Lecture 64: The BAN Logic

Dr. Bill Young  
 Department of Computer Sciences  
 University of Texas at Austin

The BAN (Burrows, Abadi, and Needham) logic is a modal logic of belief. It has several modal operators including:

$P \models X$ : (*P believes X*) P is entitled to act as though X is true.

$A \triangleleft X$ : (*A sees X*) someone has sent a message to A containing X so that he can read X and repeat it.

$A | \sim K$ : (*A once said K*) at some time, A used key K.

$A | \sim X$ : (*A once said X*) at some time, A uttered a message containing X.

$A \implies X$ : (*A has jurisdiction over X*) A is an authority on X and can be trusted on X.

$A \xleftrightarrow{K} B$ : (*A and B share key K*) A and B can use key K to communicate. The key is unknown to anyone else.

BAN Operators Continued

$\#(X)$ : (*X is fresh*) meaning that X has not been sent before in any run of the protocol.

$\xrightarrow{K} B$ : (*B has\_public\_key K*) B has a published public key K and corresponding private key  $K^{-1}$ .

$A \xleftrightarrow{X} B$ : (*A and B share secret X*) X is a secret known only to A, B and possibly some trusted associates.

Belief Logics: Rules

There are numerous rules of inference for manipulating the protocol to generate a set of beliefs. For example,

**Message meaning: If A believes (A share(K) B) and A sees  $\{X\}_K$  then A believes(B said X).**

$$\frac{A \models (A \xleftrightarrow{K} B), A \triangleleft \{X\}_K}{A \models (B | \sim X)}$$

**Nonce verification:** If A believes X is fresh and A believes B once said X, then A believes B believes X.

$$\frac{A|\equiv (\#(X)), A|\equiv (B|\sim X)}{A|\equiv (B|\equiv X)}$$

**Jurisdiction:** If A believes B has jurisdiction over X and A believes B believes X, then A believes X.

$$\frac{A|\equiv (B \implies X), A|\equiv (B|\equiv X)}{A|\equiv X}$$

To get from protocol steps to logical inferences, we have a process called *idealization*. This attempts to turn the message sent into its intended semantics. For example, given the protocol step:

$$A \rightarrow B : \{A, K_{ab}\}_{K_{bs}}$$

If B knows the key  $K_{bs}$ , this tells us that  $K_{ab}$  is a key to communicate with A. An idealized version is:

$$A \rightarrow B : \{A \xleftarrow{K_{ab}} B\}_{K_{bs}}$$

One purpose of idealization is to omit parts of the message that do not contribute to the beliefs of the recipients. *In BAN all plaintext is omitted since it can be forged.*

Idealization of the protocol is not defined unambiguously. It depends on the interpretation of the meaning of some steps.

## Lessons

- The BAN logic has been an important tool for reasoning about protocols.
- It is a modal logic of belief with 10 primitives and a number of inference rules.
