CS388: Natural Language Processing Lecture 20: Summarization

Greg Durrett

Administrivia

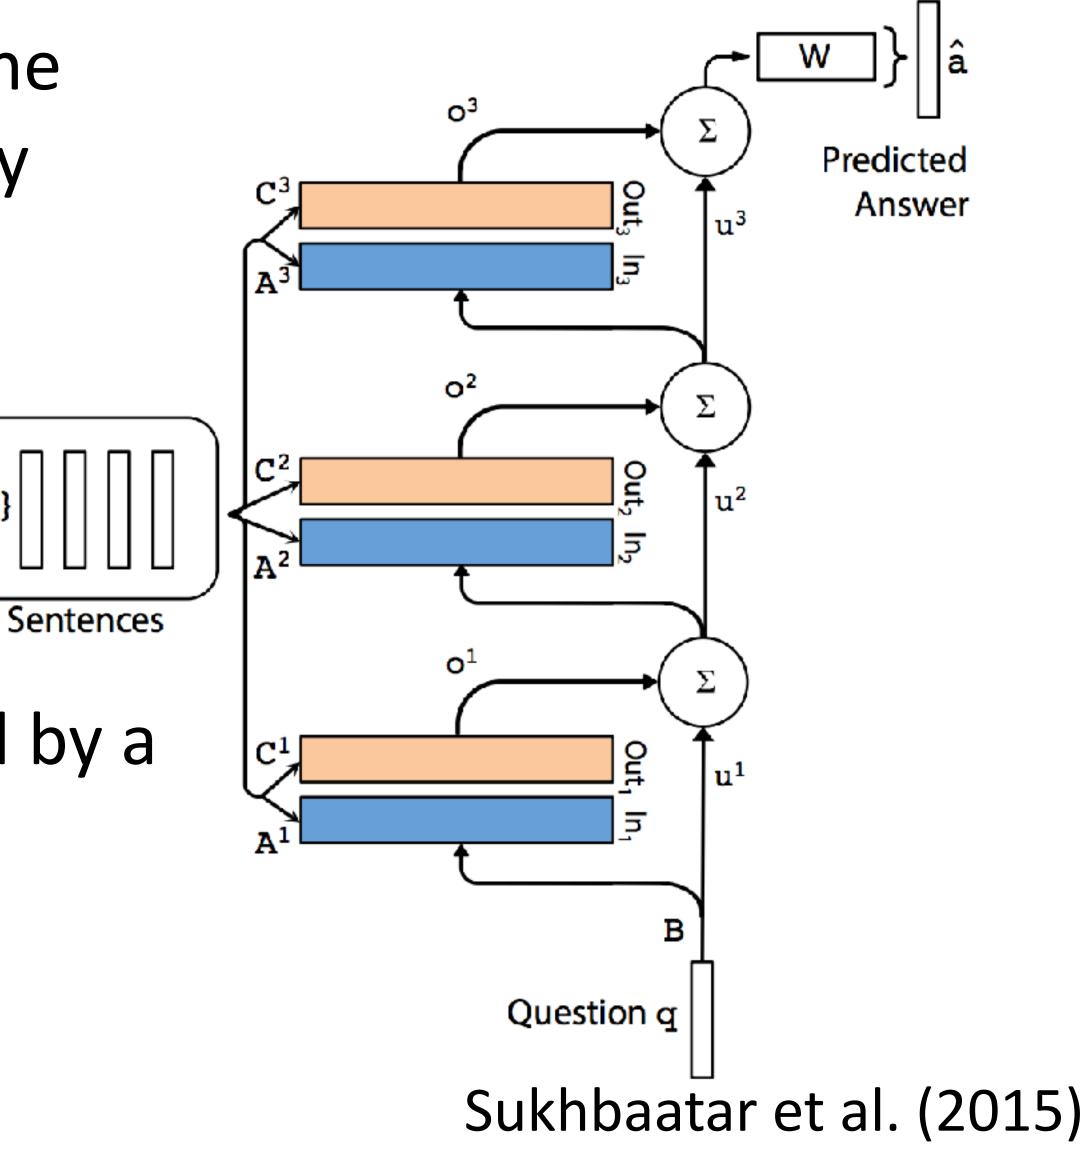

Proposals due Thursday

Recall: Memory Networks

Three layers of memory network where the query representation is updated additively based on the memories at each step

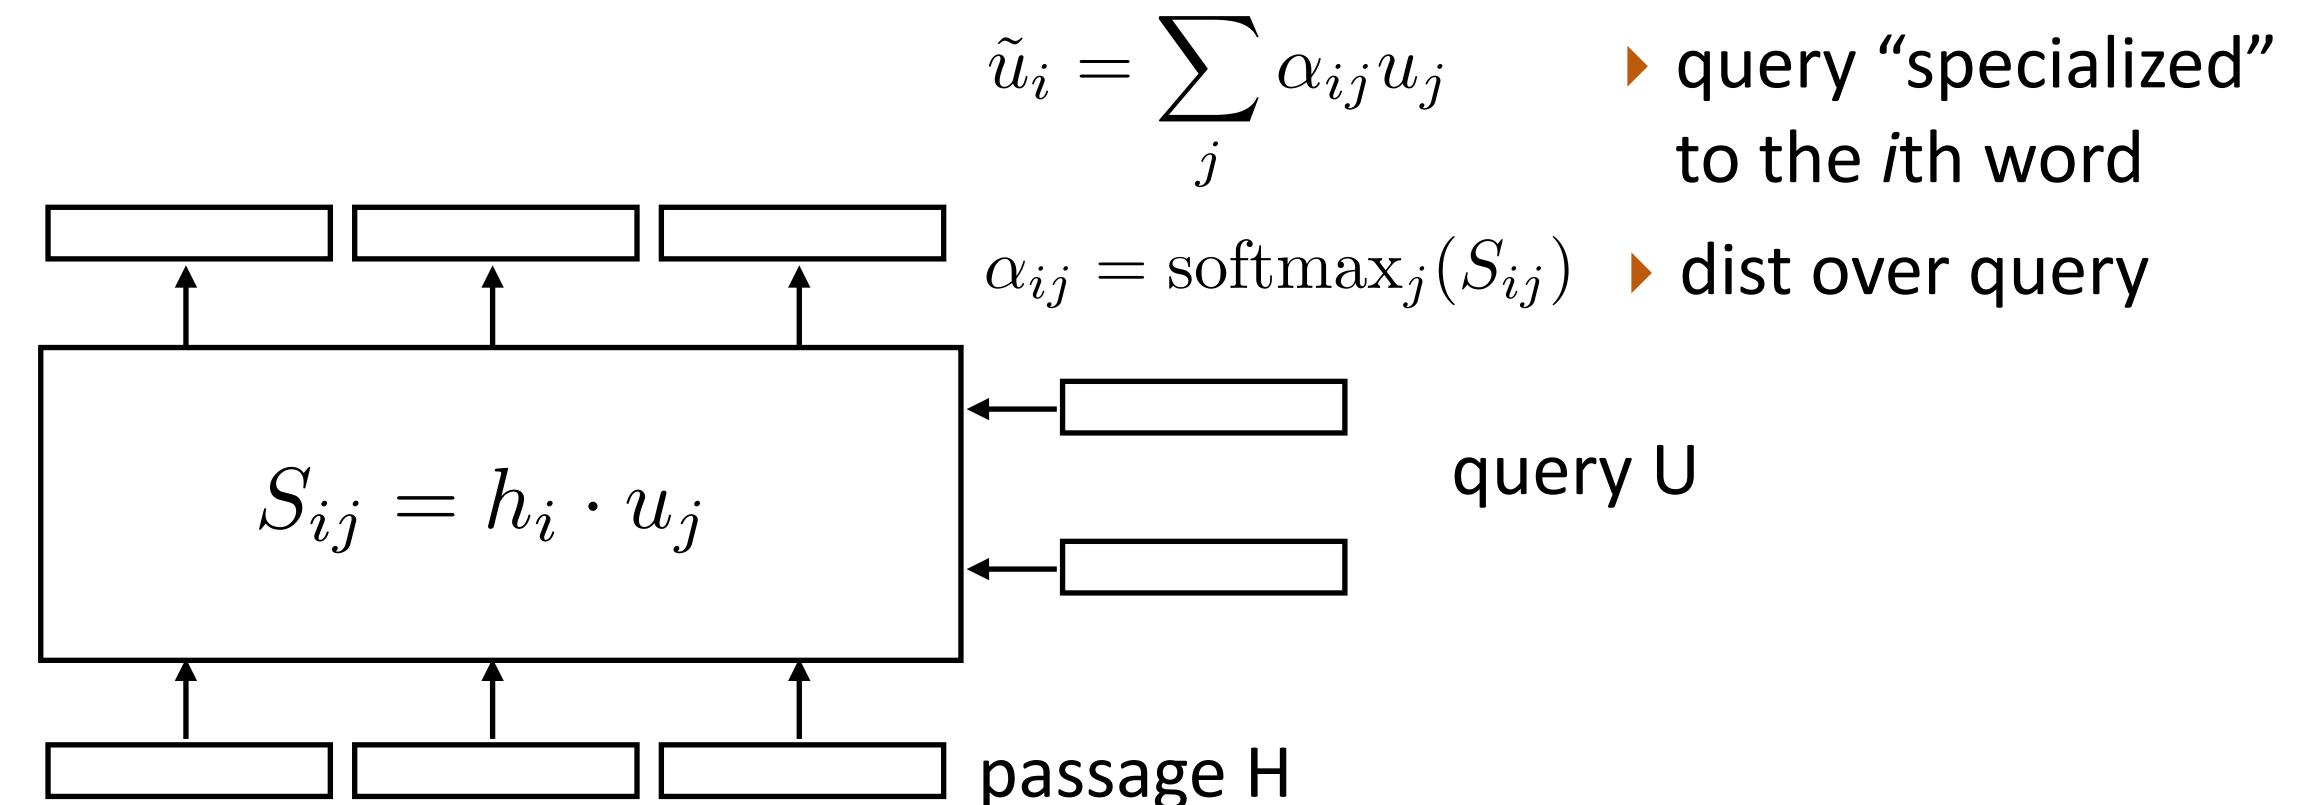

- ▶ How to encode the sentences?
 - Bag of words (average embeddings)
 - Positional encoding: multiply each word by a vector capturing position in sentence

Recall: Bidirectional Attention Flow

- Passage (context) and query are both encoded with BiLSTMs
- Context-to-query attention: compute softmax over columns of S, take weighted sum of u based on attention weights for each passage word

Final Projects

EMNLP 2018: New Approaches

- Language modeling as pretraining is really effective
 - Minimizing/distilling BERT/ELMo will be important, but this will require a lot of compute (almost certainly infeasible as a final project)
- Transformers seem to be on the rise: linguistically-informed self attention, BERT, etc.
 - Understand transformer heads? Better inductive biases?
- Unsupervised MT: lots of problems here including lexicon induction, how to use syntax, etc.
- Variational autoencoders: still don't work great but there's optimism about them

EMNLP 2018: New Datasets

- New QA settings:
 - "Conversational" machine reading (need to ask clarification questions to the user): https://arxiv.org/pdf/1809.01494.pdf
 - Questions as dialogue (user asks clarification questions to the system): https://arxiv.org/pdf/1808.07036.pdf
- emrQA: https://arxiv.org/pdf/1809.00732.pdf
- Commonsense: "Can a suit of armor conduct electricity?": https://arxiv.org/pdf/1809.02789.pdf
- Lots of new QA datasets, many will not prove that useful...sometimes hard to know in advance

This Lecture

- Extractive systems for multi-document summarization
- Extractive + compressive systems for single-document summarization
- Single-document summarization with neural networks

Summarization

What makes a good summary?

Summarization

BAGHDAD/ERBIL, Iraq (Reuters) - A strong earthquake hit large parts of northern Iraq and the capital Baghdad on Sunday, and also caused damage in villages across the border in Iran where state TV said at least six people had been killed

There were no immediate reports of casualties in Iraq after the quake, whose epicenter was in Penjwin, in Sulaimaniyah province which is in the semi-autonomous Kurdistan region very close to the Iranian border, according to an Iraqi meteorology official.

But eight villages were damaged in Iran and at least six people were killed and many others injured in the border town of Qasr-e Shirin in Iran, Iranian state TV said.

The US Geological Survey said the quake measured a magnitude of 7.3 while an Iraqi meteorology official put its magnitude at 6.5 according to preliminary information.

Many residents in the Iraqi capital Baghdad rushed out of houses and tall buildings in panic.

• • •

Summarization

Indian Express — A massive earthquake of magnitude 7.3 struck Iraq on Sunday, 103 kms (64 miles) southeast of the city of As-Sulaymaniyah, the US Geological Survey said, reports Reuters. US Geological Survey initially said the quake was of a magnitude 7.2, before revising it to 7.3.

The quake has been felt in several Iranian cities and eight villages have been damaged. Electricity has also been disrupted at many places, suggest few TV reports.

Summary

A massive earthquake of magnitude 7.3 struck Iraq on Sunday. The epicenter was close to the Iranian border. Eight villages were damaged and six people were killed in Iran.

What makes a good summary?

Summary

A strong earthquake of magnitude 7.3 struck Iraq and Iran on Sunday. The epicenter was close to the Iranian border. Eight villages were damaged and six people were killed in Iran.

- Content selection: pick the right content
 - Right content was repeated within and across documents
 - Domain-specific (magnitude + epicenter of earthquakes are important)
- Generation: write the summary
 - Extraction: pick whole sentences from the summary
 - Compression: compress those sentences but basically just do deletion
 - Abstraction: rewrite + reexpress content freely

Extractive Summarization

Extractive Summarization: MMR

- Given some articles and a length budget of k words, pick some sentences of total length <= k and make a summary</p>
- ▶ Pick important yet diverse content: maximum marginal relevance (MMR)

While summary is < k words

Calculate
$$MMR \stackrel{\text{def}}{=} Arg \max_{D_i \in R \setminus S} \left[\lambda(Sim_1(D_i, Q) - (1 - \lambda) \max_{D_j \in S} Sim_2(D_i, D_j)) \right]$$

"max over all sentences not yet in the summary" "make this sentence similar to a query" "make this sentence maximally different from all others added so far"

Add highest MMR sentence that doesn't overflow length

Carbonell and Goldstein (1998)

Extractive Summarization: Centroid

Represent the documents and each sentences as bag-of-words with TF-IDF weighting

While summary is < k words

Calculate score(sentence) = cosine(sent-vec, doc-vec)

Discard all sentences whose similarity with some sentence already in the summary is too high

Add the best remaining sentence that won't overflow the summary

Extractive Summarization: Bigram Recall

Count number of documents each bigram occurs in to measure importance

$$score(massive earthquake) = 3$$
 $score(magnitude 7.3) = 2$
 $score(six killed) = 2$ $score(Iraqi capital) = 1$

- Find summary that maximizes the score of bigrams it covers
- ▶ ILP formulation: c and s are indicator variables indexed over bigrams ("concepts") and sentences, respectively

Maximize:
$$\sum_i w_i c_i$$
 $s_j Occ_{ij} \leq c_i, \ \forall i,j$ Subject to: $\sum_j l_j s_j \leq L$ $\sum_j s_j Occ_{ij} \geq c_i \ \forall i$

"set c_i to 1 iff some sentence that contains it is included"

sum of included sentences' lengths can't exceed L

Gillick and Favre (2009)

Evaluation: ROUGE

- ▶ Rouge-n: n-gram precision/recall/F1 of summary w.r.t. gold standard
- Rouge-2 correlates well with human judgments for multi-document summarization tasks

```
A massive earthquake of magnitude 7.3 struck Iraq on Sunday prediction

An earthquake was detected in Iraq on Sunday reference

ROUGE 2 recall = 1 correct bigram (Iraq, Sunday) / 4 reference bigrams

ROUGE 2 precision = 1 correct bigram (Iraq, Sunday) / 6 predicted bigrams
```

- Many hyperparameters: stemming, remove stopwords, etc.
- ▶ Historically: ROUGE recall @ k {words, characters}. Now: ROUGE F1

Results

Model	R-1	R-2	R-4	
Centroid	36.03	7.89	1.20	
LexRank	35.49	7.42	0.81	
KLSum	37.63	8.50	1.26	
CLASSY04	37.23	8.89	1.46	
ICSI	38.02	9.72	1.72	Gillick and Favre / bigram recall
Submodular	38.62	9.19	1.34	
DPP	39.41	9.57	1.56	
RegSum	38.23	9.71	1.59	
	•			

Better centroid: 38.58 9.73 1.53

Caveat: these techniques all work better for multi-document than single-document!

Multi-Document vs. Single Document

- "a massive earthquake hit Iraq" "a massive earthquake struck Iraq" lots of redundancy to help select content in multi-document case
- When you have a lot of documents, there are more possible sentences to extract:

But eight villages were damaged in Iran and at least six people were killed and many others injured in the border town of Qasr-e Shirin in Iran, Iranian state TV said.

The quake has been felt in several Iranian cities and eight villages have been damaged.

Multi-document summarization is easier?

Compressive Summarization

Compressive Summarization

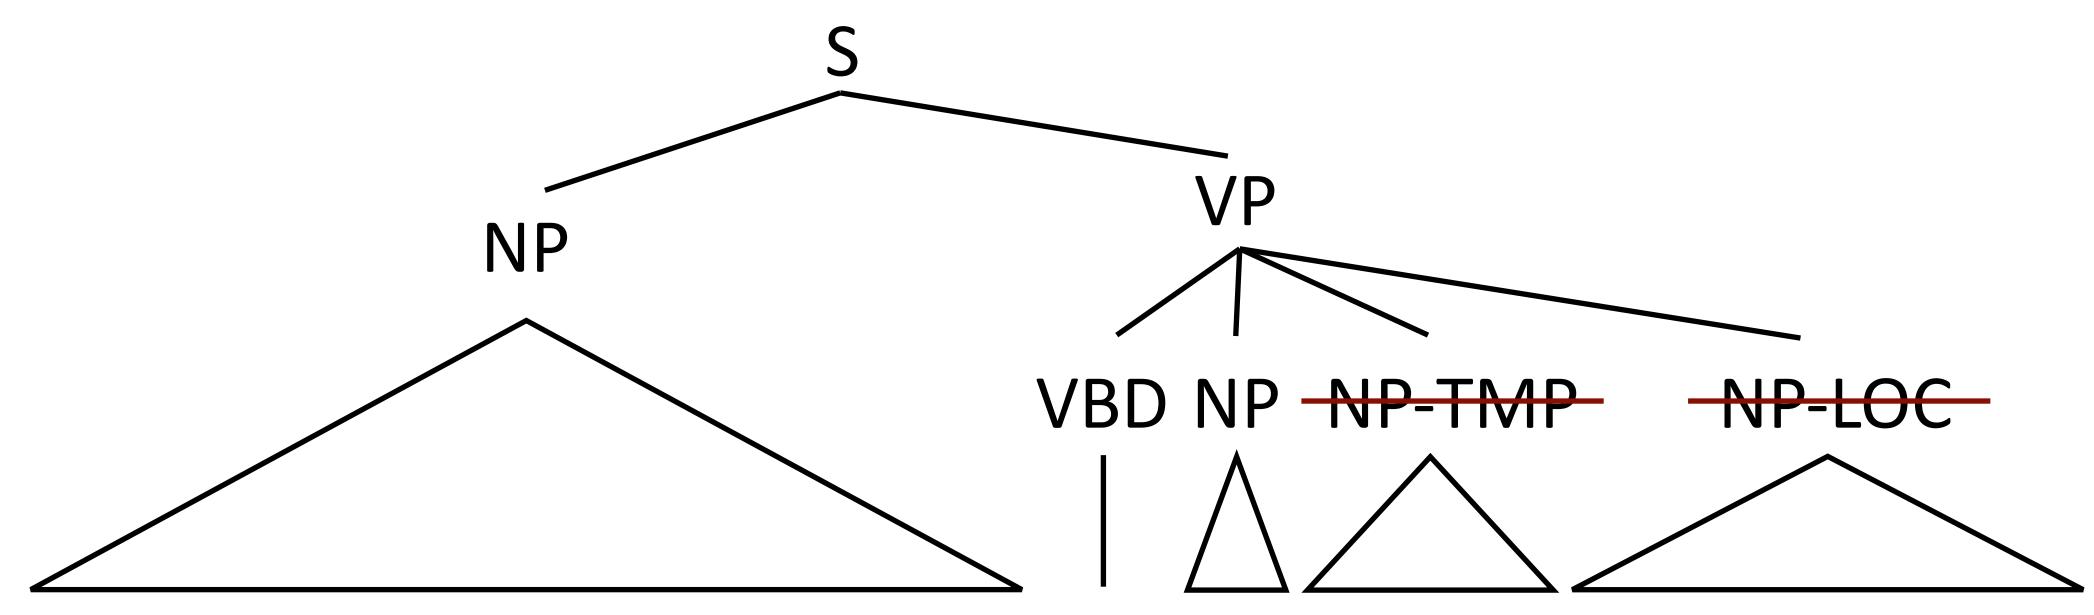

Indian Express — A massive earthquake of magnitude 7.3 struck Iraq on Sunday, 103 kms (64 miles) southeast of the city of As-Sulaymaniyah, the US Geological Survey said, reports Reuters. US Geological Survey initially said the quake was of a magnitude 7.2, before revising it to 7.3.

- Sentence extraction isn't aggressive enough at removing irrelevant content
- Want to extract sentences and also delete content from them

Syntactic Cuts

- Use syntactic rules to make certain deletions
- Delete adjuncts

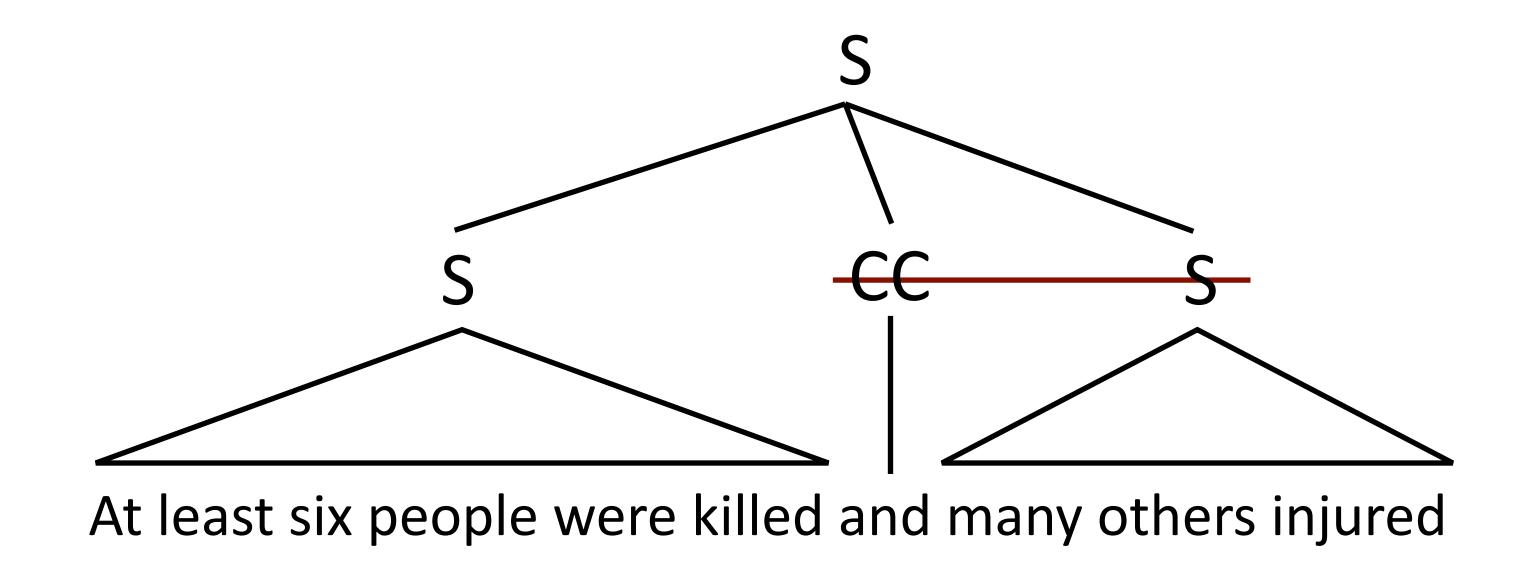

A massive earthquake of magnitude 7.3 struck Iraq on Sunday, 103 kms (64 miles)...

Berg-Kirkpatrick et al. (2011)

Syntactic Cuts

- Use syntactic rules to make certain deletions
- ▶ Delete second parts of coordination structures

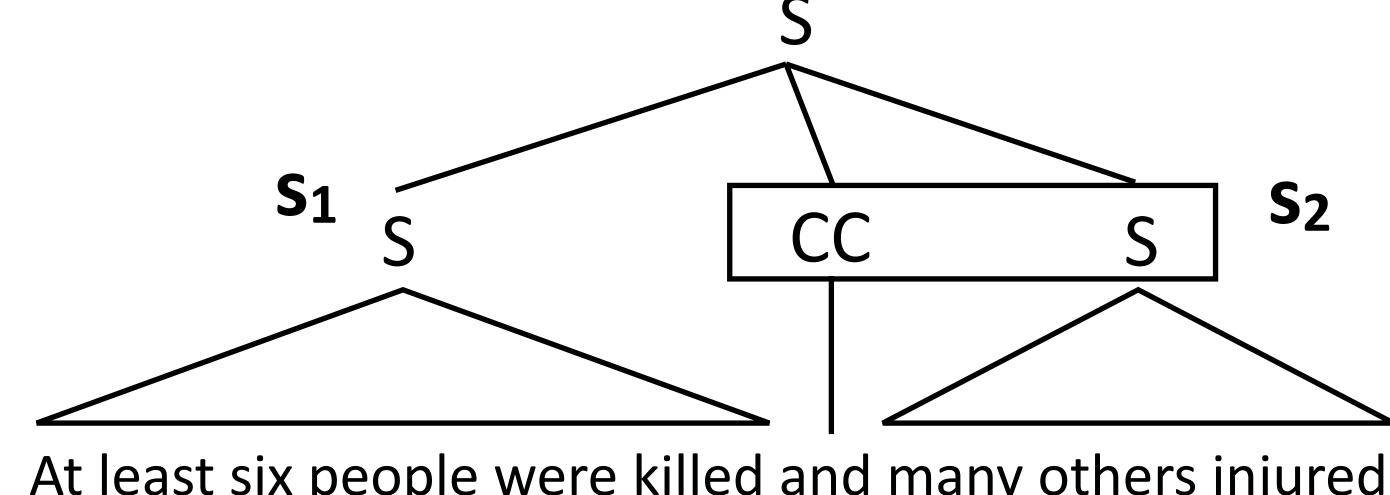

Compressive ILP

Recall the Gillick+Favre ILP:

Berg-Kirkpatrick et al. (2011)

Maximize:
$$\sum_{i} w_i c_i$$
 $s_j Occ_{ij} \leq c_i, \ \forall i, j$ Subject to: $\sum_{i} l_j s_j \leq L$ $\sum_{j} s_j Occ_{ij} \geq c_i \ \forall i$

- Now si variables are nodes or sets of nodes in the parse tree
- New constraint: $s_2 \le s_1$ "s₁ is a prerequisite for s₂"

At least six people were killed and many others injured

Compressive Summarization

- x_1 This hasn't been Kellogg's year.
- x_2 The oat-bran craze has cost Kellogg matasketshare.
- x_3 Its president quit suddenly.

NP

And now Kellogg is canceling its new rereal plant, which would have cost \$1 billion. x_4

ILP:
$$\max_{\mathbf{x}} \left(w^{\mathsf{T}} f(\mathbf{x}) \right)$$

s.t. summary(\mathbf{x}) obeys length limit summary(\mathbf{x}) is grammatical summary(\mathbf{x}) is coherent

Constraints

$$\max_{\mathbf{x}} (w^{\top} f(\mathbf{x}))$$
 s.t. summary(\mathbf{x}) obeys length limit summary(\mathbf{x}) is grammatical summary(\mathbf{x}) is coherent

Grammaticality constraints: allow cuts within sentences

Coreference constraints: do not allow pronouns that would refer to nothing

- ▶ If we're confident about coreference, rewrite the pronoun (it → Kellogg)
- Otherwise, force its antecedent to be included in the summary

Features

$$\max_{\mathbf{x}} \left(w^{\top} f(\mathbf{x}) \right)$$

s.t. summary(\mathbf{x}) obeys length limit summary(x) is grammatical summary(x) is coherent

Now uses a feature-based model, where features identify good content

(And now Kellogg is canceling its new cereal plant) =

 \prod (FirstWord=And)

Learning

$$\max_{\mathbf{x}} \left(w^{\top} f(\mathbf{x}) \right)$$
 s.t. summary(\mathbf{x}) obeys length limit summary(\mathbf{x}) is grammatical

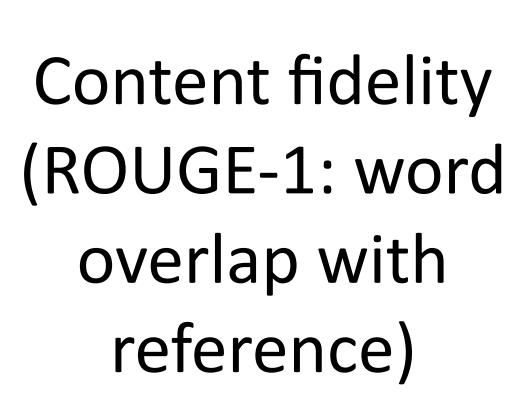

- ► Train on a large corpus of New York Times documents with summaries (100,000 documents)
- Structured SVM with ROUGE as loss function
 - Augment the ILP to keep track of which bigrams are included or not, use these for loss-augmented decode

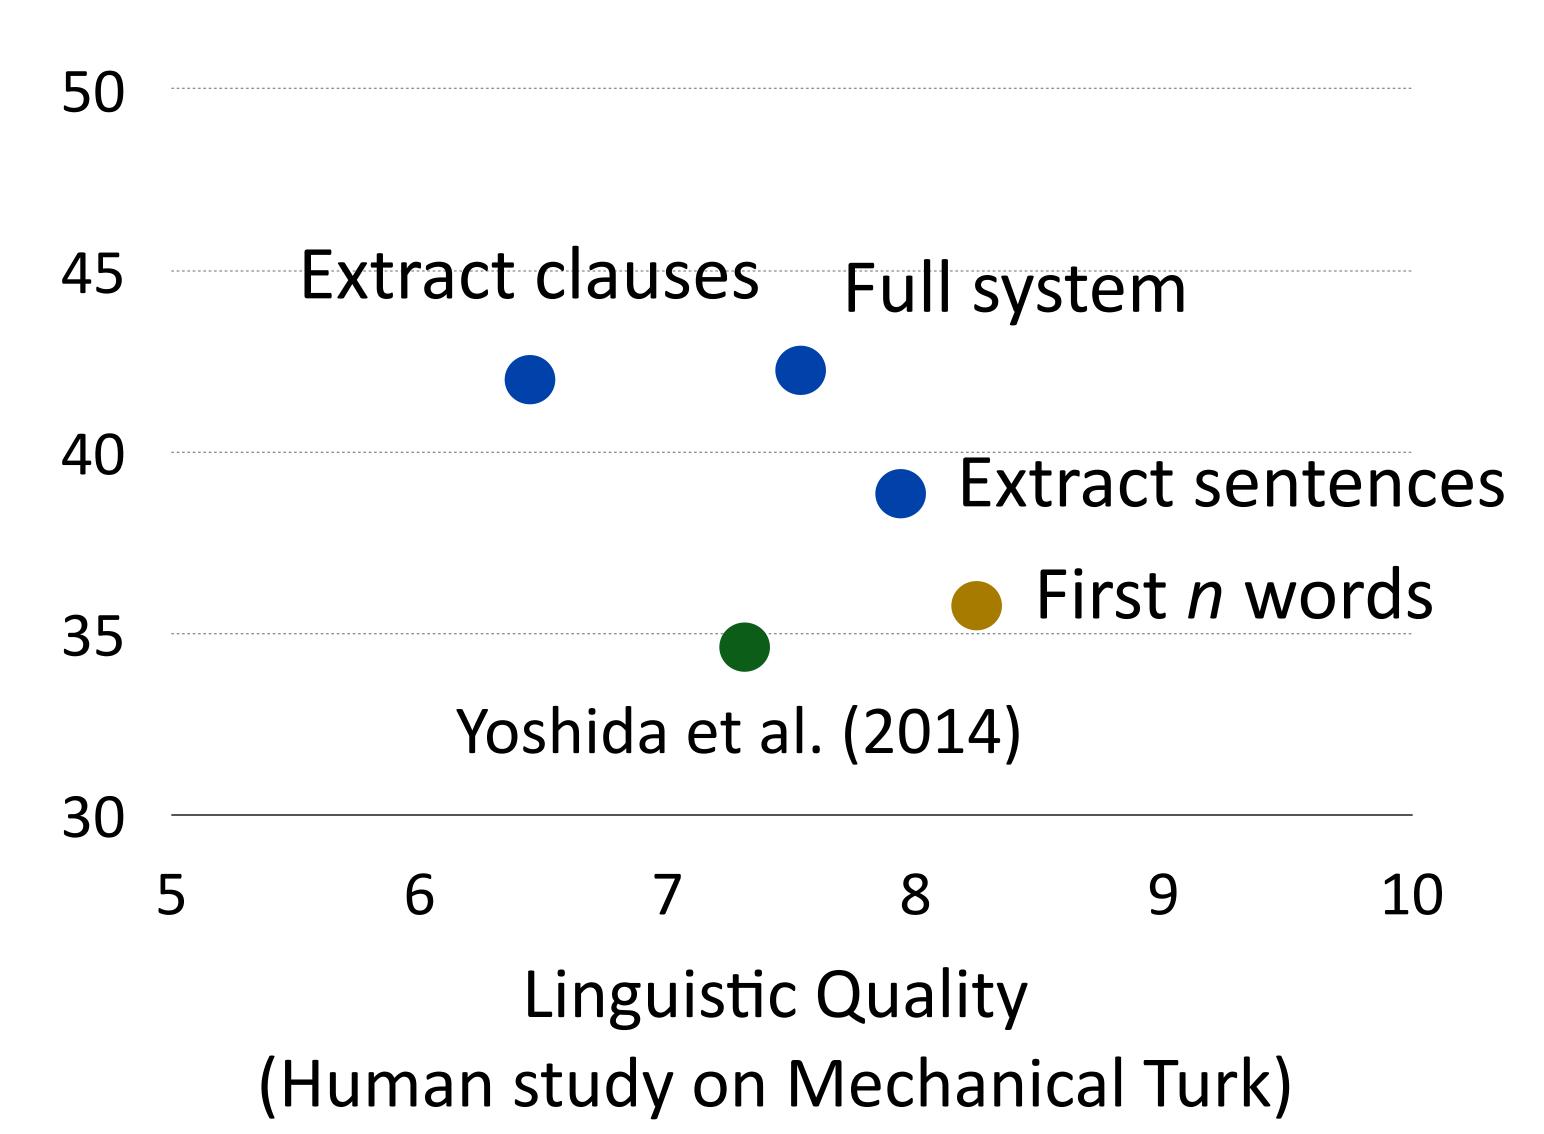

Berg-Kirkpatrick et al. (2011), Durrett et al. (2016)

summary(x) is coherent

Results: New York Times Corpus

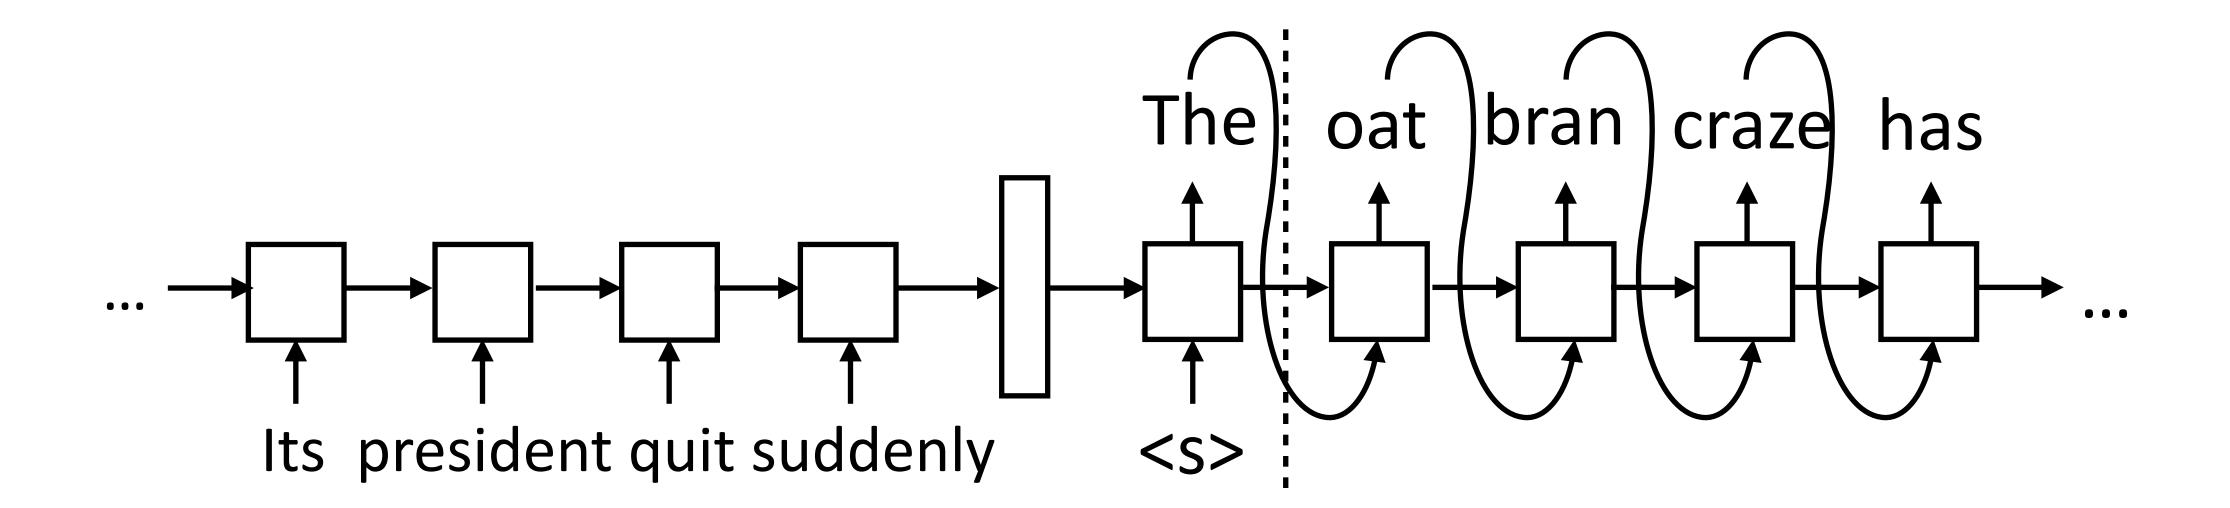

Neural Summarization

- Extractive paradigm isn't all that flexible, even with compression
- Training is hard! ILPs are hard! Maybe just use seq2seq?
- Train to produce summary based on document

Chopra et al. (2016)

▶ Task: generate headline from first sentence of article (can get lots of data!)

I(1): brazilian defender pepe is out for the rest of the season with a knee injury, his porto coach jesualdo ferreira said saturday.

G: football: pepe out for season

A+: ferreira out for rest of season with knee injury

R: brazilian defender pepe out for rest of season with knee injury

sentence

reference

no attention

with attention

- Works pretty well, though these models can generate incorrect summaries (who has the knee injury?)
- What happens if we try this on a longer article?

Chopra et al. (2016)

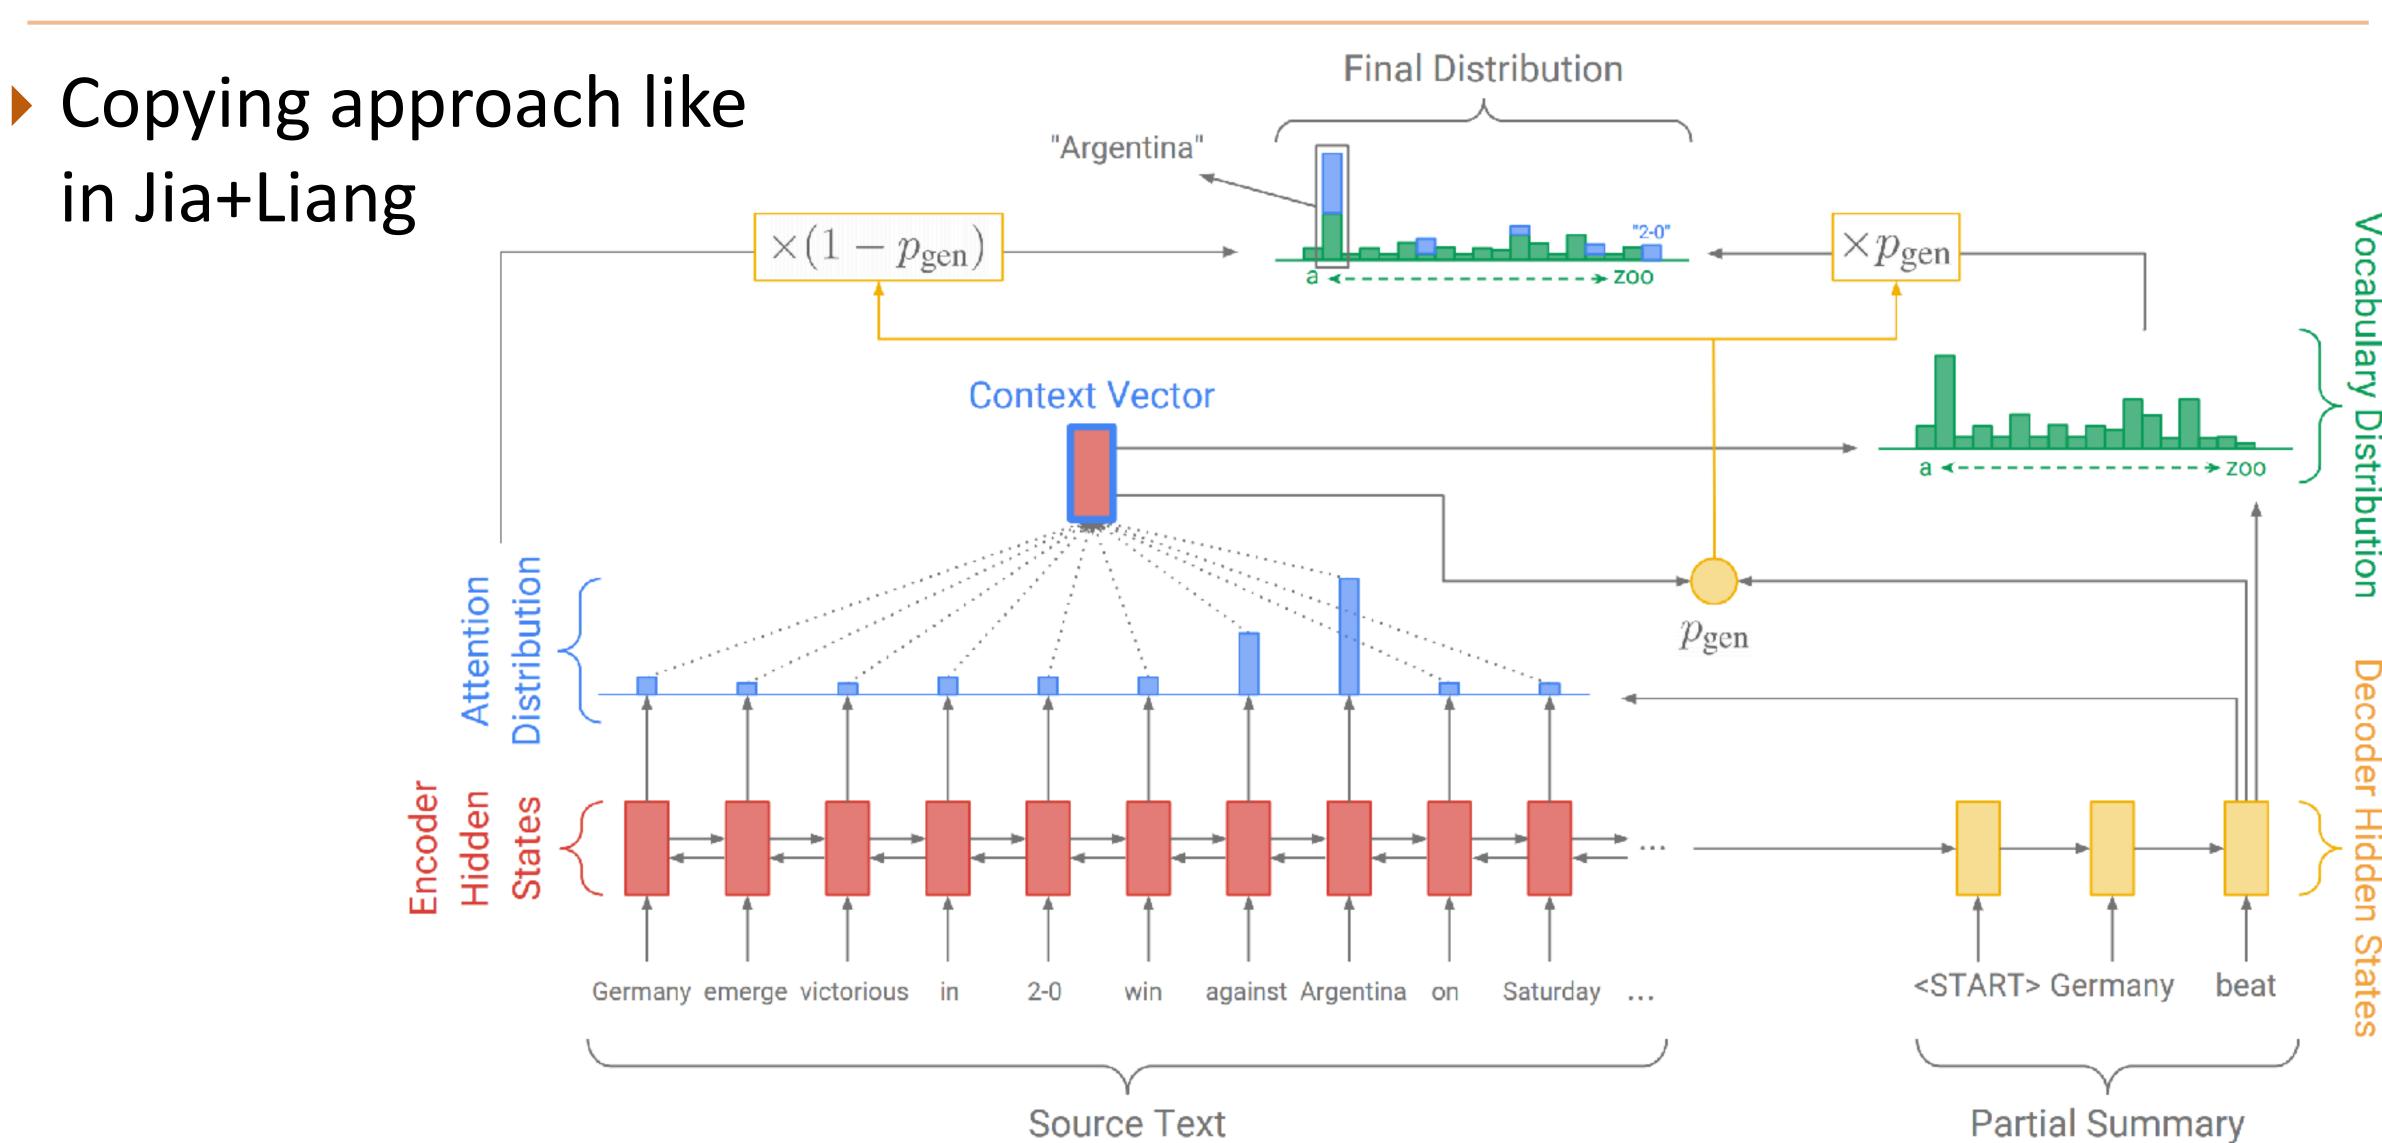

Original Text (truncated): lagos, nigeria (cnn) a day after winning nigeria's presidency, muhammadu buhari told cnn's christiane amanpour that he plans to aggressively fight corruption that has long plagued nigeria and go after the root of the nation's unrest. buhari said he'll "rapidly give attention" to curbing violence in the northeast part of nigeria, where the terrorist group boko haram operates. by cooperating with neighboring nations chad, cameroon and niger, he said his administration is confident it will be able to thwart criminals and others contributing to nigeria's instability. for the first time in nigeria's history, the opposition defeated the ruling party in democratic elections. *buhari* defeated incumbent goodluck jonathan by about 2 million votes, according to nigeria's independent national electoral commission. the win comes after a long history of military rule, coups and botched attempts at democracy in africa's most populous nation.

Baseline Seq2Seq + Attention: UNK UNK says his administration is confident it will be able to destabilize nigeria's economy. UNK says his administration is confident it will be able to thwart criminals and other nigerians. he says the country has long nigeria and nigeria's economy.

What's wrong with this summary?

Pointer-Generator Model

Solutions: copy mechanism, coverage, just like in MT...

Baseline Seq2Seq + Attention: UNK UNK says his administration is confident it will be able to destabilize nigeria's economy. UNK says his administration is confident it will be able to thwart criminals and other nigerians. he says the country has long nigeria and nigeria's economy.

Pointer-Gen: *muhammadu buhari* says he plans to aggressively fight corruption in the northeast part of nigeria. he says he'll "rapidly give attention" to curbing violence in the northeast part of nigeria. he says his administration is confident it will be able to thwart criminals.

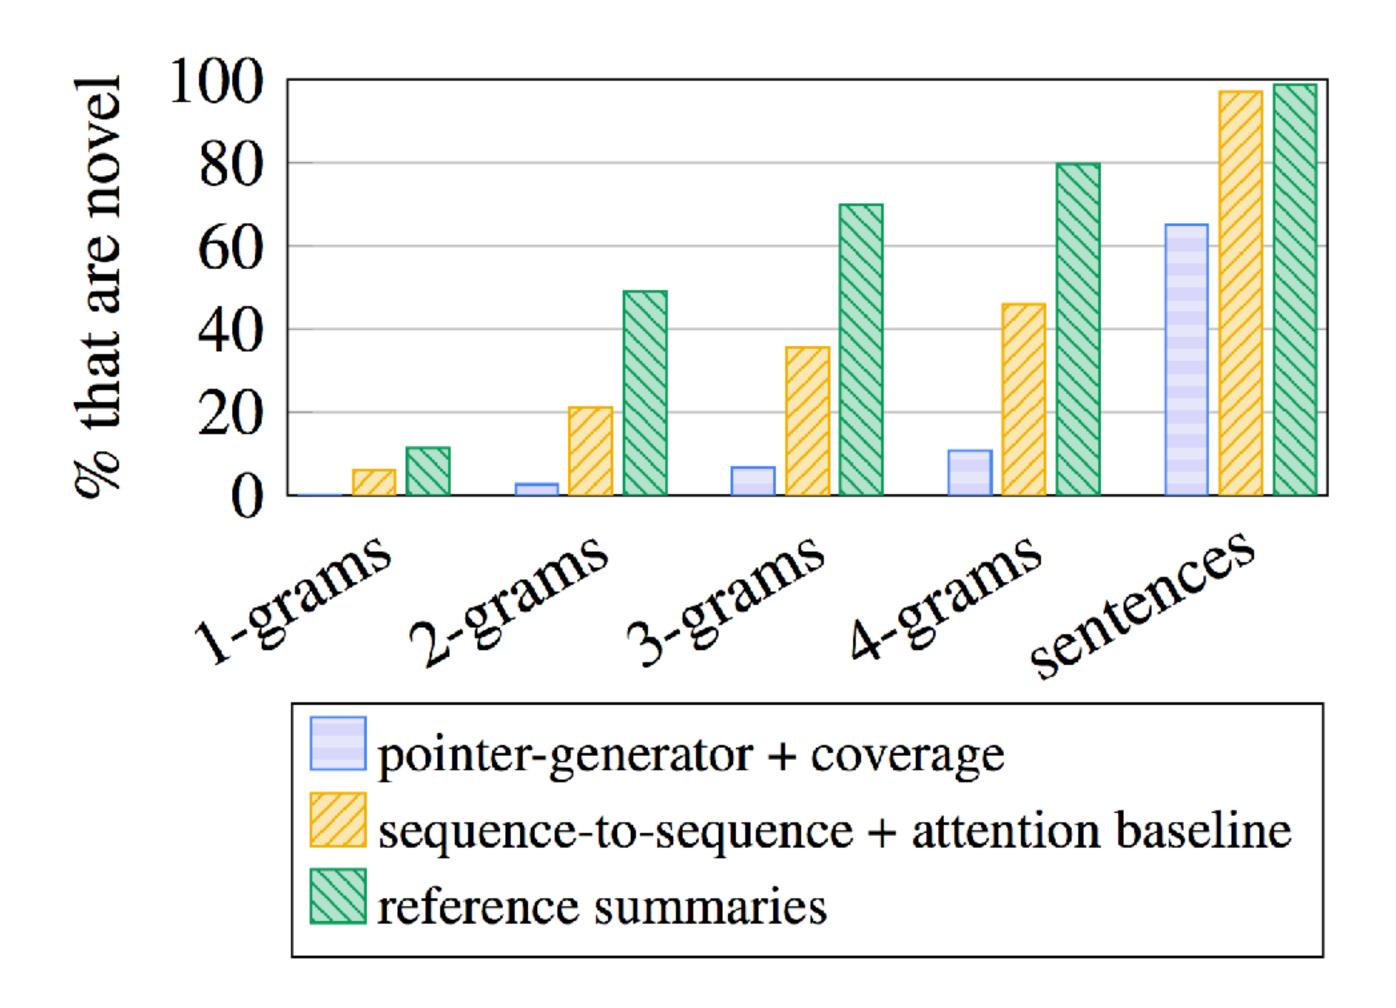

Pointer-Gen + Coverage: *muhammadu buhari* says he plans to aggressively fight corruption that has long plagued nigeria. he says his administration is confident it will be able to thwart criminals. the win comes after a long history of military rule, coups and botched attempts at democracy in africa's most populous nation.

Things might still go wrong, no way of preventing this...

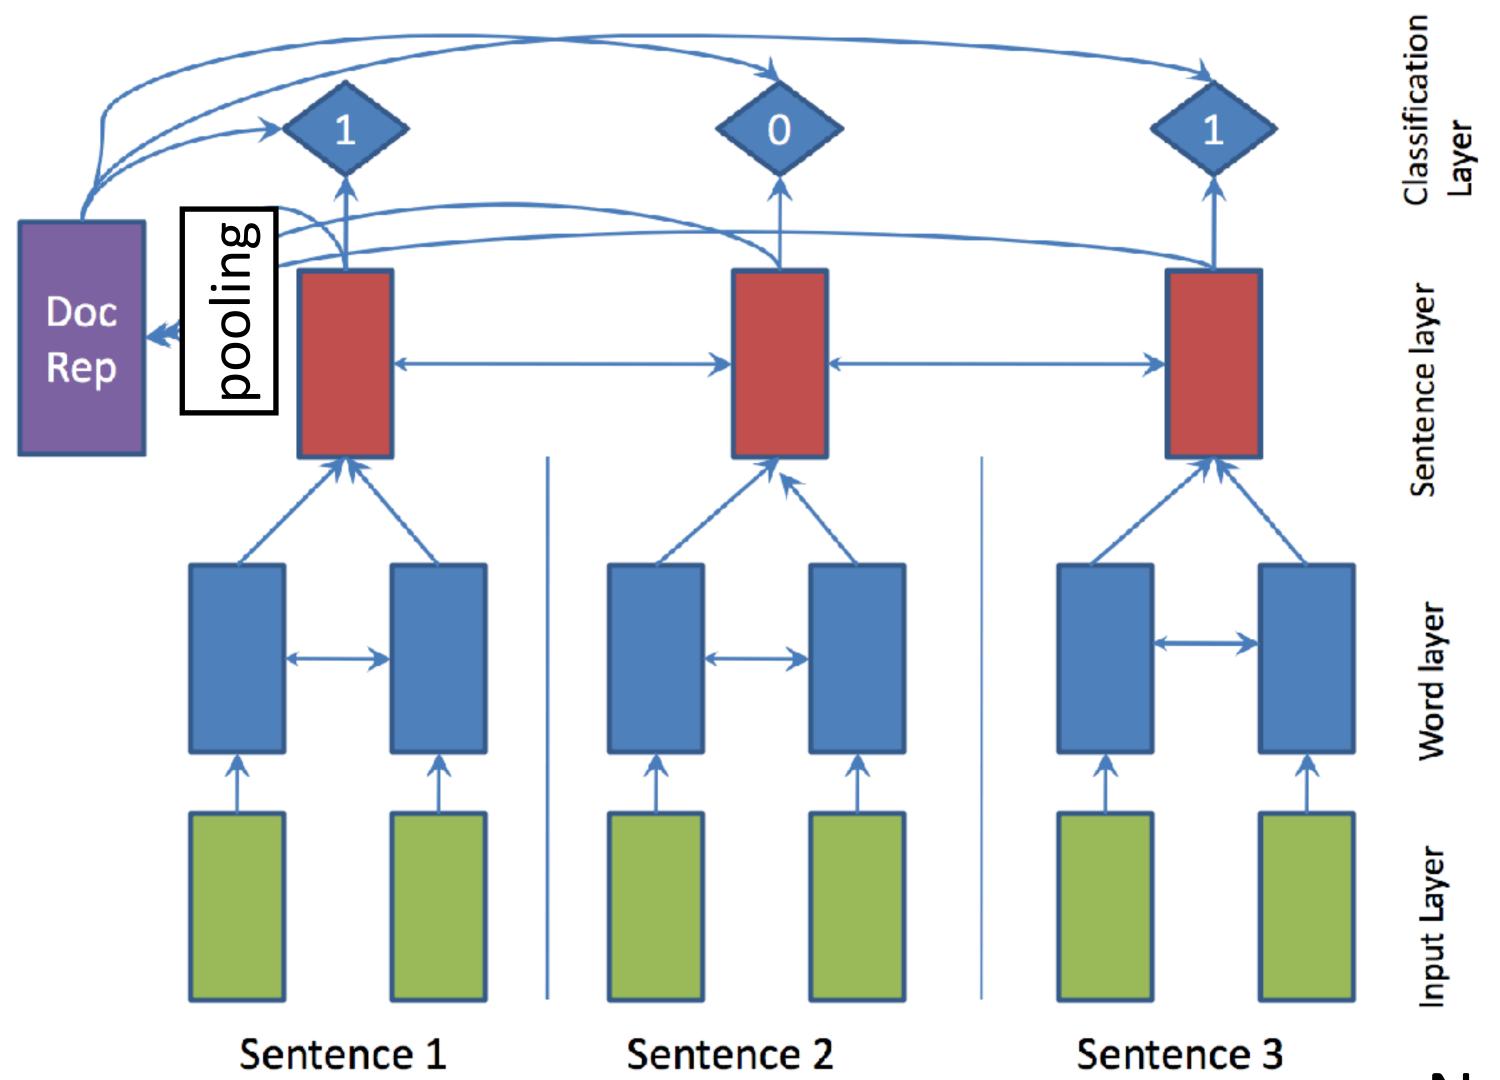

Neural Abstractive Systems

How abstractive is this, anyway?

Neural Extractive Systems

Nallapati et al. (2017)

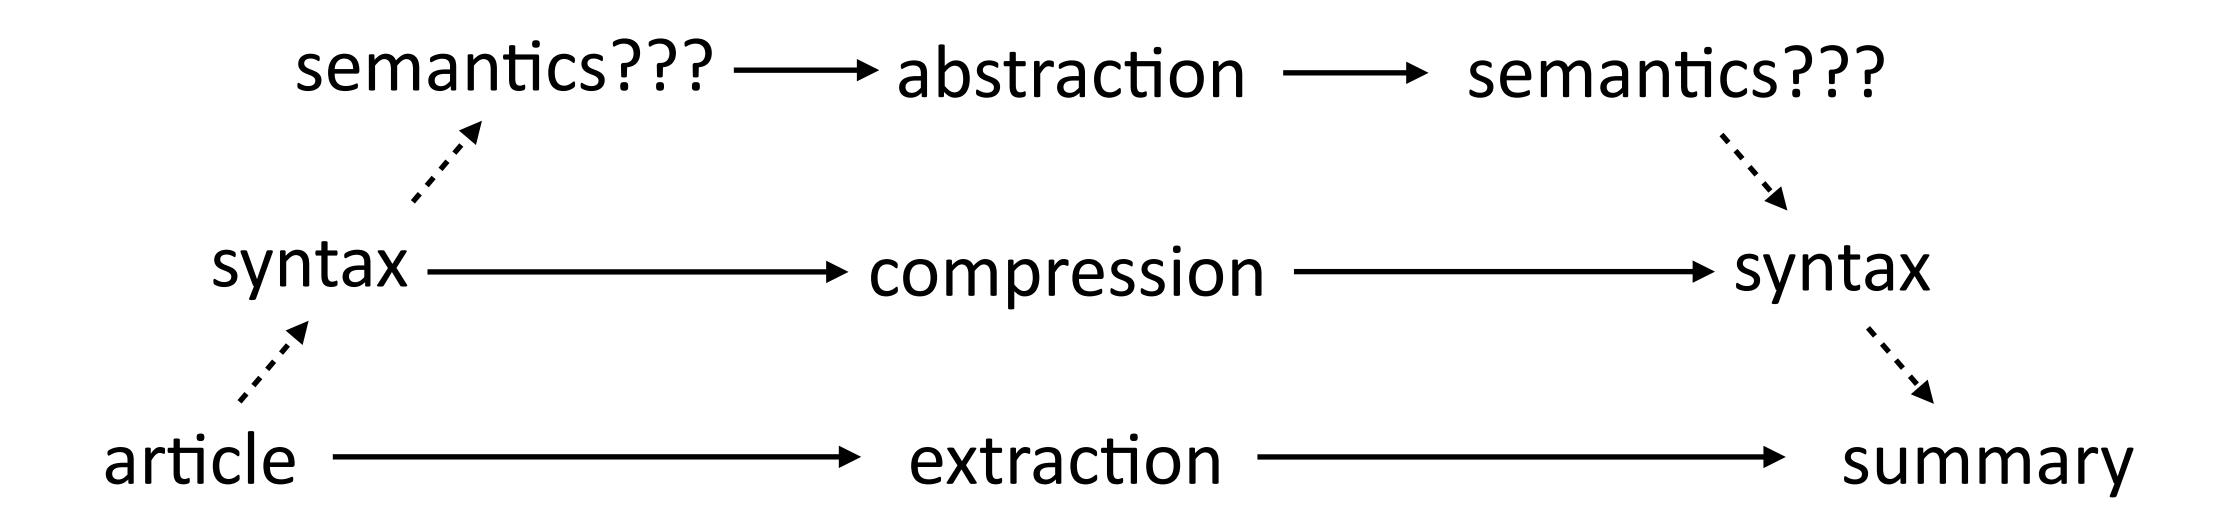

Neural Systems: Results

	ROUGE		
	1	2	L
abstractive model (Nallapati et al., 2016)*	35.46	13.30	32.65
seq-to-seq + attn baseline (150k vocab)	30.49	11.17	28.08
seq-to-seq + attn baseline (50k vocab)	31.33	11.81	28.83
pointer-generator	36.44	15.66	33.42
pointer-generator + coverage	39.53	17.28	36.38
lead-3 baseline (ours)	40.34	17.70	36.57
lead-3 baseline (Nallapati et al., 2017)*	39.2	15.7	35.5
extractive model (Nallapati et al., 2017)*	39.6	16.2	35.3

- Copy mechanism and coverage help substantially
- Abstractive systems don't/barely beat a "lead" baseline on ROUGE

Challenges of Summarization

- True abstraction?
 - Not really necessary for articles
 - Generating from structured information can usually be done with templates...

Takeaways

Extractive systems built on heuristics / ILPs work pretty well

Compression can make things better, especially in the single-document setting

Neural systems (like MT models) can do abstractive summarization, but they often just copy inputs (or deviate from inputs in bad ways)
