition, the HSDIVIDER of the DSI1 PLL generates one more clock, PLL1\_CLK4, which is used as bypass input for DSI2\_PHY.

The CLKIN4DDR clocks are twice the data rate and four times the DSI output clock frequency. The DSI PLL factors must be calculated based on the required input and output frequencies, keeping the PLL internal reference frequency in the appropriate range:

- REGM factor is programmed by the [DSI\\_PLL\\_CONFIGURATION1](#)[20:9] PLL\_REGM bit field.
- REGN factor is programmed by the [DSI\\_PLL\\_CONFIGURATION1](#)[8:1] PLL\_REGN bit field.
- M4REG factor is programmed by the [DSI\\_PLL\\_CONFIGURATION1](#)[25:21] M4\_CLOCK\_DIV bit field, and applies to PLLx\_CLK1.
- M5REG factor is programmed by the [DSI\\_PLL\\_CONFIGURATION1](#)[30:26] M5\_CLOCK\_DIV bit field, and applies to PLLx\_CLK2.
- M7 factor is programmed by the [DSI\\_PLL\\_CONFIGURATION3](#)[9:5] M7\_CLOCK\_DIV field, and applies to PLL1\_CLK4.

[Figure 10-152](#) shows the programming sequence.

**Figure 10-152. DSI PLL Programming Sequence**

ds1-067

**NOTE:**

- The M4REG and M5REG factors must be set respecting the following conditions:
  - The PLLx\_CLK1 frequency must be a multiple of PCLK frequency (for proper settings of the PCD and LCD factors in the DISPC).
  - The PLLx\_CLK1 and PLLx\_CLK2 frequencies must be lower than 186 MHz. For more information about clock frequency ratings, see [Section 10.1.2.1, DSS Clocks](#).
- Most of the other DSI PLL programming values are available for software flexibility, but it is not recommended to update the values in normal use. For the recommended DSI PLL values, see [Section 10.3.4.5.11, DSI PLL Recommended Values](#).

**Table 10-492. Register Call Summary for DSI PLL Programming Sequence**

Register Name	Register Name	Register Name
<a href="#">DSI_PLL_CONFIGURATION2</a>	<a href="#">DSI_PLL_GO</a>	<a href="#">DSI_PLL_STATUS</a>

### 10.3.4.5.10 DSI PLL Go Sequence

In manual mode (the [DSI\\_PLL\\_CONTROL\[0\] PLL\\_AUTOMODE](#) bit is set to 0), the DPLL requires a sequence on TINITZ, TENABLE, and TENABLEDIV to update the configuration values and start the locking sequence.

When all the configuration values are programmed into the registers, the GO bit must be set. The appropriate sequence is then sent on the TINITZ, TENABLE, and TENABLEDIV pins, respecting the timing requirements of the DSI PLL. The [DSI\\_PLL\\_GO\[0\] PLL\\_GO](#) bit is cleared to 0 at the end of the sequence.

The TENABLEDIV signal is shared with the HSDIVIDER module so that it is programmed at the same time. In this mode, software must deassert CLKINEN by unsetting the [DSI\\_PLL\\_CONFIGURATION2\[14\] PHY\\_CLKINEN](#) to 0 and assert HSDIVBYPASS correctly by setting the [DSI\\_PLL\\_CONFIGURATION2\[20\] HSDIVBYPASS](#) bit to 1 to prevent uncontrolled frequencies affecting DSI\_PHY and the display subsystem during PLL locking. In manual mode, the shadow register is updated anyway so that valid values are present when later selecting automatic mode.

[Figure 10-153](#) shows the DSI PLL Go flow chart in manual mode (the [DSI\\_PLL\\_CONTROL\[0\] PLL\\_AUTOMODE](#) bit is set to 0).

**Figure 10-153. DSI PLL Go Sequence (Manual Mode)**

dsi-062

- (1) All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

In automatic mode (the [DSI\\_PLL\\_CONTROL\[0\] PLL\\_AUTOMODE](#) bit is set to 1), the TINITZ, TENABLE, and TENABLEDIV sequence and the update of the PLL configuration from the [DSI\\_PLL\\_CONFIGURATION2](#) register are deferred until the time of the front porch time signal sent by the DISPC module. This is intended to simplify the software to implement a configuration change (such as a frequency change to support a different link bandwidth). In this mode, CLKINEN, HSDIVBYPASS, and REFEN are automatically controlled and the register value is overridden.

[Figure 10-154](#) shows the DSI PLL Go flow chart in automatic mode (the [DSI\\_PLL\\_CONTROL\[0\] PLL\\_AUTOMODE](#) bit is set to 1).

**Figure 10-154. DSI PLL Go Sequence (Automatic Mode)**

dsI-063

- (1) All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

**Table 10-493. Register Call Summary for DSI PLL Go Sequence (Automatic Mode)**

Register Name	Register Name	Register Name
<a href="#">DSI_PLL_CONFIGURATION2</a>	<a href="#">DSI_PLL_STATUS</a>	<a href="#">DSI_PLL_GO</a>

#### 10.3.4.5.11 DSI PLL Recommended Values

Table 10-494 shows the DSI PLL recommended values.

**Table 10-494. Recommended Programming Values**

Field Name	Value	Description
<a href="#">DSI_PLL_CONTROL</a> [4] HSDIV_SYSRESET	0	Allow power FSM to control
<a href="#">DSI_PLL_CONTROL</a> [3] PLL_SYSRESET	0	Allow power FSM to control

**Table 10-494. Recommended Programming Values (continued)**

Field Name	Value	Description
DSI_PLL_CONTROL[2] PLL_HALTMODE	-	For information, see <a href="#">Section 10.3.4.5.8, DSI PLL Clock-Gating Sequence</a> .
DSI_PLL_CONTROL[1] PLL_GATEMODE	-	For information, see <a href="#">Section 10.3.4.5.8, DSI PLL Clock-Gating Sequence</a> .
DSI_PLL_CONTROL[0] PLL_AUTOMODE	-	For information, see <a href="#">Section 10.3.4.5.8, DSI PLL Clock-Gating Sequence</a> .
DSI_PLL_GO[0] PLL_GO	1 -> 0	Write 1 when PLL is to be (re)locked with new parameters. This bit is cleared by hardware when the PLL request completes.
DSI_PLL_CONFIGURATION1[30:36] M5_CLOCK_DIV	See <sup>(1)</sup> .	DSI protocol engine clock divider
DSI_PLL_CONFIGURATION1[25:21] M4_CLOCK_DIV	See <sup>(1)</sup> .	DSS clock divider
DSI_PLL_CONFIGURATION1[20:9] PLL_REGM	See <sup>(1)</sup> .	Feedback clock divider
DSI_PLL_CONFIGURATION1[8:1] PLL_REGN	See <sup>(2)</sup> .	Reference clock divider
DSI_PLL_CONFIGURATION1[0] PLL_STOPMODE	1	Required to use the GATEMODE bit
DSI_PLL_CONFIGURATION2[20] HSDIVBYPASS	0	PLL controls HSDIVIDER bypass
DSI_PLL_CONFIGURATION2[19] M5_CLOCK_PWDN	0	If PLL/HSDIVIDER is used as the DSI protocol clock source
DSI_PLL_CONFIGURATION2[18] M5_CLK_EN	1	If PLL/HSDIVIDER is used as the DSI protocol clock source
DSI_PLL_CONFIGURATION2[17] M4_CLOCK_PWDN	0	If PLL/HSDIVIDER is used as the clock source
DSI_PLL_CONFIGURATION2[16] M4_CLOCK_EN	1	If PLL/HSDIVIDER is used as the clock source
DSI_PLL_CONFIGURATION2[15] BYPASSEN	0	To use PLL as the clock source. For small displays, it may be possible to use the display subsystem functional clock, DSS_CLK, in which case this bit must be set to 1. See <a href="#">Section 10.3.4.2, DSI Clock Configuration</a> .
DSI_PLL_CONFIGURATION2[14] PHY_CLKINEN	1	Enable CLKIN4DDR clock
DSI_PLL_CONFIGURATION2[13] PLL_REFEN	1	Enable PLL reference
DSI_PLL_CONFIGURATION2[10:9] PLL_LOCKSEL	0x0	Phase lock criteria to lock the PLL
DSI_PLL_CONFIGURATION2[8] PLL_DRIFTGUARDEN	0x0	The RECAL status/interrupt must be used to decide when to perform a PLL uncalibration. No automatic uncalibration is performed
DSI_PLL_CONFIGURATION2[6] PLL_LOWCURRSTDBY	0/1	Set to 0 for fast PLL unlock, but higher standby current. Set to 1 for leakage level standby current, but longer unlock time.
DSI_PLL_CONFIGURATION2[5] PLLLPMODE	0	Normal operation. For smaller display sizes, it may be possible to set to 1.
DSI_PLL_CONFIGURATION2[0] PLL_IDLE	0	PLL active

<sup>(1)</sup> The value of the bit field must be set according to the desired clock frequency.

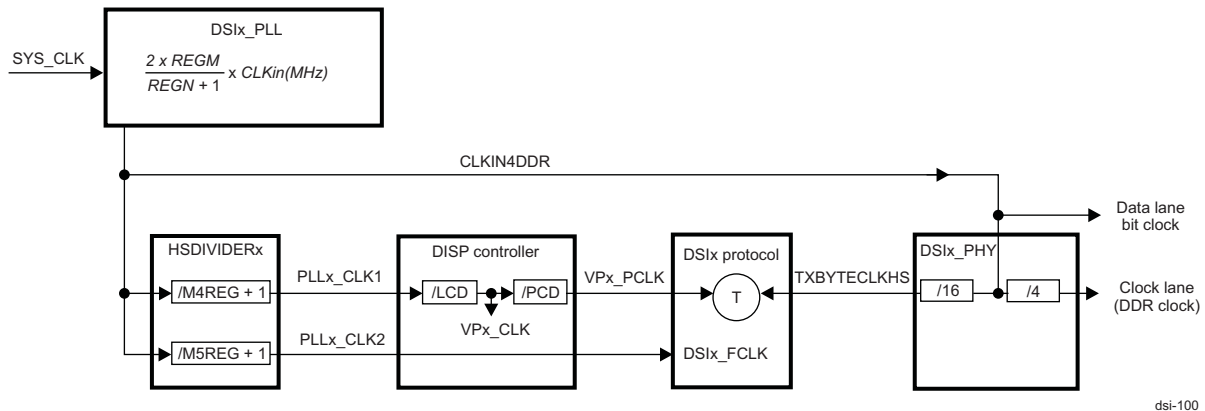

<sup>(2)</sup> The value of the bit field must be set according to the desired clock frequency.

### 10.3.4.5.12 How to Configure the DSI PLL in Video Mode

Figure 10-155 is a global overview of the DSI1 and DSI2 clock trees when used in video mode.

**Figure 10-155. DSI Clock Tree in Video Mode**

dsi-100

The settings of the DSI PLL registers can be summarized by the following equations.

#### Equation 1

$$N \times T_{VP\_CLK} = T_L \times T_{TXBYTECLKHS}$$

dsi-e101

where

- $T_L = T_{HS} + HSA_{DSI} + T_{HE} + HFP_{DSI} + \text{ceiling}((WC + 6) / ND L) + HBP_{DSI}$
- N is an integer.
- ND L: Number of data lanes
- WC: Word count or payload in bytes
- $HSA_{DSI}$  is HSA period in video mode.
- $HBP_{DSI}$  is HBP period in video mode.
- $HFP_{DSI}$  is HFP period in video mode.

$T_{HS}$  is the length of HSYNC start short packet in the number of byte clock cycles (TXBYTECLKHS).

- The generation of this packet can be enabled by setting the [DSI\\_CTRL\[17\]](#) VP\_HSYNC\_START bit to 1.
- $T_{HS}$  is equal to  $\text{ceiling}(4 / ND L)$ , if VP\_HSYNC\_START = 1; else, it is 0.

$T_{HE}$  is the length of HSYNC end short packet in the number of byte clock cycles (TXBYTECLKHS).

- The generation of this packet can be enabled by setting the [DSI\\_CTRL\[18\]](#) VP\_HSYNC\_END bit to 1.
- $T_{HE}$  is equal to 1, if (VP\_HSYNC\_START = 1, VP\_HSYNC\_END = 1,  $HSA_{DSI} = 0$ , and ND L = 3), else
- $T_{HE}$  is equal to  $\text{ceiling}(4 / ND L)$ , if (VP\_HSYNC\_START = 1 and VP\_HSYNC\_END = 1); else, it is 0.

---

**NOTE:**  $HSA_{DSI}$  timing is not used and does not have to be programmed when HE short packet is not generated.

---

#### Equation 2

$$R = T_{TXBYTECLKHS} / T_{VP\_PCLK}$$

dsi-e102

To synchronize the DISPC and DSI protocol engines, users must follow the ratio R between TXBYTECLKHS and VP\_PCLK, as listed in [Table 10-495](#).

**Table 10-495. Ratio R**

Number of Data Lanes (Up to 4 Data Lanes for DSI1) (Up to 2 Data Lanes for DSI2)	Pixel Format	Ratio R
1	16-bit pixel	1/2
1	18-bit pixel	4/9
1	24-bit pixel	1/3
2	16-bit pixel	1
2	18-bit pixel	8/9
2	24-bit pixel	2/3
3	16-bit pixel	3/2
3	18-bit pixel	4/3
3	24-bit pixel	1
4	16-bit pixel	2
4	18-bit pixel	16/9
4	24-bit pixel	4/3

All cases are covered by:

$$F_{VP\_PCLK} \times \text{bits\_per\_pixel} = F_{TXBYTECLKHS} \times NDL \times 8$$

dsi-e110

**Equation 3**

$$(HSA_{DISPC} + HFP_{DISPC} + PPL + HBP_{DISPC}) \times T_{VP\_PCLK} = (4/NDL + HFP_{DSI} + (WC + 6)/NDL + HBP_{DSI}) \times T_{TXBYTECLKHS}$$

dsi-e103

**Equation 4**

$$HFP_{DSI} = ((HFP_{DISPC} \times \text{bits\_per\_pixel}) / (NDL \times 8)) - (2 / NDL)$$

dsi-e109

**Example**

The desired performances are:

- Clock lane at 150 MHz
- RGB24-888
- 1-data lane
- LCD size 480 × 640 with  $HSA_{DISP} = HFP_{DISP} = HBP_{DISP} = 20$ ,  $VSA_{DISP} = VFP_{DISP} = VBP_{DISP} = 2$

Step 1. Determine REGM and REGN.

To obtain correct stability,  $F_{int}$  must be kept between 0.032 MHz and 52 MHz. In this case,  $F_{int}$  is maintained at 2 MHz. For more information, see [Section 10.3.4.5.2, DSI PLL Controllers Architecture](#), [Section 10.3.4.5.9, DSI PLL Clock Sequence](#), and [Section 10.3.5.2.1.1, Main Sequence – DSI PLL Setup](#).

$$REGN = (F_{SYS\_CLK} / F_{int}) - 1$$

$$REGN = 12$$

$$REGM = (REGN + 1) \times F_{CLKIN4DDR} / (2 \times F_{SYS\_CLK})$$

$$REGM = 150$$

dsi-e113

where

- $SYS\_CLK = 26$  MHz is used as a reference clock.

Step 2. Determine VP\_PCLK and TXBYTECLKHS clocks.

TXBYTECLKHS frequency is equal to 37.5 MHz. With ratio R equal to 1/3, VP\_PCLK frequency is equal to 12.5 MHz. The frame rate can be estimated by:

$$\text{Frame rate} = F_{VP\_PCLK} / (HSA_{DISPC} + HFP_{DISPC} + PPL + HBP_{DISPC}) \times (VSA_{DISPC} + LPP + VBP_{DISPC})$$

$$\text{Frame rate} = 12.5 \text{ MHz} / (540) \times (646)$$

$$\text{Frame rate} = 35.83 \text{ frame/sec}$$

dsi-e123

Step 3. Determine LCD, PCD, and M4REG.

$$T_{CLKIN4DDR} = T_{TXBYTECLKHS} / 16 = T_{VP\_PCLK} / ((M4REG + 1) \times LCD \times PCD)$$

$$((M4REG + 1) \times LCD \times PCD) = 16 \times 3$$

dsi-e115

If LCD and PCD are set to 1 and 3, respectively, M4REG is equal to 15.

Step 4. Verify N as integer.

First, TL must be determined:

$$(HSA_{DISPC} + HFP_{DISPC} + PPL + HBP_{DISPC}) \times T_{VP\_PCLK} / T_{TXBYTECLKHS} = T_L = 1620$$

dsi-e116

From **Equation 1** follows:

$$N \times T_{VP\_CLK} = T_L \times T_{TXBYTECLKHS}$$

$$N = T_{TXBYTECLKHS} \times T_L / T_{VP\_CLK} = T_L / (R \times PCD)$$

$$N = 14580$$

N is an integer.

Step 5. Determine HFP and HBP of the DSI protocol engine.

From **Equation 3** follows:

$$((HSA_{DISPC} + HFP_{DISPC} + PPL + HBP_{DISPC}) \times T_{VP\_PCLK} / T_{TXBYTECLKHS}) - (4/NDL + (WC + 6)/NDL) = HFP_{DSI} + HBP_{DSI}$$

$$HFP_{DSI} + HBP_{DSI} = 170$$

dsi-e117

From **Equation 4** follows:

$$HFP_{DSI} = ((HFP_{DISP} \times \text{bits\_per\_pixel}) / NDL \times 8) - (2/NDL)$$

$$HFP_{DSI} = 58$$

$$HBP_{DSI} = 170 - 58 = 112$$

dsi-e121

### 10.3.4.6 DSI Complex I/O

#### 10.3.4.6.1 DSI Complex I/O Overview

DSI\_PHY is a complex I/O with five unidirectional (HS) lane modules. This includes four data lane modules and one clock lane module. Each lane module has two data pads (DX, DY). These data pads are connected with a complementary lane module on the DSI receiver device using a point-to-point interconnect.

Lane modules support HS burst mode. Forward direction and reverse direction escape modes are also supported. Escape modes can be used for low-power data transmission, among other things.

The maximum data rate supported in HS mode is 824 Mbps for four data lanes, and 900 Mbps for up to three data lanes. The lane module function and position are configurable; that is, any lane module can be chosen as a clock lane module, and the DX/DY data pad for each lane module can be configured as a DP or DN pin defined by the D-PHY specification.

DSI\_PHY interacts with the higher layers of the DSI link through the PPI. DSI\_PHY does not include a PLL; a high-frequency clock input is expected in HS mode (CLKIN4DDR). DSI\_PHY also supports the SCP interface to set various configuration and control registers.

#### 10.3.4.6.2 Software Reset

The clock domain using the TXBYTECLKHS byte clock from the DSI complex I/O has dedicated reset-done information in the [DSI\\_COMPLEXIO\\_CFG1\[29\] RESET\\_DONE](#) bit. The [DSI\\_SYSCONFIG\[1\] SOFT\\_RESET](#) bit is used to reset the byte clock power domain. A dummy read using the SCP interface to any DSI\_PHY register is required after DSI\_PHY reset to complete the reset of the DSI complex I/O.

#### 10.3.4.6.3 Reset-Done Bits

The DSI complex I/O has several clock domains. The reset status for each clock domain is provided in the [DSI\\_PHY\\_REGISTER5](#) register:

- [DSI\\_PHY\\_REGISTER5\[31\] RESETDONETXBYTECLK](#) bit: Reset done for the TXBYTECLK domain.
- [DSI\\_PHY\\_REGISTER5\[28:24\] RESETDONETXCLKESC<sub>i</sub>](#) bit field: Reset done for the TXCLKESC domain for lane *i* (where *i* = 0 to 4).
- [DSI\\_PHY\\_REGISTER5\[30\] RESETDONESCCLK](#) bit: Reset done for the SCP clock domain. Software users must perform a dummy read on this bit to initiate the reset sequence of the SCP FSM. When the reset sequence completes, the RESETDONESCCLK signal goes high, and software users can read again the [DSI\\_PHY\\_REGISTER5\[30\] RESETDONESCCLK](#) bit to ensure that the value is now 1.

---

**NOTE:** Software must not write in the DSI\_PHY SCP registers before the [DSI\\_PHY\\_REGISTER5\[30\] RESETDONESCCLK](#) bit is set to 1.

---

- [DSI\\_PHY\\_REGISTER5\[29\] RESETDONEPWRCLK](#) bit: Reset done for the PWR clock domain. The reset sequence of the PWR FSM is complete when the RESETDONEPWRCLK signal goes high.

#### 10.3.4.6.4 Pad Configuration

The number of lanes is configurable through the [DSI\\_COMPLEXIO\\_CFG1](#) register.

It is not allowed to change on the fly the position (by modifying the DATA<sub>x</sub>\_POSITION, where *x* = 1 through 4, and CLOCK\_POSITION fields), the P/N order (positive/negative order of the differential pair by modifying the DATA<sub>y</sub>\_POL, where *y* = 1 through 4, and CLOCK\_POL), or the number of active data lanes (by modifying the [DSI\\_COMPLEXIO\\_CFG1\[10:8\] DATA2\\_POSITION](#), [DSI\\_COMPLEXIO\\_CFG1\[14:12\] DATA3\\_POSITION](#), and [DSI\\_COMPLEXIO\\_CFG1\[18:16\] DATA4\\_POSITION](#) bit fields). To add or remove lanes 2, 3, or 4, it is required to be in OFF mode for the DSI complex I/O.

The configuration of the DSI complex I/O (number of data lanes, position, differential order) must not be changed while the [DSI\\_CLK\\_CTRL\[20\] LP\\_CLK\\_ENABLE](#) bit is set to 1. For hardware to recognize a new configuration of the complex I/O (done in the [DSI\\_COMPLEXIO\\_CFG1](#) register), the following sequence shall be followed:

1. Set the [DSI\\_CTRL\[0\] IF\\_EN](#) bit to 1.
2. Reset the [DSI\\_CTRL\[0\] IF\\_EN](#) bit to 0.
3. Set [DSI\\_CLK\\_CTRL\[20\] LP\\_CLK\\_ENABLE](#) bit to 1.
4. Set again the [DSI\\_CTRL\[0\] IF\\_EN](#) bit to 1.

If the sequence is not followed, the DSI complex I/O configuration is undetermined.

The minimum requirement for the number of lanes is one clock lane and one data lane. By default, data lanes 2, 3, and 4 are not connected (the reset value of the DATA<sub>x</sub>\_POSITION bit fields is 0).

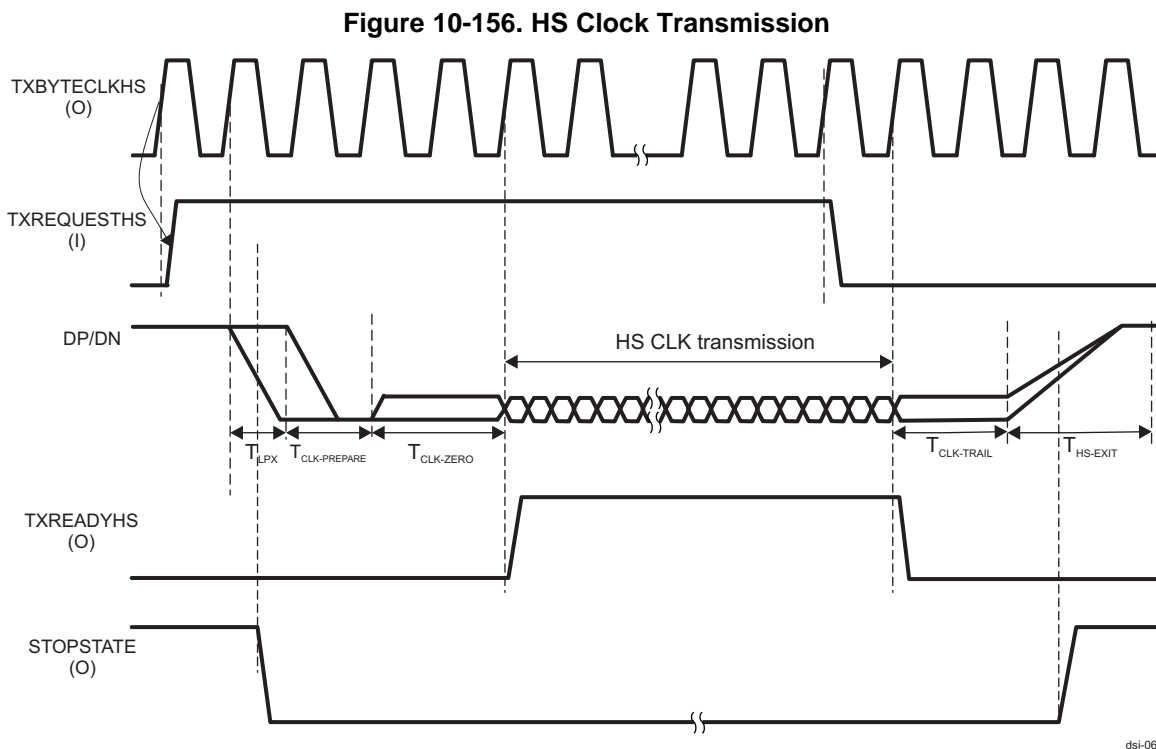

### 10.3.4.6.5 Display Timing Configuration

**NOTE:** Copyright 2005-2008 MIPI Alliance, Inc. All rights reserved. MIPI Alliance Member Confidential.

Depending on the CLKIN4DDR clock frequency settings programmed with the DSI PLL control module, software users must program accordingly the timing parameters in the DSI complex I/O registers.

#### 10.3.4.6.5.1 High-Speed Clock Transmission

Figure 10-156 shows an example of HS clock transmission.

TXBYTECLKHS is an output clock that is derived by dividing CLKIN4DDR by 16.

The TXBYTECLKHS clock is driven by DSI\_PHY when:

- The CLKIN4DDR is running and [DSI\\_PLL\\_CONFIGURATION2\[14\]](#) PHY\_CLKINEN bit is set to '1'.
- DSI\_PHY is in ON power state ([DSI\\_COMPLEXIO\\_CFG1\[28:27\]](#) PWR\_CMD bit = 1) and at least one lane is enabled.

To begin transmission, the protocol drives TXREQUESTHS high on a rising edge of TXBYTECLKHS. The PHY detects this signal on the next rising edge, after which it initiates the LP SoT procedure.

During an HS clock transmission, these parameters are defined in multiples of CLKIN4DDR and are programmed by the following bit fields:

- TLPX timing is programmed by [DSI\\_PHY\\_REGISTER1\[20:16\]](#) TLPXBY2.
- THS-PREPARE timing is programmed by [DSI\\_PHY\\_REGISTER0\[31:24\]](#) THSPREPARE.
- TCLK-ZERO timing is programmed by [DSI\\_PHY\\_REGISTER1\[7:0\]](#) TCLKZERO.

TCLK-ZERO is extended, if required, so that the entire LP SoT procedure lasts an integer number of TXBYTECLKHS cycles.

At the end of the SoT procedure, HS clock transmission begins. At the same time, TXREADYHS is made high.

To stop clock transmission, the protocol drives TXREQUESTHS low on a rising edge of TXBYTECLKHS. The DSI\_PHY detects this change in TXREQUESTHS on the next edge and stops clock transmission. TXREADYHS is made low.

The DSI\_PHY then goes through the LP EoT procedure. The TCLK-TRAIL and THS-EXIT parameters are also multiples of CLKIN4DDR and are programmed by the following bit fields:

- TCLK-TRAIL timing is programmed by [DSI\\_PHY\\_REGISTER1\[15:8\]](#) TCLKTRAIL.
- THS-EXIT timing is programmed by [DSI\\_PHY\\_REGISTER0\[7:0\]](#) THSEXIT.

The DSI\_PHY completes the SoT and EoT procedures, once begun, regardless of any change in the PPI signals. If TXREQUESTHS goes low during the SoT procedure, the PHY starts the EoT procedure immediately after finishing the SoT procedure and no clock is transmitted.

STOPSTATE is high whenever the line is in LP-11 state, as determined by the outputs of the low-power receivers. This signal is not synchronized with TXBYTECLKHS.

The HS clock must be present for a period of time before (TCLK-PRE) and after (TCLK-POST) HS data transmission. The protocol must ensure that these timings are met by asserting and deasserting TXREQUESTHS appropriately.

The PHY ensures that the clock signal has a quadrature phase with respect to a toggling bit sequence on any data lane, and a rising edge in the center of the first transmitted bit of each data byte. These relations are not described in the timing diagram.

CLKIN4DDR can be shut off 300 ns after the clock lane goes to STOPSTATE. Alternatively, CLKIN4DDR can be shut down after TCLK-Trail + THS-Exit + 2 Txbyteclk periods after the TxRequestHS falling edge is received by DSI\_PHY.

The DSI protocol engine must ensure that TXREQUESTESC, TXULPSCLK, and TURNREQUEST are low whenever TXREQUESTHS is asserted.

#### **10.3.4.6.5.2 High-Speed Data Transmission**

[Figure 10-157](#) shows an example of HS data transmission.

**Figure 10-157. HS Data Transmission**

dsi-066

To begin transmission, the protocol drives TXDATAHS with the first byte of data on a rising edge of TXBYTECLKHS. It also makes TXREQUESTHS high on the same rising edge. The PHY detects TXREQUESTHS going high on the next rising edge of TXBYTECLKHS, following which it initiates the LP SoT procedure.

During an HS data transmission, these timings are multiples of CLKIN4DDR and are programmed by the following bit fields:

- TLPX timing is programmed by [DSI\\_PHY\\_REGISTER1\[20:16\]](#) TLPXBY2.
- THS-PREPARE + THS-ZERO timing is programmed by [DSI\\_PHY\\_REGISTER0\[23:16\]](#) THSPRPR\_THSZERO.

THS-ZERO is extended, if required, so that the entire LP SoT procedure lasts an integer number of TXBYTECLKHS cycles. THS-SYNC corresponds to the length of the sync pattern (8 HS bits), and can be configured through the [DSI\\_PHY\\_REGISTER2\[31:24\]](#) HSSYNCPATTERN bit field.

Toward the end of the SoT procedure, the PHY makes TXREADYHS high on a positive edge of TXBYTECLKHS and then starts accepting data from TXDATAHS from the next positive edge onward. The protocol is expected to provide (new) valid data on TXDATAHS on every positive edge of TXBYTECLKHS if TXREADYHS is high.

At the end of the SoT procedure, HS data transmission begins. HS data transmission happens LSB first.

To stop data transmission, the protocol drives TXREQUESTHS low on a rising edge of TXBYTECLKHS. The PHY detects this change in TXREQUESTHS on the next edge and stops data transmission. TXREADYHS is made low and data on TXDATAHS, from that point, is ignored.

The PHY then goes through the LP EoT procedure. THS-TRAIL and THS-EXIT are also multiples of CLKIN4DDR and are programmed by the following bit fields:

- THS-TRAIL timing is programmed by [DSI\\_PHY\\_REGISTER0\[15:8\]](#) THSTRAIL.

- THS-EXIT timing is programmed by [DSI\\_PHY\\_REGISTER0\[7:0\]](#) THSEXIT.

The PHY completes the SoT and EoT procedures, once begun, regardless of any change in PPI signals. If TXREQUESTHS goes low during the SoT procedure, the PHY starts the EoT procedure immediately after finishing the SoT procedure and no data is transmitted.

STOPSTATE is high whenever the line is in LP-11 state, as determined by the outputs of the low-power receivers. This signal is not synchronized with TXBYTECLKHS.

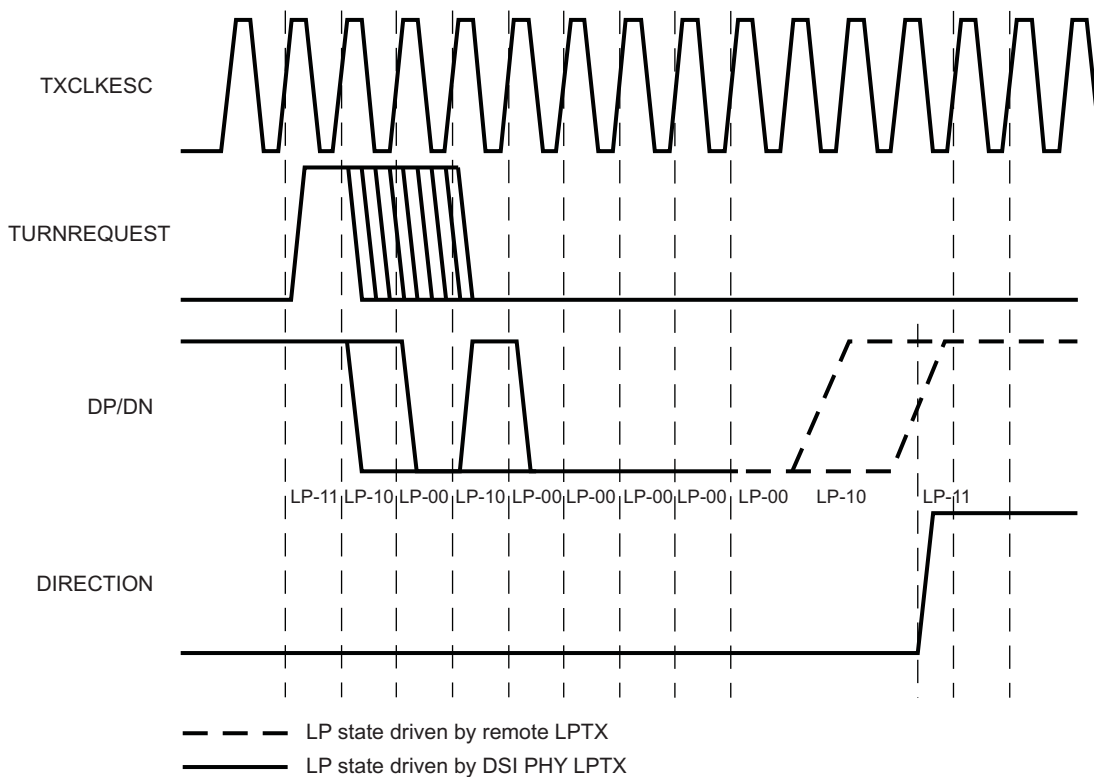

The protocol must ensure that TXREQUESTESC, TXULPSCLK, and TURNREQUEST are low whenever TXREQUESTHS is asserted.

### 10.3.4.6.5.3 Turnaround Request in Transmit Mode

When the DSI PHY is in transmit mode, the DSI protocol engine can request a turnaround by making the TurnRequest signal high for at least one clock cycle of TxClkEsc (see [Section 10.3.4.4.7.3, TurnRequest FSM](#)).

The DSI PHY transmits the turnaround request pattern (LP 11-10-00-10-00-00-00-00) (see [Figure 10-158](#)). The number of 00 states at the end of the pattern is defined by the  $T_{TA-GO}$  timing parameter and is programmable through the [DSI\\_PHY\\_REGISTER1\[31:29\]](#) REG\_TTAGO bit field, in number of TxClkEsc clocks. Following the transmission of the pattern, the DSI PHY disables its LP transmitters and waits for an acknowledgment from the remote device. The remote device detects the turnaround request and acknowledges it by driving LP 10, followed by the STOP state. When this acknowledgment is received (BTA\_IRQ is asserted, as described in [Section 10.3.4.4.8, Bus Turnaround](#)), the DSI PHY switches to receive mode and indicates the completion of the turnaround procedure by changing the direction (BTA\_EN = 0).

Figure 10-158. Turnaround Request in Transmit Mode

dsi-028

The DSI protocol engine must not stop TxClkEsc after the turnaround process completes (the [DSI\\_CLK\\_CTRL\[20\]](#) LP\_CLK\_ENABLE bit must be kept at 1), because TxClkEsc is also used in handling a turnaround request transmitted by a remote slave device (see [Section 10.3.4.6.5.4, Turnaround Request in Receive Mode](#)).

#### 10.3.4.6.5.4 Turnaround Request in Receive Mode

When DSI PHY is in receive mode, an LP pattern of 11-10-00-10-00 on DP/DN lines indicates a turnaround request from the remote device (see [Figure 10-159](#)).

**Figure 10-159. Turnaround Request in Receive Mode**

dsi-029

If the line stays in LP-00 for a time  $T_{TA-SURE}$ , the DSI PHY accepts the turnaround request, changes the direction, transmits LP-00 for a time  $T_{TA-GET}$ , and then transmits the acknowledgment pattern LP-10, followed by the STOP state.

This completes the turnaround procedure (BTA\_IRQ is asserted, as described in [Section 10.3.4.4.8, Bus Turnaround](#)). The  $T_{TA-SURE}$  and  $T_{TA-GET}$  timing parameters are programmable through [DSI\\_PHY\\_REGISTER1](#) in number of TxClkEsc clocks:

- $T_{TA-SURE}$  can be configured in the [28:27] REG\_TTASURE bit field.
- $T_{TA-GET}$  can be configured in the [26:24] REG\_TTAGET bit field.

#### 10.3.4.6.5.5 Other DSI PHY Transmission and Reception

The timings of the following sequences defined in the DSI\_PHY protocol cannot be programmed by the user:

- Low-power data transmission
- Escape mode trigger command transmission
- ULPS command transmission on data lanes
- ULPS transmission on clock lane
- Low-power data in receive mode
- Low-power trigger in receive mode
- ULPS command on clock lane in receive mode
- ULPS command on data lane in receive mode

**10.3.4.6.6 Power Management**

Power management of the DSI\_PHY analog circuitry is done through the internal power FSM, which is controlled by the subsystem. The control interface is a basic command and acknowledge protocol. The subsystem is the master of the interface. There is a dedicated command pin for each power state of DSI\_PHY and a common acknowledge pin. The subsystem sends the power command and clock. The internal FSM does the sequencing and control generation of internal power domains. It then asserts the acknowledge, which signals the completion of the power state transition. The internal power control FSM is powered by a constant power supply.

The main features of the power control interface are:

- One dedicated command line per power state
- Only one command line can be asserted at a time.
- One acknowledge signal common to all command lines
- The command line cannot be cleared unless the acknowledge has been returned.
- All the command lines and the acknowledge signal must be cleared before triggering a new command.

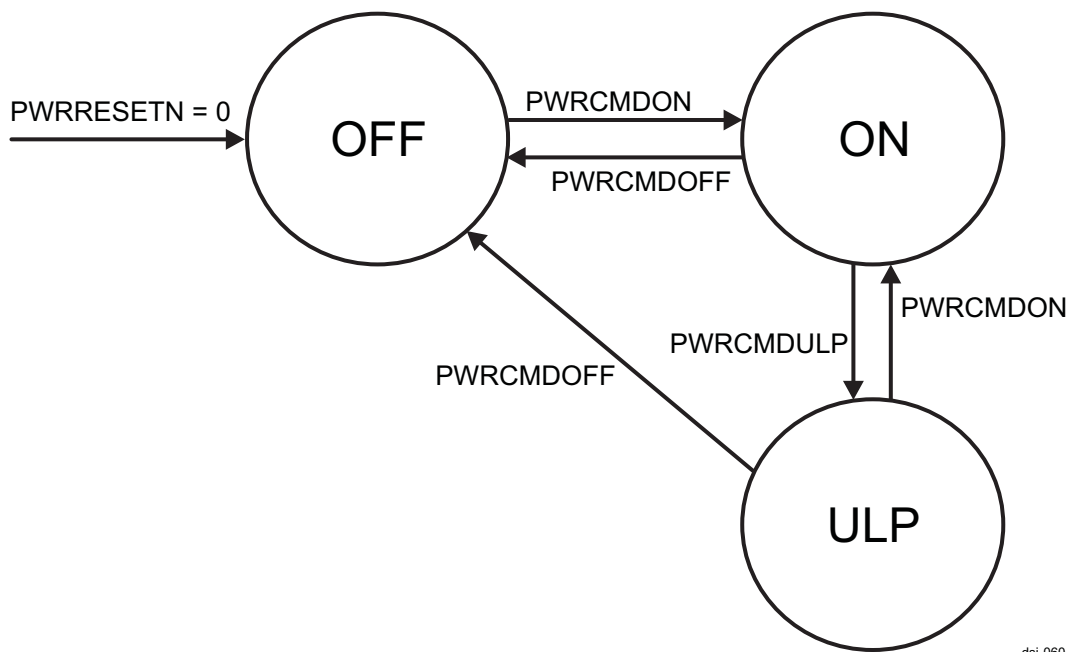

DSI\_PHY supports three power states:

- OFF/GPIO mode (OFF): The entire analog circuit is powered down. Internal LDO is OFF. All analog circuitry on 1.8-V supply is powered down. The ULPS exit detection circuit power switch is OFF. DSI\_PHY takes leakage level current.
- ON: Complete analog circuit is powered on and functional. LDO is ON. (DSI\_PHY calibrates every time the module enters power on state.)
- ULPS: Only the DSI\_PHY mode ULPS exit detection circuit power switch is ON. All the other analog circuitry is switched OFF. LDO is OFF.

**NOTE:** ULPS must be entered only when all used lane modules go into ULPS state. PHY power state must be returned to ON power state when any one of the used modules goes out of ULPS. No PPI signal except TXULPSEXIT must be toggled when in this power state.

Figure 10-160 shows the power states of the DSI complex I/O

**Figure 10-160. Power State Diagram**

dsi-060

### 10.3.4.6.7 Error Handling

A dedicated register for the DSI complex I/O ( [DSI\\_COMPLEXIO\\_IRQSTATUS](#)) indicates the state of each error provided by the DSI complex I/O error signals. The DSI\_PHY reports the following errors:

- [DSI\\_COMPLEXIO\\_IRQSTATUS](#)[9:5] ERRESC<sub>i</sub>\_IRQ: ERRESC is asserted if an unrecognized Escape entry command is received. This remains high until the next change in the line state.
- [DSI\\_COMPLEXIO\\_IRQSTATUS](#)[4:0] ERRSYNCESC<sub>i</sub>\_IRQ: If the number of bits received during a low-power data transmission is not a multiple of 8 when the transmission ends, ERRSYNCESC is made high and remains high until the next change in line state.
- [DSI\\_COMPLEXIO\\_IRQSTATUS](#)[14:10] ERRCONTROL<sub>i</sub>\_IRQ: ERRCONTROL is asserted if an incorrect line state sequence is detected. For example, if a turnaround request or escape mode request is immediately followed by a STOP state instead of the required BRIDGE state, this signal is asserted and remains asserted until the next change in the line state.
- [DSI\\_COMPLEXIO\\_IRQSTATUS](#) ERRCONTENTIONLP0<sub>i</sub>\_IRQ: ERRCONTENTION0LPDX and ERRCONTENTION0LPDY are asserted when the lane module detects a contention situation on lines DX and DY, respectively, while trying to drive the lines low. Contention is detected only if it lasts at least 50 ns.
- [DSI\\_COMPLEXIO\\_IRQSTATUS](#) ERRCONTENTIONLP1<sub>i</sub>\_IRQ: ERRCONTENTION1LPDX and ERRCONTENTION1LPDY are asserted when the lane module detects a contention situation on lines DX and DY, respectively, while trying to drive the lines high. Contention is detected only if it lasts at least 50 ns.

The ULPSACTIVENOT signal goes low, which indicates to the protocol that the PHY has entered ULPS. When all the ULPSActiveNot signals are low, the [DSI\\_COMPLEXIO\\_IRQSTATUS](#)[30] ULPSACTIVENOT\_ALL0\_IRQ event is generated. When all the ULPSActiveNot signals are high, the [DSI\\_COMPLEXIO\\_IRQSTATUS](#)[31] ULPSACTIVENOT\_ALL1\_IRQ event is generated.

When any of the events defined in the [DSI\\_COMPLEXIO\\_IRQSTATUS](#) register happen, the [DSI\\_IRQSTATUS](#)[10] COMPLEXIO\_ERR\_IRQ bit is set to 1 at DSI protocol engine level.

[Table 10-496](#) lists the DSI complex I/O interrupt events.

**Table 10-496. DSI Complex I/O Interrupts**

IRQ Name	Description
ULPSActiveNot_ALL0_IRQ	All the ULPSActiveNOT signals are 0.
ULPSActiveNot_ALL1_IRQ	All the ULPSActiveNOT signals corresponding to the lanes with TXULPSExit being high are high.
STATEULPM5_IRQ	Lane 5 in ULPS
STATEULPM4_IRQ	Lane 4 in ULPS
STATEULPM3_IRQ	Lane 3 in ULPS
STATEULPM2_IRQ	Lane 2 in ULPS
STATEULPM1_IRQ	Lane 1 in ULPS
ERRCONTROL5_IRQ	Control error for lane 5
ERRCONTROL4_IRQ	Control error for lane 4
ERRCONTROL3_IRQ	Control error for lane 3
ERRCONTROL2_IRQ	Control error for lane 2
ERRCONTROL1_IRQ	Control error for lane 1
ERRESC5_IRQ	Escape entry error for lane 5 (edge trigger interrupt)
ERRESC4_IRQ	Escape entry error for lane 4 (edge trigger interrupt)
ERRESC3_IRQ	Escape entry error for lane 3 (edge trigger interrupt)
ERRESC2_IRQ	Escape entry error for lane 2 (edge trigger interrupt)
ERRESC1_IRQ	Escape entry error for lane 1 (edge trigger interrupt)
ERRCONTENTIONLP1_1_IRQ	Contention LP1 error for lane 1
ERRCONTENTIONLP0_1_IRQ	Contention LP0 error for lane 1
ERRCONTENTIONLP1_2_IRQ	Contention LP1 error for lane 2

**Table 10-496. DSI Complex I/O Interrupts (continued)**

<b>IRQ Name</b>	<b>Description</b>
ERRCONTENTIONLP0_2_IRQ	Contention LP0 error for lane 2
ERRCONTENTIONLP1_3_IRQ	Contention LP1 error for lane 3
ERRCONTENTIONLP0_3_IRQ	Contention LP0 error for lane 3
ERRCONTENTIONLP1_4_IRQ	Contention LP1 error for lane 4
ERRCONTENTIONLP0_4_IRQ	Contention LP0 error for lane 4
ERRCONTENTIONLP1_5_IRQ	Contention LP1 error for lane 5
ERRCONTENTIONLP0_5_IRQ	Contention LP0 error for lane 5
ERRSYNCEC5_IRQ	Low-power data transmission synchronization error for lane 5
ERRSYNCEC4_IRQ	Low-power data transmission synchronization error for lane 4
ERRSYNCEC3_IRQ	Low-power data transmission synchronization error for lane 3
ERRSYNCEC2_IRQ	Low-power data transmission synchronization error for lane 2
ERRSYNCEC1_IRQ	Low-power data transmission synchronization error for lane 1

Software must take appropriate action when receiving the interrupt indicating the error from the complex I/O. The action can be:

- Reset the DSI protocol engine module
- Reset the peripheral through the reset trigger or directly driving the hardware reset pin of the display module
- Ignore the error

### 10.3.5 DSI Programming Model

This section describes the low-level hardware programming sequences for the configuration and use of the DSI module.

#### 10.3.5.1 DSI Global Initialization

##### 10.3.5.1.1 Surrounding Modules Global Initialization

This section describes the requirements to initialize the surrounding modules when the DSI module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DSI. For more information, see [Section 10.3.3, DSI Integration](#), and [Section 10.3.2, DSI Environment](#).

[Table 10-497](#) describes the global initialization of the surrounding modules.

**Table 10-497. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	DSI module interface and functional clocks must be enabled. The module power management (idle and sleep modes) must be configured. For more information, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
MPU INTC	MPU interrupt controller (INTC) configuration must be done to enable interrupts from the DSI module. For more information about the module configuration, see <a href="#">Chapter 17, Interrupt Controllers</a> .
DSP INTC	DSP INTC configuration must be done to enable interrupts from the DSI module. For more information about the module configuration, see <a href="#">Chapter 5, DSP Subsystem</a> .
sDMA	DMA configuration must be done to enable DSI module DMA channel requests. For more information about the configuration, see <a href="#">Chapter 16, sDMA</a> .
L3 / L4_PER Interconnect	For information about the interconnect configuration, see <a href="#">Chapter 13, Interconnect</a> .

##### 10.3.5.1.2 DSI Global Initialization

###### 10.3.5.1.2.1 Main Sequence - DSI Global Initialization

This procedure initializes the DSI after a power on or software reset.

[Table 10-498](#) summarizes the DSI global initialization.

**Table 10-498. DSI Global Initialization**

Steps	Registers	Value
Reset IRQ status.	<a href="#">DSI_IRQSTATUS</a> [31:0]	0x0
Set clock activity.	<a href="#">DSI_SYSCONFIG</a> [9:8] CLOCKACTIVITY	x
Configure power management.	<a href="#">DSI_SYSCONFIG</a> [4:3] SIDLEMODE	x
Reset DSI protocol engine.	<a href="#">DSI_SYSCONFIG</a> [1] SOFT_RESET	0x1
Wait until five reads of reset status?	Software test condition	
Read reset status.	<a href="#">DSI_SYSSTATUS</a> [0] RESET_DONE	
<b>IF:</b> Is reset ongoing?	<a href="#">DSI_SYSSTATUS</a> [0] RESET_DONE	= 0x0
Error occurred during reset stage <sup>(1)</sup>		
<b>ENDIF</b>		

## 10.3.5.2 DSI Operational Modes Configuration

### 10.3.5.2.1 DSI Video Mode Using the DISPC Video Port

#### 10.3.5.2.1.1 Main Sequence - DSI PLL Setup

Table 10-499 lists the steps required to configure DSI PLL.

**Table 10-499. DSI PLL Configuration Registers**

Steps	Registers	Value
Turn ON/OFF the PLL and HSDIVIDER.	DSI_CLK_CTRL[31:30] PLL_PWR_CMD	x
Wait until the status of the PLL is set (value according to the previous step)?	DSI_CLK_CTRL[29:28] PLL_PWR_STATUS	= x
Set the divider value for DSI protocol engine clock source M5REG.	DSI_PLL_CONFIGURATION1[30:26] M5_CLOCK_DIV	x
Set the divider value for clock source M4REG.	DSI_PLL_CONFIGURATION1[25:21] M4_CLOCK_DIV	x
Set the value for M divider for PLL.	DSI_PLL_CONFIGURATION1[20:9] DSI_PLL_REGM	x
Set the value for N divider for PLL.	DSI_PLL_CONFIGURATION1[8:1] DSI_PLL_REGN	x
Enable/disable PLL STOPMODE.	DSI_PLL_CONFIGURATION1[0] PLL_STOPMODE	x
Enable/disable DSI protocol engine clock divider.	DSI_PLL_CONFIGURATION2[18] M5_CLOCK_EN	x
Enable/disable M4 clock source divider.	DSI_PLL_CONFIGURATION2[16] M4_CLOCK_EN	x
Enable/disable DSI PHY clock.	DSI_PLL_CONFIGURATION2[14] PHY_CLKINEN	x
Enable/disable PLL reference clock.	DSI_PLL_CONFIGURATION2[13] PLL_REFEN	x
Set PLL automatic update mode.	DSI_PLL_CONTROL[0] PLL_AUTOMODE	x
Request PLL locking sequence.	DSI_PLL_GO[0] PLL_GO	0x1
Read until PLL_GO bit = 0?	DSI_PLL_GO[0] PLL_GO	= 0x0
Wait until PLL is locked?	DSI_PLL_STATUS[1] PLL_LOCK	= 0x1
Set the ratio for the LP clock.	DSI_CLK_CTRL[12:0] LP_CLK_DIVISOR	x
Enable/disable DSS_L3_ICLK clock gating to DSI_PHY and PLL module.	DSI_CLK_CTRL[14] CIO_CLK_ICG	x
Enable/disable the automatic assertion/deassertion of DSISyncClk.	DSI_CLK_CTRL[18] HS_AUTO_STOP_ENABLE	x
Configure the DSI functional clock synchronization and clock speed.	DSI_CLK_CTRL[21] LP_RX_SYNCHRO_ENABLE	x
Turn ON/OFF PLL and HSDIVIDER.	DSI_CLK_CTRL[31:30] PLL_PWR_CMD	x

#### 10.3.5.2.1.2 Main Sequence - Set Up DSI Protocol Engine

##### 10.3.5.2.1.2.1 Set Up DSI Control Registers

Table 10-500 lists the steps to set up the DSI control registers. Table 10-501 lists the steps to set up the DSI complex I/O registers.

**Table 10-500. DSI Control Registers**

Steps	Registers	Value
Enable the interrupt event for lost synchronization with the video port.	DSI_IRQENABLE[18] SYNC_LOST_IRQ_EN	0x1
Enable interrupt event for sent packet on desired VC.	DSI_VC_IRQENABLE_[2] PACKET_SENT_IRQ_EN	x
Enable HSYNC END pulse detection (short packet generation).	DSI_CTRL[17] VP_HSYNC_START	0x1
Enable VSYNC START pulse detection (short packet generation).	DSI_CTRL[15] VP_VSYNC_START	0x1

**Table 10-500. DSI Control Registers (continued)**

Steps	Registers	Value
Select trigger reset mode.	DSI_CTRL[14] TRIGGER_RESET_MODE	x
Set the number of line buffers.	DSI_CTRL[13:12] LINE_BUFFER	x
Set video port HSYNC signal polarity.	DSI_CTRL[10] VP_HSYNC_POL	x
Set video port VSYNC signal polarity.	DSI_CTRL[11] VP_VSYNC_POL	x
Set video port data enable signal polarity.	DSI_CTRL[9] VP_DE_POL	x
Set the size of the video port data bus.	DSI_CTRL[7:6] VP_DATA_BUS_WIDTH	x
Set the arbitration scheme for granting the VC pending ready requests in the TX FIFO.	DSI_CTRL[3] TX_FIFO_ARBITRATION	x
Enable/disable the ECC check for the received header.	DSI_CTRL[2] ECC_RX_EN	0x1

**Table 10-501. DSI Complex I/O Registers**

Steps	Registers	Value
Configure synchronized update on the shadow register.	DSI_COMPLEXIO_CFG1[30] GOBIT	x
Set the complex I/O power state.	DSI_COMPLEXIO_CFG1[28:27] PWR_CMD	x
Set the position of data lane 1.	DSI_COMPLEXIO_CFG1[6:4] DATA1_POSITION	x
Set the position of the clock lane.	DSI_COMPLEXIO_CFG1[2:0] CLOCK_POSITION	x
Clear the Interrupt status register.	DSI_COMPLEXIO_IRQSTATUS	0xFFFF FFFF
Disable all interrupt events.	DSI_COMPLEXIO_IRQENABLE	0x0
Enable the DSI protocol engine.	DSI_CTRL[0] IF_EN	0x1
Disable the DSI protocol engine.	DSI_CTRL[0] IF_EN	0x0
Wait until the interface is disabled?	DSI_CTRL[0] IF_EN	= 0x0
Enable the low-power clock (TXCLKESC).	DSI_CLK_CTRL[20] LP_CLK_ENABLE	0x1
Wait until reset is done?	DSI_COMPLEXIO_CFG1[29] RESET_DONE	= 0x1
Check if power control is ON?	DSI_COMPLEXIO_CFG1[26:25] PWR_STATUS	= 0x1
Wait until internal module reset is complete?	DSI_SYSSTATUS[0] RESETDONE	= 0x1

### 10.3.5.2.1.2.2 Configure DSI Timing and VCs

Table 10-502 lists the steps to configure DSI timing and the VCs.

**Table 10-502. DSI Timing Registers**

Steps	Registers	Value
Determine the number of DSI_FCLK clock cycles for the STOP-STATE counter.	DSI_TIMING1[12:0] STOP_STATE_COUNTER_IO	0x-
Determine the number of BYTE_CLK clock cycles for the HS RX timer.	DSI_TIMING2[28:16] HS_TX_TO_COUNTER	0x-
Enable/disable the multiplication factor of 16 for the number of BYTE_CLK clock cycles for the HS TX timer.	DSI_TIMING2[29] HS_TX_TO_X16	0x-
Determine the number of DSI_FCLK clock cycles for the LP RX timer.	DSI_TIMING2[12:0] LP_RX_TO_COUNTER	0x-
Enable/disable the multiplication factor of 16 for the number of DSI_FCLK clock cycles for the LP RX timer.	DSI_TIMING2[14] LP_RX_TO_X16	0x-
Set the horizontal sync active period.	DSI_VM_TIMING1[31:24] HSA	0x-
Set the horizontal front porch.	DSI_VM_TIMING1[23:12] HFP	0x-
Set the horizontal back porch.	DSI_VM_TIMING1[11:0] HBP	0x-

**Table 10-502. DSI Timing Registers (continued)**

Steps	Registers	Value
Set the number of BYTE clock cycles for the sync window.	DSI_VM_TIMING2[27:24] WINDOW_SYNC	0x-
Set the vertical sync active period.	DSI_VM_TIMING2[23:16] VSA <sup>(1)</sup>	0x-
Set the vertical front porch.	DSI_VM_TIMING2[15:8] VFP	0x-
Set the vertical back porch.	DSI_VM_TIMING2[7:0] VBP	0x-
Set the line length.	DSI_VM_TIMING3[31:16] TL	0x-
Set the number of active lines.	DSI_VM_TIMING3[15:0] VACT	0x-
Set the number of TXBYTECLKHS clock cycles for entering HS mode.	DSI_VM_TIMING7[31:16] ENTER_HS_MODE_LATENCY	0x-
Set the number of TXBYTECLKHS clock cycles for exiting HS mode.	DSI_VM_TIMING7[15:0] EXIT_HS_MODE_LATENCY	0x-
Set the number of TXBYTECLKHS clock cycles between the start of the DDR clock and the assertion of the data request signal.	DSI_CLK_TIMING[15:8] DDR_CLK_PRE	0x-
Set the number of TXBYTECLKHS clock cycles after the deassertion of the data request signal and the stop of the DDR clock.	DSI_CLK_TIMING[7:0] DDR_CLK_POST	0x-
Configure the RX FIFO DMA request.	DSI_VC_CTRL_i[29:27] DMA_RX_REQ_NB	0x-
Configure the TX FIFO DMA request.	DSI_VC_CTRL_i[23:21] DMA_TX_REQ_NB	0x-
Enable/disable the ECC generation for the transmit header.	DSI_VC_CTRL_i[8] ECC_TX_EN	0x-
Enable/disable the checksum generation for the transmit payload.	DSI_VC_CTRL_i[7] CS_TX_EN	0x-
Select video mode.	DSI_VC_CTRL_i[4] MODE	0x-

<sup>(1)</sup> In DSI video mode, if the VSA bit field in DSI\_VM\_TIMING2 is set to 0x0, no vertical synchronization packet will be sent even if VP\_VSYNC\_START is set to 0x1 in DSI\_CTRL.

### 10.3.5.2.1.3 Main Sequence - Configure DSI\_PHY

Table 10-503 summarizes the timing in the functions of DDR\_CLK\_P. For more information about the timing calculation, see Section 10.3.4.4.4, *Clock Requirements*.

**Table 10-503. Calculate DSI\_PHY Timing**

Steps	Registers	Value
Settings of the DSI protocol timing. For a complete description of the timing specifications, see Section 10.3.4.4.4, <i>Clock Requirements</i> .	DSI_PHY_REGISTER0[31:24] REG_THSPREPARE	ceil(70ns/DDR clock period) + 2
	DSI_PHY_REGISTER0[23:16] REG_PRPR_THSZERO	ceil(175ns/DDR clock period) + 2
	DSI_PHY_REGISTER0[7:0] REG_THSEXIT	ceil(145ns/DDR clock period)
	DSI_PHY_REGISTER0[15:8] REG_THSTRAIL	ceil(60ns/DDR clock period) + 5
	DSI_PHY_REGISTER2[7:0] REG_TCLKPREPARE	ceil(65ns/DDR clock period)
	DSI_PHY_REGISTER1[7:0] REG_TCLKZERO	ceil(265ns/DDR clock period)
	DSI_PHY_REGISTER1[15:8] REG_TCLKTRAIL	ceil(60ns/DDR clock period) + 2
	DSI_PHY_REGISTER1[20:16] REG_TLPXBY2	ceil(25ns/DDR clock period)

### 10.3.5.2.1.4 Main Sequence - Drive STOP State

Table 10-504 lists the steps to drive STOP state.

**Table 10-504. Drive STOP State**

Steps	Registers	Value
Force TX stop mode.	DSI_TIMING1[15] FORCE_TX_STOP_MODE_IO	0x1
Wait until FORCE_TX_STOP_MODE_IO = 0?	DSI_TIMING1[15] FORCE_TX_STOP_MODE_IO	= 0x0

### 10.3.5.2.1.5 Main Sequence - Enable Video Mode

Table 10-504 lists the steps to enable video mode.

**Table 10-505. Enable Video Mode**

Steps	Registers	Value
Set up long packet header.	DSI_VC_LONG_PACKET_HEADER_i	0x-
Enable desired VC.	DSI_VC_CTRL_[1] VC_EN	0x1
Enable DSI module.	DSI_CTRL[0] IF_EN	0x1
Wait until IF_EN = 1?	DSI_CTRL[0] IF_EN	= 0x1

### 10.3.5.2.2 DSI Command Mode Using the DISPC Video Port

This section explains the basic programming model of command mode using the DISPC video port.

#### 10.3.5.2.2.1 Main Sequence - Configure DSI PLL

Table 10-506 lists the steps required to configure the DSI PLL.

**Table 10-506. Configure DSI PLL**

Steps	Register/Bit Field/Programming	Value
Set PLL and HSDIVIDER to ON state.	DSI_CLK_CTRL[31:30] PLL_PWR_CMD	0x2
Wait until PLL and HSDIVIDER are enabled?	DSI_CLK_CTRL[29:28] PLL_PWR_STATUS	= 0x2
Set the M5REG value.	DSI_PLL_CONFIGURATION1[30:26] M5_CLK_DIV	x
Set the M4REG value.	DSI_PLL_CONFIGURATION1[25:21] M4_CLOCK_DIV	x
Set the REGN value.	DSI_PLL_CONFIGURATION1[8:1] PLL_REGN	x
Set the REGM value.	DSI_PLL_CONFIGURATION1[20:9] PLL_REGM	x
Select PLL STOPMODE.	DSI_PLL_CONFIGURATION1[0] PLL_STOPMODE	0x1
Enable/disable PLL reference clock control.	DSI_PLL_CONFIGURATION2[13] PLL_REFEN	x
Enable/disable CLKIN4DDR control.	DSI_PLL_CONFIGURATION2[14] PHY_CLKINEN	x
Enable/disable DSS clock divider.	DSI_PLL_CONFIGURATION2[16] M4_CLOCK_EN	x
Enable/disable DSI protocol engine clock divider.	DSI_PLL_CONFIGURATION2[18] M5_CLOCK_EN	x
Configure synchronization of configuration update with DISPC_UPDATE_SYNC.	DSI_PLL_CONTROL[0] PLL_AUTOMODE	x
Start PLL locking sequence.	DSI_PLL_GO[0] PLL_GO	0x1
Wait until there is no pending action?	DSI_PLL_GO[0] PLL_GO	= 0x0
Check whether PLL is locked?	DSI_PLL_STATUS[1] PLL_LOCK	= 0x1
Set the LP mode clock ratio.	DSI_CLK_CTRL[12:0] LP_CLK_DIVISOR	x
Configure DSS_L3_ICLK clock to the DSI complex I/O.	DSI_CLK_CTRL[14] CIO_CLK_ICG	x
Enable/disable the automatic assertion/deassertion of the DSISopClk signal.	DSI_CLK_CTRL[18] HS_AUTO_STOP_ENABLE	x

**Table 10-506. Configure DSI PLL (continued)**

Steps	Register/Bit Field/Programming	Value
Define the DSI functional clock value and synchronization.	<a href="#">DSI_CLK_CTRL</a> [21] LP_RX_SYNCHRO_ENABLE	x
Turn on PLL and HSDIVIDER.	<a href="#">DSI_CLK_CTRL</a> [31:30] PLL_PWR_CMD	0x2

### 10.3.5.2.2.2 Main Sequence - Switch to DSI PLL Clock Source

[Table 10-507](#) lists the sequence to switch the DSI and DISPC module clocks to DSI PLL clock source.

**Table 10-507. Switch to DSI PLL Clock Source**

Steps	Reference	Value
Switch DISPC clock to PLL1_CLK1.	For more information, see <a href="#">Section 10.1.2, DSS Integration</a>	
Switch DSI clock to PLL1_CLK2.	For more information, see <a href="#">Section 10.1.2, DSS Integration</a> .	

### 10.3.5.2.2.3 Main Sequence - Configure DSI Protocol Engine

#### 10.3.5.2.2.3.1 Set Up DSI Control Registers

[Table 10-508](#) lists the steps required to set up the DSI control registers. [Table 10-509](#) lists the steps to set up the DSI complex I/O registers.

**Table 10-508. DSI Control Registers**

Steps	Register/Bit Field/Programming	Value
Enable IRQ for lost synchronization with video port.	<a href="#">DSI_IRQENABLE</a> [18] SYNC_LOST_IRQ_EN	0x1
Enable IRQ to indicate that packet has been sent on desired VC.	<a href="#">DSI_VC_IRQENABLE_i</a> [2] PACKET_SENT_IRQ_EN	0x1
Set the trigger reset mode.	<a href="#">DSI_CTRL</a> [14] TRIGGER_RESET_MODE	x
Configure the number of active line buffers.	<a href="#">DSI_CTRL</a> [13:12] LINE_BUFFER	x
Set the size of the video port data bus.	<a href="#">DSI_CTRL</a> [7:6] VP_DATA_BUS_WIDTH	x
Define the ratio between VP_CLK and VP_PCLK.	<a href="#">DSI_CTRL</a> [4] VP_CLK_RATIO	x
Set the arbitration scheme for granting the VC pending ready requests in the TX FIFO.	<a href="#">DSI_CTRL</a> [3] TX_FIFO_ARBITRATION	x
Enable/disable the ECC check for the received header.	<a href="#">DSI_CTRL</a> [2] ECC_RX_EN	x

**Table 10-509. DSI Complex I/O Registers**

Steps	Register/Bit Field/Programming	Value
Determine the position of the clock lane.	<a href="#">DSI_COMPLEXIO_CFG1</a> [2:0] CLOCK_POSITION	x
Set the position of data lane 1.	<a href="#">DSI_COMPLEXIO_CFG1</a> [6:4] DATA1_POSITION	x
Configure the power state of the complex I/O.	<a href="#">DSI_COMPLEXIO_CFG1</a> [28:27] PWR_CMD	x
Enable the synchronization of the shadow registers with DISPC_UPDATE_SYNC.	<a href="#">DSI_COMPLEXIO_CFG1</a> [30] GOBIT	0x1
Clear the complex I/O IRQ status.	<a href="#">DSI_COMPLEXIO_IRQSTATUS</a>	0xFFFF FFFF
Disable all complex I/O IRQ events.	<a href="#">DSI_COMPLEXIO_IRQENABLE</a>	0x0
Enable the DSI protocol engine interface.	<a href="#">DSI_CTRL</a> [0] IF_EN	0x1
Disable the DSI protocol engine interface.	<a href="#">DSI_CTRL</a> [0] IF_EN	0x0
Wait until interface is disabled?	<a href="#">DSI_CTRL</a> [0] IF_EN	= 0x0
Enable the LP clock.	<a href="#">DSI_CLK_CTRL</a> [20] LP_CLK_ENABLE	0x1

**Table 10-509. DSI Complex I/O Registers (continued)**

Steps	Register/Bit Field/Programming	Value
Check whether internal reset is complete?	DSI_COMPLEXIO_CFG1[29] RESET_DONE	= 0x1
Check whether power state of complex I/O is ON?	DSI_COMPLEXIO_CFG1[26:25] PWR_STATUS	= 0x1
Check whether reset is complete?	DSI_SYSSTATUS[0] RESETDONE	= 0x1

### 10.3.5.2.2.3.2 Configure DSI Timing and VCs

Table 10-510 lists the steps to configure DSI timing and the VCs.

**Table 10-510. DSI Timing Registers**

Steps	Register/Bit Field/Programming	Value
Determine the number of DSI_FCLK clock cycles for the STOP-STATE counter.	DSI_TIMING1[12:0] STOP_STATE_COUNTER_IO	0x-
Enable/disable the multiplication factor of 4 for the number of DSI_FCLK clock cycles for the STOP-STATE counter.	DSI_TIMING1[13] STOP_STATE_X4_IO	0x-
Enable/disable the multiplication factor of 16 for the number of DSI_FCLK clock cycles for the STOP-STATE counter.	DSI_TIMING1[14] STOP_STATE_X16_IO	0x-
Clear turnaround timer settings.	DSI_TIMING1[30:16]	0x0
Determine the number of DSI_FCLK clock cycles for the LP RX timer.	DSI_TIMING2[12:0] LP_RX_TO_COUNTER	0x-
Enable/disable the multiplication factor of 4 for the number of DSI_FCLK clock cycles for the LP RX timer.	DSI_TIMING2[13] LP_RX_TO_X4	0x-
Enable/disable the multiplication factor of 16 for the number of DSI_FCLK clock cycles for the LP RX timer.	DSI_TIMING2[14] LP_RX_TO_X16	0x-
Determine the number of BYTE_CLK clock cycles for the HS RX timer.	DSI_TIMING2[28:16] HS_TX_TO_COUNTER	0x-
Enable/disable the multiplication factor of 16 for the number of BYTE_CLK clock cycles for the HS TX timer.	DSI_TIMING2[29] HS_TX_TO_X16	0x-
Enable/disable the multiplication factor of 64 for the number of BYTE_CLK clock cycles for the HS TX timer.	DSI_TIMING2[30] HS_TX_TO_X64	0x-
Set the number of TXBYTECLKHS clock cycles	DSI_CLK_TIMING[15:8] DDR_CLK_PRE and DSI_CLK_TIMING[7:0] DDR_CLK_POST	0x-
<b>Configuration of VCi</b>		
Select source of data and enable VP_STALL.	DSI_VC_CTRL_i[1] SOURCE	0x1
Enable/disable the checksum generation for the transmit payload.	DSI_VC_CTRL_i[7] CS_TX_EN	0x-
Enable/disable the ECC generation for the transmit header.	DSI_VC_CTRL_i[8] ECC_TX_EN	0x-
Enable/disable HS mode to send short and long packets to the peripheral.	DSI_VC_CTRL_i[9] MODE_SPEED	0x-
Configure DMA request for TX FIFO.	DSI_VC_CTRL_i[23:21] DMA_TX_REQ_NB	0x-
Configure DMA request for RX FIFO.	DSI_VC_CTRL_i[29:27] DMA_RX_REQ_NB	0x-
<b>Configuration TX and RX FIFO</b>		
Set size of the RX FIFO allocated for used VC.	DSI_RX_FIFO_VC_SIZE	0x-
Set size of the TX FIFO allocated for used VC.	DSI_TX_FIFO_VC_SIZE	0x-

### 10.3.5.2.2.4 Main Sequence - Configure DSI\_PHY Timing

Table 10-511 summarizes DSI\_PHY timing settings. For more information about timing calculation, see Section 10.3.4.4.4, *Clock Requirements*.

**Table 10-511. Configure DSI\_PHY Timing**

Steps	Register/Bit Field/Programming	Value
Settings of the DSI protocol timing. For a complete description of timing specifications, see Section 10.3.4.4.4, <i>Clock Requirements</i> .	DSI_PHY_REGISTER0[31:24] REG_THSPREPARE	ceil(70ns/DDR clock period) + 2
	DSI_PHY_REGISTER0[23:16] REG_THSPRPR_THSZERO	ceil(175ns/DDR clock period) + 2
	DSI_PHY_REGISTER0[7:0] REG_THSEXIT	ceil(145ns/DDR clock period)
	DSI_PHY_REGISTER0[15:8] REG_THSTRAIL	ceil(60ns/DDR clock period) + 5
	DSI_PHY_REGISTER2[7:0] REG_TCLKPREPARE	ceil(65ns/DDR clock period)
	DSI_PHY_REGISTER1[7:0] REG_TCLKZERO	ceil(265ns/DDR clock period)
	DSI_PHY_REGISTER1[15:8] REG_TCLKTRAIL	ceil(60ns/DDR clock period) + 2
	DSI_PHY_REGISTER1[20:16] REG_TLPXBY2	ceil(25ns/DDR clock period)

### 10.3.5.2.2.5 Main Sequence - Drive STOP State

Table 10-512 lists the steps to drive the STOP state.

**Table 10-512. Drive STOP State**

Steps	Register/Bit Field/Programming	Value
Force TX stop mode.	DSI_TIMING1[15] FORCE_TX_STOP_MODE_IO	0x1
Wait until the end of TX stop mode assertion?	DSI_TIMING1[15] FORCE_TX_STOP_MODE_IO	= 0x1

### 10.3.5.2.2.6 Main Sequence - Enable Command Mode Using DISPC Video Port

Table 10-513 lists the steps to enable DISPC to send frames continuously. Two BTAs must be generated:

- The first BTA gives bus possession to the display module.
- The second BTA obtains the TE trigger.

**Table 10-513. Enable Command Mode and Automatic TE**

Steps	Register/Bit Field/Programming	Value
Insert DCS write memory continue/start code.	DSI_VC_CTRL_i[31] DCS_CMD_CODE	0x-
Enable/disable automatic insertion of DCS command codes when data is sourced by the video port.	DSI_VC_CTRL_i[30] DCS_CMD_ENABLE	0x-
Enable used VC.	DSI_VC_CTRL_i[0] VC_EN	0x1
Enable DSI protocol engine interface.	DSI_CTRL[0] IF_EN	0x1
Wait until interface is enabled?	DSI_CTRL[0] IF_EN	= 0x0
Send the sequence to receive the TE trigger from the peripheral.	DSI_VC_SHORT_PACKET_HEADER_i[31:0] HEADER	0x-
Wait until packet is sent?	DSI_VC_IRQSTATUS_i[2] PACKET_SENT_IRQ	= 0x1
Write 1 to reset the status bit.	DSI_VC_IRQSTATUS_i[2] PACKET_SENT_IRQ	0x1

**NOTE:** Keep Reserved bits at reset value in [DSI\\_PHY\\_REGISTER1](#) and [DSI\\_PHY\\_REGISTER2](#).

### 10.3.5.2.2.7 Main Sequence - Send Frame Data to LCD Panel Using Automatic TE

[Table 10-514](#) summarizes the steps to send a frame data to the LCD panel using automatic TE.

**Table 10-514. Send Frame Data to LCD Panel Using Automatic TE**

Steps	Register/Bit Field/Programming	Value
Enable the transfer between DISPC and DSI. Reset after the transfer is done.	For more information, see <a href="#">Section 10.2</a> , <i>Display Controller</i> chapter.	
Specify the number of bytes to send. When DCS insertion is used, word count (WC) must include this one DCS byte.	<a href="#">DSI_VC_TE_i[23:0]</a> TE_SIZE	(WC+1)*LPP
Set up long packet header.	<a href="#">DSI_VC_LONG_PACKET_HEADER_i[31:0]</a> HEADER	0x-
Enable/disable TE control.	<a href="#">DSI_VC_TE_i[30]</a> TE_EN	0x1
Wait until RX FIFO is empty?	<a href="#">DSI_VC_CTRL_i[20]</a> RX_FIFO_NOT_EMPTY	= 0x0
Wait until TX FIFO is not full?	<a href="#">DSI_VC_CTRL_i[16]</a> TX_FIFO_FULL	= 0x0
Enable first BTA to give bus possession to the display module.	<a href="#">DSI_VC_CTRL_i[6]</a> BTA_EN	0x1
Wait until BTA IRQ event occurs?	<a href="#">DSI_VC_IRQSTATUS_i[5]</a> BTA_IRQ	= 0x1
Write 1 to clear BTA IRQ status bit.	<a href="#">DSI_VC_IRQSTATUS_i[5]</a> BTA_IRQ	0x1
Enable the second BTA to get the TE trigger.	<a href="#">DSI_VC_CTRL_i[6]</a> BTA_EN	0x1
Wait until BTA IRQ event occurs?	<a href="#">DSI_VC_IRQSTATUS_i[5]</a> BTA_IRQ	= 0x1
Write 1 to clear BTA IRQ status bit.	<a href="#">DSI_VC_IRQSTATUS_i[5]</a> BTA_IRQ	0x1
Wait until transfer is complete?	<a href="#">DSI_VC_TE_i[30]</a> TE_EN	= 0x0

### 10.3.6 DSI Register Manual

This section describes the DSI module registers.

#### **CAUTION**

The main access to all DSI registers is through the L3 interconnect.  
The access through L4\_PER interconnect is provided for back software compatibility.

#### 10.3.6.1 DSI Instance Summary

Table 10-515 summarizes the DSI module instances.

**Table 10-515. DSI Instance Summary**

Module Name	L3 Base Address	L4_PER Base Address	Size
DSI1_PROTOCOL_ENGINE	0x5800 4000	0x4804 4000	512 bytes
DSI1_PHY	0x5800 4200	0x4804 4200	64 bytes
DSI1_PLLCTRL	0x5800 4300	0x4804 4300	32 bytes
DSI2_PROTOCOL_ENGINE	0x5800 5000	0x4804 5000	512 bytes
DSI2_PHY	0x5800 5200	0x4804 5200	64 bytes
DSI2_PLLCTRL	0x5800 5300	0x4804 5300	32 bytes

## MIPI Display Serial Interface

www.ti.com

Bits	Field Name	Description	Type	Reset
31:25	RESERVED		R	0x00
24	DISPC_UPDATE_SYNC	Determines if the Dispc_Update_Sync signal from the display controller is used.  0x0: Dispc_Update_Sync signal is not used. 0x1: Dispc_Update_Sync signal is used.	RW	0
23	HSA_BLANKING_MODE	Blanking mode  0x0: Packets in TX FIFO are sent during HSA blanking period of video mode or LPS is used.  0x1: LONG BLANKING PACKETS only are used during HSA blanking period of video mode.	RW	0
22	HBP_BLANKING_MODE	Blanking mode  0x0: Packets in TX FIFO are sent during HBP blanking period of video mode or LPS is used.  0x1: LONG BLANKING PACKETS only are used during HBP blanking period of video mode.	RW	0
21	HFP_BLANKING_MODE	Blanking mode  0x0: Packets in TX FIFO are sent during HFP blanking period of video mode or LPS is used.  0x1: LONG BLANKING PACKETS only are used during HFP blanking period of video mode.	RW	0
20	BLANKING_MODE	Blanking mode  0x0: LPS is used during blanking periods of video mode (except HSA, HBP, HFP defined in HSA_BLANKING_MODE, HBP_BLANKING_MODE AND HFP_BLANKING_MODE respectively) when there is no command mode data in TX FIFO ready to be sent. So blanking periods can be different during the frame depending on the TX FIFO.  0x1: LONG BLANKING PACKETS are used during blanking periods of video mode (except HSA, HBP, HFP defined in HSA_BLANKING_MODE, HBP_BLANKING_MODE AND HFP_BLANKING_MODE respectively) regardless of the packets present in the TX FIFO ready to be sent	RW	0
19	EOT_ENABLE	Enable EOT packets at the end of HS transmission.  0x0: No EOT packets 0x1: EOT packet is sent at all HS to LP transitions.	RW	0
18	VP_HSYNC_END	HSYNC end pulse.  0x0: Disabled. No HSYNC END short packet is generated.  0x1: Enabled. While the HSYNC END pulse is detected, the associated short packet HSYNC END is generated.	RW	0
17	VP_HSYNC_START	HSYNC start pulse.  0x0: Disabled. No HSYNC START short packet is generated.  0x1: Enabled. While the HSYNC start pulse is detected, the associated short packet HSYNC START is generated.	RW	0
16	VP_VSYNC_END	VSYNC end pulse.  0x0: Disabled. No VSYNC END short packet is generated.  0x1: Enabled. While the VSYNC END pulse is detected, the associated short packet VSYNC END is generated.	RW	0

Bits	Field Name	Description	Type	Reset
15	VP_VSYNC_START	VSYNC start pulse.  0x0: Disabled. No VSYNC START short packet is generated.  0x1: Enabled. While the VSYNC START pulse is detected, the associated short packet VSYNC START is generated. <sup>(1)</sup>	RW	0
14	TRIGGER_RESET_MODE	Selection of the trigger reset mode  0x0: Synchronized: the mode is only valid if there is virtual channel using the video mode and it is active. The principal is to wait for the current video frame to be transferred on the link. Any data received after the VSYNC are ignored.  0x1: Immediate: all pending requests in TX FIFO are taken into account for transfer scheduling, the RX FIFO is ignored, and the data from video port are ignored as soon as possible. Only the current transfer on DSI link and already scheduled ones are transmitted. All the other transfers are discarded.	RW	0
13:12	LINE_BUFFER	Number of line buffers to be used while receiving data on the video port. The valid values are from 0 to <a href="#">DSI_GNQ[17:16]</a> VP1_NB_LINE_BUFFER.  0x0: No line buffer 0x1: 1 line buffer 0x2: 2 line buffers	RW	0x0
11	VP_VSYNC_POL	VP vertical synchronization signal polarity  0x0: VSYNC signal on the video port is active low. 0x1: VSYNC signal on the video port is active high.	RW	0
10	VP_HSYNC_POL	VP horizontal synchronization signal polarity  0x0: HSYNC signal on the video port is active low. 0x1: HSYNC signal on the video port is active high.	RW	0
9	VP_DE_POL	VP data enable signal polarity  0x0: DE signal on the video port is active low. 0x1: DE signal on the video port is active high.	RW	0
8	VP_CLK_POL	VP pixel clock polarity  0x0: The DSI Protocol Engine module captures the data on the VP on the pixel clock falling edge. The module connected to the VP shall drive the data on the pixel clock rising edge.  0x1: The DSI Protocol Engine module captures the data on the VP on the pixel clock raising edge. The module connected to the VP shall drive the data on the pixel clock falling edge.	RW	1
7:6	VP_DATA_BUS_WIDTH	Defines the size of the video port data bus  0x0: 16-bits data width (LSB of the 24-bit video port data bus)  0x1: 18-bits data width (LSB of the 24-bit video port data bus)  0x2: 24-bits data width (LSB of the 24-bit video port data bus)	RW	0x0

<sup>(1)</sup> In DSI video mode, if the VSA bit field in DSI\_VM\_TIMING2 is set to 0x0, no vertical synchronization packet will be sent even if VP\_VSYNC\_START is set to 0x1 in DSI\_CTRL.

## MIPI Display Serial Interface

www.ti.com

Bits	Field Name	Description	Type	Reset
5	TRIGGER_RESET	Send the reset trigger to the peripheral.  0x0: READS: Reset trigger generation is completed. It is reset by hardware when it is completed. WRITES: Cancellation of the request for Reset trigger generation (maybe too late since it is already on going)  0x1: READS: Generation of the reset trigger has been requested by user (could be on going but not completed yet). WRITES: Request for Reset trigger to be sent to the peripheral.	RW	0
4	VP_CLK_RATIO	The field indicates the clock ratio between VP_CLK and VP_PCLK. The clock VP_PCLK is generated from VP_CLK. It is divided down. The information is only used when the video port is used to provide data in command mode. In the case of video mode, it is not used.  0x0: The clock VP_PCLK is the clock VP_CLK divided by 2. The duty cycle of VP_PCLK is 50/50.  0x1: The clock VP_PCLK is the clock VP_CLK divided by 3 or more. The duty cycle of VP_PCLK is not 50/50 for odd ratio numbers (3,5,7,...).	RW	0
3	TX_FIFO_ARBITRATION	Defines the arbitration scheme for granting the virtual channel pending ready requests in the TX FIFO  0x0: Round-Robin Scheme is used 0x1: Sequential Scheme is used	RW	0
2	ECC_RX_EN	Enables the Error Correction Code check for the received header (short and long packets for all virtual channel ids).  0x0: Disabled 0x1: Enabled	RW	0
1	CS_RX_EN	Enables the checksum check for the received payload (long packet only for all virtual channel ids).  0x0: Disabled 0x1: Enabled	RW	0
0	IF_EN	Enables the module. When the module is disabled the signals from the complex I/O are gated (no updates of the interrupt status register). It is not possible to change the bit fields in the register <a href="#">DSI_CTRL</a> except IF_EN when it is enabled. All the other registers can be changed except the ones that require <a href="#">DSI_VC_CTRL_j[0]</a> VC_EN to be equal to 0 to be modified.  0x0: The interface is disabled. If one of the virtual channel uses the video mode with the video port to receive the data, the DSI protocol engines is disabled when the next VSYNC is received and all the data in the FIFO for the other virtual channels in command mode are sent to the peripherals (if BTA_EN is enabled, the DSI protocol needs to wait for the response and BTA from the peripheral before disabling all the internal logic since an acknowledge is requested).  0x1: The interface is enabled immediately, the data acquisition on the video port starts on the next VSYNC (video mode) or first data received in the Slave port FIFO (command mode).	RW	0

21	RESERVED		R	0
20:18	VP2_LINE_BUFFER_SIZE	Determines the video line buffer size associated to video port 2 . Read 0x1: 512x24-bits, 682x18-bits, 768x16bits (memory of 384x32-bits) Read 0x2: 682x24-bits, 910x18-bits, 1024x16bits (memory of 512x32-bits) Read 0x3: 853x24-bits, 1137x18-bits, 1280x16bits (memory of 640x32-bits) Read 0x4: 1024x24-bits, 1365x18-bits, 1536x16bits (memory of 768x32-bits) Read 0x5: 1194x24-bits, 1592x18-bits, 1792x16bits (memory of 896x32-bits) Read 0x6: 1365x24-bits, 1820x18-bits, 2048x16bits (memory of 1024x32-bits)	R	0x4 for DSI1 0x1 for DSI2
17:16	VP1_NB_LINE_BUFFER	Determines the number of video buffer lines associated to video port 1. Read 0x0: No line buffer Read 0x1: 1 line buffer of the size defined in LINE_BUFFER_SIZE Read 0x2: 2 line buffers of the size defined in LINE_BUFFER_SIZE	R	0x2
15	RESERVED		R	0
14:12	VP1_LINE_BUFFER_SIZE	Determines the video line buffer size associated to video port 1 . Read 0x1: 512x24-bits, 682x18-bits, 768x16bits (memory of 384x32-bits) Read 0x2: 682x24-bits, 910x18-bits, 1024x16bits (memory of 512x32-bits) Read 0x3: 853x24-bits, 1137x18-bits, 1280x16bits (memory of 640x32-bits) Read 0x4: 1024x24-bits, 1365x18-bits, 1536x16bits (memory of 768x32-bits) Read 0x5: 1194x24-bits, 1592x18-bits, 1792x16bits (memory of 896x32-bits) Read 0x6: 1365x24-bits, 1820x18-bits, 2048x16bits (memory of 1024x32-bits)	R	0x6 for DSI1 0x4 for DSI2
11:9	NB_DATA_LANES	Determines the number of data lanes supported by the DSI protocol engine . Read 0x1: 1 Data lane Read 0x2: 2 Data lanes Read 0x3: 3 Data lanes Read 0x4: 4 Data lanes	R	0x4 for DSI1 0x2 for DSI2

Bits	Field Name	Description	Type	Reset
8:6	NB_DMA_REQUEST	Determines the number of DMA_REQ signals. Read 0x0: No DMA request Read 0x1: 1 DMA request Read 0x2: 2 DMA requests Read 0x3: 3 DMA requests Read 0x4: 4 DMA requests	R	0x4
5:3	RX_FIFODEPTH	Determines the data RX FIFO depth (32-bit words) on the slave port. Read 0x4: 32x 33 bits Read 0x5: 64x 33 bits Read 0x6: 128 x 33 bits Read 0x7: 256 x 33 bits	R	0x6
2:0	TX_FIFODEPTH	Determines the data TX FIFO depth (33-bit words) on the slave port. Read 0x4: 32x 33 bits Read 0x5: 64x 33 bits Read 0x6: 128 x 33 bits Read 0x7: 256 x 33 bits	R	0x6

<b>Address Offset</b>	0x0000 0048	<b>Instance</b>	DSI1_PROTOCOL_ENGINE_L3 DSI1_PROTOCOL_ENGINE_PE R_L4 DSI2_PROTOCOL_ENGINE_L3 DSI2_PROTOCOL_ENGINE_PE R_L4
<b>Physical Address</b>	0x5800 4048 0x4804 4048 0x5800 5048 0x4804 5048		
<b>Description</b>	COMPLEXIO CONFIGURATION REGISTER for the complex I/O This register contains the lane configuration for the order and position of the lanes (clock and data) and the polarity order for the control of the PHY differential signals in addition to the control bit for the power FSM.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SHADOWING	GOBIT	RESET_DONE	PWR_CMD	PWR_STATUS	RESERVED	RESERVED	RESERVED	DATA4_POL	DATA4_POSITION	DATA3_POL	DATA3_POSITION	DATA2_POL	DATA2_POSITION	DATA1_POL	DATA1_POSITION	CLOCK_POL	CLOCK_POSITION														

Bits	Field Name	Description	Type	Reset
31	SHADOWING	Shadowing configuration.  0x0: Disabled. The writes to the <a href="#">DSI_PHY_REGISTER0</a> through <a href="#">DSI_PHY_REGISTER2</a> registers is done like the other SCP registers.  0x1: Enabled. The writes to the <a href="#">DSI_PHY_REGISTER0</a> through <a href="#">DSI_PHY_REGISTER2</a> registers is done only when the GOBIT is set and when the signal DISPCUpdateSync from the display controller module is active.	RW	0
30	GOBIT	Allows the synchronized update of the shadow registers when the signal DISPCUpdateSync is active.  0x0: Resets the GOBIT. The hardware has finished the update of the shadow SCP registers. The bit is reset by Hardware. The software can reset the bit in case the user decides to abort it. There is no guarantee that the software reset is done before the transfer of the values to the complex IO.  0x1: Set the GOBIT. Only when the transfer of the new values for the three first registers is completed (3, 2, 1, or 0 transfers are performed based on the number of registers to update), the GOBIT is reset. The DISPCUpdateSync signal is used to synchronize the update. The bit shall be set only when it is in reset state.	RW	0
29	RESET_DONE	Internal reset monitoring of the power domain using the TXBYTECLKHS clock from the complex I/O Read 0x0: Internal module reset is on going. Read 0x1: Reset completed.	R	1
28:27	PWR_CMD	Command for power control of the complex I/O 0x0: Command to change to OFF state 0x1: Command to change to ON state 0x2: Command to change to ULTRALOW-POWER state	RW	0x0
26:25	PWR_STATUS	Status of the power control of the complex I/O Read 0x0: Complex I/O in OFF state Read 0x1: Complex I/O in ON state Read 0x2: Complex I/O in ULTRALOW-POWER state	R	0x0
24:22	RESERVED	Reserved	R	0x0
21	RESERVED	Reserved	R	0
20	RESERVED	Reserved	RW	0
19	DATA4_POL	+/- differential pin order of DATA lane 4. Applicable only to DS1. For DS12 this bit field is RESERVED.  0x0: +/- pin order (DSI.DX=+ and DSI.DY=-) 0x1: -/+ pin order (DSI.DX=- and DSI.DY=+)	RW	0
18:16	DATA4_POSITION	Position and order of the DATA lane 4. Applicable only to DS1. For DS12 this bit field is RESERVED.  0x0: Not used/connected 0x1: Data lane 4 is at the position 1 (lane 1). 0x2: Data lane 4 is at the position 2 (lane 2). 0x3: Data lane 4 is at the position 3 (lane 3). 0x4: Data lane 4 is at the position 4 (lane 4). 0x5: Data lane 4 is at the position 5 (lane 5).	RW	0x0
15	DATA3_POL	+/- differential pin order of DATA lane 3. Applicable only to DS1. For DS12 this bit field is RESERVED.  0x0: +/- pin order (DSI.DX=+ and DSI.DY=-) 0x1: -/+ pin order (DSI.DX=- and DSI.DY=+)	RW	0

<b>Bits</b>	<b>Field Name</b>	<b>Description</b>	<b>Type</b>	<b>Reset</b>
14:12	DATA3_POSITION	Position and order of the DATA lane 3. Applicable only to DS1. For DSI2 this bit field is RESERVED.  0x0: Not used/connected 0x1: Data lane 3 is at the position 1 (lane 1). 0x2: Data lane 3 is at the position 2 (lane 2). 0x3: Data lane 3 is at the position 3 (lane 3). 0x4: Data lane 3 is at the position 4 (lane 4). 0x5: Data lane 3 is at the position 5 (lane 5).	RW	0x0
11	DATA2_POL	+/- differential pin order of DATA lane 2. 0x0: +/- pin order (DSI.DX=+ and DSI.DY=-) 0x1: -/+ pin order (DSI.DX=- and DSI.DY=+)	RW	0
10:8	DATA2_POSITION	Position and order of the DATA lane 2.  0x0: Not used/connected 0x1: Data lane 2 is at the position 1 (lane 1). 0x2: Data lane 2 is at the position 2 (lane 2). 0x3: Data lane 2 is at the position 3 (lane 3). 0x4: Data lane 2 is at the position 4 (lane 4). 0x5: Data lane 2 is at the position 5 (lane 5).	RW	0x0
7	DATA1_POL	+/- pin differential pin order of DATA lane 1 0x0: +/- pin order (DSI.DX=+ and DSI.DY=-) 0x1: -/+ pin order (DSI.DX=- and DSI.DY=+)	RW	0
6:4	DATA1_POSITION	Position and order of the DATA lane 1. The data lane 1 is always present.  0x0: Not used/connected 0x1: Data lane 1 is at the position 1 (lane 1). 0x2: Data lane 1 is at the position 2 (lane 2). 0x3: Data lane 1 is at the position 3 (lane 3). 0x4: Data lane 1 is at the position 4 (lane 4). 0x5: Data lane 1 is at the position 5 (lane 5).	RW	0x0
3	CLOCK_POL	+/- differential pin order of CLOCK lane. 0x0: +/- pin order (DSI.DX=+ and DSI.DY=-) 0x1: -/+ pin order (DSI.DX=- and DSI.DY=+)	RW	0
2:0	CLOCK_POSITION	Position and order of the CLOCK lane. 0, 5, 6 and 7 are reserved. The clock lane is always present but cannot be at the position 5 even if the COMPLEX I/O consists of 5 lanes.  0x0: Not used/connected 0x1: Clock lane is at the position 1 (lane 1). 0x2: Clock lane is at the position 2 (lane 2). 0x3: Clock lane is at the position 3 (lane 3). 0x4: Clock lane is at the position 4 (lane 4). 0x5: Reserved 0x6: Reserved 0x7: Reserved	RW	0x0

Bits	Field Name	Description	Type	Reset
31	ULPSACTIVENOT_ALL1_IRQ	All the ULPSActiveNOT signals corresponding to the lanes with TXULPSExit being high are high.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
30	ULPSACTIVENOT_ALL0_IRQ	All signals ULPSActiveNOT are 0  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
29	ERRCONTENTIONLP1_5_IRQ	Contention LP1 error for lane 5 Applicable only to DS1. For DSi2 this bit field is RESERVED.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0

Bits	Field Name	Description	Type	Reset
28	ERRCONTENTIONLP0_5_IRQ	Contention LP0 error for lane 5 Applicable only to DS1. For DSI2 this bit field is RESERVED.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
27	ERRCONTENTIONLP1_4_IRQ	Contention LP1 error for lane 4 Applicable only to DS1. For DSI2 this bit field is RESERVED.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
26	ERRCONTENTIONLP0_4_IRQ	Contention LP0 error for lane 4 Applicable only to DS1. For DSI2 this bit field is RESERVED.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
25	ERRCONTENTIONLP1_3_IRQ	Contention LP1 error for lane 3  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
24	ERRCONTENTIONLP0_3_IRQ	Contention LP0 error for lane 3  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
23	ERRCONTENTIONLP1_2_IRQ	Contention LP1 error for lane 2  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
22	ERRCONTENTIONLP0_2_IRQ	Contention LP0 error for lane 2  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
21	ERRCONTENTIONLP1_1_IRQ	Contention LP1 error for lane 1  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
20	ERRCONTENTIONLP0_1_IRQ	Contention LP0 error for lane 1  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
19	STATEULPS5_IRQ	lane 5 in ULTRALOW-POWER State Applicable only to DS1. For DSI2 this bit field is RESERVED.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0

Bits	Field Name	Description	Type	Reset
18	STATEULPS4_IRQ	lane 4 in ultralow-power mode Applicable only to DS1. For DS12 this bit field is RESERVED.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
17	STATEULPS3_IRQ	lane 3 in ULTRALOW-POWER state  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
16	STATEULPS2_IRQ	lane 2 in ULTRALOW-POWER state  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
15	STATEULPS1_IRQ	lane 1 in ULTRALOW-POWER state  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
14	ERRCONTROL5_IRQ	Control error for lane 5 Applicable only to DS1. For DS12 this bit field is RESERVED.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
13	ERRCONTROL4_IRQ	Control error for lane 4 Applicable only to DS1. For DS12 this bit field is RESERVED.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
12	ERRCONTROL3_IRQ	Control error for lane 3  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
11	ERRCONTROL2_IRQ	Control error for lane 2  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
10	ERRCONTROL1_IRQ	Control error for lane 1  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
9	ERRESC5_IRQ	Escape entry error for lane 5 Applicable only to DS1. For DS12 this bit field is RESERVED.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0

Bits	Field Name	Description	Type	Reset
8	ERRESC4_IRQ	Escape entry error for lane 4 Applicable only to DS1. For DS12 this bit field is RESERVED.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
7	ERRESC3_IRQ	Escape entry error for lane 3  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
6	ERRESC2_IRQ	Escape entry error for lane 2  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
5	ERRESC1_IRQ	Escape entry error for lane 1  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
4	ERRSYNCESC5_IRQ	Low power Data transmission synchronization error for lane 5 Applicable only to DS1. For DS12 this bit field is RESERVED.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
3	ERRSYNCESC4_IRQ	Low power Data transmission synchronization error for lane 4 Applicable only to DS1. For DS12 this bit field is RESERVED.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
2	ERRSYNCESC3_IRQ	Low power Data transmission synchronization error for lane 3  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
1	ERRSYNCESC2_IRQ	Low power Data transmission synchronization error for lane 2  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
0	ERRSYNCESC1_IRQ	Low power Data transmission synchronization error for lane 1  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0

Bits	Field Name	Description	Type	Reset
31:30	PLL_PWR_CMD	Command for power control of the DSI PLL Control module 0x0: Command to change to OFF state 0x1: Command to change to ON state for PLL only (HSDIVISER is OFF) 0x2: Command to change to ON state for both PLL and HSDIVISER 0x3: Command to change to ON state for both PLL and HSDIVISER (no clock output to the DSI complex I/O)	RW	0x0

Bits	Field Name	Description	Type	Reset
29:28	PLL_PWR_STATUS	Status of the power control of the DSI PLL Control module  Read 0x0: DSI PLL Control module in OFF state  Read 0x1: DSI PLL Control module in ON state for PLL only (HSDIVISER is OFF)  Read 0x2: DSI PLL Control module in ON state for both PLL and HSDIVISER  Read 0x3: DSI PLL Control module in ON state for both PLL and HSDIVISER (no clock output to the DSI complex I/O)	R	0x0
27:22	RESERVED		R	0x00
21	LP_RX_SYNCHRO_ENABLE	Defines if the functional is higher or lower than 30 MHz. The information is used to define synchronization to be used for RxValidEsc.  0x0: The DSI functional clock is equal or slower than 30 MHz. The synchronization is falling/rising.  0x1: The DSI functional clock is higher than 30 MHz. The synchronization is rising/rising.	RW	0
20	LP_CLK_ENABLE	Controls the gating of the TXCLKESC clock.  0x0: Disabled. The clock is not generated. The value of LP_CLK_DIVISOR is not used and does not need to be programmed.  0x1: Enabled. The clock is generated. The value of LP_CLK_DIVISOR is used and needs to be programmed.	RW	0
19	HS_MANUAL_STOP_CTRL	In case HS_AUTO_STOP_ENABLE=0, the bit field allows manual control of the assertion/de-assertion of the signal DSISStopClk by the user.  0x0: DSISStopClk de-assertion unconditionally.  0x1: DSISStopClk assertion unconditionally.	RW	0
18	HS_AUTO_STOP_ENABLE	Enables the automatic assertion/de-assertion of DSISStopClk signal.  0x0: Auto mode disabled.  0x1: Auto mode enabled.	RW	0
17:16	LP_CLK_NULL_PACKET_SIZE	Indicates the size of LP NULL Packets to be sent automatically when after the last LP packet transfer. It is used by the receiver to drain its internal pipeline. The valid values are from 0 to 3 bytes for the payload size.	RW	0x0
15	LP_CLK_NULL_PACKET_ENABLE	Enables the generation of NULL packet in low speed.  0x0: Disabled. The NULL packet is not sent in LP mode after the last LP packet.  0x1: Enabled. The NULL packet is sent in LP mode after the last LP packet.	RW	0
14	CIO_CLK_ICG	Gates SCPClk clock provided to DSI_PHY and PLL-CTRL module.  0x0: Disabled. SCPClk is not generated. It remains at 0.  0x1: Enabled. SCPClk is generated (OCP_CLK/4)	RW	0
13	DDR_CLK_ALWAYS_ON	Defines if the DDR clock is also sent when there is no HS packets sent to the peripheral (low-power mode). So TXRequest for the clock lane is not de-asserted.  0x0: Disabled. The DDR clock is only provided when HS packets are sent.  0x1: Enabled. The DDR clock is always sent to the peripheral regardless of the state of the data lanes (HS or LS mode).	RW	0
12:0	LP_CLK_DIVISOR	Defines the ratio to be used for the generation of the low-power mode clock from DSI functional clock. The supported values are from 1 to 8191 (the value 0 is invalid). The output frequency shall be in the range between 20 MHz and 32 kHz.	RW	0x0001

<b>Description</b>	TIMING1 REGISTER This register controls the DSI Protocol Engine module timers. Any bit field can be modified while <a href="#">DSI_CTRL[0]</a> IF_EN is set to '1'. It is used to indicate the number of DSI1_CLK and DSI2_CLK functional clocks cycles for the timers FORCE_TX_STOP_TIMER and TA_TO_TIMER		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TA_TO	TA_TO_X16	TA_TO_X8	TA_TO_COUNTER													FORCE_TX_STOP_MODE_IO	STOP_STATE_X16_IO	STOP_STATE_X4_IO	STOP_STATE_COUNTER_IO												

Bits	Field Name	Description	Type	Reset
31	TA_TO	Enables the turn-around timer  0x0: Turn-around counter is disabled.  0x1: Turn-around counter is enabled (required to receive TA interrupt in case the turn-around procedure is not successful).	RW	0
30	TA_TO_X16	Multiplication factor for the number of DSI_CLK functional clocks cycles defined in TA_TO_COUNTER bit field  0x0: The number of DSI_CLK functional clock cycles defined in TA_TO_COUNTER is multiplied by 1x  0x1: The number of DSI_CLK functional clock cycles defined in TA_TO_COUNTER is multiplied by 16x	RW	1

Bits	Field Name	Description	Type	Reset
29	TA_TO_X8	Multiplication factor for the number of DSI_CLK functional clock cycles defined in TA_TO_COUNTER bit field  0x0: The number of DSI_CLK functional clock cycles defined in TA_TO_COUNTER is multiplied by 1x  0x1: The number of DSI_CLK functional clock cycles defined in TA_TO_COUNTER is multiplied by 8x	RW	1
28:16	TA_TO_COUNTER	Turn around counter. It indicates the number of DSI_CLK function clock to wait for the change of the Direction PPI signal according to the TurnRequest signal The value is from 0 to 8191.	RW	0x1FFF
15	FORCE_TX_STOP_MODE_IO	Control of ForceTxStopMode signal  0x0: De-assertion of ForceTxStopMode. The hardware reset the bit at the end of the ForceTXStopMode assertion. The software can reset the bit in order to stop the assertion of the ForceTXStopMode signal prior to the completion of the period.  0x1: Assertion of ForceTxStopMode	RW	0
14	STOP_STATE_X16_IO	Multiplication factor for the number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER_IO bit field  0x0: The number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER_IO is multiplied by 1x  0x1: The number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER_IO is multiplied by 16x	RW	1
13	STOP_STATE_X4_IO	Multiplication factor for the number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER_IO bit field  0x0: The number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER is multiplied by 1x  0x1: The number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER_IO is multiplied by 4x	RW	1
12:0	STOP_STATE_COUNTER_IO	Stop state counter. It indicates the number of DSI_CLK function clock to assert ForceTXStopMode signal. The value is from 0 to 8191.	RW	0x1FFF

<b>Description</b>	VIDEO MODE TIMING REGISTER This register defines the video mode timing.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED				WINDOW_SYNC				VSA								VFP								VBP							

Bits	Field Name	Description	Type	Reset
31:28	RESERVED		R	0x0
27:24	WINDOW_SYNC	Number of BYTE clock cycles for the synchronization window. An interrupt for synchronization lost is generated when the received synchronizaton on video port is not inside the window. DSI does not change its own timings if the synch is inside the window. The valid values are from 4 to 15.	RW	0x0
23:16	VSA	Defines the vertical Sync active period used in video mode in number of lines. The supported values are from 0 to 255 It is used to generate the short packet for End of Vertical synchronization. <sup>(1)</sup>	RW	0x00
15:8	VFP	Defines the vertical front porch used in video mode in number of lines. The supported values are from 0 to 255	RW	0x00
7:0	VBP	Defines the vertical back porch used in video mode in number of lines. The supported values are from 0 to 255	RW	0x00

<sup>(1)</sup> In DSI video mode, if the VSA bit field in DSI\_VM\_TIMING2 is set to 0x0, no vertical synchronization packet will be sent even if VP\_VSYNC\_START is set to 0x1 in DSI\_CTRL.

<b>Description</b>	CLOCK TIMING REGISTER This register controls the DSI Protocol Engine module timers. This register shall not be modified while <a href="#">DSI_CTRL.IF_EN</a> is set to '1'.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																DDR_CLK_PRE						DDR_CLK_POST									

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0000
15:8	DDR_CLK_PRE	Indicates the number of TXBYTECLKHS clock cycles between the start of the DDR clock and the assertion of the data request signal. The values from 1 to 255 are valid. The value 0 is reserved. The value is not used if <a href="#">DSI_CLK_CTRL[13]</a> <a href="#">DDR_CLK_ALWAYS_ON</a> is set to '1' since the DDR clock is always present.	RW	0x01

Bits	Field Name	Description	Type	Reset
7:0	DDR_CLK_POST	Indicates the number of TXBYTECLKHS clock cycles after the de-assertion of the data request signal and the stop of the DDR clock. The values from 1 to 255 are valid. The value 0 is reserved. The value is not used if <a href="#">DSI_CLK_CTRL</a> [13] DDR_CLK_ALWAYS_ON is set to '1' since the DDR clock is always present.	RW	0x01

<b>Physical Address</b>	0x5800 4090 0x4804 4090 0x5800 5090 0x4804 5090		
<b>Description</b>	Defines the minimum number of HS bytes clock cycles that are required to allow for the delays in entering and exiting HS mode. The supported values are from 0 to 65535		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ENTER_HS_MODE_LATENCY												EXIT_HS_MODE_LATENCY																			

Bits	Field Name	Description	Type	Reset
31:16	ENTER_HS_MODE_LATENCY	Defines the number of TXBYTECLKHS clock cycles necessary for entering to HS mode. It corresponds to the delay in number of HS clock cycles from assertion of TxRequestHS signal to 1 until assertion of TxReadyHS signal to 1. The supported values are from 0 to 65535 .	RW	0x0000

Bits	Field Name	Description	Type	Reset
15:0	EXIT_HS_MODE_LATENCY	Defines the number of TXBYTECLKHS clock cycles necessary for exiting from HS mode. It corresponds to the maximum delay in number of TXBYTECLKHS clock from de-assertion of TxRequestHS signal until PPI link is in LP-11 state from which a new entrance to HS mode can be initiated which does not take more than ENTER_HS_MODE_LATENCY clock cycles. The supported values are from 0 to 65535	RW	0x0000

## MIPI Display Serial Interface

www.ti.com

Bits	Field Name	Description	Type	Reset
31	DCS_CMD_CODE	DCS command code value to insert between header and video port or Interface slave data when enabled by DCS_CMD_ENABLE (only when TE mechanism is not used otherwise the bit field DCS_CMD_CODE is ignored by DSI protocol engine).  0x0: DCS write memory continue code is inserted.  0x1: DCS write memory start code is inserted.	RW	0
30	DCS_CMD_ENABLE	Enables automatic insertion of DCS command codes when data is sourced by the video port.  0x0: DCS command code is NOT inserted when command mode traffic is coming from the Video Port or Interface slave port.  0x1: DCS command code is inserted automatically when command mode traffic is coming from the Video Port or Interface slave port.	RW	0
29:27	DMA_RX_REQ_NB	Selection of the use of the DMA request (associated to the RX FIFO)  0x0: DMA_req0 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 0)  0x1: DMA_req1 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 1)  0x2: DMA_req2 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 2)  0x3: DMA_req3 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is equal to 3)  0x4: No DMA req selected	RW	0x0
26:24	DMA_RX_THRESHOLD	Defines the threshold value for the DMA request (associated to the RX FIFO)  0x0: 1 x 32 bits  0x1: 2 x 32 bits  0x2: 4 x 32 bits  0x3: 8 x 32 bits  0x4: 16 x 32 bits  0x5: 32 x 32 bits	RW	0x0
23:21	DMA_TX_REQ_NB	Selection of the use of the DMA request (associated to the TX FIFO)  0x0: DMA_req0 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 0)  0x1: DMA_req1 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 1)  0x2: DMA_req2 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 2)  0x3: DMA_req3 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is equal to 3)  0x4: No DMA req selected	RW	0x0
20	RX_FIFO_NOT_EMPTY	FIFO status in command mode. Otherwise, this bit can be ignored.  Read 0x0: The RX FIFO is empty (the FIFO does not contain any data for the virtual channel)  Read 0x1: The RX FIFO is not empty (the FIFO contains at least one byte for the virtual channel)	R	0

Bits	Field Name	Description	Type	Reset
19:17	DMA_TX_THRESHOLD	Defines the threshold value for the DMA request (associated to the TX FIFO) 0x0: 1x 32 bits 0x1: 2 x 32 bits 0x2: 4 x 32 bits 0x3: 8 x 32 bits 0x4: 16 x 32 bits 0x5: 32 x 32 bits	RW	0x0
16	TX_FIFO_FULL	FIFO status in command mode. Otherwise, this bit can be ignored. Read 0x0: The TX FIFO is not full (the FIFO can accept at least one more 32-bit value) Read 0x1: The TX FIFO is full	R	0
15	VC_BUSY	Indicates if previously scheduled activities (packets, BTA) are still being processed. Forced to 1 if VC is enabled. Software should check this bit is 0 before changing channel configuration. Read 0x0: No pending operations for this VC Read 0x1: Pending operations for this VC	R	0
14	PP_BUSY	Ping-pong buffer busy status. Read 0x0: Software is permitted to write a new header for VP command mode traffic. Read 0x1: Software is NOT permitted to write a new header for VP command mode traffic.	R	0
13	VP_SOURCE	Selection between video port 1 and video port 2. If <a href="#">DSI_GNQ[24]</a> NB_VIDEO_PORTS = 0, the bit field is ignored since only video port 1 is present. 0x0: The video port 1 is selected. 0x1: The video port 2 is selected. Note: This selection applies only to DSI1. For DSI2 to work properly, the VP_SOURCE bit must always be set to 0x0.	RW	0
12	RGB565_ORDER	Byte order for RBG565 0x0: Byte order as for DBI compliance 0x1: Byte order as for video mode	RW	0
11:10	OCP_DATA_BUS_WIDTH	Defines the size of the Interface data bus 0x0: 16-bits data width (LSB of the 32-bit Interface port data bus) 0x1: 24-bits data width (LSB of the 32-bit Interface port data bus) 0x2: 2x16-bits data width (first pixel on the LSB of the 32-bit Interface port data bus and second pixel on the MSB of the 32-bit Interface port data bus for the same Interface access) 0x3: 32-bits data width	RW	0x0
9	MODE_SPEED	Selection of the mode. The information is used by hardware only if MODE=COMMAND_MODE otherwise it is ignored. 0x0: Low-power mode (CMOS) is used to send short and long packets to the peripheral. 0x1: High Speed mode (SLVS) is used to send short and long packets to the peripheral.	RW	0

## MIPI Display Serial Interface

www.ti.com

Bits	Field Name	Description	Type	Reset
8	ECC_TX_EN	Enables the Error Correction Code generation for the transmit header (short and long packets). 0x0: Disabled 0x1: Enabled	RW	0
7	CS_TX_EN	Enables the checksum generation for the transmit payload (long packet only). 0x0: Disabled. The value 0x00 is used. 0x1: Enabled. The checksum value is calculated by HW.	RW	0
6	BTA_EN	Send the bus turn around to the peripheral. It can be used when the automatic mode is enabled (BTA_SHORT_EN=1 or/and BTA_LONG_EN=1). In that case only one BTA is sent to the peripheral. The manual mode is used to allow the user to define for which packets, the turn around is required for example getting acknowledge from the peripheral. 0x0: READS: BTA generation is completed. It is reset by hardware when it is completed. WRITES: Cancellation of the BTA generation (not guarantee since it could already on going, shall not be used). 0x1: READS: BTA generation has been requested by user (it could be on going but not completed). WRITES: Request for BTA generation.	RW	0
5	TX_FIFO_NOT_EMPTY	FIFO status Read 0x0: The TX FIFO is empty (the FIFO does not contain any data for the virtual channel) Read 0x1: The TX FIFO is not empty (the FIFO contains at least one byte for the virtual channel)	R	0
4	MODE	Selection of the mode 0x0: Command mode. 0x1: Video mode. The bit fields MODE_SPEED and SOURCE are not used by hardware. The bit field VP_SOURCE is used to select between video port 1 and video port 2 when two video ports are present.	RW	0
3	BTA_LONG_EN	Enables the automatic bus turn-around after completion of each long packet transmission. 0x0: Disabled 0x1: Enabled	RW	0
2	BTA_SHORT_EN	Enables the automatic bus turn-around after completion of each short packet transmission. 0x0: Disabled 0x1: Enabled	RW	0

Bits	Field Name	Description	Type	Reset
1	SOURCE	<p>Selection of the source between Interface and the Video port(s) (used by the hardware only if MODE=COMMAND MODE (0x0) otherwise it is ignored). The number of available video ports is defined in <a href="#">DSI_GNQ[24]</a> NB_VIDEO_PORTS bit.</p> <p>0x0: All the data are provided by the slave port. Any transfer on the video port is ignored for this virtual channel.</p> <p>0x1: If MODE=VIDEO_MODE, the data received on the video port 1 or video port 2, selected using VP_SOURCE (pixels and enabled synchronization events using <a href="#">DSI_CTRL[17]</a> VP_HSYNC_START, <a href="#">DSI_CTRL[18]</a> VP_HSYNC_END, <a href="#">DSI_CTRL[15]</a> VP_VSYNC_START, <a href="#">DSI_CTRL[16]</a> VP_VSYNC_END for video port 1 and <a href="#">DSI_CTRL2[]</a> VP_HSYNC_START, <a href="#">DSI_CTRL2[]</a> VP_HSYNC_END, <a href="#">DSI_CTRL2[]</a> VP_VSYNC_START, <a href="#">DSI_CTRL2[]</a> VP_VSYNC_END for video port 2) are sent on the virtual channel (only one virtual channel can be associated with the video port, it is the software responsibility to ensure that no more than one virtual channel is enabled with the video port as the main source for data).</p> <p>If MODE=COMMAND_MODE, the VP.STALL signal is used by the protocol engine to indicate when new data are required. The synchronization signals are not generated by the display controller. Regardless of the MODE, no data can be provided on the Interface slave port.</p>	RW	0
0	VC_EN	<p>Enables the virtual channel.</p> <p>0x0: Disabled. The virtual channel shall be disabled for any register change in the DSI_VC_... registers to the corresponding VC ID (except for setting the <a href="#">DSI_VC_CTRL_i[6]</a> BTA_EN, <a href="#">DSI_VC_TE_i[23:0]</a> TE_SIZE and <a href="#">DSI_VC_TE_i[31]</a> TE_START bit fields, and <a href="#">DSI_VC_LONG_...</a>, <a href="#">DSI_VC_SHORT_...</a>, <a href="#">DSI_VC_IRQ...</a> registers).</p> <p>0x1: Enabled. No change is allowed to the virtual channel registers expect resetting the VC_EN.</p>	RW	0

**Table 10-584. DSI\_VC\_TE\_i**

<b>Address Offset</b>	0x0000 0104 + (0x20 * i)	<b>Index</b>	i = 0 to 3
<b>Physical Address</b>	0x5800 4104 + (0x20 * i) 0x4804 4104 + (0x20 * i) 0x5800 5104 + (0x20 * i) 0x4804 5104 + (0x20 * i)	<b>Instance</b>	DSI1_PROTOCOL_ENGINE_L3 DSI1_PROTOCOL_ENGINE_P R_L4 DSI2_PROTOCOL_ENGINE_L3 DSI2_PROTOCOL_ENGINE_P R_L4
<b>Description</b>	CONTROL REGISTER - Virtual channel This register controls the tearing effect logic. It defines the size of the transfer when TE occurs and enables the automatic TE mode.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TE_START	TE_EN	TE_LINE	TE_LINE_NB	RESERVED				TE_SIZE																							

Bits	Field Name	Description	Type	Reset
31	TE_START	<p>Manual control of the start of the transfer. The user can use the TE interrupt in order to know that the TE trigger has been received prior to set the TE_START bit field. It is not mandatory to use the TE interrupt.</p> <p>0x0: Indicates the end of the transfer. The bit can be used by user to cancel the transfer if not already started. The FIFO shall be flushed by software to ensure there is no data remaining in it.</p> <p>0x1: Starts the transfer of the data. The size is defined in TE_SIZE. The bit field is set until the transfer is completed. It is reset by hardware when the transfer is completed.</p>	RW	0
30	TE_EN	<p>Tearing Effect Control</p> <p>0x0: Disables the automatic transfer. The user shall use the interruption in order to know when TE PHY trigger is received or when the TE is detected on the input CMOS signals. The hardware reset the bit field when the transfer is completed (TE_SIZE=0).</p> <p>0x1: Enables the automatic transfer of the data using the TE PHY trigger or one of the TE input signals as a synchronization event. The bit field TE_LINE defines if the CMOS signal is used or if the PHY trigger is used.</p>	RW	0
29	TE_LINE	<p>0x0: Disabled the TE CMOS signalling for the automatic data transfer. The DSI PHY trigger is used for the automatic data transfer.</p> <p>0x1: Enables the TE CMOS signalling for the automatic data transfer. The DSI PHY trigger is not used for the automatic data transfer.</p>	RW	0
28	TE_LINE_NB	<p>Selection between TE0 and TE1 CMOS signals.</p> <p>0x0: TE0 CMOS input line is selected</p> <p>0x1: TE1 CMOS input line is selected</p>	RW	0
27:24	RESERVED		R	0x0
23:0	TE_SIZE	<p>Defines the number of byte (payload data excluding the check -sum) to be sent. The write into the register <a href="#">DSI_VC_LONG_PACKET_HEADER_i</a> shall be performed by the user before sending data from the register <a href="#">DSI_VC_LONG_PACKET_PAYLOAD_i</a>. The register value is decremented for every byte sent of the DSI link. At the end of the transfer (TE_SIZE=0), the bit field TE_EN is reset by hardware. The DMA request will be asserted when the trigger is received in order to receive data in the TX FIFO. It should not be deasserted until all data (TE_SIZE) have been received in the FIFO.</p>	RW	0x000000

<b>Description</b>	Configuration register for HS mode timings		
<b>Type</b>	RW		

31 30 29 28 27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0
REG_THSPREPARE	REG_THSPRPR_THSZERO	REG_THSTRAIL	REG_THSEXIT

Bits	Field Name	Description	Type	Reset
31:24	REG_THSPREPARE	REG_THSPREPARE timing parameter in multiples of DDR clock period. DDR clock = CLKIN4DDR/4.  D-PHY specification: 40 ns + 4 * UI ÷ 85 ns + 6 * UI. UI = Unit Interval, equal to the duration of any HS state on the clock lane.  Default value is programmed for 400 MHz.	RW	0x1E
23:16	REG_THSPRPR_THSZERO	REG_THSPREPARE_THSZERO timing parameter in multiples of DDR clock period. DDR clock = CLKIN4DDR/4.	RW	0x48

Bits	Field Name	Description	Type	Reset
		D-PHY specification: > 145 ns + 10 * UI. Default value is programmed for 400 MHz.		
15:8	REG_THSTRAIL	REG_THSTRAIL timing parameter in multiples of DDR clock period. DDR clock = CLKIN4DDR/4. D-PHY specification: > 60 ns + 4 * UI. Default value is programmed for 400 MHz.	RW	0x1D
7:0	REG_THSEXIT	REG_THSEXIT timing parameter in multiples of DDR clock frequency. DDR clock = CLKIN4DDR/4. D-PHY specification: > 100 ns. Default value is programmed for 400 MHz.	RW	0x3A

<b>Type</b>	RW																														
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REG_TTAGO			REG_TTASURE			REG_TTAGET			RESERVED			REG_TLPXBY2				REG_TCLKTRAIL				REG_TCLKZERO											

Bits	Field Name	Description	Type	Reset
31:29	REG_TTAGO	TTA-GO timing in terms of number of TXCLKESC clocks. 0x0: 2 cycles 0x1: 3 cycles 0x2: 4 cycles 0x3: 5 cycles 0x4: 6 cycles 0x5: 7 cycles 0x6: 8 cycles 0x7: 9 cycles Default value: 4 cycles	RW	0x2
28:27	REG_TTASURE	TTA-SURE timing in terms of number of TXCLKESC clocks.	RW	0x0

Bits	Field Name	Description	Type	Reset
		0x0: 2 cycles 0x1: 1 cycles 0x2: 3 cycles 0x3: 4 cycles Default value: 2 cycles		
26:24	REG_TTAGET	TTA-GET timing in terms of number of TXCLKESC clocks. 0x0: 3 cycles 0x1: 4 cycles 0x2: 5 cycles 0x3: 6 cycles 0x4: 7 cycles 0x5: 8 cycles 0x6: 9 cycles 0x7: 10 cycles Default value: 5 cycles	RW	0x2
23:21	RESERVED	Reserved	R	0x0
20:16	REG_TLPXBY2	(TLPX)/2 timing parameter in multiples of DDR clock frequency. DDR clock = CLKIN4DDR/4. Default value is programmed for 400 MHz. This is the internal timer value. The value seen on line will have variance due to rise/fall mismatch effects. Note: TLPX is used to define the length of LP-01 state in HS start of Transmission sequences on clock and data lanes. For all other purposes TLPX is defined by the period of TXLPESC	RW	0x0A
15:8	REG_TCLKTRAIL	REG_TCLKTRAIL timing parameter in multiples of DDR clock frequency. DDR clock = CLKIN4DDR/4. D-PHY specification: > 60 ns. Default value is programmed for 400 MHz	RW	0x1A
7:0	REG_TCLKZERO	REG_TCLKZERO timing parameter in multiples of DDR clock period. DDR clock = CLKIN4DDR/4. D-PHY specification: (REG_TCLKPREPARE + REG_TCLKZERO) > 300 ns. Derived specification for REG_TCLKZERO (Min REG_TCLKPREPARE = 38 ns): REG_TCLKZERO > 262 ns. Default value is programmed for 400 MHz	RW	0x6A

## 10.4 High-Definition Multimedia Interface

This section introduces the high-definition multimedia interface (HDMI) module. It also describes its main functions and connections in the device.

### 10.4.1 High-Definition Multimedia Interface (HDMI) Overview

Figure 10-161 shows an overview of the HDMI module.

Figure 10-161. HDMI Overview

hdm\_i-001

#### 10.4.1.1 HDMI Main Features

The HDMI module provides the following main features:

- HDMI 1.3, HDCP 1.2, and DVI 1.0 compliant
  - Including support for the 3D stereoscopic frame-packing formats of the HDMI v1.4 standard (720p, 50 Hz; 720p, 60 Hz; and 1080p, 24 Hz)
- EIA/CEA-861-D video format support (refer to [Table 10-628](#) for more details)
- VESA DMT video format support (refer to [Table 10-629](#) for more details)
- Support for deep-color mode:
  - 10-bit/component color depth up to 1080p @60Hz
  - 12-bit/component color depth up to 720p/1080i @60Hz
  - 16-bit/component color depth is not supported

- Supports up to 148.5 MHz pixel clock (1920 x 1080p @60Hz) with deep-color mode
- Supports 154 MHz pixel clock (for VESA DMT 1920x1200p @60Hz) and 162 MHz pixel clock (for VESA DMT 1600x1200p @60Hz) with no deep-color mode
- Video formats: 24-bit RGB
- Uncompressed multi-channel (up to 8 channels) audio (L-PCM) support
- Master I2C interface for Display Data Channel (DDC) connection
- Consumer Electronic Control (CEC) interface
- Integrated High-bandwidth Digital Content Protection (HDCP) encryption engine for transmitting protected audio and video content (authentication performed by software)
- Integrated Transition Minimized Differential Signaling (TMDS) and TMDS Error Reduction Coding (TERC4) encoders for data island support
- Integrated TMDS PHY (3 TMDS differential data lanes + TMDS differential clock lane)
  - Up to 1,85625 Gbps per lane at (1080p @60Hz at 10 bits/component, lower resolutions at 12 bits/component)
  - 928,125Mbps per lane at (720p/1080i @60Hz 10 bits/component, lower resolutions at 12 bits/component)
  - 337,5 Mbps at (576p @50Hz/480p @60Hz 10 bits/component)

### 10.4.1.2 HDMI Video Formats and Timings

#### 10.4.1.2.1 CEA-861-D video formats and timings

[Table 10-628](#) presents the video timings supported by the HDMI module, according to the CEA-861-D standart:

**Table 10-628. HDMI Video Timings (CEA-861-D)**

Refresh Rate	Resolution
24 Hz (Low field rate)	1920 x 1080p
50 Hz	1920 x 1080p
	1920 x 1080i
	1280 x 720p
	2880 x 576p
	1440 x 576p
	1440 x 576i
59.94 Hz	720 x 576p
	1920 x 1080p
	2880 x 480p
	1440 x 480p
	1440 x 480i
60 Hz	720 x 480p
	640 x 480p
	1920 x 1080p
	1920 x 1080i
	2880 x 480p

	1440 x 900p
	1680 x 1050p
1920 x 1200p <sup>(1)</sup>	

<sup>(1)</sup> Only available without deep color mode

## 10.5 Remote Frame Buffer Interface

This section describes the remote frame buffer interface (RFBI).

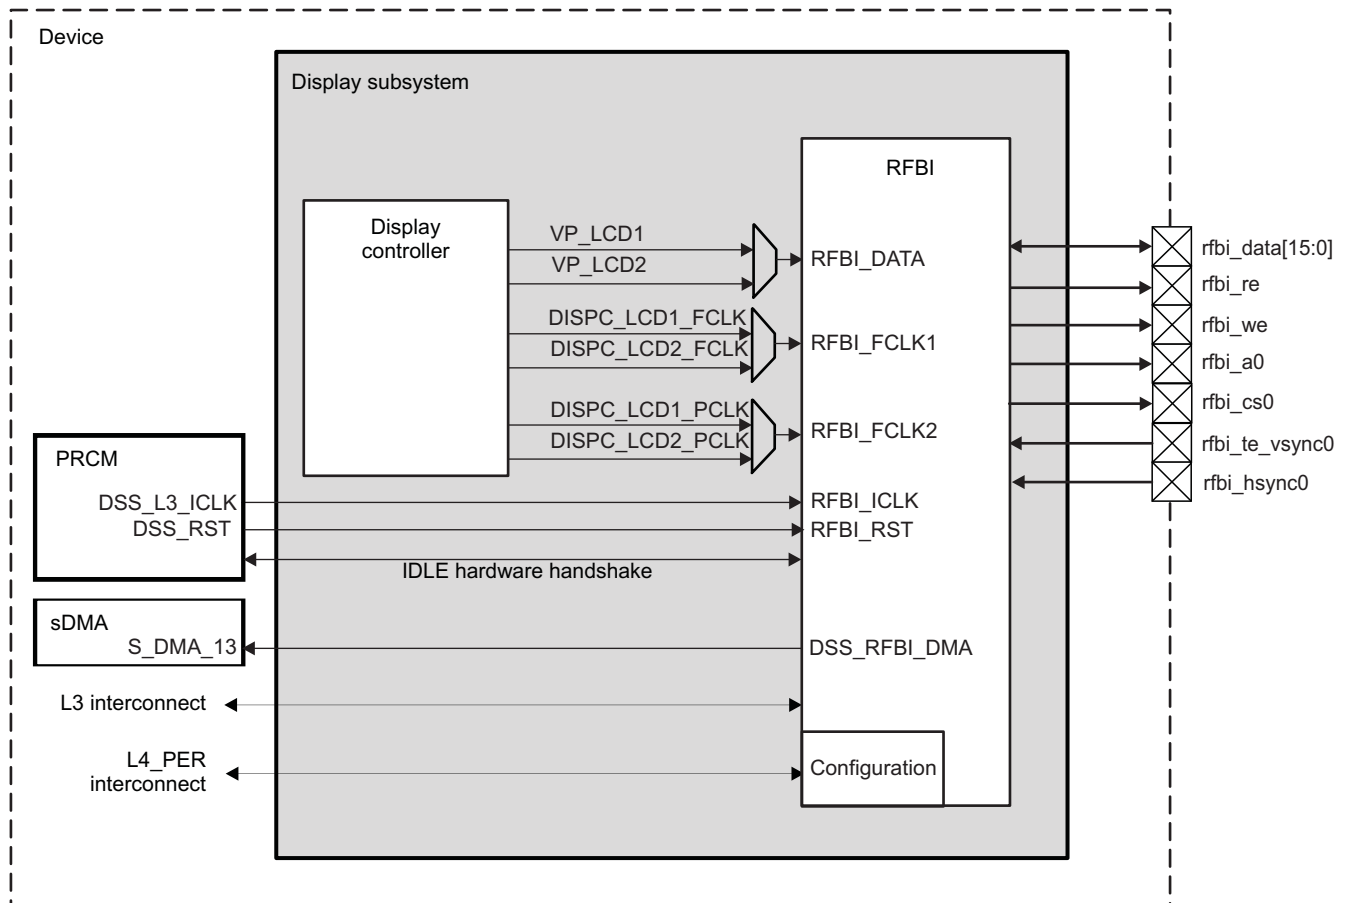

### 10.5.1 Remote Frame Buffer Interface Overview

The RFBI module is part of the display subsystem that provides the logic to display a picture from the memory frame buffer (SDRAM or SRAM) on a LCD panel.

The RFBI is connected to the L3 and L4\_PER interconnect through the display subsystem local interconnect. It is preferred from a performance point of view to use the L4\_PER interconnect for configuration and the L3 interconnect for data transfer.

Figure 10-162 shows an overview of the RFBI.

**Figure 10-162. RFBI Highlight**

rfbi-001

The RFBI supports the MIPI DBI protocol with the following features:

- Access to RFB direct MPU interface
  - Sends commands to the RFB panel through the slave port interconnect
  - Sends data, received from the DISPC or from the MPU through the DISPC pixel data bus, to the RFB panel
  - Reads data/status from the RFB to the slave port interconnect
- RFB interface
  - 8-/9-/16-bit parallel interface
  - One programmable configuration for one LCD connected to the RFBI
- Data formats

- Programmable pixel modes (12-/16-/18-/24-BPP modes in RGB format)
- Programmable output formats on one/multiple cycles per pixel (data from the DISPC and the L3 interconnect)
- FIFO
  - One slave port with DMA request and interconnect FIFO of 24 × 32-bit depth (for write access to the [RFBI\\_DATA](#) register only)
  - One video port FIFO of 8 × 24-bit depth receiving data from the DISPC through [RFBI\\_DATA](#)

## 10.5.2 RFBI Environment

In the display subsystem, data are read by the DISPC from the memory frame buffer (SDRAM, SRAM, IVA-HD SL2, etc.), and sent through the RFBI to the external LCD/RFB.

The DISPC associated with the RFBI implements the MIPI DBI protocol.

The DISPC provides the required control signals to interface the memory frame buffer (SDRAM, SRAM or IVAHD-SL2) directly to the external displays. The RFBI is connected to the memory through the L3 interconnect and has its own DMA (with embedded FIFOs) to read data from the system memory. There is one master port (L3 interconnect) and two slave ports (one for L4\_PER interconnect and the other for L3 interconnect).

The DISPC\_CONTROL1[16] GPOUT[1] and DISPC\_CONTROL1[15] GPOUT[0] bits control selection of the display subsystem modules (see [Table 10-630](#)).

**Table 10-630. I/O Pad Mode Selection**

DSS.DISPC_CONTROL[16] GPOUT1	DSS.DISPC_CONTROL[15] GPOUT0	Mode
0	0	Reset
0	1	RFBI mode
1	0	Invalid
1	1	Bypass mode

The RFB of the LCD panel is directly connected to the RFBI of the device. The RFBI controls the reads/writes from/to the RFB. The RFBI receives data from its slave port or output from the DISPC and generates the signals to control the LCD panel. Through the RFBI, the MPU can send commands or parameter/display data to the LCD panel and directly set the DISPC registers to read/write data from/to the memory in the LCD panel. The RFBI can manage only one LCD panel.

### 10.5.2.1 RFBI Parallel Interface (MIPI DBI Protocol)

[Figure 10-163](#) shows the LCD support parallel interface in RFBI mode.

**Figure 10-163. RFBI LCD Support Interface**

[Table 10-631](#) describes the interface signals to/from the LCD panel.

**Table 10-631. LCD Interface Signals**

Signal Name	Type <sup>(1)</sup>	Description
rfbi_data[15:0]	I/O	RFBI I/O data

<sup>(1)</sup> I = Input; O = Output; I/O = Input/Output

**Table 10-631. LCD Interface Signals (continued)**

Signal Name	Type <sup>(1)</sup>	Description
rbi_re	O	Read access signal
rbi_we	O	Write access signal
rbi_a0	O	Command/data selection signal
rbi_cs0	O	Chip-select (CS) signal for LCD 1
rbi_te_vsync0	I	Tearing effect (TE) synchronization signal (TE or VSYNC for LCD panel 1)
rbi_hsync0	I	HSYNC from LCD panel 1

- rbi\_data[15:0]:** The pixel data comprises the RFBI pixel data (bits 15:0). A write/read command must be sent to the LCD panel to send/read the data.  
 Before any data access, the application must send commands and parameters when it is necessary to configure an LCD panel. The data is used as input in read operations during production test and also to read the status of the registers in the LCD panel and pixels from the embedded frame buffer in the LCD panel.
- rbi\_re:** This is the read-enable signal used to indicate when a read from the embedded memory in the LCD panel is ongoing. The RFBI registers describe the behavior of the read signal (off/on/cycle time). The polarity of the read-enable signal is programmable. The read is used to get status/data information from the LCD panel.
- rbi\_we:** The write-enable signal is used to indicate when a write is ongoing. The RFBI registers allow flexible behavior of the write signal (programmable off/on/cycle times and signal polarity).
- rbi\_a0:** The signal is asserted to indicate its status: Command or data. The polarity is programmable and the status of the signal depends on the RFBI registers written by the application (CMD/READ/STATUS/PARAM/PIXEL). The register in use by the hardware defines the status of rbi\_a0. The order of the writes/reads to the RFBI registers CMD/READ/STATUS/PARAM/PIXEL defines the transitions of A0.
- rbi\_cs0:** The signal is the chip-select (CS0) asserted to indicate which LCD panel is selected and must be ready to receive/transmit commands and data. When RE or WE is on, CS0 must not be changed.  
 To select the trigger mode, configure the [RFBI\\_CONFIG\[3:2\]](#) TRIGGERMODE bit field (0x0: Internal trigger mode with the [RFBI\\_CONTROL\[4\]](#) ITE bit, 0x1: External trigger mode with the TE signal rbi\_te\_vsync0, 0x2: External trigger mode with the rbi\_te\_vsync0, and rbi\_hsync0 signals with the programmable line counter).
- rbi\_te\_vsync0** (only used by RFBI if [RFBI\\_CONFIG\[3:2\]](#) TRIGGERMODE = 0x1 or 0x2, otherwise ignored): Based on the trigger mode selected, the signal is the TE pulse signal or the LCD panel vertical synchronization (VSYNC) pulse signal. rbi\_te\_vsync0 is used by the TE logic as the synchronization signal to send the pixel to the LCD panel.
- rbi\_hsync0** (only used by RFBI if [RFBI\\_CONFIG\[3:2\]](#) TRIGGERMODE = 0x2, otherwise ignored): The HSYNC pulse signals indicate to the RFBI when horizontal synchronization occurs. The polarity of the HSYNC signals is programmable. The minimum pulse width of the signal is two RFBI\_ICLK clock cycles. rbi\_hsync0 is used by the TE logic as a synchronization signal to send the pixel to the LCD panel.

#### 10.5.2.1.1 Description of the Tearing Effect Pulse Signal

The TE signal can be generated externally by the RFBI depending on the value of the [RFBI\\_CONFIG\[3:2\]](#) TRIGGERMODE bit field:

- TRIGGERMODE = 0x1: external trigger mode with TE signal. TE signal corresponds to rbi\_te\_vsync0 pad.
- TRIGGERMODE = 0x2: external trigger mode with HSYNC/VSYNC signals. HSYNC signal corresponds to rbi\_hsync0 pad and VSYNC signal to rbi\_te\_vsync0 pad.

The externally generated TE synchronization signal is a logical OR or AND operation between the HSYNC and VSYNC signals (see [Figure 10-164](#)). The logical operation (OR or AND) depends on the HSYNC and VSYNC signals polarity. The VSYNC signal indicates to the RFBI when vertical synchronization occurs; the HSYNC signal indicates to the RFBI when horizontal synchronization occurs.

**Figure 10-164. External Generation of TE Signal Based on Logical OR Operation Between HSYNC and VSYNC (Active-High)**

- TE signal is connected to rfb<sub>i</sub>\_te\_vsync0 external pad when the [RFBI\\_CONFIG\[3:2\] TRIGGERMODE](#) bit field is set to 0x1.
- HSYNC and VSYNC signals are connected to rfb<sub>i</sub>\_hsync0 and rfb<sub>i</sub>\_te\_vsync0, respectively, when the [RFBI\\_CONFIG\[3:2\] TRIGGERMODE](#) bit field is set to 0x2.

The RFBI module detects the VSYNC and HSYNC pulses embedded in the received signal. VSYNC is detected based on the minimum pulse width defined by the [RFBI\\_VSYNC\\_WIDTH](#) register. VSYNC is not triggered by an inactive-to-active edge.

HSYNC is detected based on the minimum pulse width defined by the [RFBI\\_HSYNC\\_WIDTH](#) register. HSYNC is not triggered by an inactive-to-active edge.

The signal is generated from external logic based on VSYNC and HSYNC of the LCD panel. The automatic trigger can be programmed based on the external RFBI\_TE signal or use the [RFBI\\_CONTROL\[4\] ITE](#) bit to start data capture (internal trigger mode).

The polarity of the TE signal is programmable in the [RFBI\\_CONFIG](#) register. HSYNC and VSYNC pulses embedded in the TE signal have the same polarity, which is active high for an ORed signal and active low for an ANDed signal. The minimum pulse width of the signal is two RFBI\_ICLK clock cycles. Hardware resets the line counter when VSYNC occurs and increments it at every HSYNC. Transfer to the LCD panel begins when the line counter reaches the programmable line number.

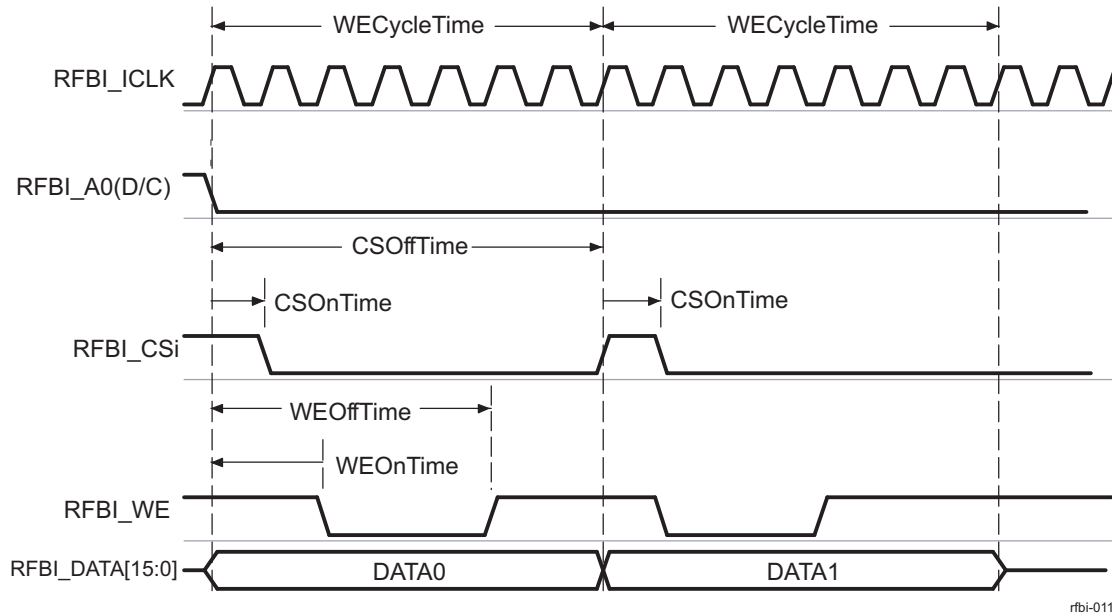

### 10.5.2.2 Transaction Timing Diagrams

[Table 10-632](#) lists the programmable timing fields. [Figure 10-165](#) through [Figure 10-167](#) show timing diagrams of read/write transactions to the LCD panel for the RFBI. In these figures, the polarity 0 (active low) is used to describe the RFBI\_A0, RFBI\_CS<sub>i</sub>, RFBI\_RE, and RFBI\_WE signals.

**Table 10-632. Programmable Timing Fields in RFBI Mode**

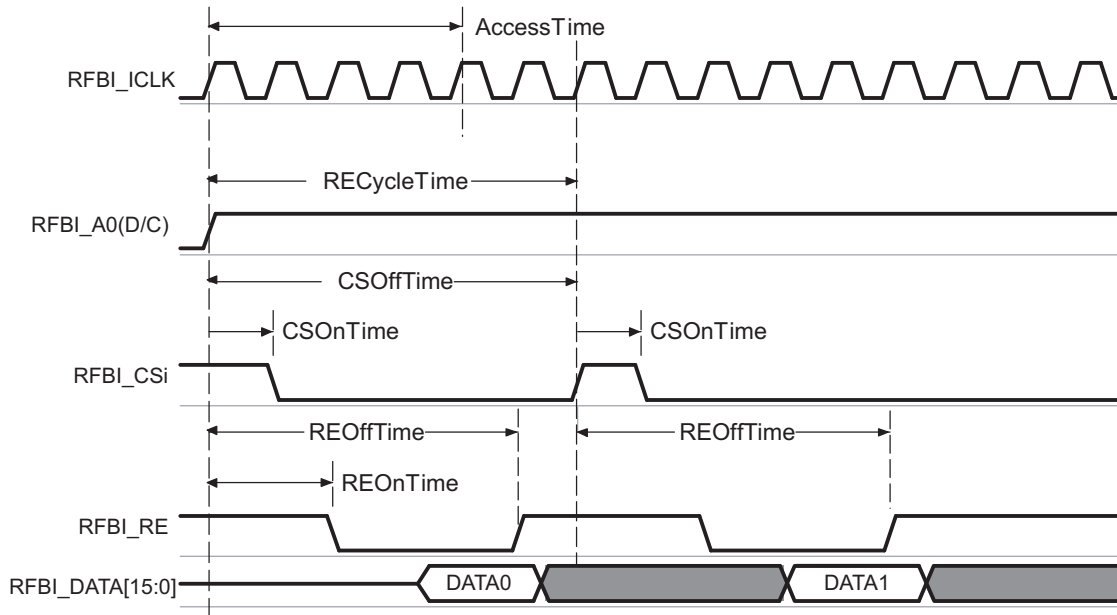

Timing Name	Register Field	Description
CSONTime	<a href="#">RFBI_ONOFF_TIME[3:0]</a> CSONTIME bit field	CS assertion time from start access time
CSOffTime	<a href="#">RFBI_ONOFF_TIME[9:4]</a> CSOFFTIME bit field	CS deassertion time from start access time
WECycleTime	<a href="#">RFBI_CYCLE_TIME[5:0]</a> WECYCLETIME bit field	The time when A0 becomes valid until write cycle completion
WEOnTime	<a href="#">RFBI_ONOFF_TIME[13:10]</a> WEONTIME bit field	WE assertion delay time from start access time
WEOffTime	<a href="#">RFBI_ONOFF_TIME[19:14]</a> WEOFFTIME bit field	WE deassertion delay time from start access time
RECycleTime	<a href="#">RFBI_CYCLE_TIME[11:6]</a> RECYCLETIME bit field	The time when A0 becomes valid until read cycle completion
REOnTime	<a href="#">RFBI_ONOFF_TIME[23:20]</a> REONTIME bit field	RE assertion delay time from start access time
REOffTime	<a href="#">RFBI_ONOFF_TIME[29:24]</a> REOFFTIME bit field	RE deassertion delay time from start access time
CSPulseWidth	<a href="#">RFBI_CYCLE_TIME[17:12]</a> CSPULSEWIDTH bit field	The time when write cycle time or read cycle time completes

### 10.5.3 RFBI Integration

This section describes the RFBI integration in the device, including information about clocks, resets, and hardware requests.

Figure 10-168 shows the RFBI module integration.

**Figure 10-168. RFBI Integration**

**NOTE:** For more information about the IDLE hardware handshake, see [Section 3.1.1.1.2, Module-Level Clock Management, Chapter 3, Power, Reset, and Clock Management](#).

Table 10-633 through Table 10-635 summarize the integration of the module in the device.

**Table 10-633. Integration Attributes**

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
RFBI	PD_DSS	No	L3 L4_PER

**Table 10-634. Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
RFBI	RFBI_FCLK1	DISPC_LCDx_FCLK	DISPC	Logic clock used by the RFBI when capturing data on the video port and for the generation of the RFBI_STALL signal
	RFBI_FCLK2	DISPC_LCDx_PCLK	DISPC	Pixel clock used by the RFBI to capture the pixels
	RFBI_ICLK	DSS_L3_ICLK	PRCM	L3 interface clock
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
RFBI	RFBI_RST	DSS_RST	PRCM	Display subsystem global hardware reset

**NOTE:** If video mode is used, the VPn\_PCLK and VPn\_CLK clocks must be generated using a CLKIN4DDR clock.

**Table 10-635. Hardware Requests**

DMA Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
RFBI	DSS_RFBI_DMA	S_DMA_13	sDMA	RFBI DMA request

**NOTE:** For DMA source description, see [Section 10.5.3.1, DMA Requests](#).

### 10.5.3.1 DMA Requests

All peripherals internal to the device use the transition-sensitive scheme for DMA requests. For more information about the transition-sensitive scheme, see [Chapter 16, sDMA](#).

[Table 10-636](#) describes the RFBI DMA request.

**Table 10-636. RFBI DMA Request Description**

DMA	Source	Description	Sensitivity <sup>(1)</sup>
RFBI_DMA	DSS_RFBI_DMA	The DMA request can be used to transfer data using the sDMA T from memory to RFBI interconnect slave FIFO.	T

<sup>(1)</sup> T: Transition-sensitive (fixed in hardware) active low request

### 10.5.4 RFBI Functional Description

This section describes the functions of the RFBI.

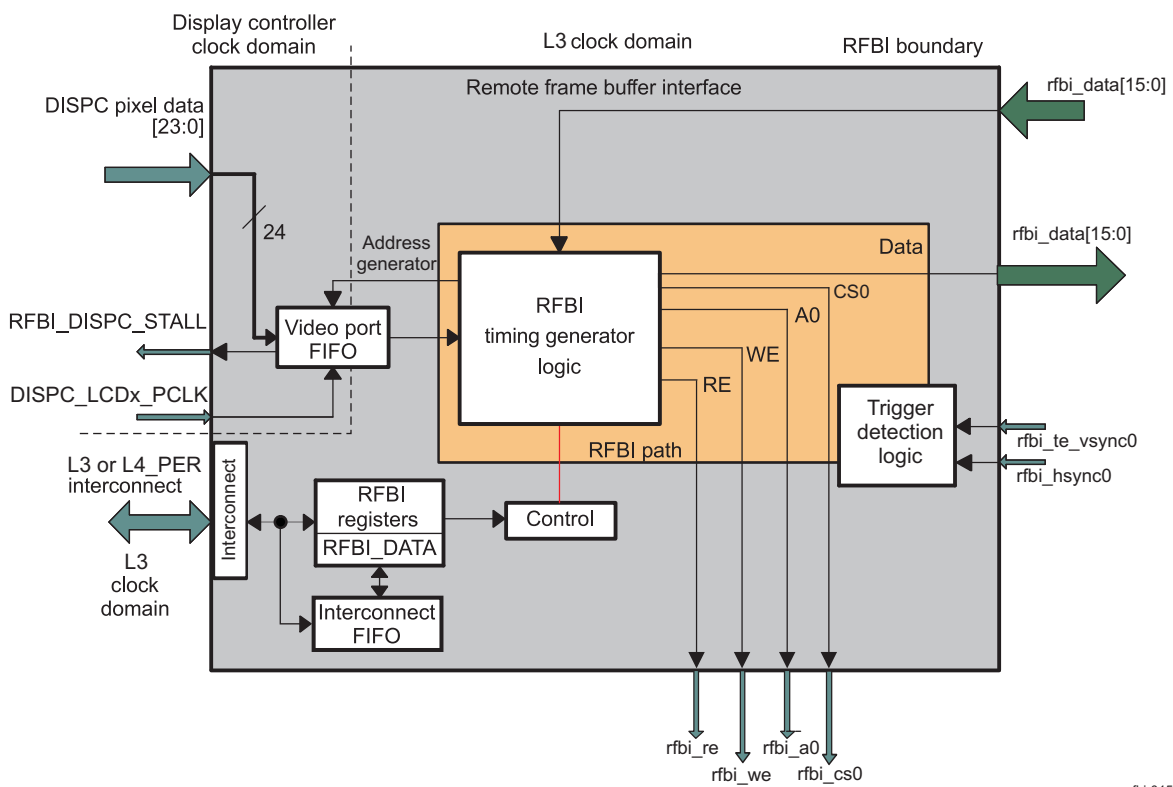

#### 10.5.4.1 Block Diagram

The RFBI can capture the output pixel from the DISPC and send the data to the RFB in the LCD panel. The application configures the RFBI, sends commands, reads data, and configures the DISPC to send data fetched from the system memory by the DISPC DMA engine. The commands/data are sent using an 8-, 9-, or 16-bit parallel interface.

The DISPC is configured to send the data in 12-, 16-, 18-, or 24-BPP format. In the video port FIFO, the encoded pixel values are in an LSB alignment independent of the endianness in system memory.

Figure 10-169 is an overview of the RFBI architecture.

Figure 10-169. RFBI Architecture Overview

rfbi-015

#### 10.5.4.2 Clock Configuration

The RFBI functional clocks (RFBI\_FCLK1 and RFBI\_FCLK2) are provided internally to the display subsystem by the DISPC. For more details about the DISPC clocks, see, Section 10.2 Display Controller.

#### 10.5.4.3 Software Reset

To perform a software reset, set the RFB\_SYSCONFIG[1] SOFTRESET bit to 1. The RFB\_SYSSTATUS[0] RESETDONE bit indicates that the software reset is complete when its value is 1. When the software reset completes, the RFB\_SYSCONFIG[1] SOFTRESET bit is automatically reset. Software must ensure that the software reset completes before performing any RFBI operation.

#### 10.5.4.4 Power Management

Table 10-637 describes power-management features available for the RFBI.

**NOTE:** For information about source clock gating description, see [Section 3.1.1.1.2, Module-Level Clock Management](#) in [Chapter 3, Power, Reset and Clock Management](#).

**Table 10-637. Local Power Management Features**

Feature	Registers	Description
Clock autogating	<a href="#">RFBI_SYSCONFIG</a> [0] AUTOIDLE bit	This bit allows a local power optimization inside the module by gating functional clocks (RFBI_FCLK1, RFBI_FCLK2) and interface clock (RFBI_ICLK) upon the internal activity.
Slave idle modes	<a href="#">RFBI_SYSCONFIG</a> [4:3] SIDLEMODE bit field	Force-idle, no-idle, and smart-idle. For more details, see below.
Clock activity	N/A	Feature not available
Master standby modes	N/A	Feature not available
Global wake-up enable	N/A	Feature not available
Wake-up sources enable	N/A	Feature not available

As shown in [Table 10-637](#), the RFBI supports the No-Idle, Force-idle, and Smart-Idle modes.

The conditions of assertion of the SIdleAck signal are:

- No-idle mode: SIdleAck is never asserted.
- Force-idle mode: SIdleAck is asserted unconditionally after one RFBI\_ICLK clock cycle delay with respect to assertion of IdleReq.
- Smart-idle mode: SIdleAck is asserted when the following conditions are satisfied:
  - The RFBI stops using the RFBI\_ICLK clock and all the data have been sent to the RFB (LCD panel).

Once SIdleAck signal is asserted:

- The RFBI\_ICLK (DSS\_L3\_ICLK) clock can shutdown at any time.
- Any transaction on the RFBI configuration port is ignored

The conditions of deassertion of the SIdleAck signal are:

- Force-idle mode: In this mode SIdleAck is deasserted after one RFBI\_ICLK clock cycle delay with respect to deassertion of IdleReq.
- Smart-idle mode: In this mode SIdleAck is deasserted after one RFBI\_ICLK clock cycle delay with respect to deassertion of IdleReq.

Once SIdleAck is released, the RFBI is fully operational (guaranteed only in the case of smart-idle mode).

#### 10.5.4.5 Interrupt Requests

The RFBI does not generate interrupts but the following DISPC interrupts can be enabled depending on which LCD output of DISPC is currently used for connection to the RFBI:

- FRAMEDONE1\_IRQ
- PROGRAMMEDLINENUMBER\_IRQ
- GFXFIFOUNDERFLOW\_IRQ
- GFXENDWINDOW\_IRQ
- PALETTEGAMMALOADING\_IRQ
- OCPERROR\_IRQ
- VID1FIFOUNDERFLOW\_IRQ
- VID1ENDWINDOW\_IRQ
- VID2FIFOUNDERFLOW\_IRQ
- VID2ENDWINDOW\_IRQ

- SYNCLOST1\_IRQ
- WAKEUP\_IRQ
- SYNCLOST2\_IRQ
- VID3FIFOUNDERFLOW\_IRQ
- VID3ENDWINDOW\_IRQ
- FRAMEDONE2\_IRQ

**NOTE:** For more details about DISPC interrupts, see, [Section 10.2 Display Controller](#).  
The other DISPC interrupts are not used in the RFBI.

### 10.5.4.6 DMA Requests

[Table 10-638](#) lists event flags and their mask, that can cause RFBI DMA requests.

**Table 10-638. DMA Requests Events**

DMA Request Name	DMA Request Mask	Map to	Description
DSS_RFBI_DMA	RFBI_CONTROL[7] DISABLE_DMA_REQ	S_DMA_XX	DMA request used to transfer data using the sDMA from memory to the RFBI interconnect FIFO

**NOTE:** For more details about DMA requests, see [Figure 10-175](#).

### 10.5.4.7 Video Port FIFO

#### 10.5.4.7.1 Description

The input video port FIFO receives data from the DISPC at the pixel clock. The data in the video port FIFO are read by the RFBI and sent to the LCD panel. The video port FIFO is 24 bits wide and each pixel in 12-, 16-, 18-, and 24-BPP format is stored in the video port FIFO using one 24-bit value aligned on the 24-bit LSB. [Section 10.5.4.9, RFBI Output Parallel Modes](#), provides examples of various output configurations based on the interface width (up to 16 bits) and pixel format output (up to 24 bits). Setting the [RFBI\\_CONTROL\[1\]](#) RFBIMODE bit to 0 directs the MPU to send commands, parameters, and data from the input video port FIFO.

#### 10.5.4.7.2 RFBI Input Formats

The encoded pixel formats supported at the RFBI input interface connected to the DISPC are: RGB12-444, RGB16-565, RGB18-666, and RGB24-888. This input data width is controlled by the [RFBI\\_CONFIG\[6:5\]](#) DATATYPE bit field. The following graphics describe the bit representation of each format in the video port FIFO. The output of the DISPC is aligned on the LSB of the interface. The pixels are then formatted in accordance with the configuration of the output interlaces (multiple cycles); for more details, see [Section 10.5.4.9.1, Cycle Mode Selection](#).

- RGB12-444 format:

- RGB16-565 format:

- RGB18-666 format:

rfbi-018

- RGB24-888 format:

rfbi-019

---

**NOTE:** These pixel formats are also supported when data are provided from the slave port interconnect (for writing parameters).

---

### 10.5.4.7.3 Stall Mechanism

The stall signal (RFBI\_STALL) is generated by the video port FIFO and used to indicate when the DISPC must stop sending data on the corresponding LCD output interface. This stall signal is used for both LCD outputs (DISPC\_LCD1\_DATA\_STALL and DISPC\_LCD2\_DATA\_STALL) only when the DISPC is configured in stall mode. The stall mode is activated by setting the DISPC\_CONTROLo[11] STALLMODE bit to 1 for the primary LCD output and DISPC\_CONTROLo[11] STALLMODE bit to 1 for the secondary LCD output.

---

**NOTE:** When the DISPC is configured in stall mode, the minimum transfer size is 1 byte.

---

The RFBI\_STALL signal allows the RFBI to reformat the data.

RFBI\_STALL is asserted when at least one of the following cases occurs:

- Default status when there is no data to capture from the DISPC
- High FIFO threshold reached
- End of transfer (number of data to output)
- RFBI reset
- [RFBI\\_CONTROL\[0\] ENABLE](#) bit reset to 0x0

RFBI\_STALL is deasserted when the [RFBI\\_CONTROL\[0\] ENABLE](#) bit is set to 0x1 and at least one of the following cases occurs:

- Low FIFO threshold reached
- External TE occurs and the [RFBI\\_CONFIG\[3:2\] TRIGGERMODE](#) bit field is set to 0x1 for automatic external trigger (start of the transfer, the FIFO pointers are reset, the FIFO is empty).
- [RFBI\\_CONTROL\[4\] ITE](#) bit set to 0x1 by users (start of transfer, the FIFO pointers are reset, the FIFO is empty)

---

**NOTE:** This stall mechanism is also used by the DSI protocol engines. When multiple modules are connected to the same LCD output (RFBI and DSI protocol engines), the STALL signals from the modules are merged into a single DISPC\_LCDx\_DATA\_STALL signal inside the display subsystem. Only one signal for each LCD output is connected the DISPC (two signals total for the two LCD outputs). In that case, only one module can control the STALL assertion/deassertion. The module which is not using the LCD output interface at that time is not disturbed because the STALL signal is asserted/deasserted by another module. For more details, see chapter *Display Subsystem*.

---

The RFBI asserts the STALL signal to stop data output by the DISPC. It is deasserted to indicate when new data must be output by the DISPC.

#### 10.5.4.7.3.1 Data Stall Diagram Without DMA Buffer Handshake

[Figure 10-170](#) shows the RFBI data stall diagram when DISPC\_DIVISOR[7:0] PCD bit field is set to 3.

**Figure 10-170. RFBI Data Stall Signal Diagram With PCD=3**

rbi-020

**10.5.4.7.3.2 Data Stall Diagram with DMA Buffer Handshake**

To avoid underflow of the DMA buffer, the DMA buffer handshake feature can be enabled by setting the DISPC\_CONFIG0[16] BUFFERHANDCHECK bit to 1. The fullness of the FIFOs associated with the pipelines used for the LCD output is checked when the STALL signal is inactive before providing data to the pipeline. This prevents emptying the FIFO when the RFBI requests data and there is not enough data in the DISPC DMA buffer. This feature must be enabled only when stall mode is used (DISPC\_CONTROL0[11] STALLMODE bit set to 1).

When the DMA buffer handshake feature is activated, the pixel transfer to the RFBI during STALL inactivity period can be stopped (no DISPC\_LCD1\_PCLK or DISPC\_LCD2\_PCLK pulse) and restarted when there is enough data in the DMA buffer. The DMA buffer handshake ensures that underflow cannot occur for the pipelines associated with the LCD output in stall mode. Figure 10-171 shows the RFBI data stall with DMA buffer handshake mode activated (PCD=3).

**Figure 10-171. RFBI Data Stall Signal Diagram With Handshake With PCD=3**

rbi-021

**10.5.4.8 Interconnect FIFO**

**10.5.4.8.1 Description**

The interconnect FIFO receives the data from RFBI\_DATA write requests to the slave port interconnect slave port. The data in the interconnect FIFO are read by the RFBI and sent to the LCD panel. The interconnect FIFO is 32 bits wide. The size of the interconnect FIFO is 24 words of 32 bits (that is, 24 words of RFBI\_DATA). The address of the RFBI\_DATA register is used to access the interconnect FIFO. The DSS\_RFBI\_DMA DMA request can be used to transfer data using the system DMA from memory to interconnect FIFO.

**10.5.4.8.2 Using DMA Request With Interconnect FIFO**

**10.5.4.8.2.1 Threshold for DMA Request Generation**

The RFBI\_CONTROL[6:5] HIGHTHRESHOLD bit field is used to define the threshold to be used for the generation of the DMA request to receive data into the interconnect FIFO (24 x 32 FIFO depth) through the address of the register RFBI\_DATA. The sDMA configuration regarding the size of the burst depends on the value of the RFBI\_CONTROL[6:5] HIGHTHRESHOLD bit field. The supported values are 4 x 32, 8 x 32 and 16 x 32. When for example, 4 words of 32 bits are set for the threshold, the sDMA sends a burst of 4 x 32 bits only. The sDMA receives the DMA request and is in charge of providing the correct number of bytes.

#### 10.5.4.8.2.2 Disabling DMA Request

If the [RFBI\\_CONTROL\[7\] DISABLE\\_DMA\\_REQ](#) bit is reset, the DMA request is generated when there is enough room in the interconnect FIFO to accept the full burst. In case the RFBI receives writes slave port requests to the [RFBI\\_DATA](#) location when the interconnect FIFO is full, the request is not accepted. The RFBI waits for a free entry in the interconnect FIFO to accept the slave port request.

If the [RFBI\\_CONTROL\[7\] DISABLE\\_DMA\\_REQ](#) bit is set, the DMA request is not generated. The threshold value is ignored.

---

**NOTE:** Software users can access the [RFBI\\_DATA](#) location without using the DMA request and without programming the high threshold value (backward compatibility mode).

---

#### 10.5.4.8.2.3 Smart DMA Request Mode

If the [RFBI\\_CONTROL\[8\] SMART\\_DMA\\_REQ](#) bit is reset (smart DMA mode disabled), the DMA request is asserted and deasserted depending on the interconnect FIFO space even if `Midlereq` is high in smart-idle/no-idle mode and the entire burst gets error responses from the RFBI. The RFBI waits for a free entry in the interconnect FIFO to accept the burst request.

If the [RFBI\\_CONTROL\[8\] SMART\\_DMA\\_REQ](#) bit is set (smart DMA mode enabled), the DMA request is deasserted after two [RFBI\\_ICLK](#) clock cycles if it has been asserted for more than or equal to two [RFBI\\_ICLK](#) clock cycles and `Midlereq` is high in smart-idle or no-idle mode. If asserting time is less than two [RFBI\\_ICLK](#) clock cycles, no more burst requests are accepted even if the space is available in the interconnect FIFO.

### 10.5.4.9 RFBI Output Parallel Modes

#### 10.5.4.9.1 Cycle Mode Selection

The `RFBI_CONFIG[10:9]` `CYCLEFORMAT` bit field defines the number of cycles to output a pixel. The number of cycles determines the number of registers used to format the data in the interconnect FIFO with the appropriate number of bits (starting from the LSB) and with the alignment on the interface. The data are formatted based on the configuration of the `RFBI_DATA_CYCLEi` registers.

- One cycle: `RFBI_CONFIG[10:9]` `CYCLEFORMAT` bit field = 0x00 and the `RFBI_DATA_CYCLE1` register
- Two cycles: `RFBI_CONFIG [10:9]` `CYCLEFORMAT` bit field = 0x01 and the `RFBI_DATA_CYCLE1` and `RFBI_DATA_CYCLE2` registers
- Three cycles: `RFBI_CONFIG[10:9]` `CYCLEFORMAT` bit field = 0x10 and the `RFBI_DATA_CYCLE1`, `RFBI_DATA_CYCLE2`, and `RFBI_DATA_CYCLE3` registers

Figure 10-172 through Figure 10-174 list the bits position of the pixel during the cycles for an 8-, 9- and 16-bit parallel output, respectively.

rfbi-028

10.5.4.9.2 Unmodified Bits

In a cycle, if every bit in the interface does not have a pixel value, the status of the unused bits can be programmed to be 0, 1, or the previous value (I/O power consumption optimization). Based on the configuration, the undefined bits for each cycle are defined with the previous values of the bits at the same position in the previous cycle, 0s, or 1s (the unused bits can be at any position). The RFBI\_CONFIG[12:11] UNUSEDBITS bit field is used.

### 10.5.4.9.3 Number of Pixels to Transfer

The [RFBI\\_PIXEL\\_CNT\[31:0\]](#) PIXELCNT bit field indicates the number of pixels to be transferred to the LCD panel. The value can be changed only when the [RFBI\\_CONTROL\[0\]](#) ENABLE bit is reset.

During the transfer, the hardware decrements the register when a pixel is sent to the RFB. When the [RFBI\\_CONTROL\[0\]](#) ENABLE bit is set and a new value is written in the [RFBI\\_PIXEL\\_CNT](#) register, and the current value in the register is a not 0 (the remaining number of pixels to transfer), the ongoing transfer is aborted.

### 10.5.4.10 RFBI Timing Generator

#### 10.5.4.10.1 Configuration Selection

The [RFBI\\_CONTROL\[3:2\]](#) CONFIGSELECT bit field selects the chip select.

#### 10.5.4.10.2 Read/Write

Depending on the status of A0, WE, and RE, the commands and display/parameter data are written to the panel (handled by the state-machine for the commands/parameter data and stored in memory for the display data), or the display data/status values are read from the LCD panel (status and display data in the LCD panel memory). The polarity of A0 (RFBI\_A0 signal), WE (RFBI\_WE signal), RE (RFBI\_RE signal), and CS0 (RFBI\_CS0 signal) is programmable.

[Table 10-639](#) describes the read/write function.

**Table 10-639. Read/Write Function Description**

A0 (RFBI_A0)	WE (RFBI_WE)	RE (RFBI_RE)	Function Description
1	0	1	Display data write, parameter data write
1	1	0	Display data read
0	1	0	Status read
0	0	1	Command data write

A minimum of RFBI\_Cs cycle time, as defined in [Table 10-640](#), is required to keep the RFBI\_CS0 signal asserted between write transfers of multiple pixels.

[Table 10-640](#) lists the minimum cycle time for RFBI\_CS0, depending on the source of pixels (DISPC or slave port) and the cycle format (1 pixel/cycle, 1 pixel/2 cycles, or 1 pixel/3 cycles).

**Table 10-640. Minimum Cycle Time for CS0/WE Always Asserted**

RFBI Performance	<a href="#">RFBI_CONFIG[10:9]</a> CYCLEFORMAT	<a href="#">RFBI_CONFIG[8:7]</a> PORTFORMAT	Minimum Cycle Time (in Number of RFBI_ICLK Clock Cycles)
Slave port interconnect	1 pixel/cycle	1 pixel	5
	1 pixel/2 cycles	1 pixel	4
	1 pixel/3 cycles	1 pixel	4
	1 pixel/cycle	2 pixels	4
	1 pixel/2 cycles	2 pixels	4
	1 pixel/3 cycles	2 pixels	4
DISPC	1 pixel/cycle	N/A	4
	1 pixel/2 cycles	N/A	3
	1 pixel/3 cycles	N/A	3
	2 pixel/3 cycles	N/A	6

### 10.5.4.10.3 RFBI State-Machine

The RFBI\_A0, RFBI\_RE, and RFBI\_WE signals are asserted and deasserted based on the register accessed (RFBI\_CMD, RFBI\_PARAM, RFBI\_DATA, RFBI\_READ, or RFBI\_STATUS). (See Table 10-639.) When the RFBI\_SYSSTATUS[8] BUSY bit is set by hardware, any access to the registers is stalled, except for the RFBI\_DATA register.

The RFBI\_SYSSTATUS[9] BUSYRFBIDATA bit indicates whether there are still pending data in the interconnect FIFO associated with the RFBI\_DATA register only.

- **Command register**  
Write one command at a time by writing through the slave port interconnect into the RFBI\_CMD register. If the previous command is not processed, the RFBI\_SYSSTATUS[8] BUSY bit is set by hardware and the access to writing a new command is stalled.
- **Parameter register**  
Write one parameter at a time by writing in the RFBI\_PARAM register.  
If the previous parameter is not processed, the RFBI\_SYSSTATUS[8] BUSY bit is set by hardware and the access to writing a new parameter is stalled.
- **Data register**  
Write one or two pixels at a time by writing in the RFBI\_DATA register.  
The pixels are formatted based on the specified cycle format. If two pixels are written into the 32-data register, the RFBI\_CONFIG[8:7] PORTFORMAT bit field indicates the number of pixels for each slave port access to the register and the order of the pixels.  
If the previous data are not processed, the RFBI\_SYSSTATUS[8] BUSY bit is set by hardware and any access for writing new data is stalled. When the RFBI\_SYSSTATUS[8] BUSY bit is reset by hardware, the access is not stalled.
- **Read/status register**  
Send through the command and parameter registers the correct information to receive data in the data or status register. The read data from the LCD panel is initiated by writing into the RFBI\_READ or RFBI\_STATUS registers. In this case, the RFBI\_SYSSTATUS[8] BUSY bit is set until the data are available in the register.  
When the RFBI\_SYSSTATUS[8] BUSY bit is set by hardware, the read or write access is stalled until the register is updated with a new value from the LCD panel. To avoid the stall, the software can poll the RFBI\_SYSSTATUS[8] BUSY bit until it is reset by hardware. To receive the data, send the appropriate command/parameters.

### 10.5.4.10.4 RFBI Timings

The timing registers can be accessed only when there is no transaction in progress (based on the value of the RFBI\_CONTROL[3:2] CONFIGSELECT bit field). Granularity is defined using the RFBI\_CONFIG[4] TIMEGRANULARITY bit. This feature allows the extension of programmable ranges of timing parameters for the RFBI interface. See Table 10-641 for the configuration values of the timing bits.

- **Chip-select assertion/deassertion time (CSOnTime/CSOffTime)**  
RFBI\_A0 setup time to chip-select assertion is assured by the programmable chip-select assertion time from the start access time:  
RFBI\_ONOFF\_TIME[3:0] CSONTIME bit field.  
The chip-select deassertion time from the start access time is programmable:  
RFBI\_ONOFF\_TIME[9:4] CSOFFTIME bit field

**CAUTION**

Configuring RFBI\_ONOFF\_TIME[3:0] CSONTIME = RFBI\_ONOFF\_TIME[9:4] CSOFFTIME = 0 is not supported and must be avoided. This configuration creates contention on the bus and progressively damages the LCD panel.

- **Chip-select pulse width (CSPulseWidth)**

The total chip-select pulse width is the time when write cycle time or read cycle time has completed and is programmable:

[RFBI\\_CYCLE\\_TIME\[17:12\]](#) CSPULSEWIDTH bit field

It applies on the read-to-write, write-to-read, read-to-read, and write-to-write access based on:

- The [RFBI\\_CYCLE\\_TIME\[19\]](#) RRENABLE bit: Read-to-read access
- The [RFBI\\_CYCLE\\_TIME\[20\]](#) WWENABLE bit: Write-to-write access
- The [RFBI\\_CYCLE\\_TIME\[18\]](#) RWENABLE bit: Read-to-write access
- The [RFBI\\_CYCLE\\_TIME\[21\]](#) WRENABLE bit: Write-to-read access

By default, it applies to any access (read-to-read, read-to-write, write-to-read, write-to-write) when the chip-select CS0 is activated by setting the [RFBI\\_CONTROL\[3:2\]](#) CONFIGSELECT bit field to 0x1.

- Access time

Access time is the time delay between A0 assertion to data sampling before RE signal deassertion; access time is programmable:

[RFBI\\_CYCLE\\_TIME\[27:22\]](#) ACCESSTIME bit field

When reading the data on the bus, the data are sampled at the end of the access time, which occurs before the end of the read off time ([RFBI\\_ONOFF\\_TIME\[29:24\]](#) REOFFTIME).

- Write-enable cycle time (WECycleTime)

The total write-enable cycle time is the time when A0 becomes valid until write cycle completion; the write-enable cycle time is programmable:

The [RFBI\\_CYCLE\\_TIME\[5:0\]](#) WECYCLETIME bit field

- Write-enable assertion/deassertion time (WEOnTime/WEOffTime)

The WE assertion delay time from start access time is programmable:

[RFBI\\_ONOFF\\_TIME\[13:10\]](#) WEONTIME bit field

The WE deassertion delay time from the start access time is programmable:

[RFBI\\_ONOFF\\_TIME\[19:14\]](#) WEOFFTIME bit field

- Read-enable cycle time (RECycleTime)

The total read-enable cycle time is the time when A0 becomes valid until read cycle completion; the read-enable cycle time is programmable:

The [RFBI\\_CYCLE\\_TIME\[11:6\]](#) RECYCLETIME bit field

- Read-enable assertion/deassertion time (REOnTime/REOffTime)

The RE assertion delay time from the start access time is programmable:

[RFBI\\_ONOFF\\_TIME\[23:20\]](#) REONTIME bit field

The RE deassertion delay time from the start access time is programmable:

[RFBI\\_ONOFF\\_TIME\[29:24\]](#) REOFFTIME bit field

At cycle time completion (read access or write access), all control signals (RFBI\_CS0, RFBI\_WE, and RFBI\_RE) are deasserted regardless of their deassertion time parameter values, if they are not deasserted already.

However, an exception to this forced deassertion exists when a pipelined request to CS0 is pending. Also, a control signal with deassertion time parameters equal to the cycle time parameter is not necessarily deasserted when a pipelined request to the same chip-select or different chip-select is pending. This prevents any unnecessary glitch transitions.

If no inactive cycles are required between successive accesses to the same chip-select (the [RFBI\\_CYCLE\\_TIME\[17:12\]](#) CSPULSEWIDTH bit field = 0), and if assertion time parameters associated with the following access equal 0, the asserted control signals (RFBI\_CS0, RFBI\_WE, and RFBI\_RE) stay asserted. This applies only to write-to-write access combination. In case of read-to-write, read-to-read, or write-to-read sequences, the RFBI\_CS0, RFBI\_WE, and RFBI\_RE signals are always deasserted.

[Table 10-641](#) lists the configuration values for each timing bit.

**Table 10-641. RFBI Timings Configuration**

Timing Configuration Bits	Granularity <sup>(1)</sup>	
	One	Two
<a href="#">RFBI_ONOFF_TIME</a> [3:0] CSONTIME	0 to 15	0 to 30
<a href="#">RFBI_ONOFF_TIME</a> [9:4] CSOFTIME	0 to 63	0 to 126
<a href="#">RFBI_CYCLE_TIME</a> [17:12] CSPULSEWIDTH	0 to 63	0 to 126
<a href="#">RFBI_CYCLE_TIME</a> [27:22] ACCESSTIME	0 to 63	0 to 126
<a href="#">RFBI_CYCLE_TIME</a> [5:0] WECYCLETIME	0 to 63	0 to 126
<a href="#">RFBI_ONOFF_TIME</a> [13:10] WEONTIME	0 to 15	0 to 30
<a href="#">RFBI_ONOFF_TIME</a> [19:14] WEOFFTIME	0 to 63	0 to 126
<a href="#">RFBI_CYCLE_TIME</a> [11:6] RECYCLETIME	0 to 63	0 to 126
<a href="#">RFBI_ONOFF_TIME</a> [23:20] REONTIME	0 to 15	0 to 30
<a href="#">RFBI_ONOFF_TIME</a> [29:24] REOFFTIME	0 to 63	0 to 126

<sup>(1)</sup> Number of RFBI\_ICLK clock cycles. The granularity can be configured using the [RFBI\\_CONFIG](#)[4] TIMEGRANULARITY bit.

### 10.5.4.11 Trigger Detection Logic

#### 10.5.4.11.1 Trigger Mode

Setting the [RFBI\\_CONFIG](#)[3:2] TRIGGERMODE bit field configures the different trigger modes:

- Internal trigger mode with the internal programmable [RFBI\\_CONTROL](#)[4] ITE bit
- External trigger mode with external TE signal ([RFBI\\_TE\\_VSYNC](#))
- External trigger mode with external VSYNC/HSYNC signals

#### 10.5.4.11.2 Internal Trigger Mode

##### 10.5.4.11.2.1 ITE Bit

Set the [RFBI\\_CONTROL](#)[4] ITE bit to start capturing the data from the DISPC. The DISPC must be configured in the RFBI mode to account for the [RFBI\\_DISPC\\_STALL](#) signal. Setting the trigger mode to external ([RFBI\\_CONFIG](#)[3:2] TRIGGERMODE bit field set to 0x1 or 0x2) causes the [RFBI\\_CONTROL](#)[4] ITE bit to be ignored. The chip-select CS0 must be selected ([RFBI\\_CONTROL](#)[3:2] CONFIGSELECT set to 0x1) when this bit is set by users.

#### 10.5.4.11.3 External Trigger Mode

There are two external trigger modes:

- TE only: VSYNC and HSYNC are merged by logical OR operation, and are detected through VSYNC and HSYNC pulse widths.
- HSYNC/VSYNC: This mode uses the two external signals which are detected through VSYNC and HSYNC pulse widths.

##### 10.5.4.11.3.1 Programmable Line Number

When the trigger mode is set to external trigger mode with HSYNC and VSYNC or the TE, hardware resets the line counter when the VSYNC occurs and, after a programmable number of lines programmed by the user in the [RFBI\\_LINE\\_NUMBER](#)[10:0] LINENUMBER bit field (the HSYNC pulse occurs for every line), the transfer to the LCD panel begins. When the programmable line number is 0, only the VSYNC pulse indicates the beginning of the transfer in both modes: HSYNC/VSYNC and TE (logical OR operation between HSYNC and VSYNC).

### 10.5.4.11.3.2 VSYNC Pulse Width (Minimum Value)

The [RFBI\\_VSYNC\\_WIDTH](#)[15:0] MINVSYNCPULSEWIDTH bit field defines the minimum number of RFBI\_ICLK clock cycles of the VSYNC pulse for detection on VSYNC. It allows differentiation between VSYNC and HSYNC, which are ORed on the same signal, and is also used in HSYNC/VSYNC mode on the two separate input lines.

- The VSYNC pulse width must be equal to at least two RFBI\_ICLK clock cycles when HSYNC is not present (TE trigger mode only).
- The VSYNC pulse width must be equal to at least four RFBI\_ICLK clock cycles when HSYNC is present (TE trigger mode only).

### 10.5.4.11.3.3 HSYNC Pulse Width (Minimum Value)

The [RFBI\\_HSYNC\\_WIDTH](#)[15:0] MINHSYNCPULSEWIDTH bit field defines the minimum number of RFBI\_ICLK clock cycles of the HSYNC pulse for detection on HSYNC. It allows differentiation between VSYNC and HSYNC, which are ORed on the same signal, and is also used in VSYNC/HSYNC mode on the separate two input lines. To be detected, the HSYNC/VSYNC pulse width must always be equal to at least two RFBI\_ICLK clock cycles. See [Table 10-642](#).

**Table 10-642. Minimum Pulse Width (HSYNC/VSYNC)**

Configuration Bits	TE Mode	HSYNC/VSYNC Mode
<a href="#">RFBI_HSYNC_WIDTH</a> [15:0] MINHSYNCPULSEWIDTH field value	2	2
<a href="#">RFBI_VSYNC_WIDTH</a> [15:0] MINVSYNCPULSEWIDTH field value	4	2

The pulse received by the RFBI must be at least two RFBI\_ICLK clock cycles to be detected. In case of TE mode, since the minimum value for differentiate VSYNC and HSYNC is two RFBI\_ICLK clock cycles, the VSYNC pulse width must be at least four RFBI\_ICLK clock cycles and the HSYNC pulse width must be at least two RFBI\_ICLK clock cycles

## 10.5.5 RFBI Programming Guide

### 10.5.5.1 RFBI Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and use of the RFBI.

#### 10.5.5.1.1 Global Initialization

##### 10.5.5.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the RFBI is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the RFBI. For more information, see [Section 10.5.2, RFBI Environment](#), and [Section 10.5.3, RFBI Integrator](#).

[Table 10-643](#) describes the global initialization of surrounding modules.

**Table 10-643. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	RFBI_ICLK interface clock must be enabled. See <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
DISPC	RFBI_FCLK1 and RFBI_FCLK2 functional clocks must be enabled. See <a href="#">Section 10.2.1, Display Controller</a> .
Control module	rfb_i_re pad muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_we pad muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_cs0 pad muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_te_vsync0 pad muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_data[15:0] pads muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_hsync0 pad muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_a0 pad muxing must be set in the SYSCTRL_PADCONF_CORE module. See <a href="#">Chapter 18, Control Module</a> .
MPU INTC	MPU interrupt controller configuration must be done to enable the interrupts from the DISPC module. See <a href="#">Chapter 17, Interrupt Controllers</a> .
sDMA	DMA configuration must be done to enable the RFBI module DMA channel requests. See <a href="#">Chapter 16, Direct Memory Access</a> .
Interconnect	See <a href="#">Chapter 13, Interconnect</a> , for more information about the interconnect configuration.

---

**NOTE:** The MPU INTC and the sDMA configurations are necessary if the interrupt- and DMA-based communication modes are used.

---

### 10.5.5.1.1.2 RFBI Global Initialization

#### 10.5.5.1.1.2.1 Main Sequence RFBI Global Initialization

This procedure initializes the RFB and DISPC after a power on or software reset. See [Table 10-644](#).

**Table 10-644. RFBI Global Initialization**

Step	Register/Bit Field Programming Model	Value
DISPC configuration in RFBI mode	See <a href="#">Section 10.5.5.1.1.2.2</a> , <i>Subsequence: DISPC Configuration</i> .	
RFBI configuration	See <a href="#">Section 10.5.5.1.1.2.3</a> , <i>Subsequence: RFBI Configuration</i> .	
LCD panel configuration	See <a href="#">Section 10.5.5.1.1.2.4</a> , <i>Subsequence: LCD Panel Configuration</i> .	

#### 10.5.5.1.1.2.2 Subsequence: DISPC Configuration

This procedure configures the DISPC registers in RFBI mode. See [Table 10-645](#).

**Table 10-645. DISPC Configuration in RFBI Mode**

Step	Register/Bit Field Programming Model	Value
DISPC pipeline configuration	Configuration of the pipeline associated to the LCD output (DMA engine, pipelines associated to the LCD output, etc.). See <a href="#">Section 10.2.4</a> , <i>Display Controller Functional Description</i>	
Enable TFT mode.	DISPC_CONTROLo[3] STNTFT	0x1
Program the DISPC in RFBI mode.	DISPC_CONTROLo[11] STALLMODE	0x1
Reset the DISPC signal configuration to default value.	DISPC_POL_FREQo	0x00
Select the RFBI data path.	DISPC_CONTROL1[16:15] GPOUT	0x1
Enable the hardware handshake to avoid the DISPC FIFO underflow (applies to the pipeline connected to the LCD output).	DISPC_CONFIGo[16] BUFFERHANDCHECK	0x1

**NOTE:** In RFBI mode, the DISPC\_CONTROLo[5] GOLCD bit must not be set to 1. It must be disabled before resetting the DISPC\_CONTROLo[11] STALLMODE bit to 0.

The hardware handshake applies to the pipelines connected to the LCD output. It must be disabled before resetting the DISPC\_CONTROLo[11] STALLMODE bit to 0.

#### 10.5.5.1.1.2.3 Subsequence: RFBI Configuration

This procedure configures the RFBI registers. See [Table 10-646](#).

#### CAUTION

The RFBI configuration registers for CS0 configuration can be accessed only when the configuration is not in use (that is, when the [RFBI\\_CONTROL\[3:2\] CONFIGSELECT](#) is set to 0x0).

**Table 10-646. RFBI Configuration – Main Sequence**

Step	Register/Bit Field Programming Model	Value
Enable the RFBI data path.	<a href="#">RFBI_CONTROL[1] RFBIMODE</a>	0x0
DMA mode configuration	See <a href="#">Section 10.5.5.1.1.2.3.1</a> , <i>Subsequence: DMA Mode Configuration</i> .	

**Table 10-646. RFBI Configuration – Main Sequence (continued)**

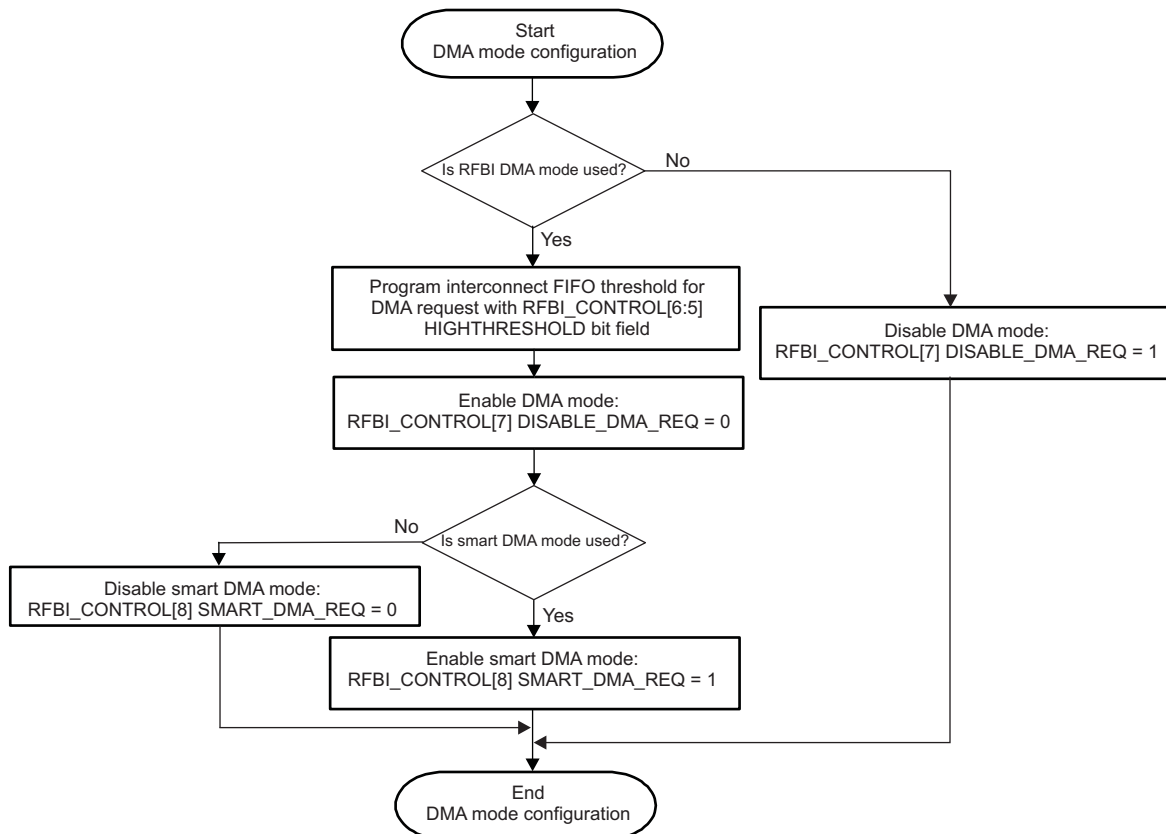

Step	Register/Bit Field Programming Model	Value
Disable the chip-select and configuration (this step is necessary to configure the timing registers).	RFBI_CONTROL[3:2] CONFIGSELECT	0x0
Timing and polarity signals configuration	See Section 10.5.5.1.1.2.3.2, Subsequence: Timing and Polarity Signals Configuration.	
Configure the parallel input data width.	RFBI_CONFIG[6:5] DATATYPE	x <sup>(1)</sup>
Configure the number of cycles.	RFBI_CONFIG[10:9] CYCLEFORMAT	x <sup>(1)</sup>

Program the data format per cycle.	RFBI_DATA_CYCLE_1	xxx <sup>(1)</sup>
	RFBI_DATA_CYCLE_2	xxx <sup>(1)</sup>
	RFBI_DATA_CYCLE_3	xxx <sup>(1)</sup>
Select the configuration of CS0	RFBI_CONTROL[3:2] CONFIGSELECT	0x1

<sup>(1)</sup> Values depend on the application

**10.5.5.1.1.2.3.1 Subsequence: DMA Mode Configuration**

Figure 10-175 shows DMA mode configuration.

**Figure 10-175. DMA Mode Configuration**

rbi-024

Table 10-647 describes DMA mode configuration.

**Table 10-647. Register Call Summary for Subsequence: DMA Mode Configuration**

Register Name
<a href="#">RFBI_CONTROL</a>

### 10.5.5.1.1.2.3.2 Subsequence: Timing and Polarity Signals Configuration

[Table 10-648](#) describes timing and polarity signals configuration.

**Table 10-648. Timing and Polarity Signals Configuration**

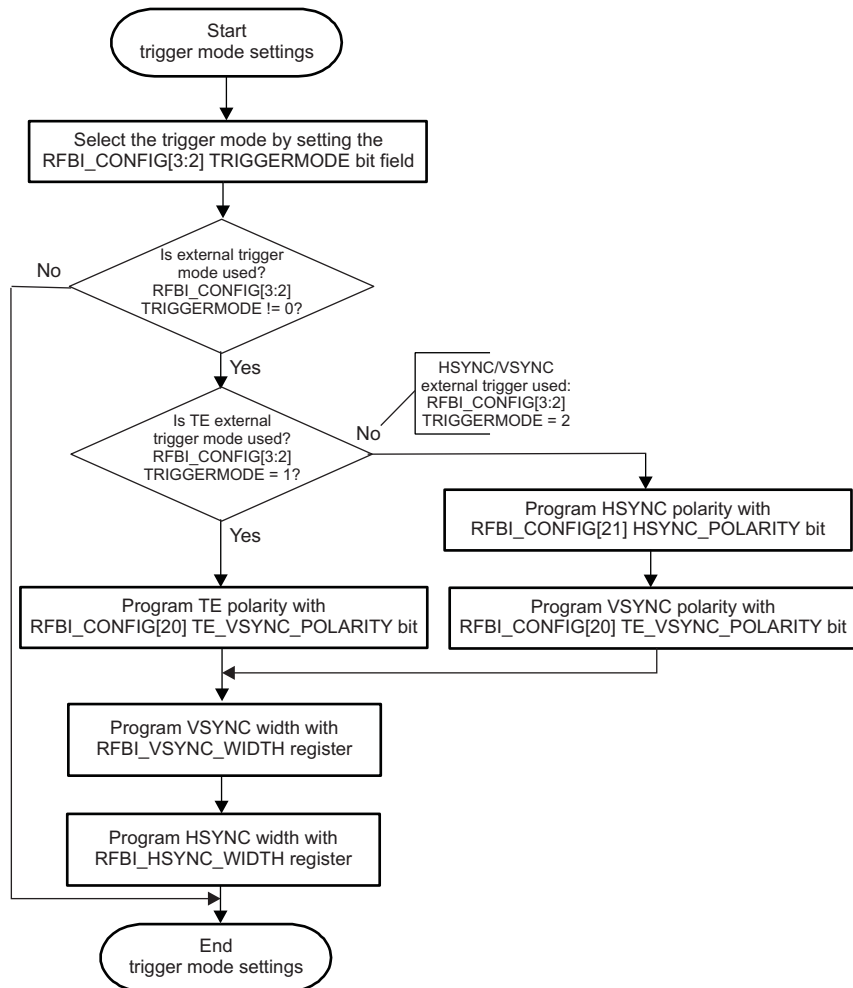

Step	Register/Bit Field Programming Model	Value
Program ON/OFF timings.	<a href="#">RFBI_ONOFF_TIME</a>	xxx <sup>(1)</sup>
Program cycle timings.	<a href="#">RFBI_CYCLE_TIME</a>	xxx <sup>(1)</sup>
Program CS polarity.	<a href="#">RFBI_CONFIG[19]</a> CSPOLARITY	x <sup>(1)</sup>
Program WE polarity.	<a href="#">RFBI_CONFIG[18]</a> WEPOLARITY	x <sup>(1)</sup>
Program RE polarity.	<a href="#">RFBI_CONFIG[17]</a> REPOLARITY	x <sup>(1)</sup>
Program A0 polarity.	<a href="#">RFBI_CONFIG[16]</a> A0POLARITY	x <sup>(1)</sup>
Program unused bits.	<a href="#">RFBI_CONFIG[12:11]</a> UNUSEDBITS	x <sup>(1)</sup>
Program the factor x2 latency.	<a href="#">RFBI_CONFIG[4]</a> TIMEGRANULARITY	x <sup>(1)</sup>

<sup>(1)</sup> Values depend on the application.

10.5.5.1.1.2.3.3 Subsequence: Trigger Mode Settings

Figure 10-176 shows trigger mode settings.

Figure 10-176. Trigger Mode Settings

rbi-025

Table 10-649 describes register call summary for subsequence: trigger mode settings

Table 10-649. Register Call Summary for Subsequence: Trigger Mode Settings

Register Name		
RFBI_CONFIG	RFBI_VSYNC_WIDTH	RFBI_HSYNC_WIDTH

10.5.5.1.1.2.4 Subsequence: LCD Panel Configuration

This procedure consists of sending and receiving commands. See Table 10-650 and Table 10-651.

Table 10-650. RFBI Command Interface: Writing Command to the LCD Panel

Step	Register/Bit Field Programming Model	Value
Write command to the LCD panel.	RFBI_CMD[8:0] CMD	0x <sup>(1)</sup>
Wait until BUSY != 1.	RFBI_SYSSTATUS[8] BUSY	

<sup>(1)</sup> Value depends on the command sent to the LCD panel.

**Table 10-651. RFBI Command Interface: Reading Command From the LCD Panel**

Step	Register/Bit Field Programming Model	Value
Initialize reading command.	RFBI_STATUS[8:0] STATUS	0x
Initialize reading command.	RFBI_READ [8:0] READ	0x
Wait until BUSY != 1.	RFBI_SYSSTATUS[8] BUSY	
Read command from the LCD panel.	RFBI_STATUS[8:0] STATUS	0x <sup>(1)</sup>
	RFBI_READ [8:0] READ	0x <sup>(1)</sup>

<sup>(1)</sup> Value depends on the command read from the LCD panel.

### 10.5.5.1.2 Operational Modes Configuration

#### 10.5.5.1.2.1 RFBI Start Transfer

##### 10.5.5.1.2.1.1 Main Sequence: RFBI Start Transfer With Polling Method

Table 10-652 describes the RFBI start transfer polling method.

**Table 10-652. RFBI Start Transfer With Polling Method**

Step	Register/Bit Field Programming Model	Value
Enable DISPC module output.	See Section 10.5.5.1.2.1.4, Subsequence: DISPC Output Enable.	
Enable RFBI module output.	See Section 10.5.5.1.2.1.5, Subsequence: RFBI Interrupts Enable.	
Detect event.	See Table 10-658.	

##### 10.5.5.1.2.1.2 Main Sequence: RFBI Start Transfer With Interrupts and DMA Method

Table 10-653 describes the RFBI start transfer interrupts method.

**Table 10-653. RFBI Start Transfer With Interrupts Method**

Step	Register/Bit Field Programming Model	Value
Enable DISPC interrupts.	See Table 10-654.	
Enable DISPC module output.	See Section 10.5.5.1.2.1.4, Subsequence: DISPC Output Enable.	
Enable RFBI module output.	See Section 10.5.5.1.2.1.5, RFBI Interrupts Enable.	
Detect Event.	See Table 10-658.	

##### 10.5.5.1.2.1.3 Subsequence: DISPC Interrupts Enable

This procedure enables the DISPC interrupts used in RFBI mode. See Table 10-654.

**Table 10-654. DISPC Interrupts Enable**

Step	Register/Bit Field Programming Model	Value
Clears all interrupts	DISPC_IRQSTATUS	0xFFFF
Enable the FRAMEDONEi IRQ.	DISPC_IRQENABLE FRAMEDONEi_EN	0x1
Enable the BUFFERUNDERFLOW IRQ.	DISPC_IRQENABLE BUFFERUNDERFLOW_EN	0x1
Enable the SYNCLOSTi IRQ.	DISPC_IRQENABLE SYNCLOSTi_EN	0x1

**NOTE:** The other interrupts requests (see [Section 10.5.4.5, Interrupt Requests](#)) can also be enabled, depending on the application.

**10.5.5.1.2.1.4 Subsequence: DISPC Output Enable**

This procedure enables the DISPC output. See [Table 10-655](#).

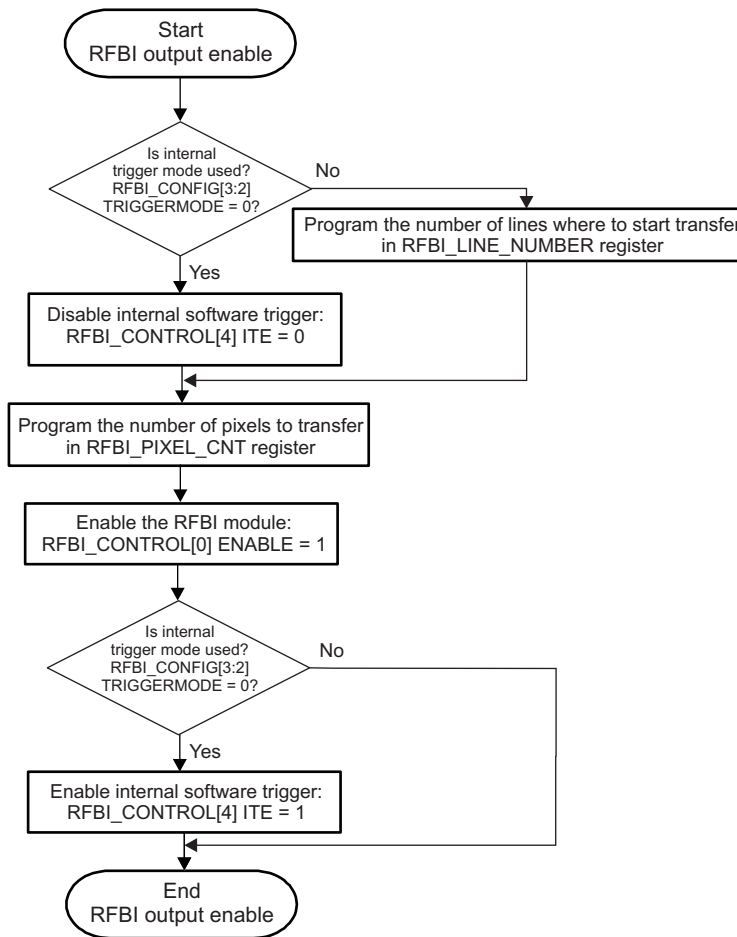

**Table 10-655. DISPC Output Enable**

Step	Register/Bit Field Programming Model	Value
Enable the video or GFX pipeline.	DISPC_VIDp_ATTRIBUTES[0] ENABLE	0x1
	DISPC_GFX_ATTRIBUTES[0] ENABLE	0x1
Enable the DISPC output.	DISPC_CONTROLo[0] LCDENABLE	0x1

**10.5.5.1.2.1.5 Subsequence: RFBI Output Enable**

This procedure enables the RFBI output. [Figure 10-177](#) details the settings for this subsequence.

**Figure 10-177. RFBI Output Enable Flow Chart**

rfbi-022

[Table 10-656](#) describes RFBI output enable.

**Table 10-656. Register Call Summary for Subsequence: RFBI Output Enable**

Register Name		
RFBI_CONFIG	RFBI_CONTROL	RFBI_LINE_NUMBER
RFBI_PIXEL_CNT		

Table 10-657 describes the RFBI behavior depending on the RFBI output enable.

**Table 10-657. RFBI Behavior**

RFBI_CONTROL[0] ENABLE Bit Value	RFBI Behavior
0	Slave port interconnect can write command/parameter/data and read data/status from the RFB. Slave port interconnect access can only be done to the active CS0.
1	The DISPC sends pixels to the RFB.

**NOTE:** The LCD output is disabled at the end of the transfer of the frame. The software must reenble the LCD output to generate a new frame by setting the DISPC\_CONTROLo[0] LCDENABLE bit to 1.

**CAUTION**

The following registers must not be modified when the module is enabled (the RFBI\_CONTROL[0] ENABLE bit set to 1):

- RFBI\_CONTROL
- RFBI\_PIXEL\_CNT
- RFBI\_LINE\_NUMBER
- RFBI\_STATUS
- RFBI\_CONFIG
- RFBI\_ONOFF\_TIME
- RFBI\_CYCLE\_TIME
- RFBI\_DATA\_CYCLE<sub>i</sub> (i = 1 to 3)
- RFBI\_VSYNC\_WIDTH
- RFBI\_HSYNC\_WIDTH

**NOTE:** The RFBI\_STALL STALL signal is asserted when the RFBI is disabled. Through the slave port, pixels can be sent to the LCD panel only when the pixel count has reached 0x0.

**10.5.5.1.2.1.6 Subsequence: Detect Event**

Table 10-658 describes the detect event.

**Table 10-658. Detect Event**

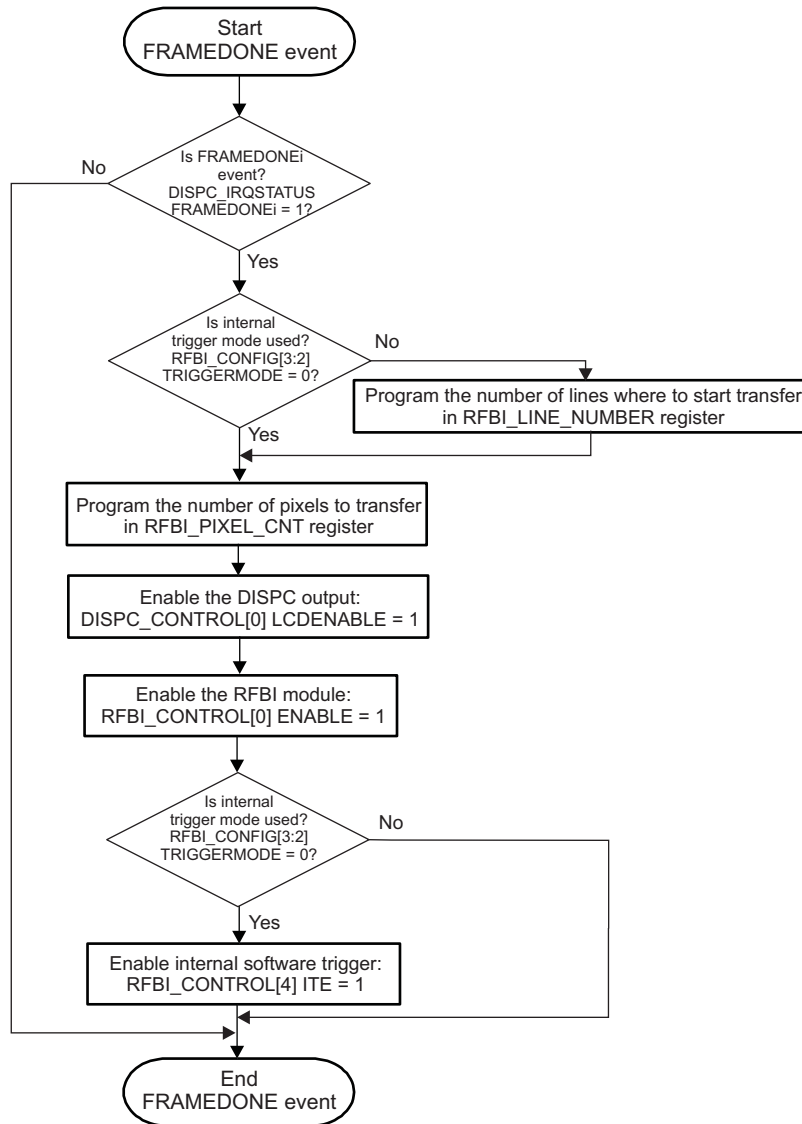

Step	Register/Bit Field Programming Model	Value
Wait until DISPC_IRQSTATUS != 0.	DISPC_IRQSTATUS	
Service event.	See Section 10.5.5.1.3, RFBI Events Servicing.	

10.5.5.1.3 RFBI Events Servicing

10.5.5.1.3.1 FRAMEDONE Interrupt Servicing

The FRAMEDONE event occurs each time a frame has been transferred to the LCD panel. [Figure 10-178](#) details how to serve this event.

Figure 10-178. FRAMEDONE Event Servicing Flow Chart

rfbi-023

Table 10-659 describes FRAMEDONE interrupt servicing.

Table 10-659. Register Call Summary for RFBI Events Servicing: FRAMEDONE Interrupt Servicing

Register Name		
DISPC_IRQSTATUS	RFBI_CONFIG	RFBI_LINE_NUMBER
RFBI_PIXEL_CNT	DISPC_CONTROL	RFBI_CONTROL

## 10.5.6 RFBI Hardware Status Features

Table 10-660 lists the RFBI hardware status features.

**Table 10-660. RFBI Hardware Status Features**

Feature	Type	Register/Bit Field/Observability Control	Description
Data pending	Status	RFBI_SYSTATUS[9] BUSYRFBIDATA	It is set to 1 when some data are pending to be processed from interconnect FIFO.
Slave port bus busy	Status	RFBI_SYSTATUS[9] BUSY	It is set to 1 when the slave port bus is busy and access of some RFBI registers ( <a href="#">RFBI_CMD</a> , <a href="#">RFBI_STATUS</a> , <a href="#">RFBI_PARAM</a> , and <a href="#">RFBI_READ</a> ) is stalled.

## 10.5.7 RFBI Register Manual

### CAUTION

The main access to all RFBI registers is through the L3 interconnect.  
The access through L4\_PER interconnect is provided for back software compatibility.

### 10.5.7.1 RFBI Instance Summary

**Table 10-661. RFBI Instance Summary**

Module Name	L3 Base Address	L4_PER Base Address	Size
RFBI	0x5800 2000	0x4804 2000	4KB

### 10.5.7.2 RFBI Registers

#### 10.5.7.2.1 RFBI Register Summary

### 10.5.7.2.2 RFBI Register Description

**Table 10-663. RFBI\_REVISION**

<b>Address Offset</b>	0x0000 0000		
<b>Physical Address</b>	See <a href="#">Table 10-662</a> .	<b>Instance</b>	RFBI
<b>Description</b>	This register contains the IP revision.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REVISION																															

Bits	Field Name	Description	Type	Reset
31:0	REVISION	IP revision	R	See <sup>(1)</sup>

<sup>(1)</sup> Ti internal data

**Table 10-664. Register Call Summary for Register RFBI\_REVISION**

Remote Frame Buffer Interface

- [RFBI Register Summary: \[0\]](#)

**Table 10-665. RFBI\_SYSCONFIG**

<b>Address Offset</b>	0x0000 0010		
<b>Physical Address</b>	See <a href="#">Table 10-662</a> .	<b>Instance</b>	RFBI
<b>Description</b>	This register controls various parameters of the slave port interface.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																								RESERVED	RESERVED	SIDLEMODE	RESERVED	SOFTRESET	AUTOIDLE		

Bits	Field Name	Description	Type	Reset
31:7	RESERVED	Write 0's for future compatibility. Reads returns 0.	RO	0x00000000
6	RESERVED	Write 0's for future compatibility. Reads returns 0.	RO	0
5	RESERVED	Write 0's for future compatibility. Reads returns 0.	RO	0
4:3	SIDLEMODE	Slave interface power management, Idle req/ack control. 0x0: Force-idle. An idle request is acknowledged unconditionally. 0x1: No-idle. An idle request is never acknowledged 0x2: Smart-idle. Acknowledgement to an idle request is given based on the internal activity of the module.	RW	0x0
2	RESERVED	Write 0's for future compatibility. Reads returns 0.	RO	0
1	SOFTRESET	Software reset Sets this bit to 1 to trigger a module reset. The bit is automatically reset by the hardware. During reads, it always returns 0. 0x0: Normal mode 0x1: The module is reset	RW	0

Bits	Field Name	Description	Type	Reset
0	AUTOIDLE	Internal clock gating strategy (RFBI_ICLK clock and DISPC clock) 0x0: RFBI_ICLK clock and DISPC clock are free-running 0x1: Automatic clock gating strategy is applied for the RFBI_ICLK clock and DISPC clock, based on the slave port interface and internal activity.	RW	1

<b>Address Offset</b>	0x0000 0040	<b>Instance</b>	RFBI
<b>Physical Address</b>	See <a href="#">Table 10-662</a> .		
<b>Description</b>	The register configures the RFBI module.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																SMART_DMA_REQ	DISABLE_DMA_REQ	HIGHTHRESHOLD	ITE	CONFIGSELECT	RFBIMODE	ENABLE									

Bits	Field Name	Description	Type	Reset
31:9	RESERVED	Write 0's for future compatibility. Reads return 0.	RO	0x000000
8	SMART_DMA_REQ	Smart DMA request  0x0: The dmareq is asserted and deasserted depending on FIFO space even if Mldlreq is high in smart-idle/no-idle mode and the entire burst gets error responses from the module.  0x1: The dmareq is deasserted after 2 clock cycles if it has been asserted for more than or equal to 2 clock cycles and Mldlreq is high in smart-idle or no-idle mode. No more burst requests will be given even if the space is available in the FIFO.	RW	0
7	DISABLE_DMA_REQ	Disable DMA request  0x0: The dmareq is enabled and the signal is generated based on the space available and the request coming into the data register.  0x1: The dmareq is disabled and the signal is not generated at all based on space in FIFO. It stays high until the DISABLE DM AREQ is high even if there is space in FIFO to take requests.	RW	0
6:5	HIGHTHRESHOLD	Defines the FIFO high threshold used by hardware to assert DMA request. Used only if data written to <a href="#">RFBI_DATA</a> are sent using system DMA.  0x0: Size of the transfer of 4 words of 32-bit wide 0x1: Size of the transfer of 8 words of 32-bit wide 0x2: Size of the transfer of 16 words of 32-bit wide	RW	0x0
4	ITE	Internal Trigger  0x0: Hardware waits for ITE bit to be set if in internal trigger mode for the configuration in use.  0x1: User sets the ITE bit to start the transfer, when hardware takes into account the bit, the hardware resets it.	RW	0

Bits	Field Name	Description	Type	Reset
3:2	CONFIGSELECT	Select the CS and configuration 0x0: No CS selected 0x1: CS0 selected 0x2: Reserved 0x3: Reserved	RW	0x0
1	RFBIMODE	RFBI Mode 0x0: The RFBI mode is selected. 0x1: The RFBI mode is not selected.	RW	1
0	ENABLE	Enable/Disable flag 0x0: Disable the RFBI module. 0x1: Enable the RFBI module.	RW	0

## 10.6 Video Encoder

This section describes the video encoder for the device.

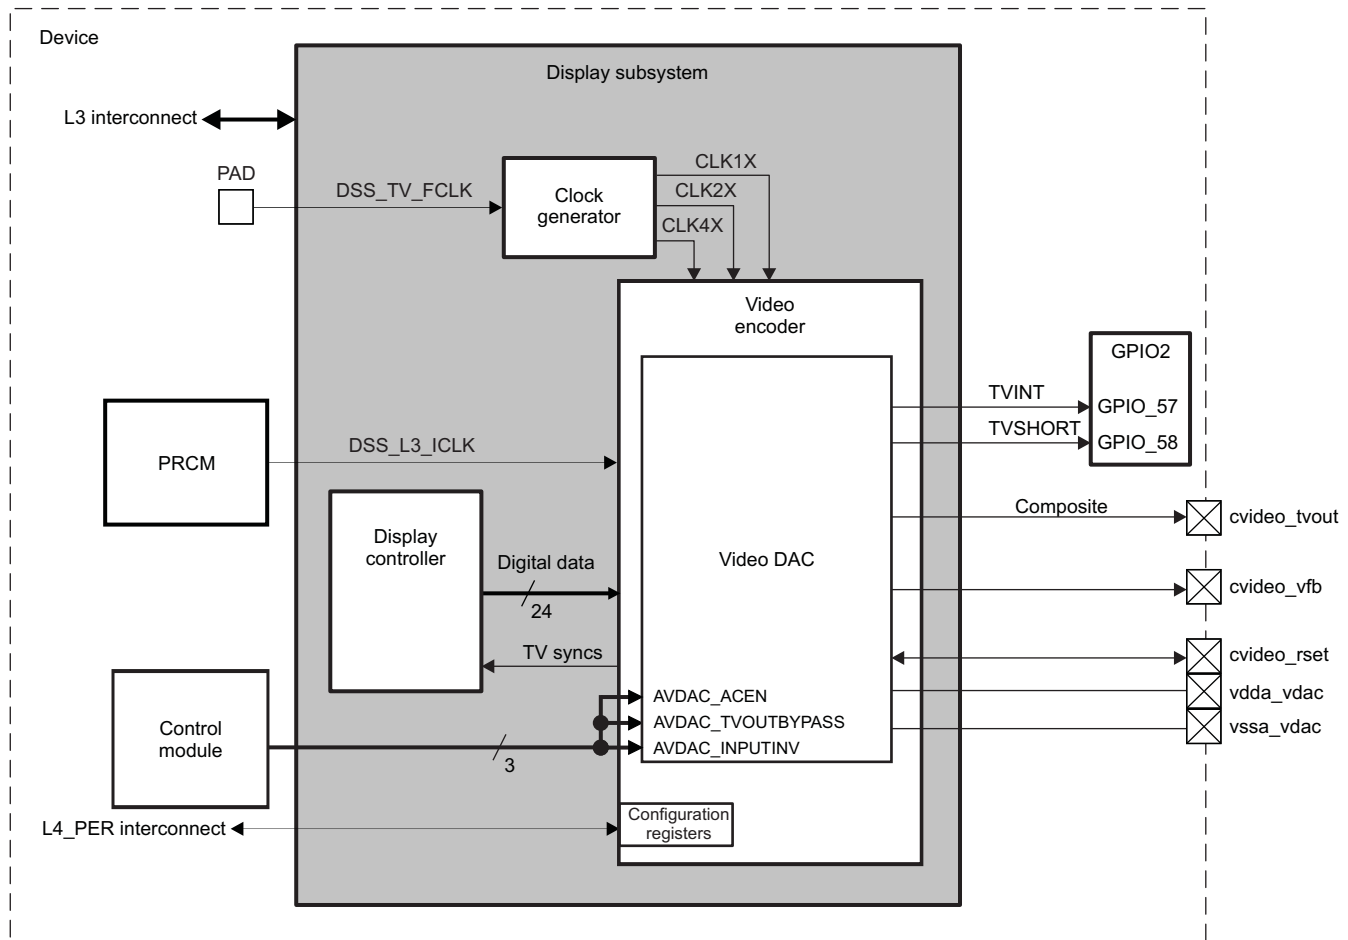

**NOTE:** The VDAC function is not supported.

### 10.6.1 Video Encoder Overview

The display subsystem provides the logic to display a video frame from the memory frame buffer (either SDRAM or SRAM) on a TV set.

Figure 10-179 shows a block diagram of the display subsystem.

Figure 10-179. Video Encoder Overview

Venc-001

The video encoder includes the following features:

- Supports the following standards for composite video (CVBS) :
  - NTSC-J, M
  - PAL-B, D, G, H, I
  - PAL-M
- Input data interface compatible with the following protocols:
  - 24-bit input bus compatible with external sync
  - RGB 4:4:4
- 10-bit interface for internal digital-to-analog converter (DAC) that supports:

- 1.1V digital power supply, 1.8V analog power supply
- 10-bit resolution
- DNL within 1 LSB and INL within 1 LSB
- Sample rate of up to 60 megasamples per second (MSPS)
- Supports composite video standard output
- Supports TVOUT buffer bypass mode (DAC only mode)
- Full-scale voltage output: 1.2 V<sub>pp</sub> with a 75-Ω load
- Internal TV detect feature
- Signal-to-noise ratio (SNR) is 54 dB (taking into account the ac coupling)
- Suitable for low-power wireless applications
- Power-down mode with less than 12-μA standby current
- Differential gain error and differential phase error: within 3% and 1°, respectively
- TV output data supports ITU-R BT 470-7 recommendation standard for consumer market
- Master clock input 13.5 MHz, 27 MHz (supports ITU-R 601 sampling for NTSC/PAL), and 54 MHz
- Programmable horizontal sync, vertical timing, and waveforms
- Programmable subcarrier frequency and SCH
- Internal test pattern generation (color bar, flat field, color burst)
- 2x/4x oversampling
- TV detection gating pulse generation
- Supports square pixel sampling (NTSC: 12.27 MHz, 24.54 MHz, 49.09 MHz PAL: 14.75 MHz, 29.5 MHz, 59 MHz)

**CAUTION**

In square pixel mode, an external clock generator is required to provide sampling frequencies.

### 10.6.2 Video Encoder Environment

To display on a TV, the path used is as follow:

- Display controller
- Video encoder
- 10-bit DAC with video amplifiers

**NOTE:** The VDAC function is not supported.

The display controller module receives synchronization signals from the video encoder and synchronously sends pixel data to the video encoder with these signals. The digital output of the display controller is always a 24-bit RGB value based on a pixel request from the video encoder. For more information on the display controller settings and features, see [Section 10.2, Display Controller](#).

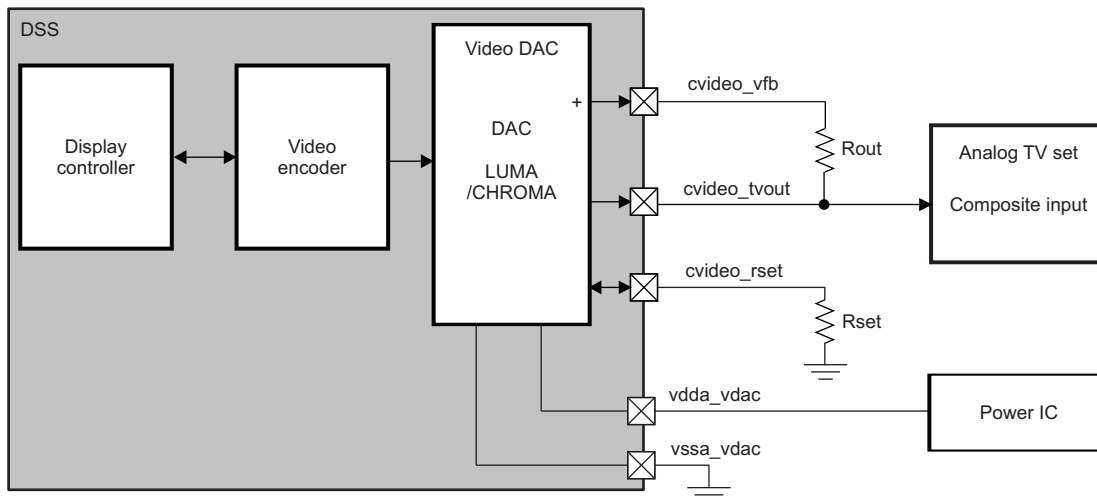

The video encoder converts RGB video signals to conform to the NTSC/PAL standard analog video. The video encoder includes an integrated synchronization signal generator and a video digital-to-analog converter (DAC) with video amplifiers, data manager, luma stage, chroma stage, modulator, and a control interface.

The video encoder also provides the synchronization signals to the display controller: VSYNC, active VIDEO (AVID), and field ID (FID).

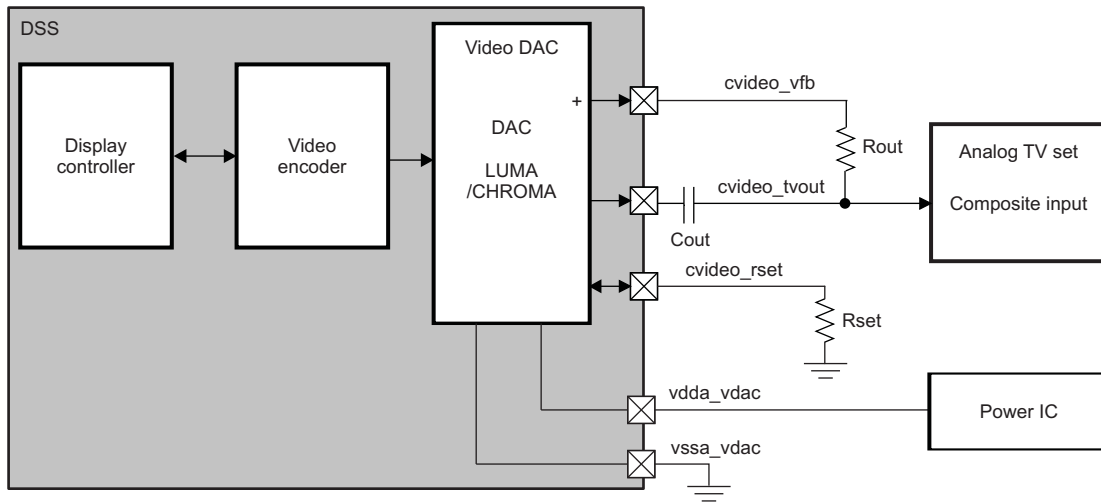

**NOTE:** To enhance the TV color display, it is highly recommended to set the DSS\_CONTROL[4] DAC\_DEMEN bit.

Figure 10-180 through Figure 10-182 show the TV display interface in composite mode.

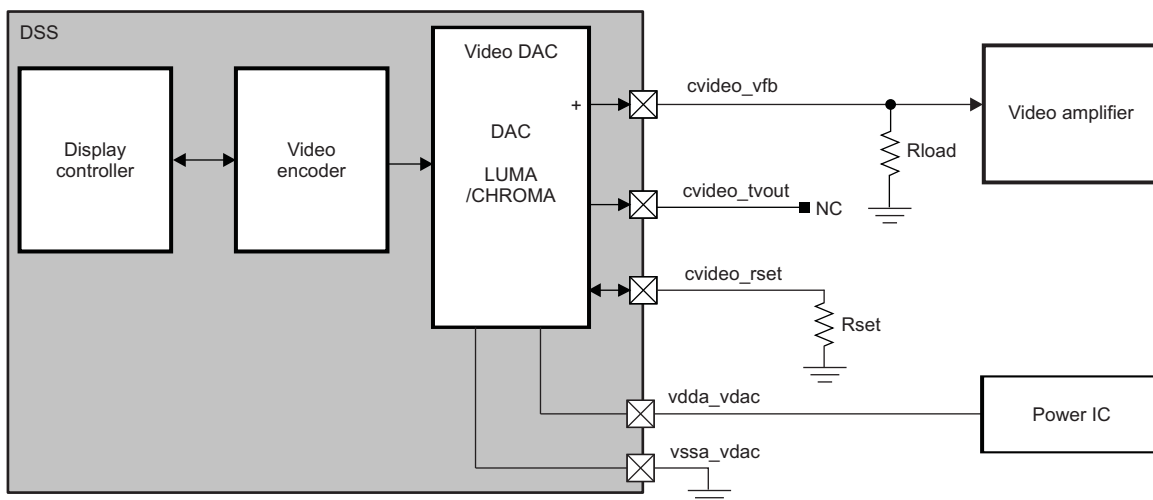

**Figure 10-180. Video Encoder Environment, Normal Mode DC-Coupling**

Venc-003

**Figure 10-181. Video Encoder Environment, Normal Mode AC-Coupling**

venc-015

**Figure 10-182. Video Encoder Environment, Bypass Mode**

venc-016

Table 10-697 describes the interface signals to/from the TV set for TV display support.

**Table 10-697. TV Display Interface Pins**

Pin Name	Type <sup>(1)</sup>	Description
cvideo_tvout	O	Analog luma or composite video output. An external resistor ( $R_{out}$ ) is connected between this node and the <i>cvideo_vfb</i> pin. The nominal value of $R_{out}$ is 2700 $\Omega$ . This is the output node that drives the load (75 $\Omega$ ). In AC-coupling mode, a series capacitor ( $C_{out}$ ) must be connected. The nominal value for $C_{out}$ is $\geq 200 \mu\text{F}$ .
cvideo_vfb	O	In Normal mode (video DAC+Buffer), it acts as the buffer feedback node. An external resistor ( $R_{out}$ ) shall be connected between this node and <i>cvideo_tvout</i> pin. In TVOUT Bypass mode, it acts as the video DAC output. A load resistor ( $R_{load}$ ) shall be connected to the pin to ground. The nominal value of $R_{load}$ is 1500 $\Omega$ .

<sup>(1)</sup> I = input; O = output; power = power pin

**Table 10-697. TV Display Interface Pins (continued)**
