

# CS388: Natural Language Processing

## Lecture 17: Machine Translation 2

Greg Durrett

# Administrivia

---

- ▶ Project 2 due Thursday

# Recall: Phrase-Based MT

cat ||| chat ||| 0.9  
the cat ||| le chat ||| 0.8  
dog ||| chien ||| 0.8  
house ||| maison ||| 0.6  
my house ||| ma maison ||| 0.9  
language ||| langue ||| 0.9  
...

Phrase table  $P(f|e)$

Unlabeled English data

Language  
model  $P(e)$

$$P(e|f) \propto P(f|e)P(e)$$

Noisy channel model:  
combine scores from  
translation model +  
language model to  
translate foreign to  
English

“Translate faithfully but make fluent English”

# Recall: HMM for Alignment

- ▶ Sequential dependence between a's to capture monotonicity

$$P(\mathbf{f}, \mathbf{a}|\mathbf{e}) = \prod_{i=1}^n P(f_i|e_{a_i})P(a_i|a_{i-1})$$

- ▶ Alignment dist parameterized by jump size:  $P(a_j - a_{j-1})$  →

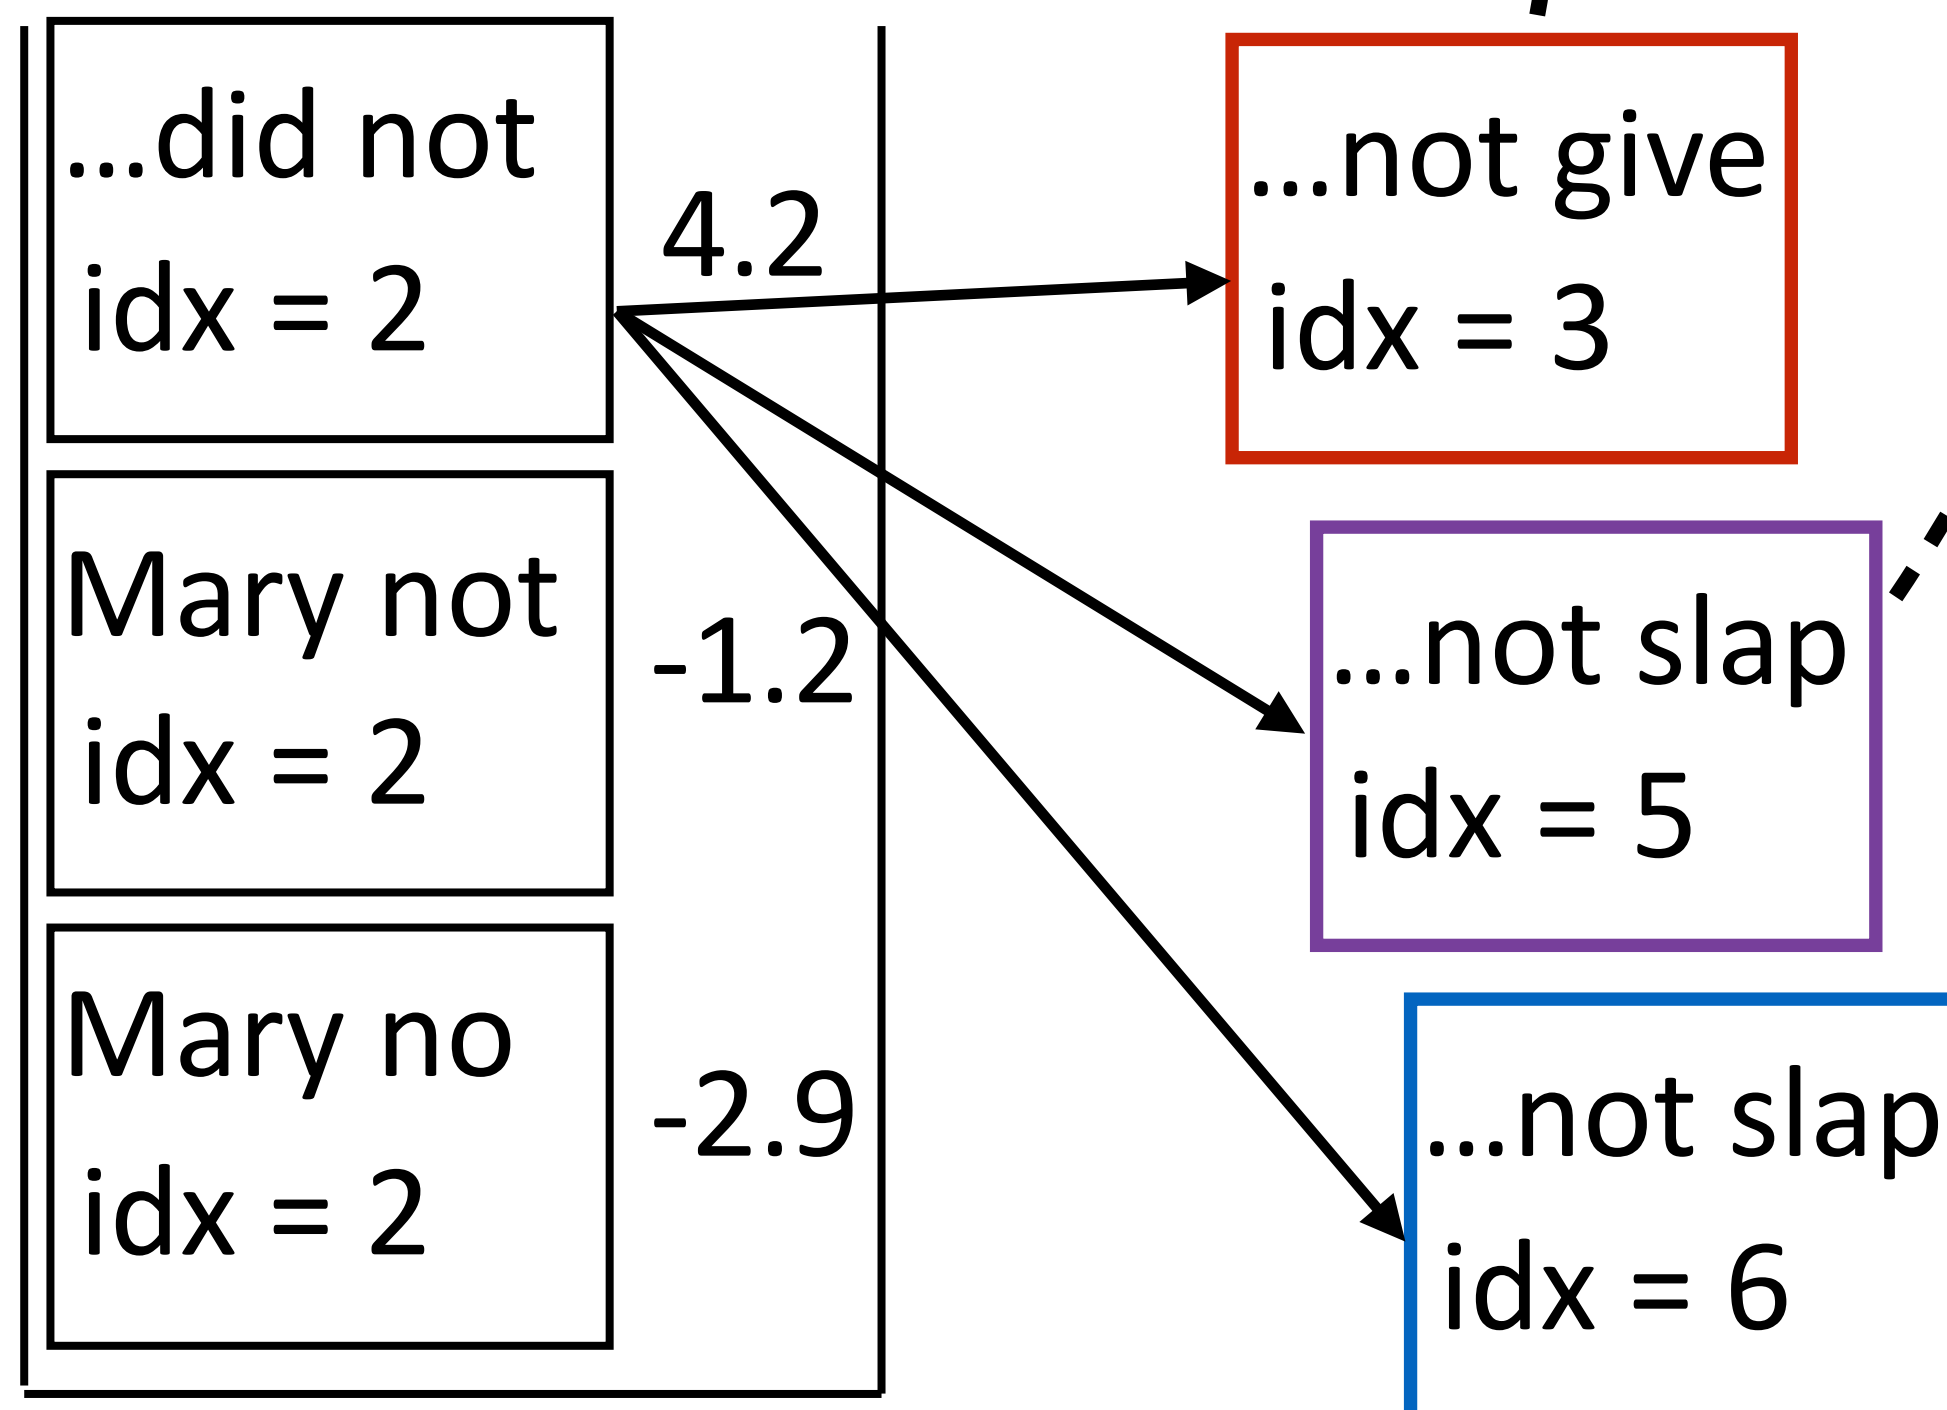

- ▶  $P(f_i|e_{a_i})$ : word translation table

Brown et al. (1993)

# Recall: Decoding

Maria	no	dio	una	bofetada	a	la	bruja	verde
1	2	3	4	5	6	7	8	9
Mary	not	<u>give</u>	a	slap	to	the	witch	green
	did not		a slap		by		green witch	
	no		slap		to the			
	did not give				to			
			slap		the			
						the witch		

► Scores from language model  $P(e)$  + translation model  $P(f|e)$

# This Lecture

---

- ▶ Neural MT details
- ▶ Tokenization
- ▶ Google's NMT system
- ▶ Transformers for MT

Neural MT

# Encoder-Decoder MT

- ▶ Sutskever seq2seq paper: first major application of LSTMs to NLP
- ▶ Basic encoder-decoder with beam search

Method	test BLEU score (ntst14)
Single forward LSTM, beam size 12	26.17
Single reversed LSTM, beam size 12	30.59
Ensemble of 5 reversed LSTMs, beam size 1	33.00
Ensemble of 2 reversed LSTMs, beam size 12	33.27
Ensemble of 5 reversed LSTMs, beam size 2	34.50
Ensemble of 5 reversed LSTMs, beam size 12	<b>34.81</b>

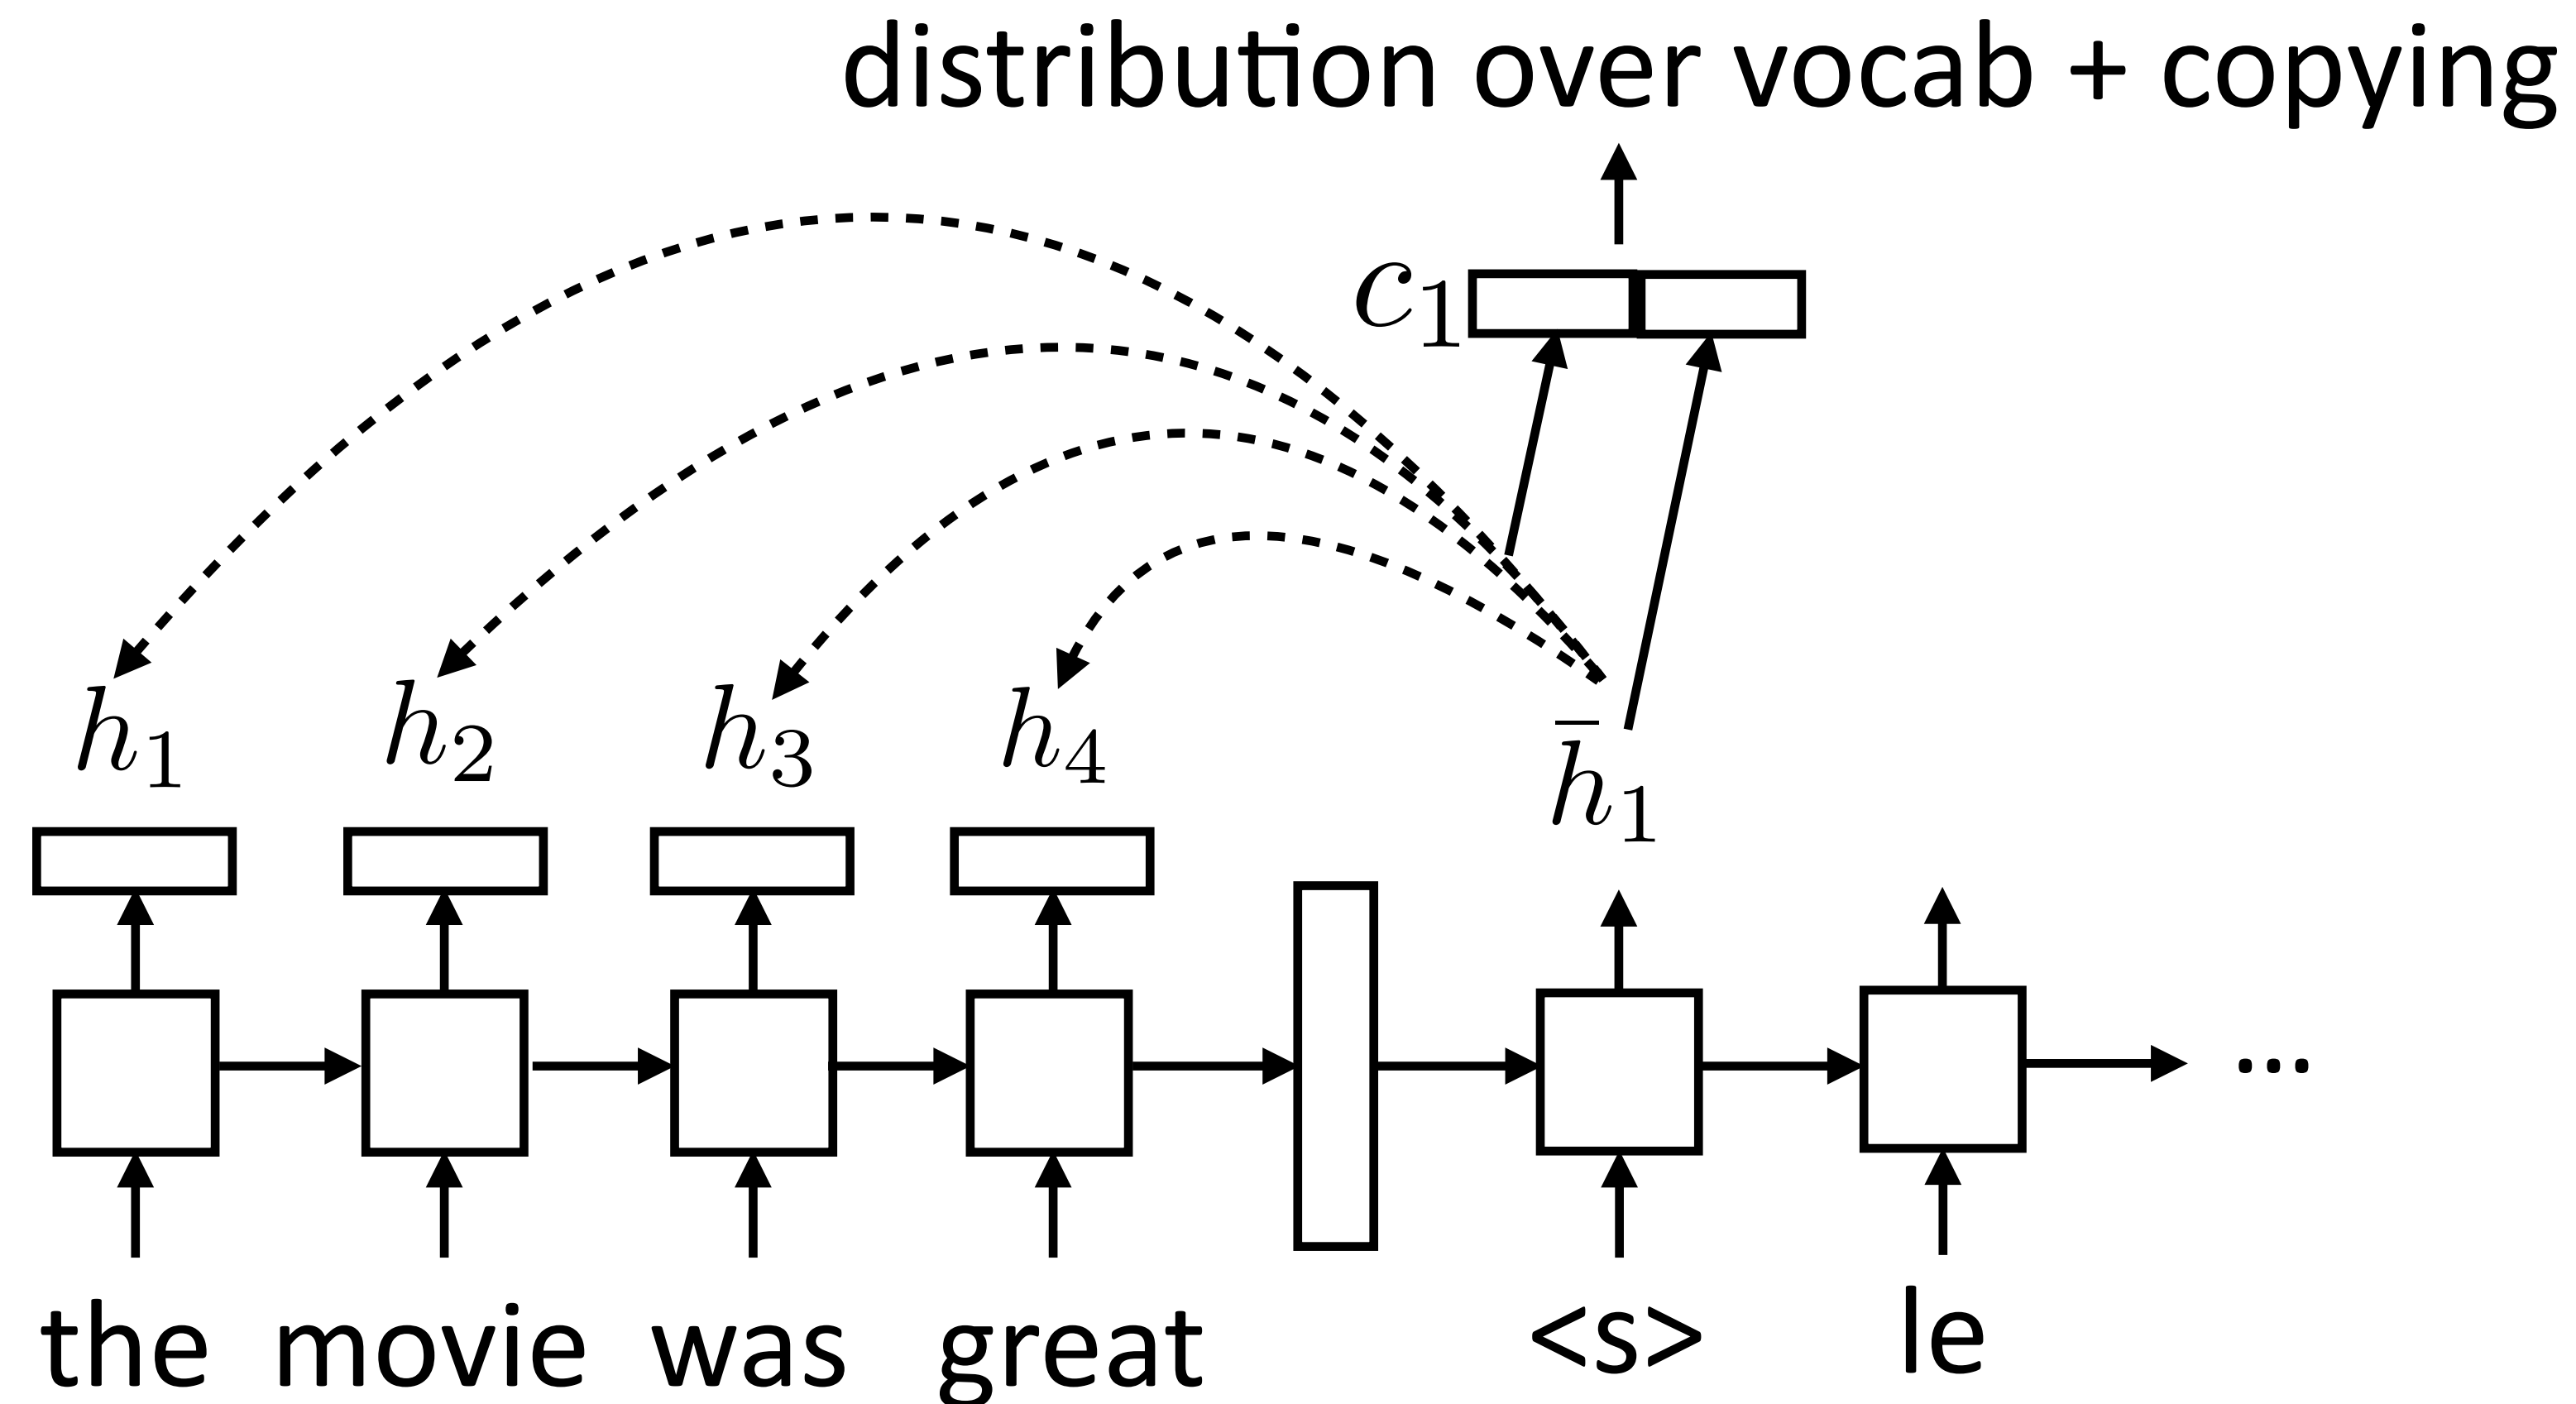

- ▶ SOTA = 37.0 — not all that competitive...

# Encoder-Decoder MT

- ▶ Better model from seq2seq lectures: encoder-decoder with attention and copying for rare words

# Results: WMT English-French

---

12M sentence pairs

Classic phrase-based system: ~**33** BLEU, uses additional target-language data

Rerank with LSTMs: **36.5** BLEU (long line of work here; Devlin+ 2014)

Sutskever+ (2014) seq2seq single: **30.6** BLEU

Sutskever+ (2014) seq2seq ensemble: **34.8** BLEU

Luong+ (2015) seq2seq ensemble with attention and rare word handling:  
**37.5** BLEU

- But English-French is a really easy language pair and there's *tons* of data for it

# Results: WMT English-German

---

4.5M sentence pairs

Classic phrase-based system: **20.7** BLEU

Luong+ (2014) seq2seq: **14** BLEU

Luong+ (2015) seq2seq ensemble with rare word handling: **23.0** BLEU

- ▶ BLEU isn't comparable across languages, but this performance still isn't as good
- ▶ French, Spanish = easiest  
German, Czech, Chinese = harder  
Japanese, Russian = hard (grammatically different, lots of morphology...)

# MT Examples

src	In einem Interview sagte Bloom jedoch , dass er und Kerr sich noch immer lieben .
ref	However , in an interview , Bloom has said that he and <i>Kerr</i> still love each other .
<i>best</i>	In an interview , however , Bloom said that he and <i>Kerr</i> still love .
base	However , in an interview , Bloom said that he and <b>Tina</b> were still <unk> .

- ▶ best = with attention, base = no attention
- ▶ NMT systems can hallucinate words, especially when not using attention  
— phrase-based doesn't do this

# MT Examples

src	Wegen der von Berlin und der Europäischen Zentralbank verhängten strengen Sparpolitik in Verbindung mit der Zwangsjacke , in die die jeweilige nationale Wirtschaft durch das Festhalten an der gemeinsamen Währung genötigt wird , sind viele Menschen der Ansicht , das Projekt Europa sei zu weit gegangen
ref	The <i>austerity imposed by Berlin and the European Central Bank</i> , coupled with the straitjacket imposed on national economies through adherence to the common currency , has led many people to think Project Europe has gone too far .
best	Because of the strict <i>austerity measures imposed by Berlin and the European Central Bank in connection with the straitjacket</i> in which the respective national economy is forced to adhere to the common currency , many people believe that the European project has gone too far .
base	Because of the pressure <b>imposed by the European Central Bank and the Federal Central Bank with the strict austerity</b> imposed on the national economy in the face of the single currency , many people believe that the European project has gone too far .

► best = with attention, base = no attention

# Backtranslation

- ▶ Classical MT methods used a bilingual corpus of sentences  $B = (S, T)$  and a large monolingual corpus  $T'$  to train a language model. Can neural MT do the same?
- ▶ Approach 1: force the system to generate  $T'$  as targets from null inputs
- ▶ Approach 2: generate synthetic sources with a  $T \rightarrow S$  machine translation system (backtranslation)

$s_1, t_1$   
 $s_2, t_2$   
...  
[null],  $t'_1$   
[null],  $t'_2$   
...

$s_1, t_1$   
 $s_2, t_2$   
...  
 $MT(t'_1), t'_1$   
 $MT(t'_2), t'_2$   
...

Sennrich et al. (2015)

# Backtranslation

name	training		BLEU			
	data	instances	tst2011	tst2012	tst2013	tst2014
baseline (Gülçehre et al., 2015)			18.4	18.8	19.9	18.7
deep fusion (Gülçehre et al., 2015)			20.2	20.2	21.3	<b>20.6</b>
baseline	parallel	7.2m	18.6	18.2	18.4	18.3
parallel <sub>synth</sub>	parallel/parallel <sub>synth</sub>	6m/6m	19.9	20.4	20.1	20.0
Gigaword <sub>mono</sub>	parallel/Gigaword <sub>mono</sub>	7.6m/7.6m	18.8	19.6	19.4	18.2
Gigaword <sub>synth</sub>	parallel/Gigaword <sub>synth</sub>	8.4m/8.4m	<b>21.2</b>	<b>21.1</b>	<b>21.8</b>	20.4

- ▶ Gigaword: large monolingual English corpus
- ▶ parallel<sub>synth</sub>: backtranslate training data; makes additional noisy source sentences which could be useful

Sennrich et al. (2015)

# Tokenization

# Handling Rare Words

- ▶ Words are a difficult unit to work with: copying can be cumbersome, word vocabularies get very large
- ▶ Character-level models don't work well
- ▶ Compromise solution: use thousands of “word pieces” (which may be full words but may also be parts of words)

Input: \_the \_**eco tax** \_port i co \_in \_Po nt - de - Bu is ...

Output: \_le \_port ique \_**éco taxe** \_de \_Pont - de - Bui s

- ▶ Can achieve transliteration with this, subword structure makes some translations easier to achieve

Sennrich et al. (2016)

# Byte Pair Encoding (BPE)

- ▶ Start with every individual byte (basically character) as its own symbol

```
for i in range(num_merges):  
    pairs = get_stats(vocab)  
    best = max(pairs, key=pairs.get)  
    vocab = merge_vocab(best, vocab)
```

- ▶ Count bigram character cooccurrences in dictionary
- ▶ Merge the most frequent pair of adjacent characters

- ▶ Vocabulary stats are weighted over a large corpus
- ▶ Doing 30k merges => vocabulary of around 30,000 word pieces. Includes many whole words

*and there were no re\_fueling stations anywhere*

*one of the city's more un\_princi\_pled real estate agents*

Sennrich et al. (2016)

# Word Pieces

---

- ▶ Alternative to BPE

while voc size < target voc size:

- Build a language model over your corpus

- Merge pieces that lead to highest improvement in language model perplexity

- ▶ Issues: what LM to use? How to make this tractable?
- ▶ SentencePiece library from Google: unigram LM
- ▶ Result: way of segmenting input appropriate for translation

Schuster and Nakajima (2012), Wu et al. (2016), Kudo and Richardson (2018)

# Comparison

(a)	<b>Original:</b>	furiously		(b)	<b>Original:</b>	tricycles			
	<b>BPE:</b>	_fur	iously		<b>BPE:</b>	_t	ric	y	cles
	<b>Unigram LM:</b>	_fur	ious   ly		<b>Unigram LM:</b>	_tri	cycle	s	
(c)	<b>Original:</b>	Completely preposterous suggestions							
	<b>BPE:</b>	_Comple	t	ely	_prep	ost	erous	_suggest	ions
	<b>Unigram LM:</b>	_Complete	ly	_pre	post	er	ous	_suggestion	s

- ▶ BPE produces less linguistically plausible units than word pieces (unigram LM)
- ▶ Some evidence that unigram LM works better in pre-trained transformer models

# Subword Regularization

Subwords (- means spaces)	Vocabulary id sequence
_Hell/o/_world	13586 137 255
_H/ello/_world	320 7363 255
_He/llo/_world	579 10115 255
_/He/l/l/o/_world	7 18085 356 356 137 255
_H/el/l/o/_/world	320 585 356 137 7 12295

Domain (size)	Corpus	Language pair	Baseline (BPE)	Proposed (SR)
Web (5k)	IWSLT15	en → vi	13.86	17.36*
		vi → en	7.83	11.69*
		en → zh	9.71	13.85*
		zh → en	5.93	8.13*
		en → fr	16.09	20.04*
	IWSLT17	fr → en	14.77	19.99*
		en → de	22.71	26.02*
		de → en	26.42	29.63*
		en → cs	19.53	21.41*
		cs → en	25.94	27.86*

- Change subword sampling on-the-fly during training

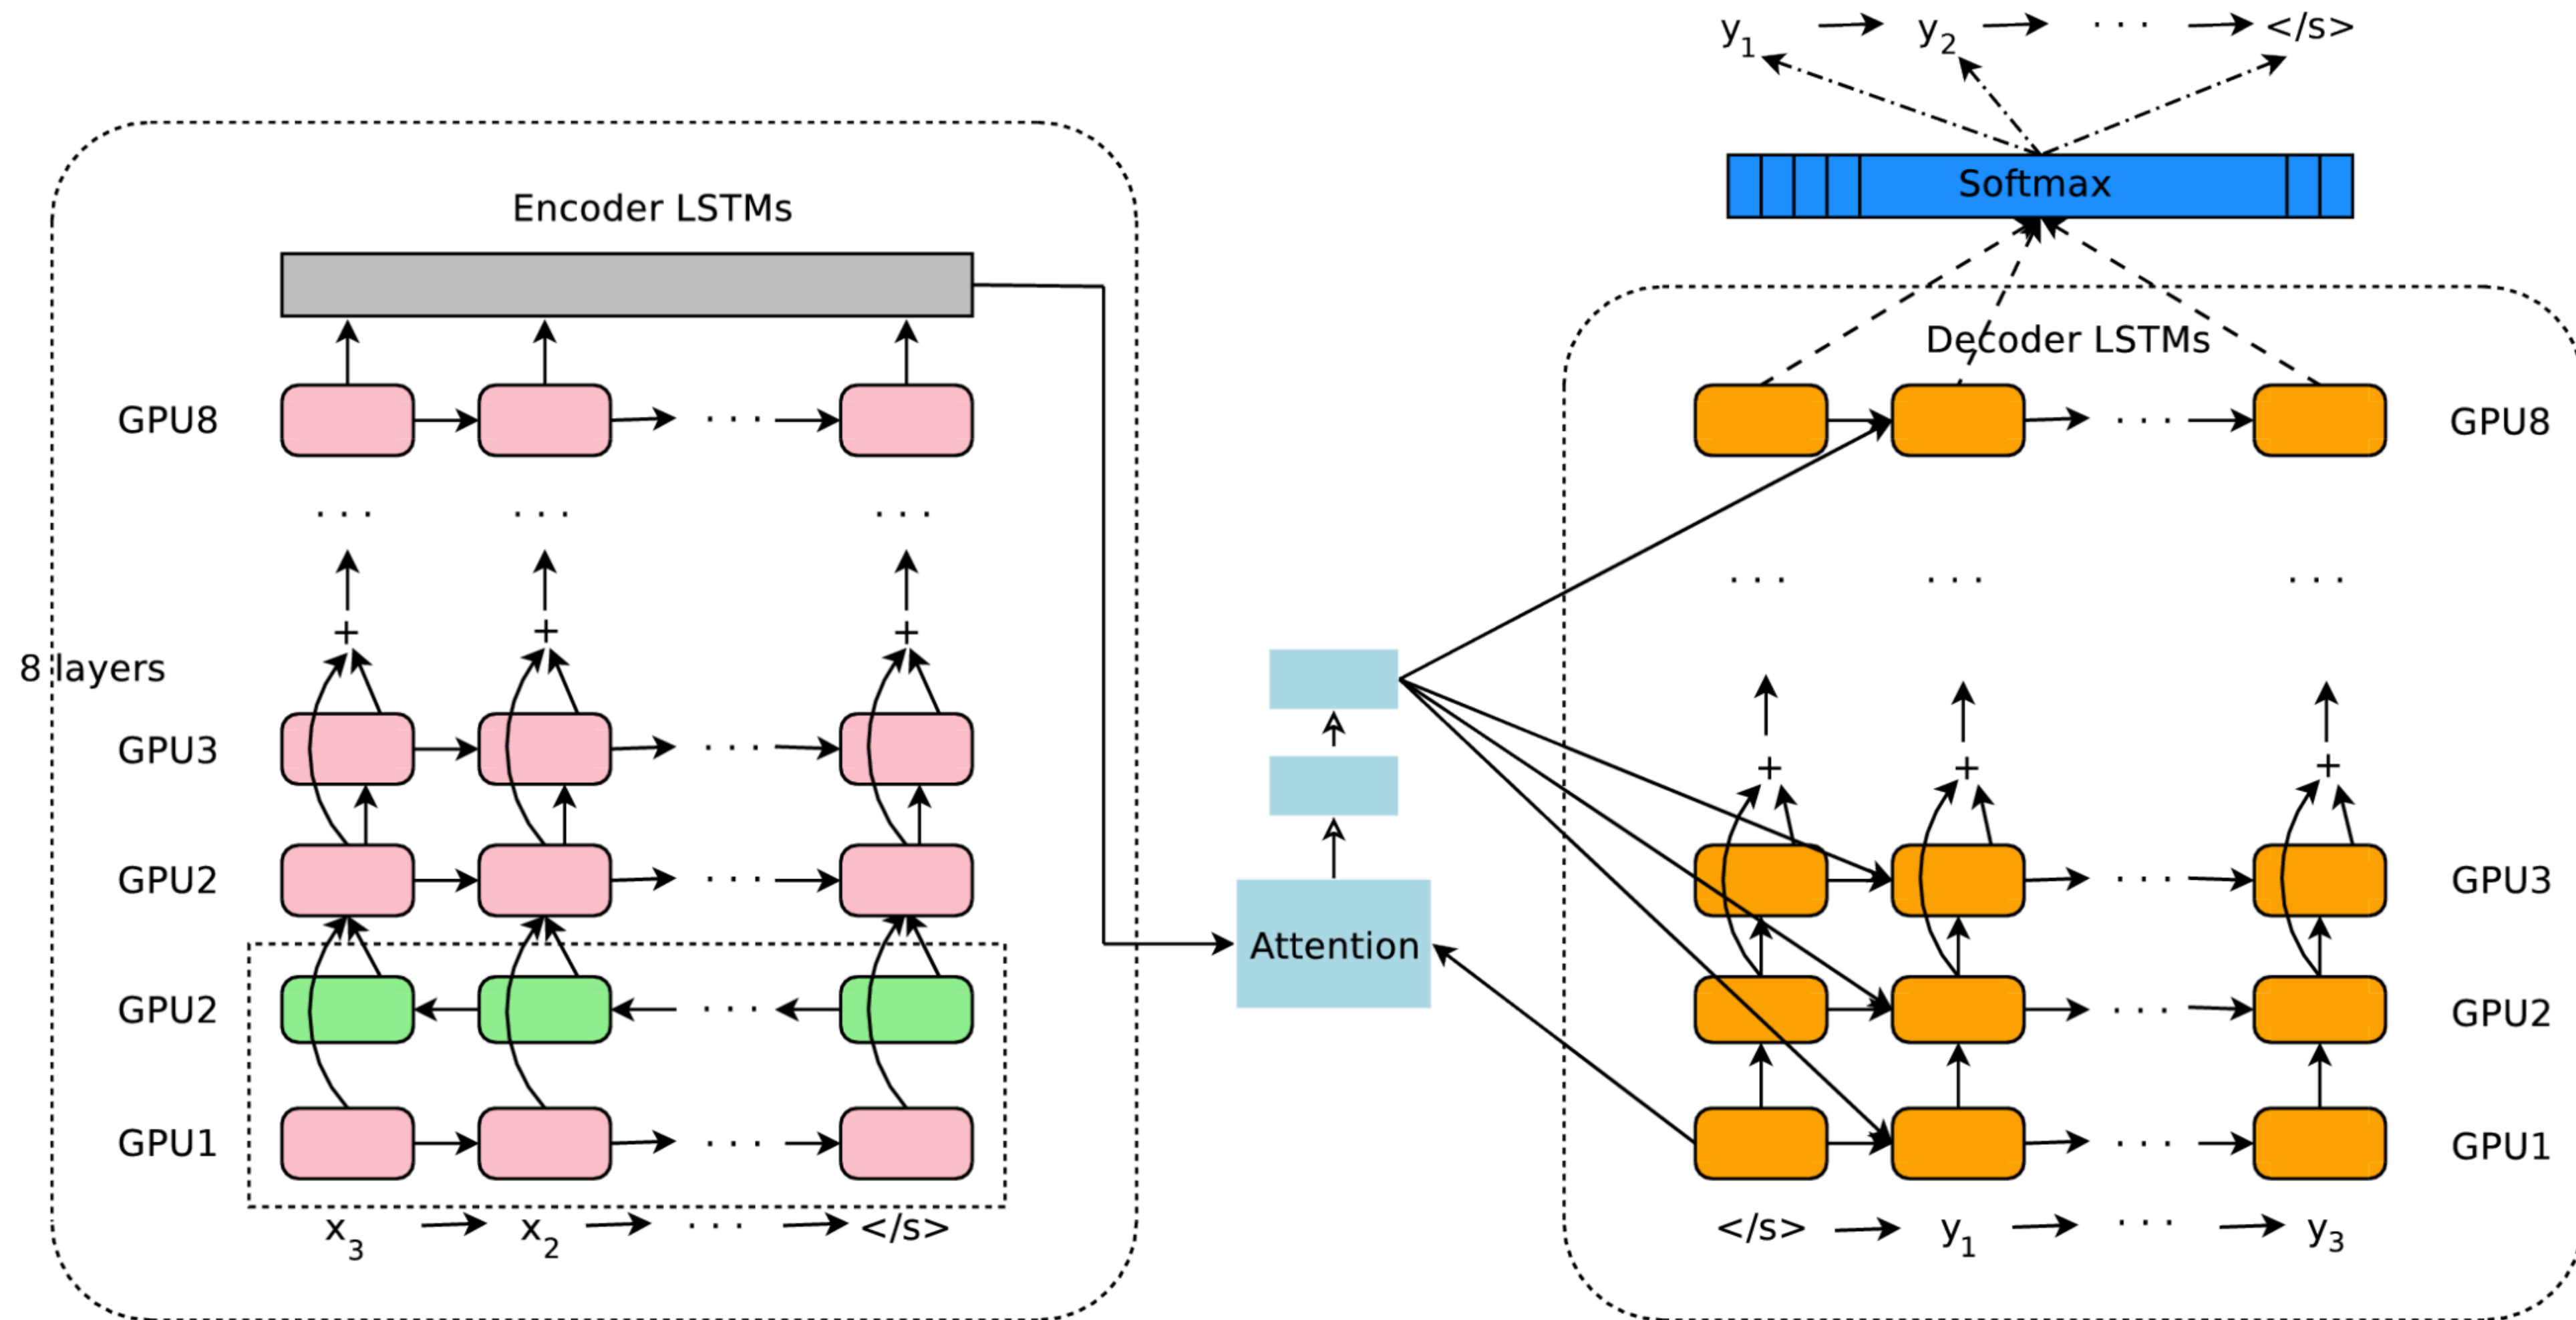

- Subword regularization (SR) improves results over a static scheme (BPE)

Google NMT

# Google's NMT System

- ▶ 8-layer LSTM encoder-decoder with attention, word piece vocabulary of 8k-32k

Wu et al. (2016)

# Google's NMT System

---

English-French:

Google's phrase-based system: 37.0 BLEU

Luong+ (2015) seq2seq ensemble with rare word handling: 37.5 BLEU

Google's 32k word pieces: 38.95 BLEU

English-German:

Google's phrase-based system: 20.7 BLEU

Luong+ (2015) seq2seq ensemble with rare word handling: 23.0 BLEU

Google's 32k word pieces: 24.2 BLEU

# Human Evaluation (En-Es)

- ▶ Similar to human-level performance *on English-Spanish*

# Google's NMT System

Source	She was spotted three days later by a dog walker trapped in the quarry	
PBMT	Elle a été repéré trois jours plus tard par un promeneur de chien piégé dans la carrière	6.0
GNMT	Elle a été repérée trois jours plus tard par un traîneau à chiens piégé dans la carrière.	2.0
Human	Elle a été repérée trois jours plus tard par une personne qui promenait son chien coincée dans la carrière	5.0

Gender is correct in GNMT  
but not in PBMT

“sled” “walker”

# Frontiers in MT: Small Data

ID	system	BLEU	
		100k	3.2M
1	phrase-based SMT	15.87 $\pm$ 0.19	26.60 $\pm$ 0.00
2	NMT baseline	0.00 $\pm$ 0.00	25.70 $\pm$ 0.33
3	2 + "mainstream improvements" (dropout, tied embeddings, layer normalization, bideep RNN, label smoothing)	7.20 $\pm$ 0.62	31.93 $\pm$ 0.05
4	3 + reduce BPE vocabulary (14k $\rightarrow$ 2k symbols)	12.10 $\pm$ 0.16	-
5	4 + reduce batch size (4k $\rightarrow$ 1k tokens)	12.40 $\pm$ 0.08	31.97 $\pm$ 0.26
6	5 + lexical model	13.03 $\pm$ 0.49	31.80 $\pm$ 0.22
7	5 + aggressive (word) dropout	15.87 $\pm$ 0.09	<b>33.60</b> $\pm$ 0.14
8	7 + other hyperparameter tuning (learning rate, model depth, label smoothing rate)	<b>16.57</b> $\pm$ 0.26	32.80 $\pm$ 0.08
9	8 + lexical model	16.10 $\pm$ 0.29	33.30 $\pm$ 0.08

- Synthetic small data setting: German  $\rightarrow$  English

Sennrich and Zhang (2019)

# Frontiers in MT: Low-Resource

- ▶ Particular interest in deploying MT systems for languages with little or no parallel data

- ▶ BPE allows us to transfer models even without training on a specific language

- ▶ Pre-trained models can help further

Burmese, Indonesian, Turkish  
BLEU

Transfer	My→En	Id→En	Tr→En
baseline (no transfer)	4.0	20.6	19.0
transfer, train	17.8	27.4	20.3
transfer, train, reset emb, train	13.3	25.0	20.0
transfer, train, reset inner, train	3.6	18.0	19.1

Table 3: Investigating the model’s capability to restore its quality if we reset the parameters. We use En→De as the parent.

Aji et al. (2020)

# Transformers for MT

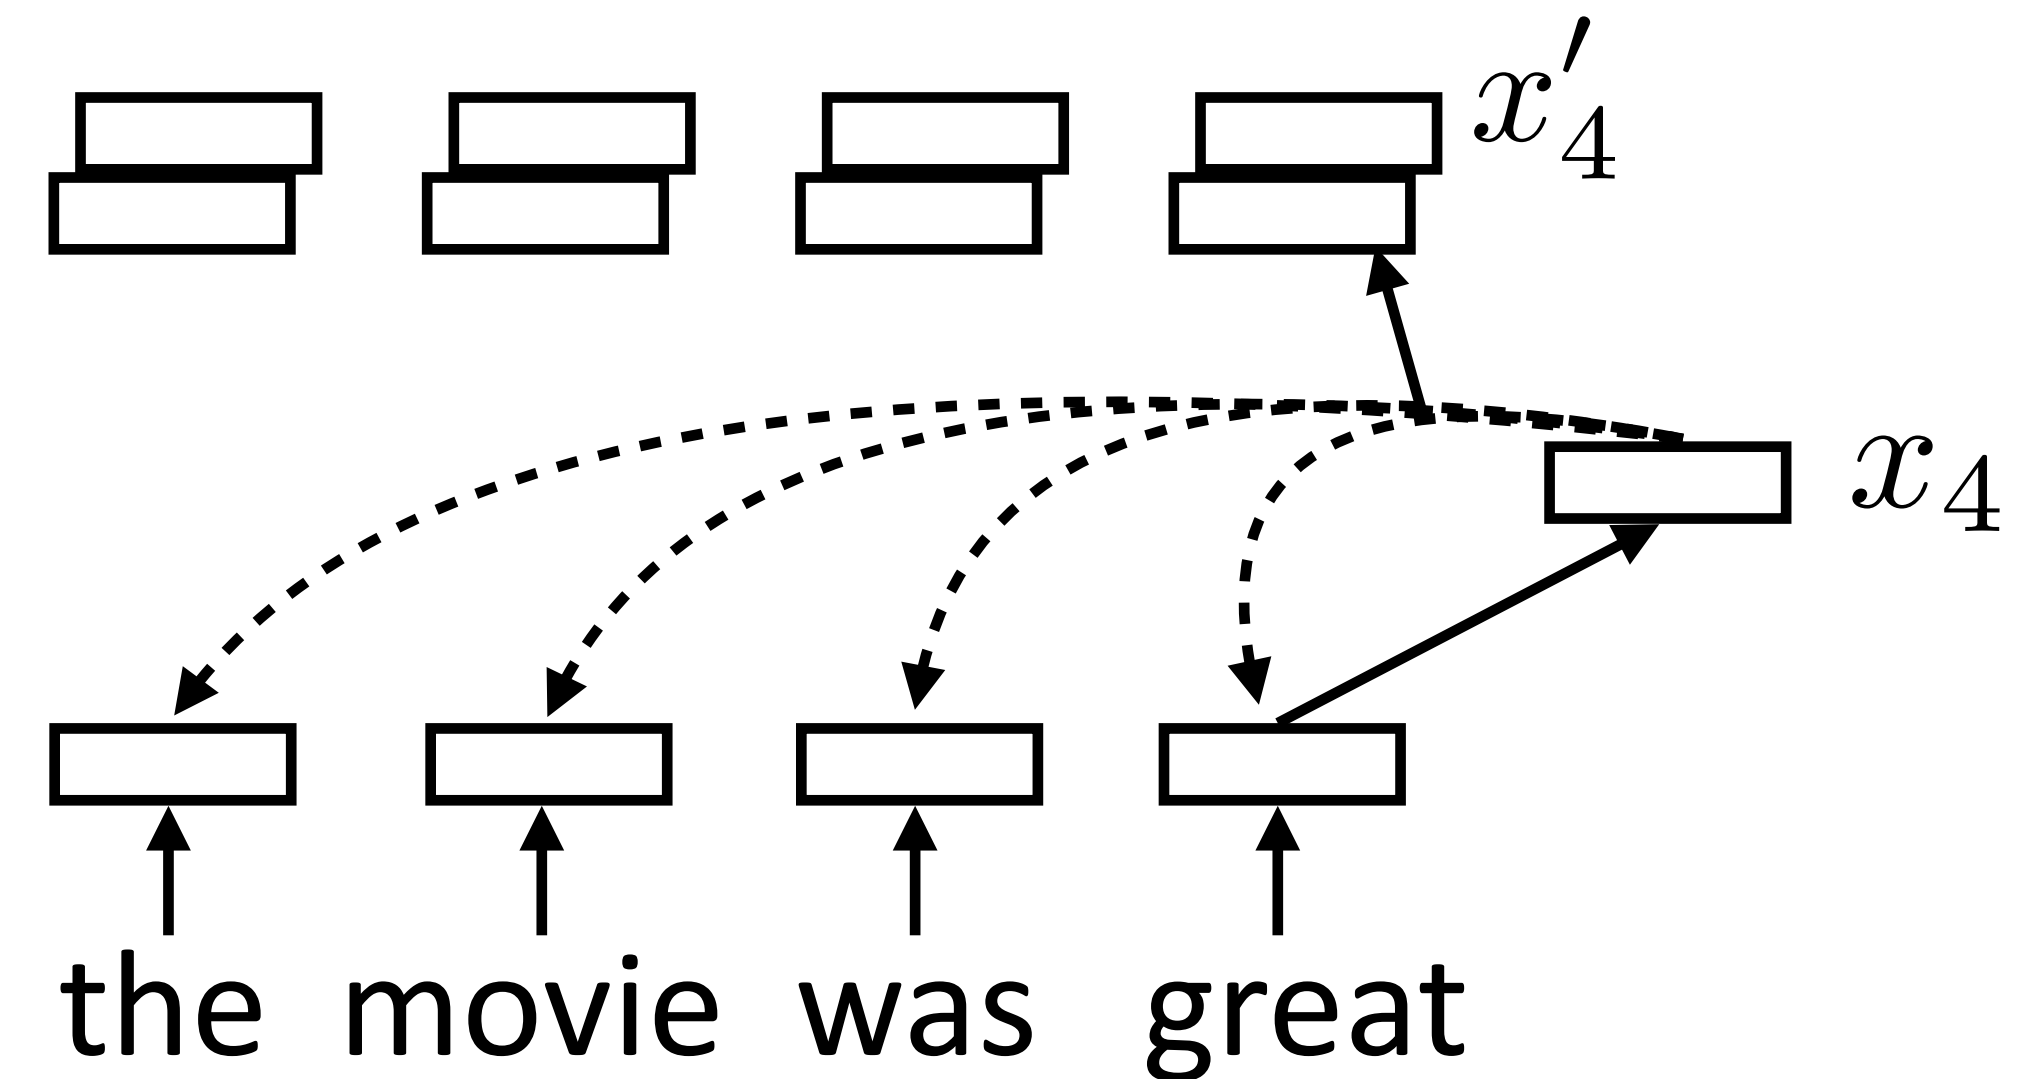

# Recall: Self-Attention

- ▶ Each word forms a “query” which then computes attention over each word

$$\alpha_{i,j} = \text{softmax}(x_i^\top x_j) \quad \text{scalar}$$

$$x'_i = \sum_{j=1}^n \alpha_{i,j} x_j \quad \text{vector} = \text{sum of scalar} * \text{vector}$$

- ▶ Multi-head self attention: we are going to replicate this machinery several times with different parameters

# Multi-Head Self Attention

- ▶ Multiple “heads” analogous to different convolutional filters
- ▶ Let  $X = [\text{sent len}, \text{embedding dim}]$  be the input sentence
- ▶ Query  $Q = W^Q X$ : these are like the **decoder hidden state** in attention
- ▶ Keys  $K = W^K X$ : these control what gets attended to, along with the query
- ▶ Values  $V = W^V X$ : these vectors get summed up to form the output

$$\text{Attention}(Q, K, V) = \text{softmax}\left(\frac{QK^T}{\sqrt{d_k}}\right)V$$

dim of keys

# Multi-Head Self Attention

$$\begin{matrix} \text{X} \\ \begin{array}{|c|c|c|c|} \hline \square & \square & \square & \square \\ \hline \square & \square & \square & \square \\ \hline \end{array} \end{matrix} \times \begin{matrix} \text{W}^{\text{Q}} \\ \begin{array}{|c|c|c|} \hline \square & \square & \square \\ \hline \square & \square & \square \\ \hline \square & \square & \square \\ \hline \end{array} \end{matrix} = \begin{matrix} \text{Q} \\ \begin{array}{|c|c|c|} \hline \square & \square & \square \\ \hline \square & \square & \square \\ \hline \end{array} \end{matrix}$$

$$\begin{matrix} \text{X} \\ \begin{array}{|c|c|c|c|} \hline \square & \square & \square & \square \\ \hline \square & \square & \square & \square \\ \hline \end{array} \end{matrix} \times \begin{matrix} \text{W}^{\text{K}} \\ \begin{array}{|c|c|c|} \hline \square & \square & \square \\ \hline \square & \square & \square \\ \hline \square & \square & \square \\ \hline \end{array} \end{matrix} = \begin{matrix} \text{K} \\ \begin{array}{|c|c|c|} \hline \square & \square & \square \\ \hline \square & \square & \square \\ \hline \end{array} \end{matrix}$$

$$\begin{matrix} \text{X} \\ \begin{array}{|c|c|c|c|} \hline \square & \square & \square & \square \\ \hline \square & \square & \square & \square \\ \hline \end{array} \end{matrix} \times \begin{matrix} \text{W}^{\text{V}} \\ \begin{array}{|c|c|c|} \hline \square & \square & \square \\ \hline \square & \square & \square \\ \hline \square & \square & \square \\ \hline \end{array} \end{matrix} = \begin{matrix} \text{V} \\ \begin{array}{|c|c|c|} \hline \square & \square & \square \\ \hline \square & \square & \square \\ \hline \end{array} \end{matrix}$$

Alammar, *The Illustrated Transformer*

sent len x sent len (attn for each word to each other)

$$\text{softmax} \left( \frac{\begin{matrix} \text{Q} \\ \begin{array}{|c|c|c|} \hline \square & \square & \square \\ \hline \square & \square & \square \\ \hline \end{array} \end{matrix} \times \begin{matrix} \text{K}^{\text{T}} \\ \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \square & \square \\ \hline \end{array} \end{matrix}}{\sqrt{d_k}} \right) \begin{matrix} \text{V} \\ \begin{array}{|c|c|c|} \hline \square & \square & \square \\ \hline \square & \square & \square \\ \hline \end{array} \end{matrix}$$

$$= \begin{matrix} \text{Z} \\ \begin{array}{|c|c|c|} \hline \square & \square & \square \\ \hline \square & \square & \square \\ \hline \end{array} \end{matrix}$$

sent len x hidden dim

Z is a weighted combination of V rows

# Properties of Self-Attention

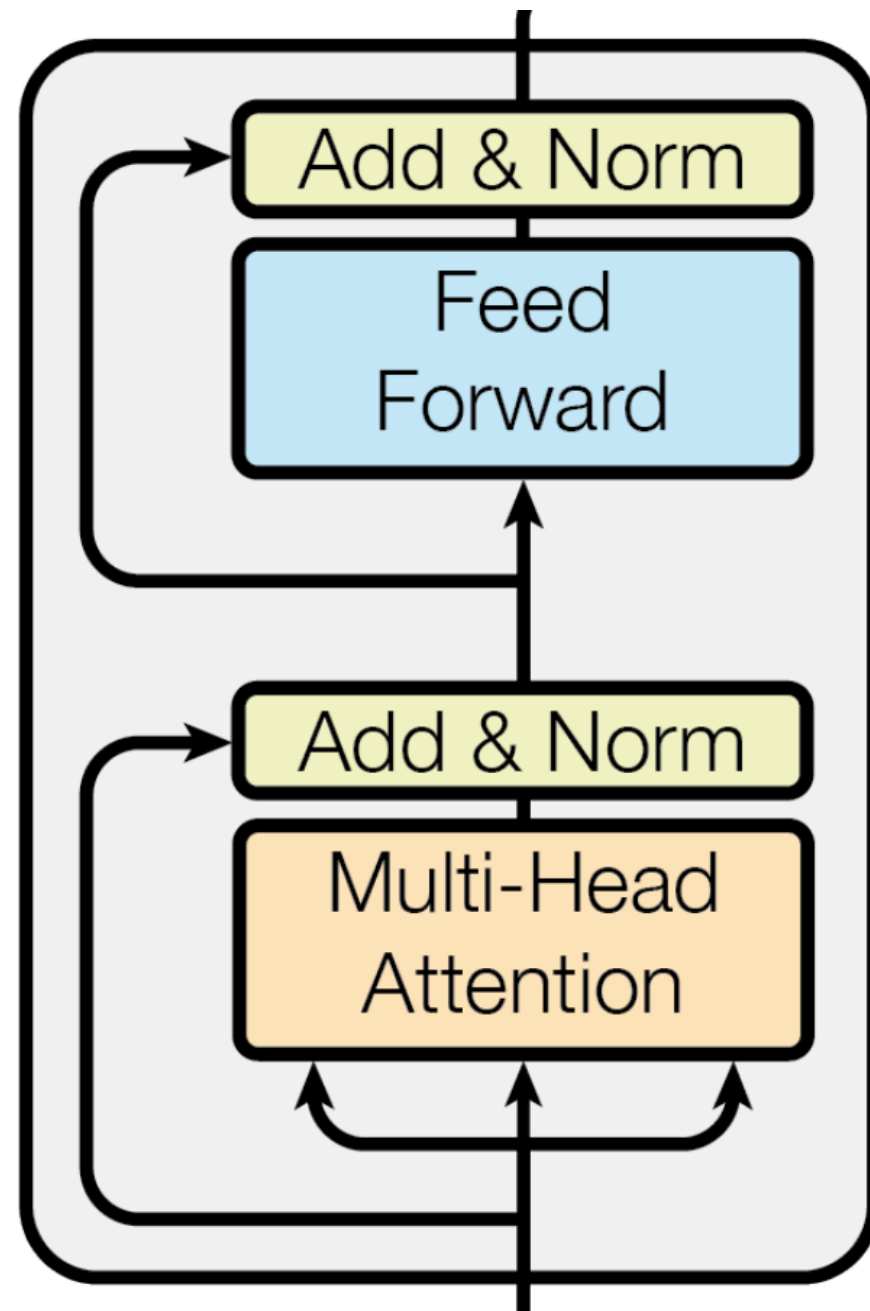

Layer Type	Complexity per Layer	Sequential Operations	Maximum Path Length
Self-Attention	$O(n^2 \cdot d)$	$O(1)$	$O(1)$
Recurrent	$O(n \cdot d^2)$	$O(n)$	$O(n)$
Convolutional	$O(k \cdot n \cdot d^2)$	$O(1)$	$O(\log_k(n))$
Self-Attention (restricted)	$O(r \cdot n \cdot d)$	$O(1)$	$O(n/r)$

- ▶  $n$  = sentence length,  $d$  = hidden dim,  $k$  = kernel size,  $r$  = restricted neighborhood size
- ▶ **Quadratic complexity**, but  $O(1)$  sequential operations (not linear like in RNNs) and  $O(1)$  “path” for words to inform each other

# Transformers

- ▶ Alternate multi-head self-attention layers and feedforward layers
- ▶ Residual connections let the model “skip” each layer — these are particularly useful for training deep networks

# Transformers: Position Sensitivity

---

*The ballerina is very excited that **she** will dance in the **show**.*

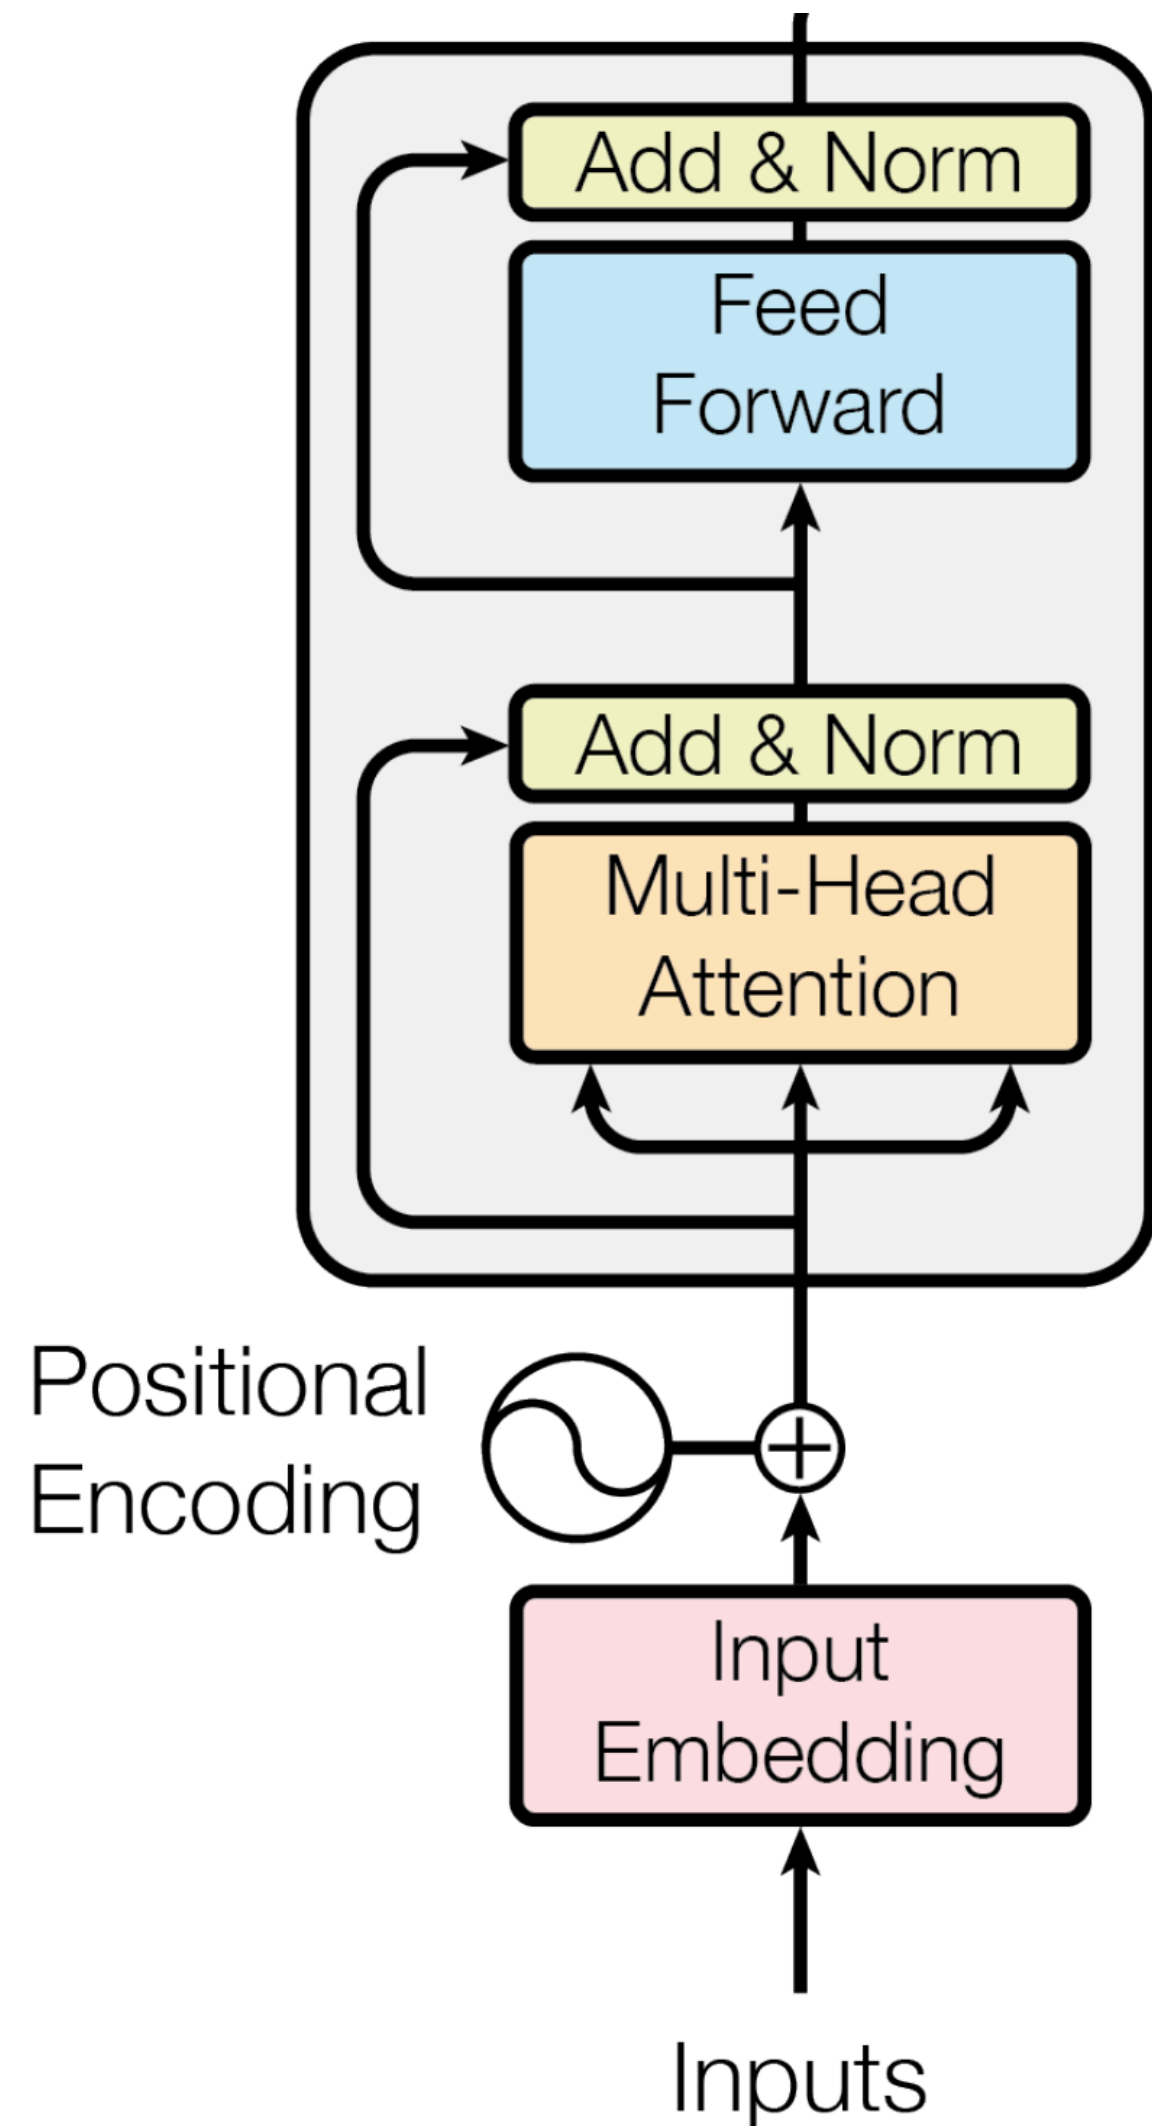

A diagram illustrating attention weights for the word "show". A blue curved arrow originates from the word "show" and points to the word "she". A red curved arrow originates from the word "show" and points to the word "excited".

- ▶ If this is in a longer context, we want words to attend *locally*
- ▶ But transformers have *no notion of position* by default

# Transformers: Position Sensitivity

- ▶ Augment word embedding with position embeddings, each dim is a sine/cosine wave of a different frequency. Closer points = higher dot products
- ▶ Works essentially as well as just encoding position as a one-hot vector

Vaswani et al. (2017)

# Transformers

Alammar, *The Illustrated Transformer*

# Transformers: Complete Model

- ▶ Encoder and decoder are both transformers
- ▶ Decoder alternates attention over the output and attention over the input as well
- ▶ Decoder consumes the previous generated tokens but has *no recurrent state*

# Transformers

Model	BLEU	
	EN-DE	EN-FR
ByteNet [18]	23.75	
Deep-Att + PosUnk [39]		39.2
GNMT + RL [38]	24.6	39.92
ConvS2S [9]	25.16	40.46
MoE [32]	26.03	40.56
Deep-Att + PosUnk Ensemble [39]		40.4
GNMT + RL Ensemble [38]	26.30	41.16
ConvS2S Ensemble [9]	26.36	<b>41.29</b>
Transformer (base model)	27.3	38.1
Transformer (big)	<b>28.4</b>	<b>41.8</b>

- Big = 6 layers, 1000 dim for each token, 16 heads, base = 6 layers + other params halved

# Visualization

# Takeaways

---

- ▶ Can build MT systems with LSTM encoder-decoders or transformers (or CNNs)
- ▶ Word piece / byte pair models are really effective and easy to use
- ▶ State of the art systems are getting pretty good, but lots of challenges remain, especially for low-resource settings
- ▶ Next time: pre-trained transformer models (BERT), applied to other tasks
