Question Answering

The Victoria and Albert Museum (often abbreviated as the V&A), London, is the world's largest museum of decorative arts and design, housing a permanent collection of over 4.5 million objects. It was founded in 1852 and named after Queen Victoria and Prince Albert. The V&A is located in the Brompton district of the Royal Borough of Kensington and Chelsea, in an area that has become known as "Albertopolis" because of its association with Prince Albert, the Albert Memorial and the major cultural institutions with which he was associated. These include the Natural History Museum, the Science Museum and the Royal Albert Hall. The museum is a non-departmental public body sponsored by the Department for Culture, Media and Sport. Like other national British museums, entrance to the museum has been free since 2001.

where is the Victoria and Albert Museum located?
Ground Truth Answers: The V&A is located in the Brompton district of the Royal Borough of Kensington and Chelsea London London in the Brompton district of the Royal Borough of Kensington and Chelsea

how many permanent objects are located there?
Ground Truth Answers: a permanent collection of over 4.5 million objects over 4.5 million objects over 4.5 million 4.5 million

when was the Victoria and Albert museum founded?
Ground Truth Answers: It was founded in 1852 1852 1852 1852

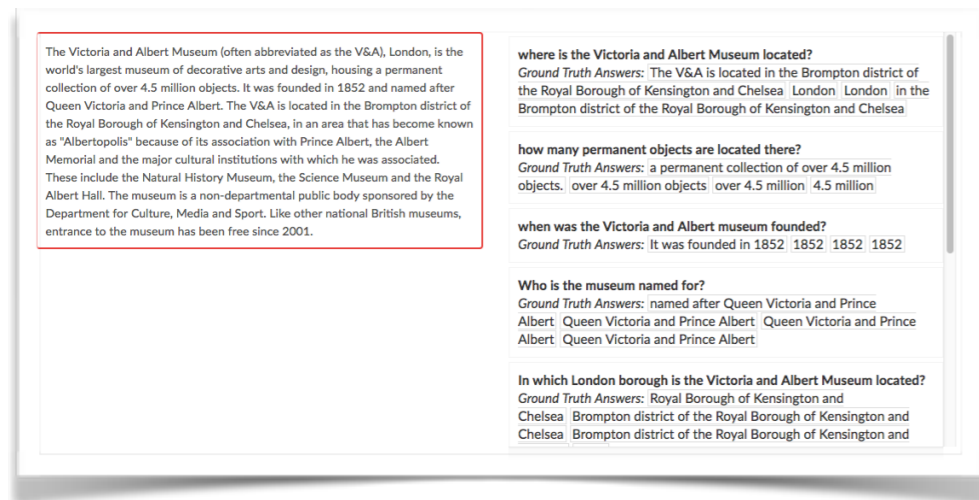

Who is the museum named for?
Ground Truth Answers: named after Queen Victoria and Prince Albert Queen Victoria and Prince Albert Queen Victoria and Prince Albert Queen Victoria and Prince Albert

In which London borough is the Victoria and Albert Museum located?
Ground Truth Answers: Royal Borough of Kensington and Chelsea Brompton district of the Royal Borough of Kensington and Chelsea Brompton district of the Royal Borough of Kensington and Chelsea

How long do effects of lorazepam last?

Question Answering

How long do effects of lorazepam last?

Lorazepam

From Wikipedia, the free encyclopedia

Not to be confused with Loprazolam.

Lorazepam, sold under the brand name **Ativan** among others, is a **benzodiazepine** medication often used to treat **anxiety disorders**.^[4] Lorazepam *reduces anxiety, interferes with new memory formation, reduces agitation, induces sleep, treats seizures, treats nausea and vomiting, and relaxes muscles*.^{[5][6]} Lorazepam is used for the short-term treatment of **anxiety, trouble sleeping, acute seizures including status epilepticus, sedation of people in hospital, as well as sedation of aggressive patients**.^{[6][7][8][9]} Due to tolerance and dependence, lorazepam is recommended for short-term use, up to two to four weeks only.

Among benzodiazepines, lorazepam has possible **physical addiction** potential.^[5] Lorazepam also has misuse potential; the main types of misuse are for recreational purposes.^[10] **Long-term effects of benzodiazepines** include **tolerance, dependence, benzodiazepine withdrawal syndrome, and cognitive impairments** which may not completely reverse after stopping treatment. Withdrawal symptoms can range from **anxiety and insomnia** to **seizures and psychosis**. Adverse effects, including inability to form new memories, **depression, and paradoxical effects**, such as excitement or worsening of seizures, may occur. Children and the elderly are more sensitive to the adverse effects of benzodiazepines.^{[5][11][12]} Lorazepam impairs body balance and standing steadiness and is associated with falls and hip fractures in the elderly.^[13]

Lorazepam was initially patented in 1963 and went on sale in the United States in 1977.^[14] It is on the **World Health Organization's List of Essential Medicines**, the most important medications needed in a basic health system.^[15]

receiving a continuous lorazepam infusion.^[88] Intravenous injections should be given slowly and patients closely monitored for side effects, such as respiratory depression, hypotension, or loss of airway control.

Peak effects roughly coincide with peak serum levels,^[79] which occur 10 minutes after intravenous injection, up to 60 minutes after intramuscular injection, and 90 to 120 minutes after oral administration,^{[73][79]} but initial effects will be noted before this. A clinically relevant lorazepam dose will normally **be effective for six to 12 hours**, making it unsuitable for regular once-daily administration, so it is usually prescribed as two to four daily doses when taken regularly, but this may be extended to five or six, especially in the case of elderly patients

Model

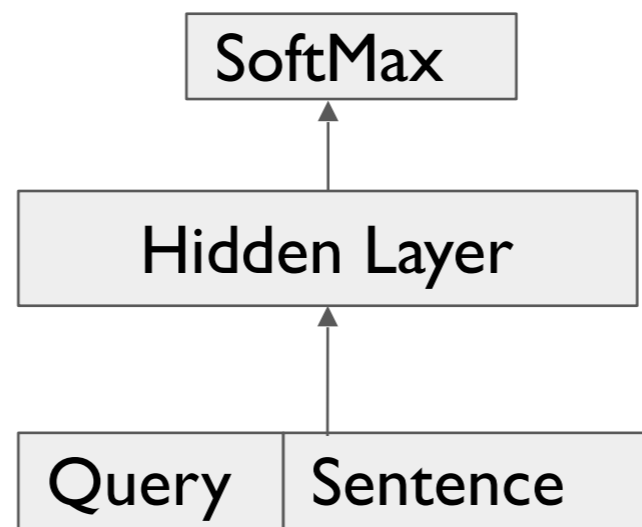

Model

Sentence Selection Model

- Take query and document as input
- Computes relevance score for each sentence ($P(s|x, d)$)
to generate sentence set to pass on to answer generation model.
- Coarse and fast sentence representation (BoW)

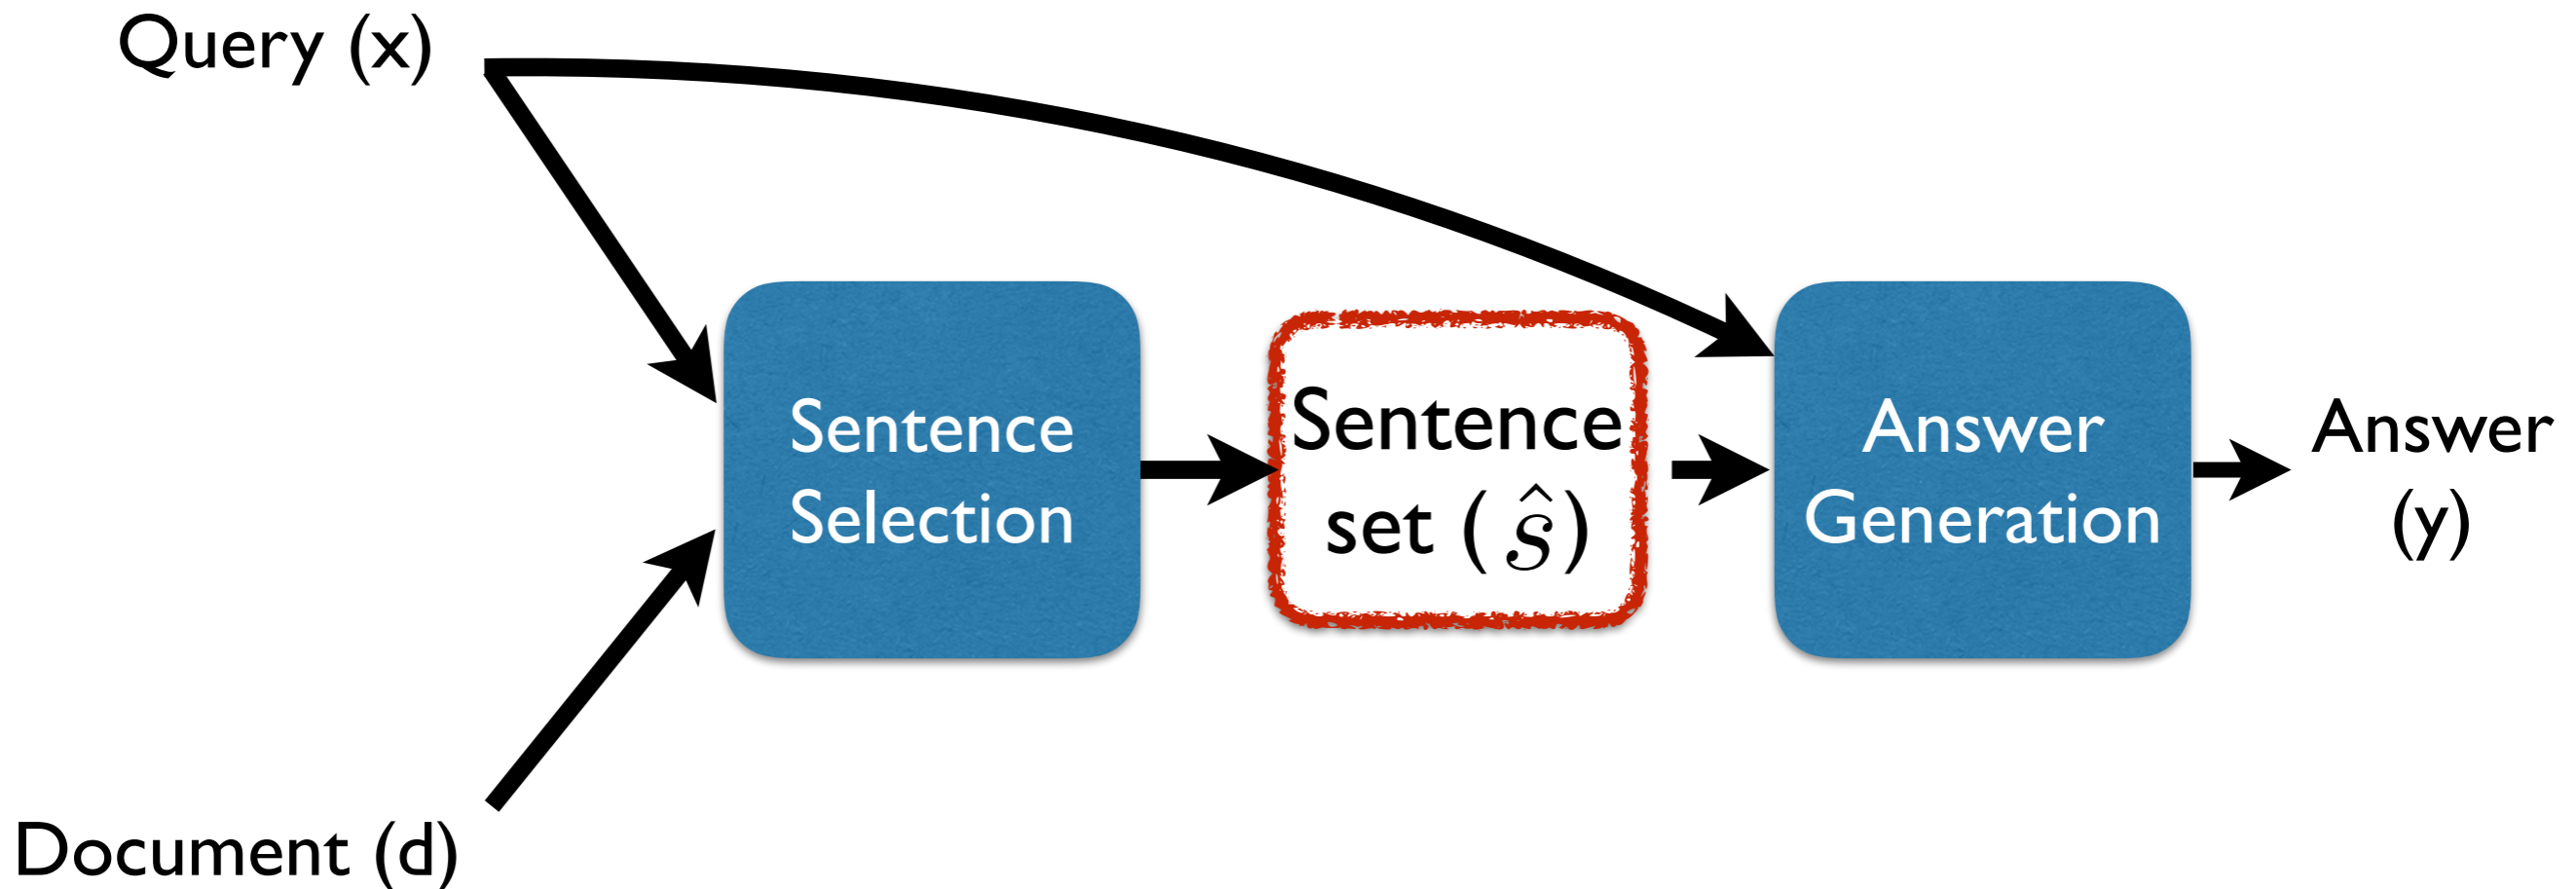

Answer Generation Model

(Hewlett et al, ACL16)

- Given a sentence set and a query, generate answer strings
- RNN encoder-decoder model with placeholders

Learning

We do not have supervision for which sentences contain the information.

Can we know which sentence contains answer?

- Good heuristics:
 - Sentence with an answer string is the sentence that you should pay close attention to.

False Negative!

False Positive!

Q:country	A:Turkey	S:Folkart Towers are twin skyscrapers in Turkish city of Izmir.
Q:Where did Alexandro Friedmann die?	A: St. Petersburg	S:Alexandro Friedmann was born in St. Petersburg .

Answer String Match Statistics

	Answer String Exists	Avg. # of Answer Match	Answer in First Sentence if answer exists
WikiReading	47.1%	1.22	75.1%
WikiReading Long	50.4%	2.18	31.3%
WikiSuggest	100.0%	13.95	33.6%

False Negative

False Positive

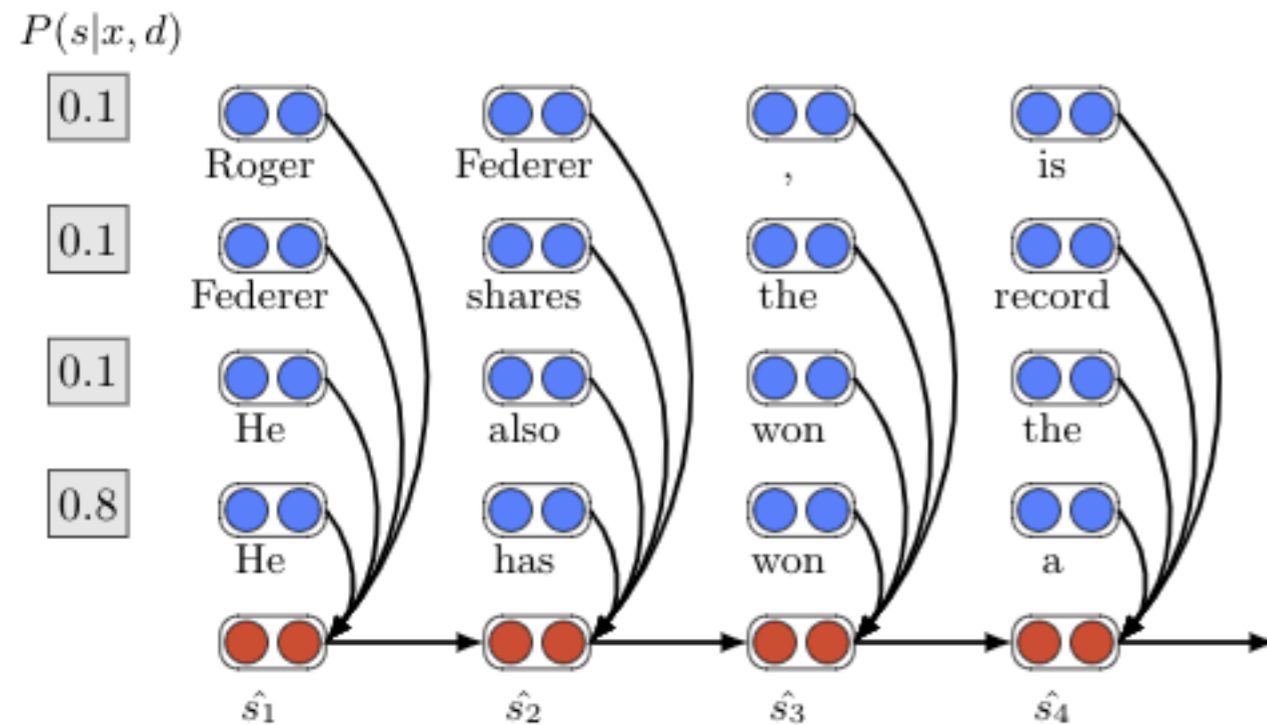

Pipeline (Distant Supervision)

- Separate objective for two models

$$\log p(s^* | x, d) + \log p(y^* | x, s^*)$$

- Gold sentence (s^*): First sentence with an answer string match or first sentence if answer string match does not exist.

Soft Attention

- Make a “blended” token representation by merging each sentence token weighted by its relevancy score $p(s|x)$.
- Allows end-to-end learning.

$$\log p(y^* | x, d) = \log p(y^* | x, \hat{s})$$

Hard Attention

(Reinforcement Learning)

- Action: Choosing a sentence
- Reward: Log probability of answer with chosen sentence

$$R(s) = \log P(y^* | s, x)$$

$$\begin{aligned} E[R] &= \sum_s P(s|x) \cdot R(s) \\ &= \sum_s P(s|x) \cdot \log P(y^* | s, x) \end{aligned}$$

- Can approximate the gradient with sampling (REINFORCE)

$$\nabla \log P(y^* | \tilde{s}, x) + \log P(y^* | \tilde{s}, x) \cdot \nabla \log P(\tilde{s} | x)$$

Hard Attention

(Reinforcement Learning)

- Can be flexible on the number of sentences to pass on to the answer generation model
- Curriculum learning (Ross et al, AISTAT11)
 - Trained with pipeline objective at the beginning

Evaluation

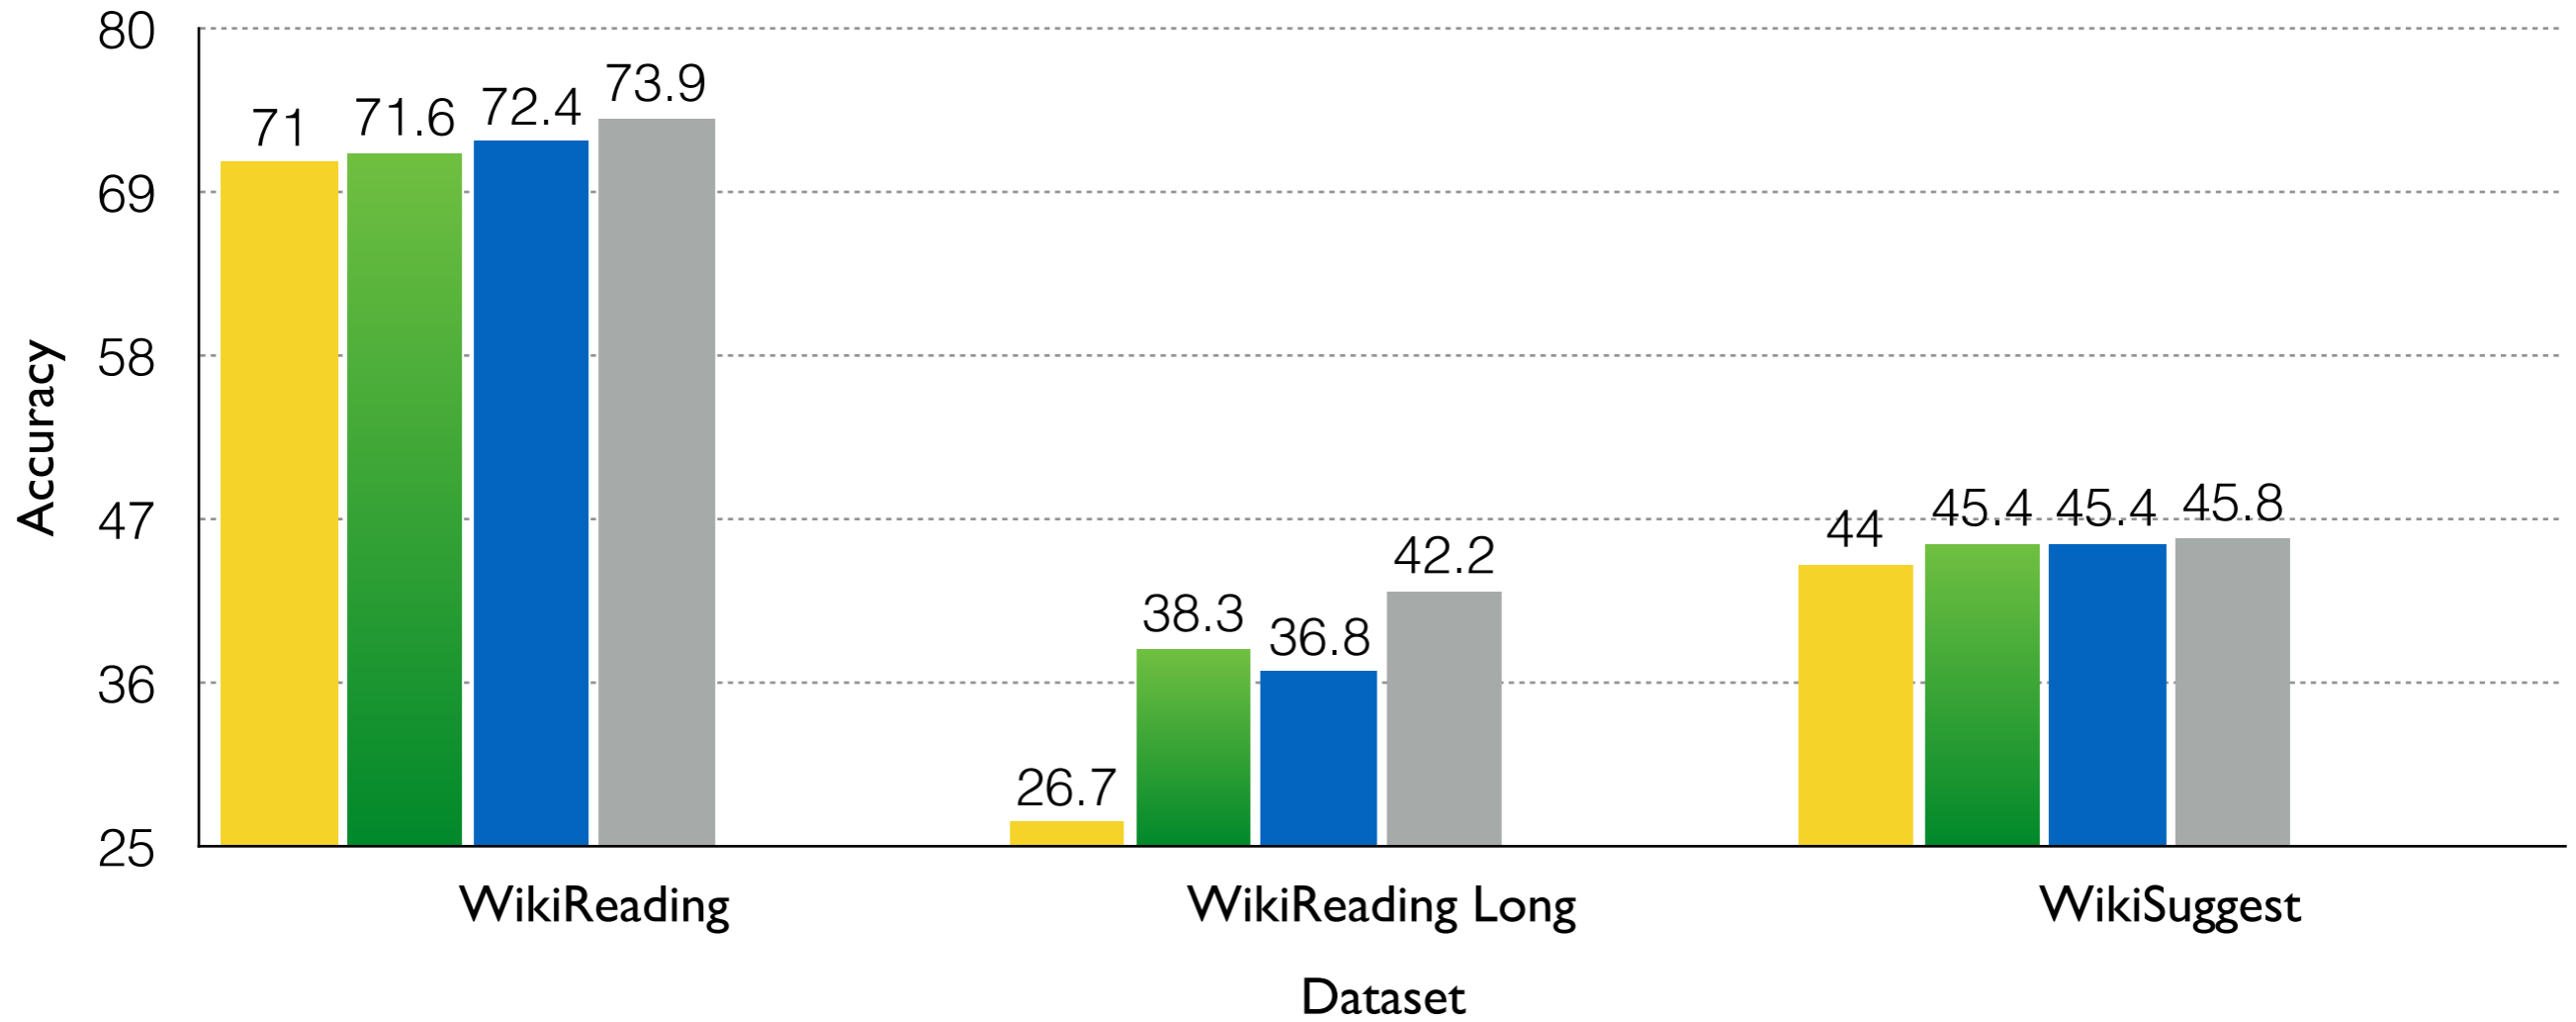

- Answer accuracy:
 - exact match accuracy
- Efficiency:
 - time to finish document encoding

Comparison Systems

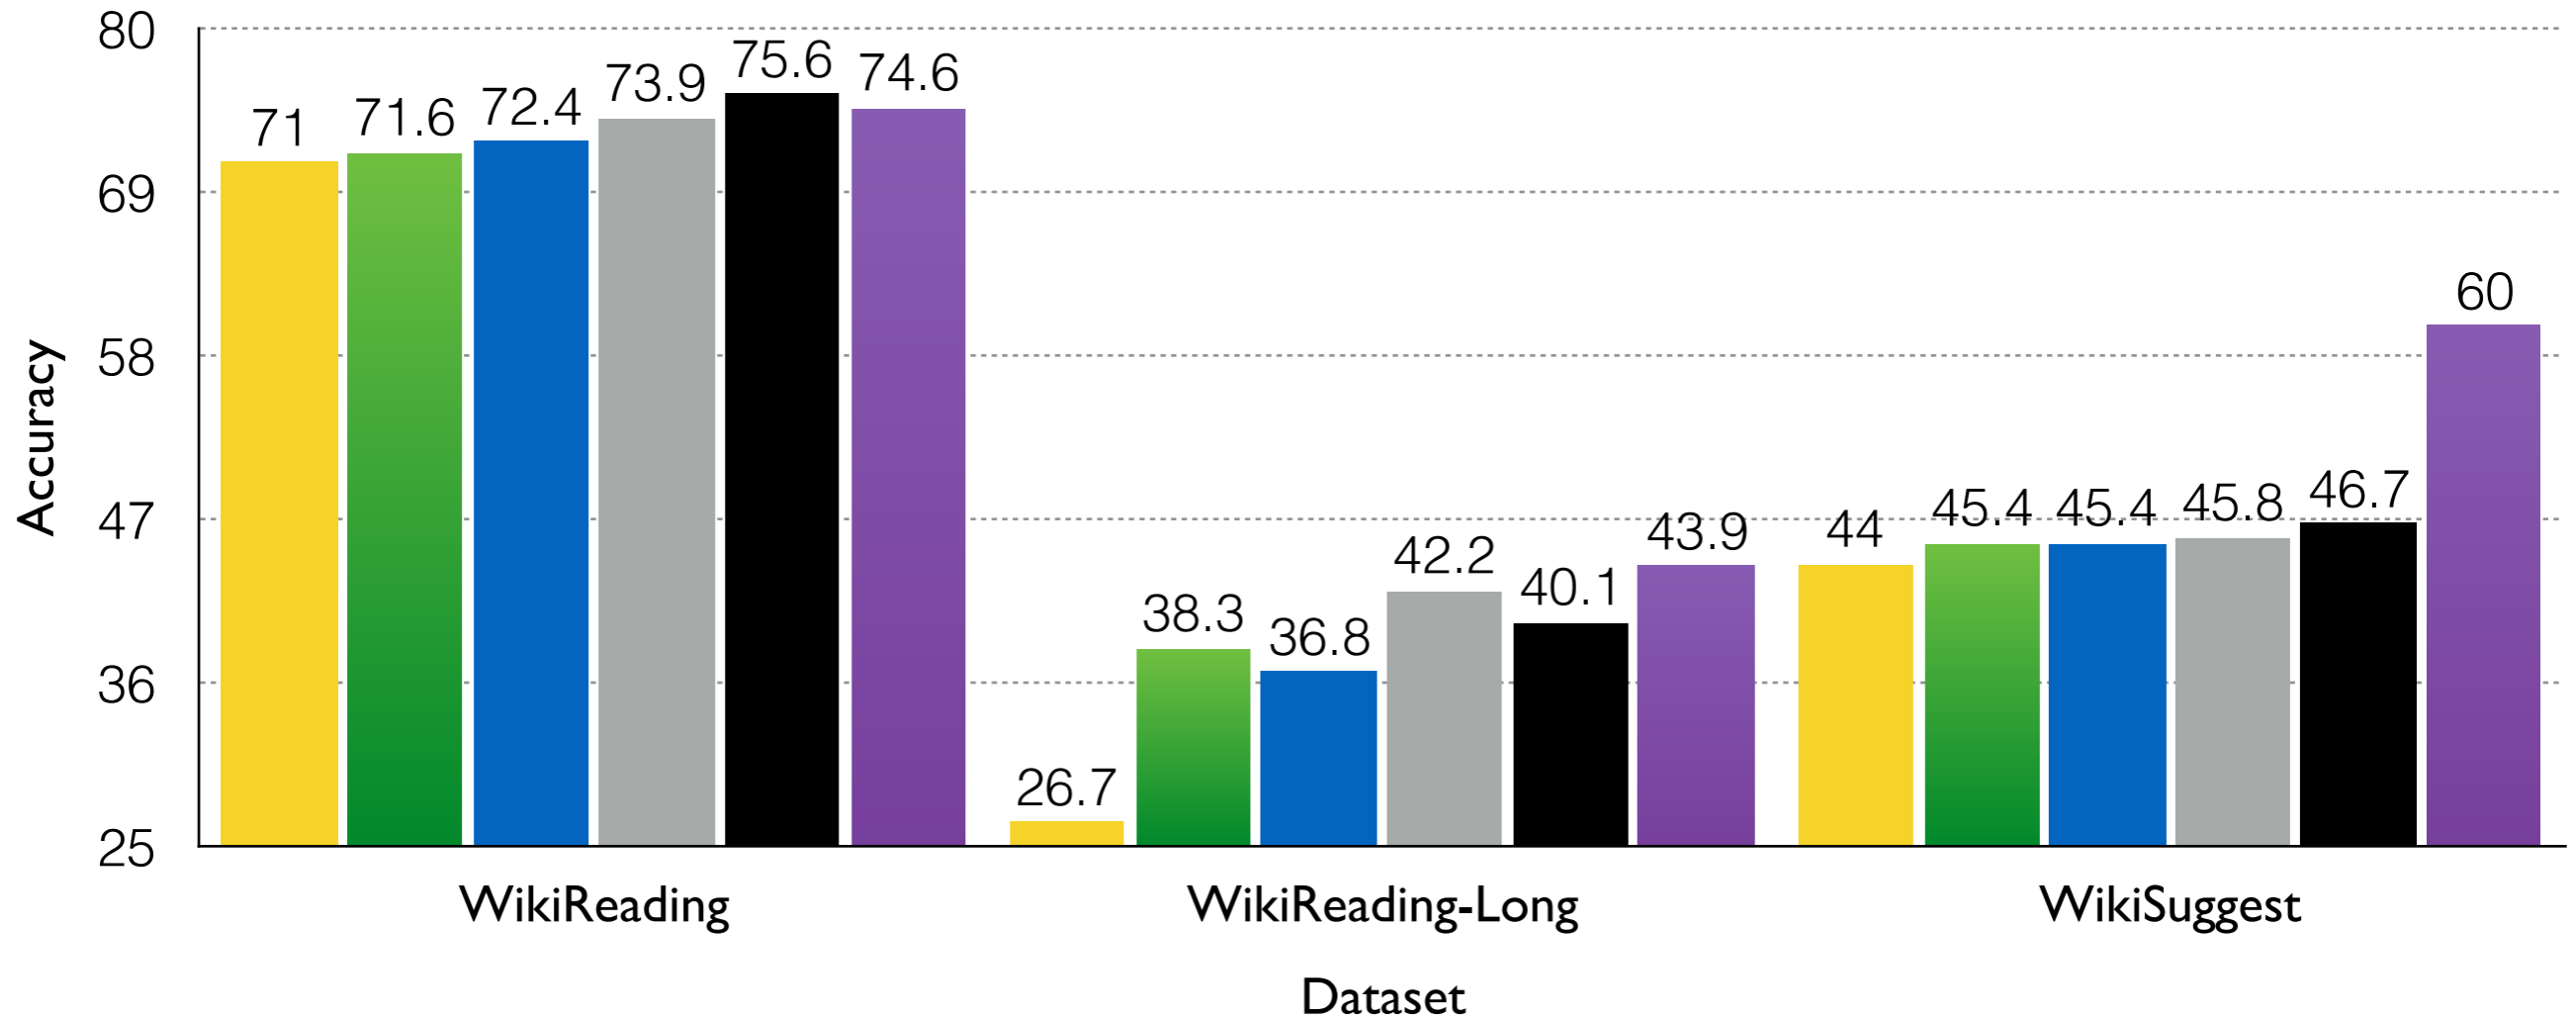

- First sentence baseline
- Answer generation baseline:
 - Input is the first 300 tokens.
- Heuristic oracle:
 - Input is the sentence with answer string or the first sentence when there is no answer match.

Accuracy Results

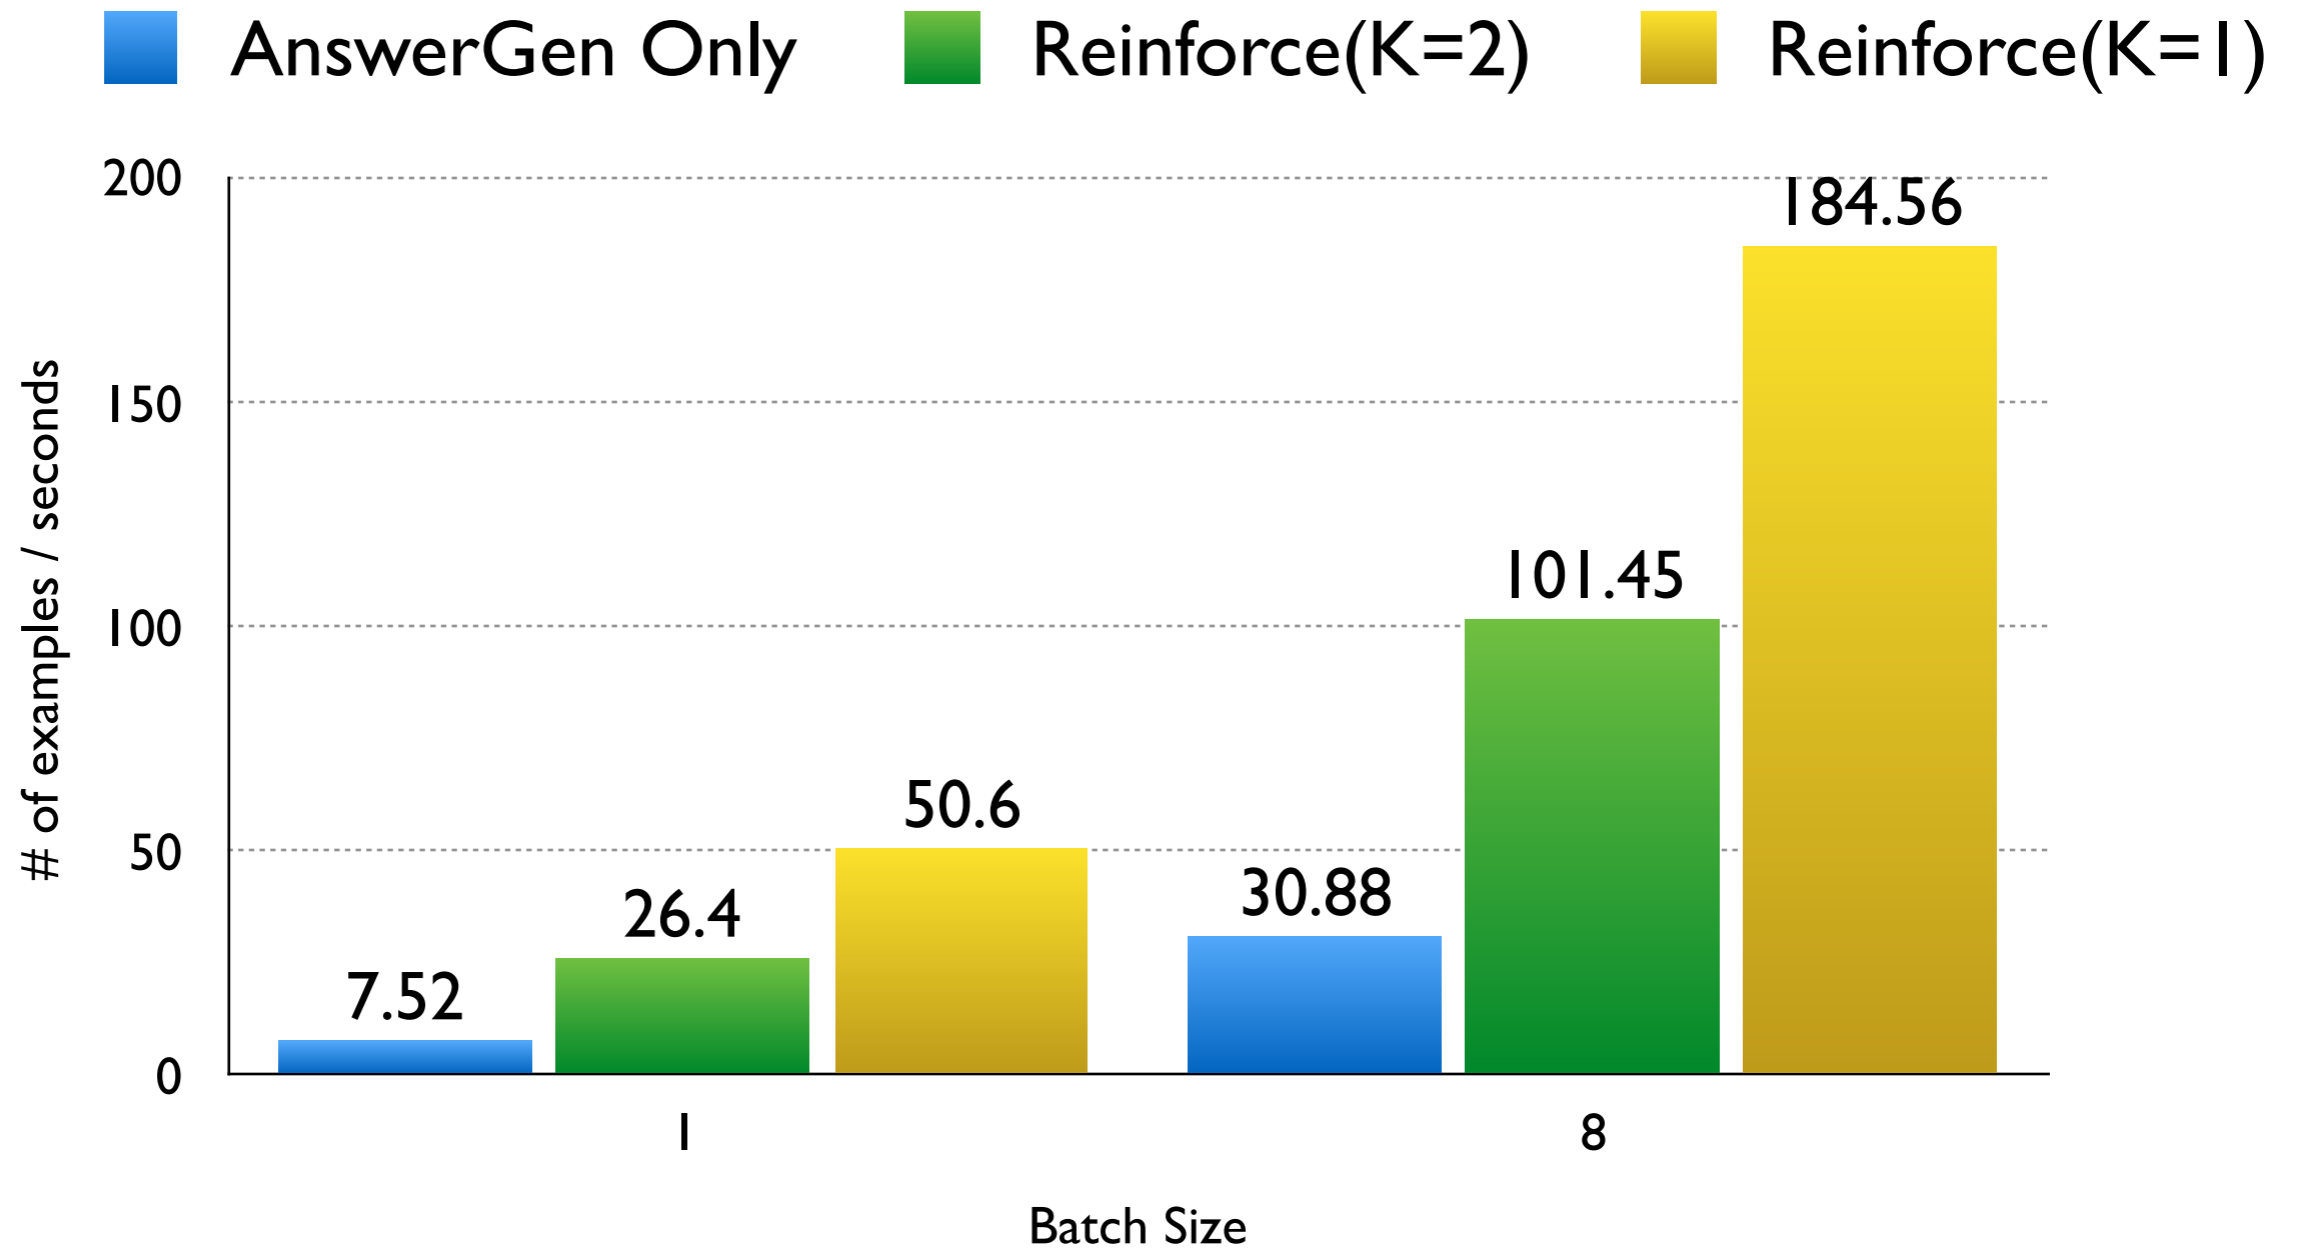

First SoftAttend Pipeline Reinforce

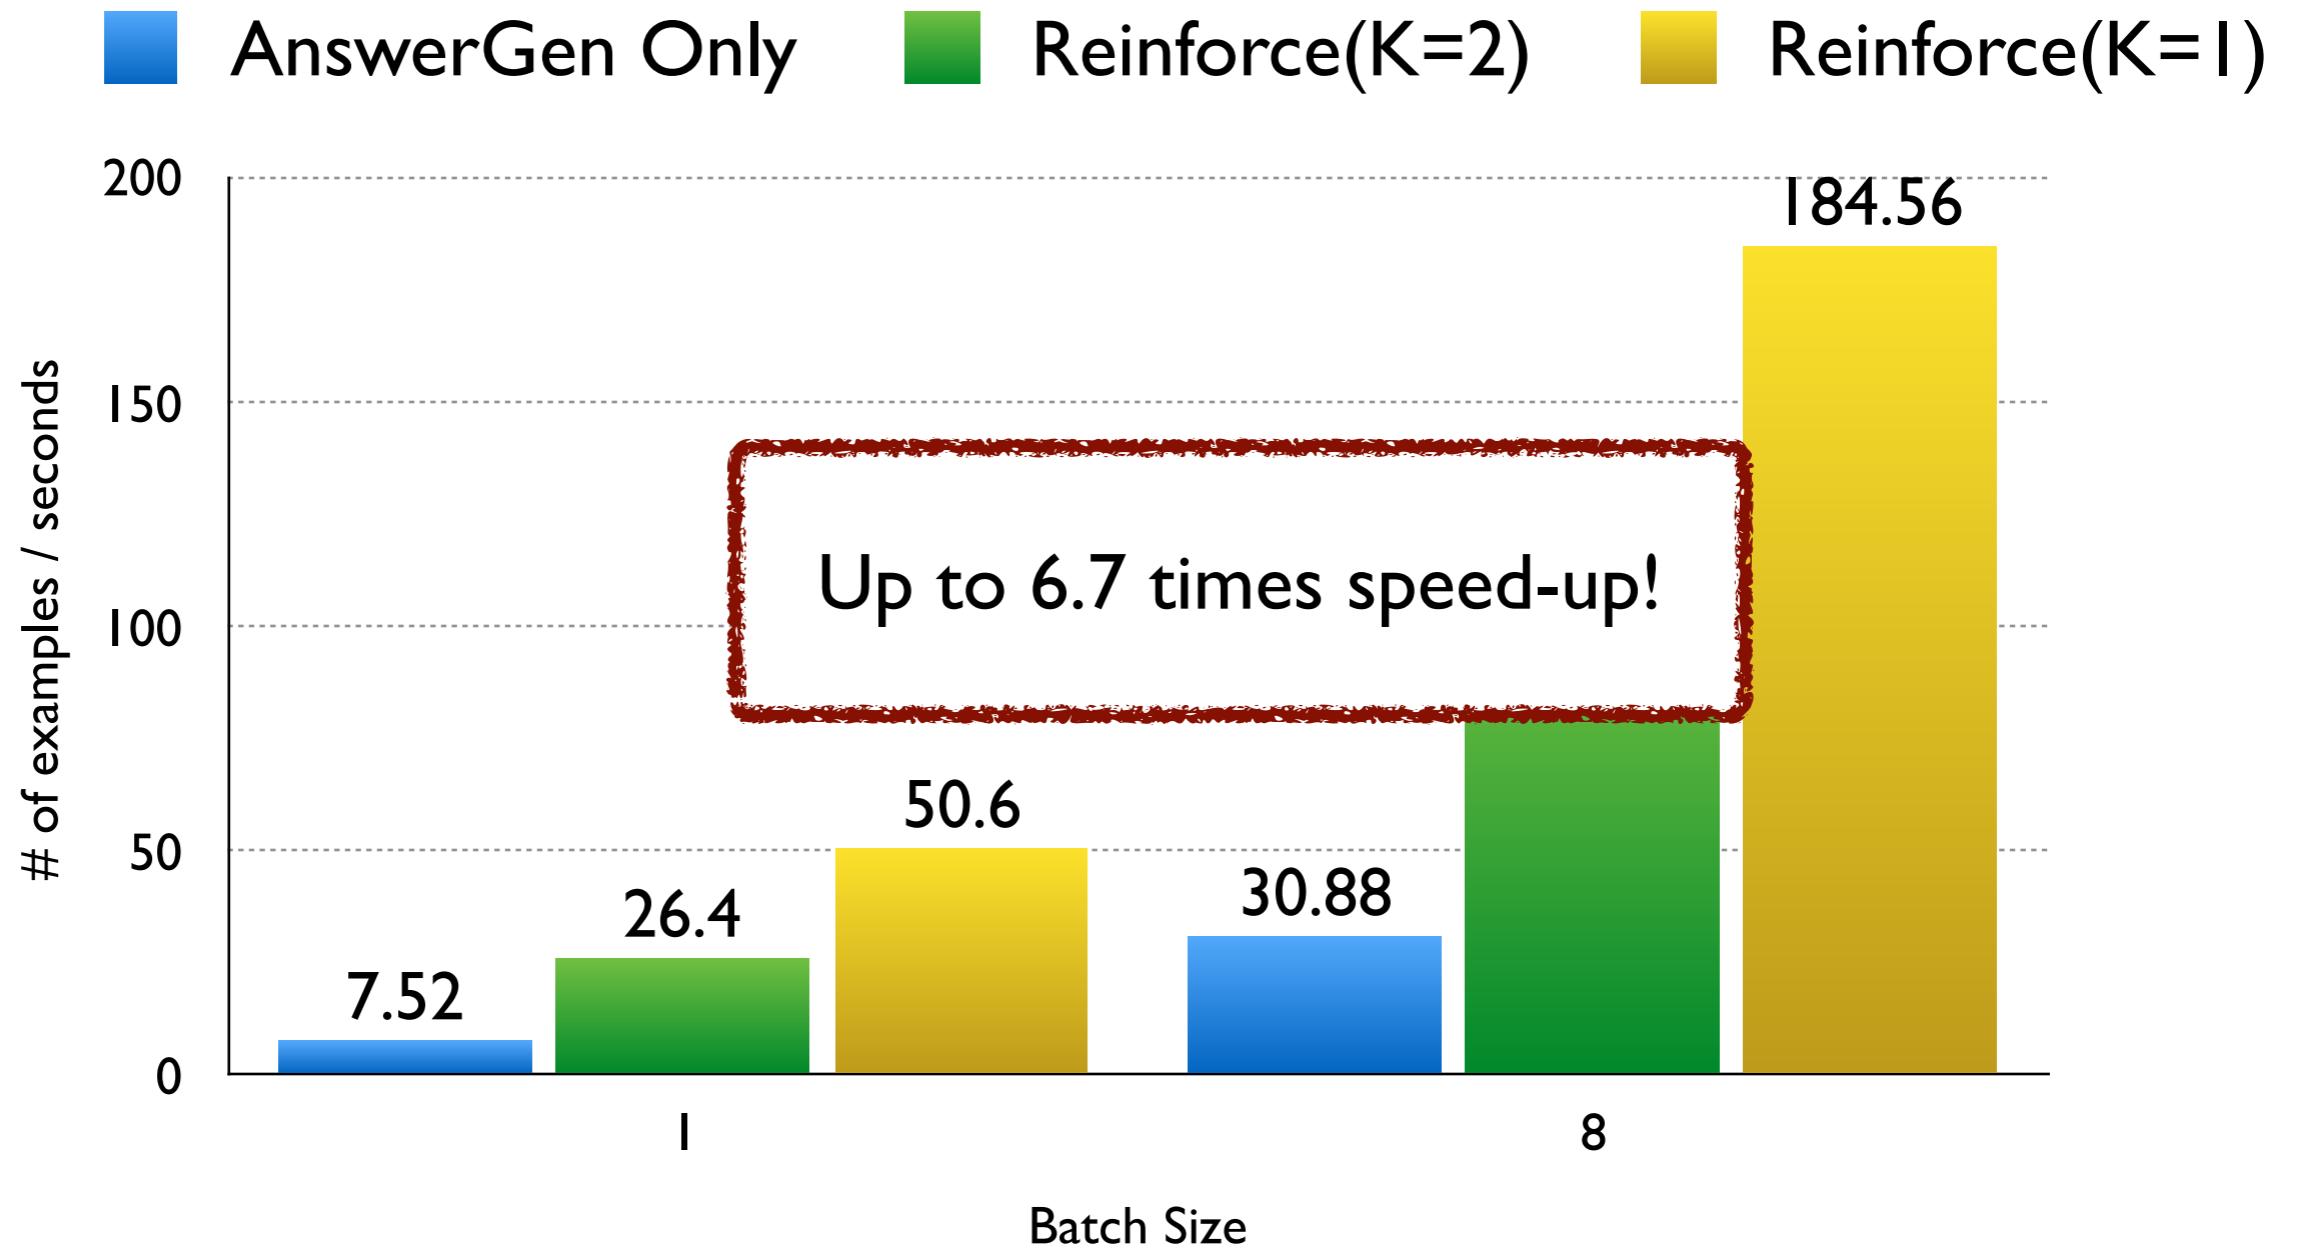

Accuracy Results

Speed Results

Speed Results

Error Analysis

	WikiReading-Long	WikiSuggest
No evidence in document	58%	16%
Error in answer generation	26%	30%
Error in sentence selection	16%	6%
Noisy QA pairs	0%	48%

Conclusion

- Coarse-to-Fine model for question answering
- Efficient model (up to 6.7 times speed up) with comparable accuracies
- Learning strategy without direct supervision for evidence sentence

Future Work

- Introduce more flexible document selection
- Extend to more challenging dataset (multi document setting)
