

	CFGs and PCFGs					
	Grar	mmar (CFG)		Lexicon		
	$ROOT \rightarrow S$	1.0 NP \rightarrow NP PP	0.3	$NN \rightarrow interest$	1.0	
	$S \to NP \: VP$	1.0 VP \rightarrow VBP NP	0.7	NNS \rightarrow raises	1.0	
	$NP \to DT NN$	0.2 VP \rightarrow VBP NP PP	0.3	$VBP \rightarrow interest$	1.0	
	$NP \to NN \; NNS$	0.5 PP → IN NP	1.0	VBZ → raises	1.0	
Conte	ext-free gramn	nar: symbols which r	rewrite	as one or more sy	mbols	
Lexico	on consists of	"preterminals" (POS	tags) i	rewriting as termin	hals (words)	
CFG i symb	s a tuple (N, T, ol (generally a	S, R): N = nontermin special ROOT symbol	nals, T ol) <i>,</i> R =	= terminals, S = sta rules	art	
PCFG	CFG: probabilities associated with rewrites, normalize by source symbol					

Results	
 Standard dataset for English: Penn Treebank (Marcus et al., 1993) Evaluation: F1 over labeled constituents of the sentence 	
Vanilla PCFG: ~75 F1	Refining Generative Grammars
Best PCFGs for English: ~90 F1	
> SOTA: 95 F1	
 Other languages: results vary widely depending on annotation + complexity of the grammar 	
Klein and Manning (2003)	

Takeaways	Survey
PCFGs estimated generatively can perform well if sufficiently engineered	 Write one thing you like about the class
Neural CRFs work well for constituency parsing	Write one thing you don't like about the class
Next time: revisit lexicalized parsing as dependency parsing
