

2008-2013: A glimmer of light...

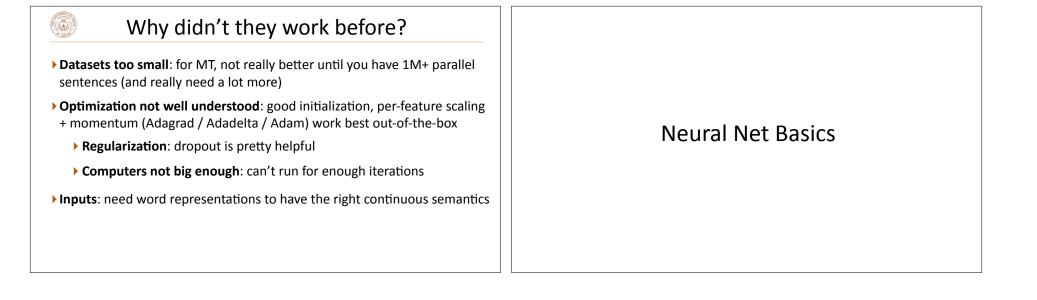

- Collobert and Weston 2011: "NLP (almost) from scratch'
 - Feedforward neural nets induce features for sequential CRFs ("neural CRF")
 - 2008 version was marred by bad experiments, claimed SOTA but wasn't, 2011 version tied SOTA
- Krizhevskey et al. (2012): AlexNet for vision

Socher 2011-2014: tree-structured RNNs working okay

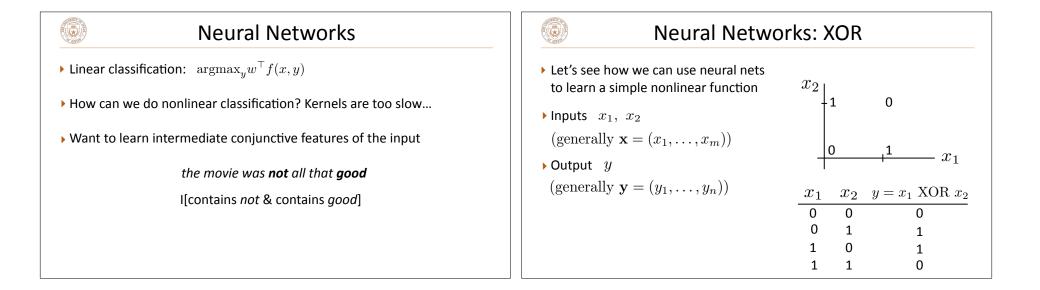

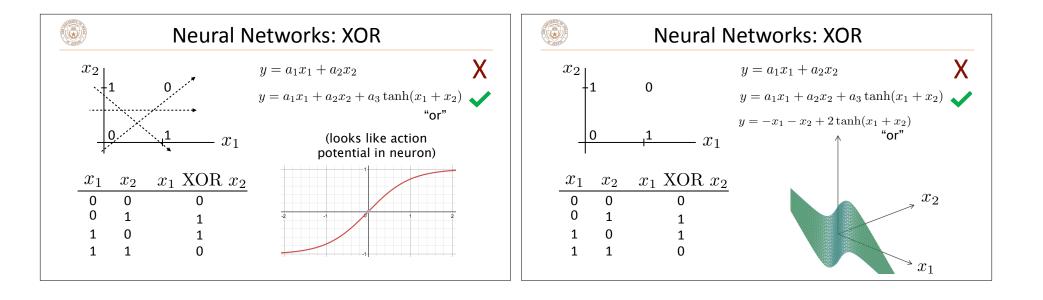

2014: Stuff starts working

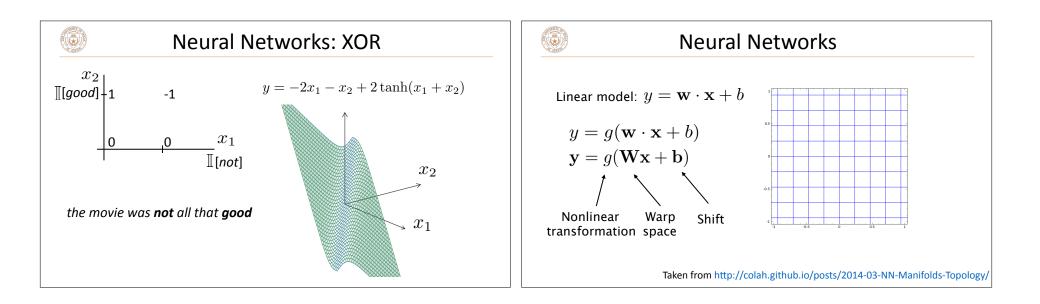

- Kim (2014) + Kalchbrenner et al. (2014): sentence classification / sentiment (convnets work for NLP?)
- Sutskever et al. + Bahdanau et al.: seq2seq for neural MT (LSTMs work for NLP?)
- Chen and Manning transition-based dependency parser (even feedforward networks work well for NLP?)
- > 2015: explosion of neural nets for everything under the sun

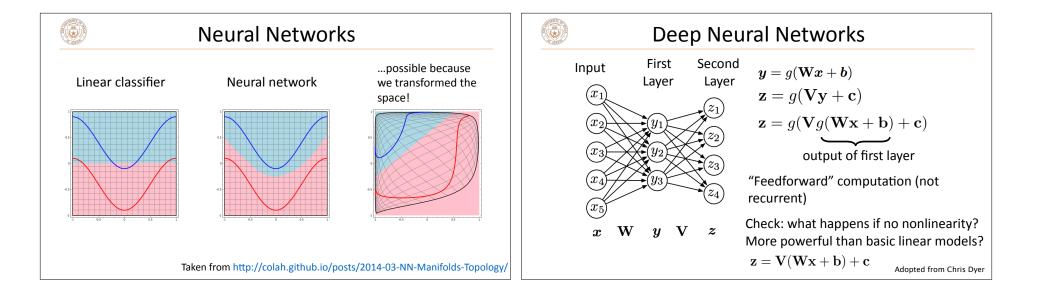

(())

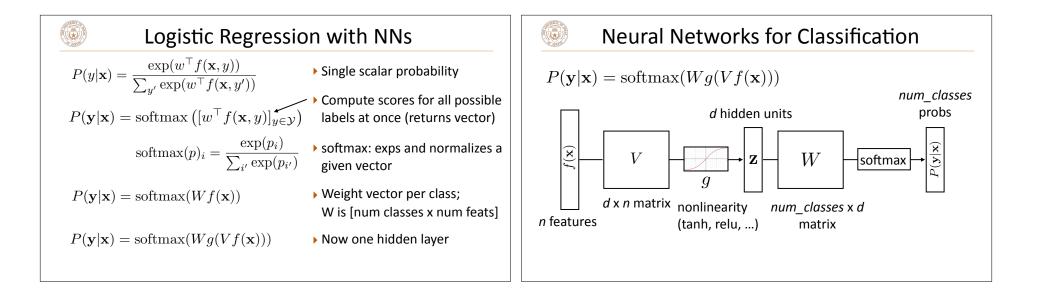

Training Neural Networks

 $P(\mathbf{y}|\mathbf{x}) = \operatorname{softmax}(W\mathbf{z}) \qquad \mathbf{z} = g(Vf(\mathbf{x}))$

Maximize log likelihood of training data

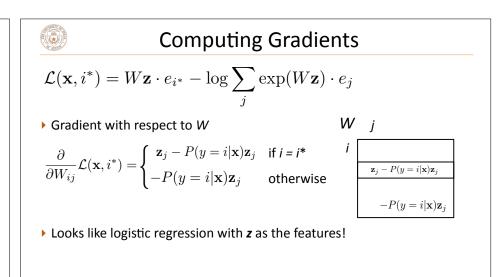

$$\mathcal{L}(\mathbf{x}, i^*) = \log P(y = i^* | \mathbf{x}) = \log \left(\operatorname{softmax}(W\mathbf{z}) \cdot e_{i^*} \right)$$

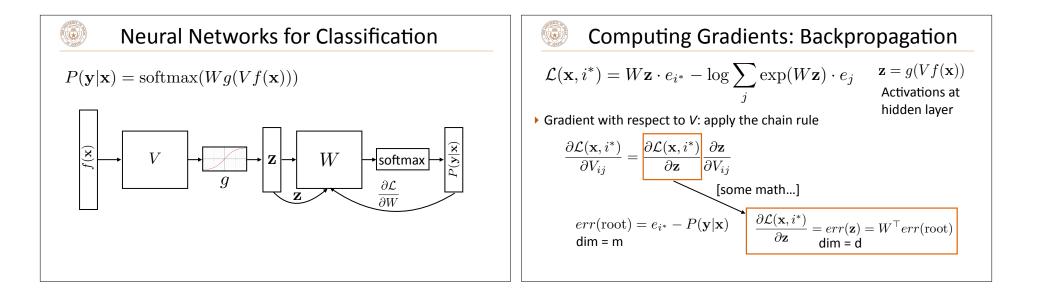

▶ *i**: index of the gold label

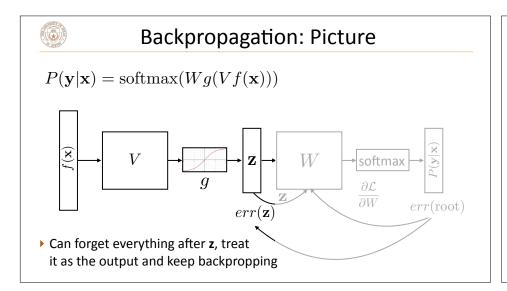

(@)

• e_i : 1 in the *i*th row, zero elsewhere. Dot by this = select *i*th index

 $\mathcal{L}(\mathbf{x}, i^*) = W \mathbf{z} \cdot e_{i^*} - \log \sum_j \exp(W \mathbf{z}) \cdot e_j$

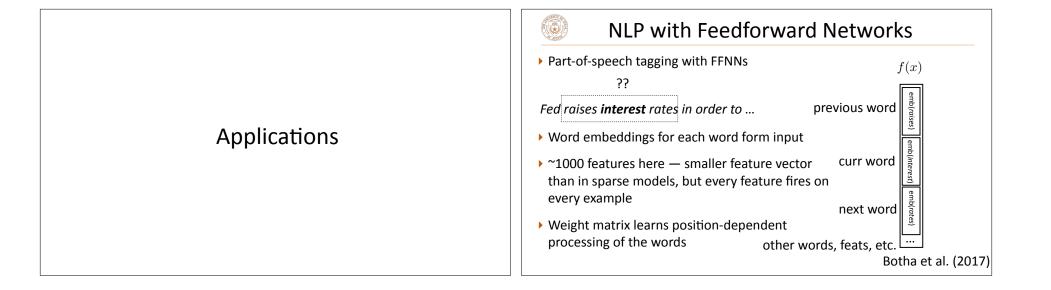

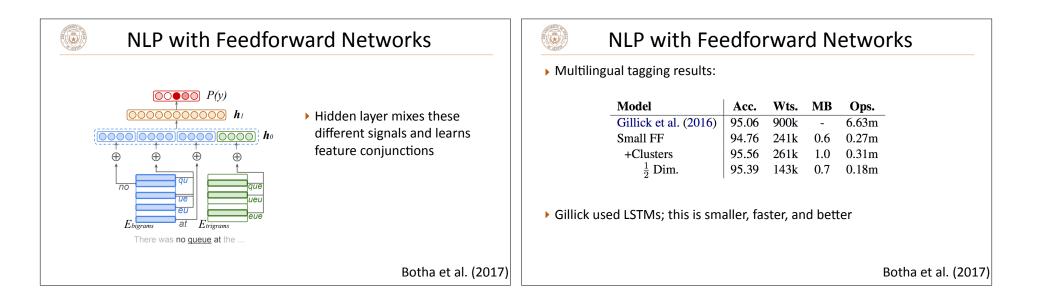

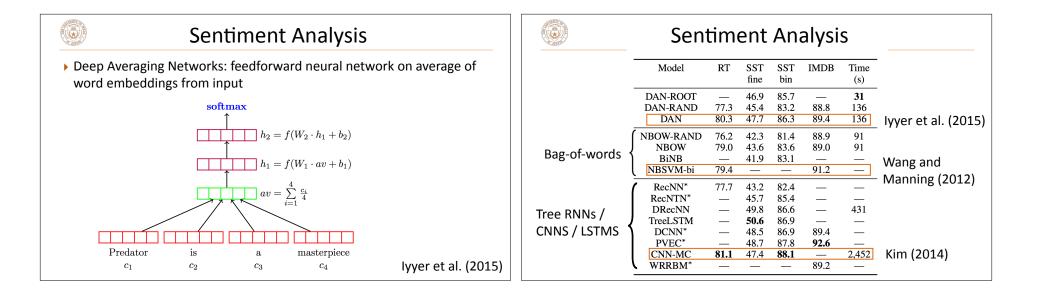

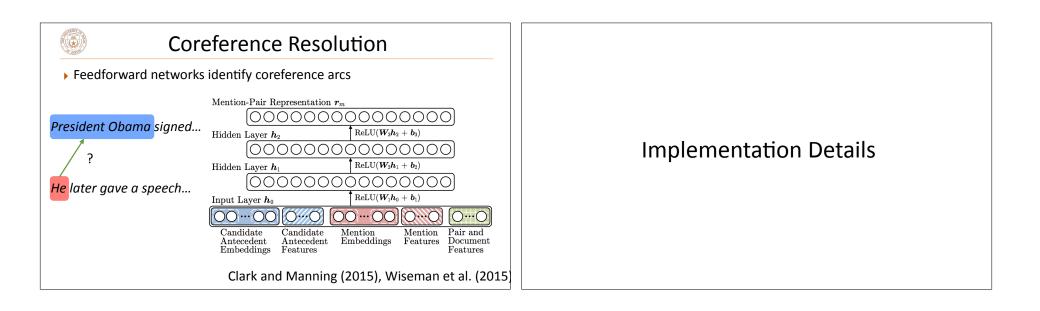

Backpropagation: Takeaways

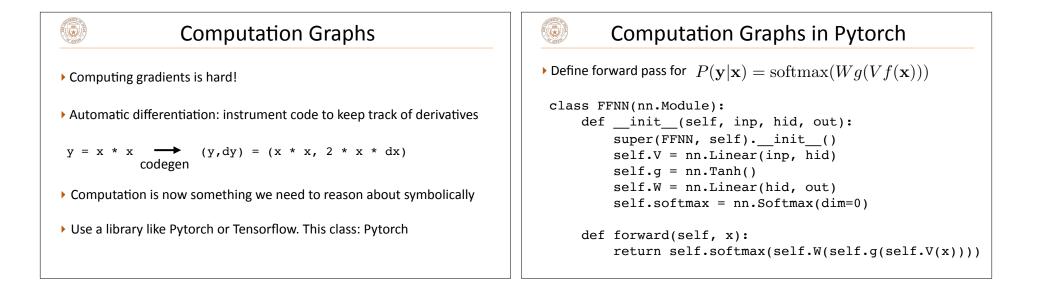

- ▶ Gradients of output weights W are easy to compute looks like logistic regression with hidden layer z as feature vector
- Can compute derivative of loss with respect to z to form an "error signal" for backpropagation
- Easy to update parameters based on "error signal" from next layer, keep pushing error signal back as backpropagation
- Need to remember the values from the forward computation

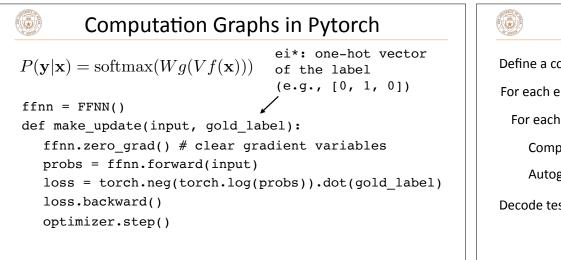

Training a Model

Define a computation graph

For each epoch:

For each batch of data:

Compute loss on batch

Autograd to compute gradients and take step

Decode test set
