

CS243: Discrete Structures

Propositional Logic II

Işıl Dillig

Işıl Dillig,

CS243: Discrete Structures Propositional Logic II

1/32

Announcements

- ▶ First homework assignment out today!
- ▶ Due in one week, i.e., before lecture next Tuesday 09/11
- ▶ Weilin's Tuesday office hours are 9-10 AM, not 10-11 AM

Işıl Dillig,

CS243: Discrete Structures Propositional Logic II

2/32

Review

- ▶ Propositional logic is simplest kind of logic
- ▶ Building blocks are **propositions**, i.e., statements that are true or false
- ▶ Formulas in propositional logic are formed using propositional variables and boolean connectives
- ▶ **Connectives**: negation \neg , conjunction \wedge , disjunction \vee , conditional \rightarrow , biconditional \leftrightarrow
- ▶ Truth table shows truth value of formula under all possible assignments to variables

Işıl Dillig,

CS243: Discrete Structures Propositional Logic II

3/32

Operator Precedence

- ▶ Given a formula $p \wedge q \vee r$, do we parse this as $(p \wedge q) \vee r$ or $p \wedge (q \vee r)$?
- ▶ Without settling on a convention, formulas without explicit paranthesization are ambiguous.
- ▶ To avoid ambiguity, we will specify **precedence** for logical connectives.
- ▶ Operator precedence is a convention that tells us how to parse formulas if they are not explicitly paranthesized.

Işıl Dillig,

CS243: Discrete Structures Propositional Logic II

4/32

Operator Precedence, cont.

- ▶ Negation (\neg) has **higher precedence** than all other connectives.
- ▶ **Question**: Does $\neg p \wedge q$ mean (i) $\neg(p \wedge q)$ or (ii) $(\neg p) \wedge q$?
- ▶ Conjunction (\wedge) has next highest precedence.
- ▶ **Question**: Does $p \wedge q \vee r$ mean (i) $(p \wedge q) \vee r$ or (ii) $p \wedge (q \vee r)$?
- ▶ Disjunction (\vee) has third highest precedence.
- ▶ Next highest is precedence is \rightarrow , and lowest precedence is \leftrightarrow

Işıl Dillig,

CS243: Discrete Structures Propositional Logic II

5/32

Operator Precedence Example

- ▶ Which is the correct interpretation of the formula

$$p \vee q \wedge r \leftrightarrow q \rightarrow \neg r$$

- (A) $((p \vee (q \wedge r)) \leftrightarrow q) \rightarrow (\neg r)$
- (B) $((p \vee q) \wedge r) \leftrightarrow q \rightarrow (\neg r)$
- (C) $(p \vee (q \wedge r)) \leftrightarrow (q \rightarrow (\neg r))$
- (D) $(p \vee ((q \wedge r) \leftrightarrow q)) \rightarrow (\neg r)$

Işıl Dillig,

CS243: Discrete Structures Propositional Logic II

6/32

Validity, Unsatisfiability

- ▶ The truth value of a propositional formula depends on truth assignments to variables
- ▶ **Example:** $\neg p$ evaluates to true under the assignment $p = F$ and to false under $p = T$
- ▶ Some formulas evaluate to true for **every assignment**, e.g., $p \vee \neg p$
- ▶ Such formulas are called **tautologies** or **valid formulas**
- ▶ Some formulas evaluate to false for **every assignment**, e.g., $p \wedge \neg p$
- ▶ Such formulas are called **unsatisfiable formulas** or **contradictions**

lpl Dilling,

CS243: Discrete Structures Propositional Logic II

7/32

Interpretations

- ▶ Concepts of validity, satisfiability are very important in logic!
- ▶ To make them precise, we'll define **interpretation** of formula
- ▶ An **interpretation** I for a formula F is a mapping from each propositional variables in F to exactly one truth value

$$I : \{p \mapsto \text{true}, q \mapsto \text{false}, \dots\}$$

- ▶ In general, for formula with n propositional variables, there are 2^n interpretations
- ▶ Each interpretation corresponds to one row in the truth table

lpl Dilling,

CS243: Discrete Structures Propositional Logic II

8/32

Entailment

- ▶ Under an interpretation, every propositional formula evaluates to T or F

Formula F + Interpretation I = Truth value

- ▶ We write $I \models F$ if F evaluates to **true** under I
- ▶ Similarly, $I \not\models F$ if F evaluates to **false** under I .
- ▶ **Theorem:** $I \models F$ if and only if $I \not\models \neg F$

lpl Dilling,

CS243: Discrete Structures Propositional Logic II

9/32

Examples

- ▶ Consider the formula $F : p \wedge q \rightarrow \neg p \vee \neg q$
- ▶ Let I_1 be the interpretation such that $[p \mapsto \text{true}, q \mapsto \text{false}]$
- ▶ What does F evaluate to under I_1 ?
- ▶ Thus, $I_1 \models F$
- ▶ Let I_2 be the interpretation such that $[p \mapsto \text{true}, q \mapsto \text{true}]$
- ▶ What does F evaluate to under I_2 ?
- ▶ Thus, $I_2 \not\models F$

lpl Dilling,

CS243: Discrete Structures Propositional Logic II

10/32

Another Example

- ▶ Let F_1 and F_2 be two propositional formulas
- ▶ Suppose F_1 evaluates to true under interpretation I
- ▶ What does $F_2 \wedge \neg F_1$ evaluate to under I ?

lpl Dilling,

CS243: Discrete Structures Propositional Logic II

11/32

Satisfiability, Validity

- ▶ F is **satisfiable** iff there exists interpretation I s.t. $I \models F$
- ▶ F is **valid** iff for **all** interpretations I , $I \models F$
- ▶ F is **unsatisfiable** iff for all interpretations I , $I \not\models F$
- ▶ F is **contingent** if it is satisfiable, but not valid.
- ▶ Valid formulas also called **tautologies**
- ▶ Unsatisfiable formulas called **contradictions**

lpl Dilling,

CS243: Discrete Structures Propositional Logic II

12/32

True/False Questions

Are the following statements true or false?

- ▶ If a formula is valid, then it is also satisfiable.
- ▶ If a formula is satisfiable, then its negation is unsatisfiable.
- ▶ If F_1 and F_2 are satisfiable, then $F_1 \wedge F_2$ is also satisfiable.
- ▶ A formula can be both contingent and unsatisfiable

lpl Dillig,

CS243: Discrete Structures Propositional Logic II

13/32

Duality Between Validity and Unsatisfiability

F is valid if and only if $\neg F$ is unsatisfiable

▶ Proof:

- ▶ By definition, F is valid iff for all interpretations I , $I \models F$
- ▶ By theorem, $I \models F$ iff $I \not\models \neg F$
- ▶ Thus, F is valid iff for all interpretations I , $I \not\models \neg F$
- ▶ But if for all interpretations I , $I \not\models \neg F$, then $\neg F$ is unsat
- ▶ Thus, F valid iff $\neg F$ unsat

lpl Dillig,

CS243: Discrete Structures Propositional Logic II

14/32

Proving Validity

▶ **Question:** How can we prove that a propositional formula is a tautology?

▶ **Exercise:** Which formulas are tautologies? Prove your answer.

1. $(p \rightarrow q) \leftrightarrow (\neg q \rightarrow \neg p)$
2. $(p \wedge q) \vee \neg p$

lpl Dillig,

CS243: Discrete Structures Propositional Logic II

15/32

Proving Satisfiability, Unsatisfiability, Contingency

▶ Similarly, can prove satisfiability, unsatisfiability, contingency using truth tables:

- ▶ **Satisfiable:** There exists a row where formula evaluates to true
- ▶ **Unsatisfiable:** In all rows, formula evaluates to false
- ▶ **Contingent:** Exists a row where formula evaluates to true, and another row where it evaluates to false

lpl Dillig,

CS243: Discrete Structures Propositional Logic II

16/32

Exercises

1. Prove $\neg(p \wedge q) \wedge \neg(\neg p \vee \neg q)$ is unsatisfiable
2. Prove $(p \rightarrow q) \rightarrow (q \rightarrow p)$ is a contingency

lpl Dillig,

CS243: Discrete Structures Propositional Logic II

17/32

Implication

▶ Formula F_1 **implies** F_2 (written $F_1 \Rightarrow F_2$) iff for all interpretations I , $I \models F_1 \rightarrow F_2$

$F_1 \Rightarrow F_2$ iff $F_1 \rightarrow F_2$ is valid

- ▶ **Caveat:** $F_1 \Rightarrow F_2$ is not a propositional logic formula; \Rightarrow is not part of PL syntax!
- ▶ Instead, $F_1 \Rightarrow F_2$ is a semantic judgment, like satisfiability!

lpl Dillig,

CS243: Discrete Structures Propositional Logic II

18/32

Syntax vs. Semantics

- ▶ **Syntax:** What you are allowed to write
 - ▶ \wedge, \rightarrow are part of PL **syntax**, but \star, \Rightarrow are not!
 - ▶ $p_1 \wedge p_2$ is a syntactically valid PL formula, $p_1 \star p_2$ is not!
- ▶ **Semantics:** Concerns meaning of what is written
 - ▶ Validity, satisfiability semantic notions b/c they concern **meaning** of the formula
 - ▶ Semantics gives meaning to syntax
- ▶ Difference between syntax vs. semantics **crucial** in CS
 - ▶ Comes up in logic, programming languages, theory of computation, ...

Checking Implication

- ▶ **Question:** How can we check if $F_1 \Rightarrow F_2$?
- ▶ **Exercise:** Does $p \vee q$ imply p ? Prove your answer!

Equivalence

- ▶ Consider two propositional formulas F_1 and F_2 .
- ▶ Sometimes F_1 and F_2 always have same truth value for every interpretation, e.g., $p \vee p$ and $p \wedge p$
- ▶ Such formulas F_1 and F_2 called **equivalent**, written $F_1 \equiv F_2$ or $F_1 \Leftrightarrow F_2$
- ▶ More precisely, formulas F_1 and F_2 are **equivalent** iff for all interpretations I , $I \models F_1 \leftrightarrow F_2$

$F_1 \Leftrightarrow F_2$ iff $F_1 \leftrightarrow F_2$ is valid

- ▶ \equiv, \Leftrightarrow not part of PL syntax; they are **semantic judgments**!

Checking Equivalence

- ▶ **Question:** How can we prove $F_1 \equiv F_2$?
- ▶ **Exercise:** Prove $p \rightarrow q$ and $\neg p \vee q$ are equivalent

Important Equivalences

- ▶ Some important equivalences are useful to know!
- ▶ **Law of double negation:** $\neg\neg p \equiv p$
- ▶ **Identity Laws:** $p \wedge T \equiv p$ $p \vee F \equiv p$
- ▶ **Domination Laws:** $p \vee T \equiv T$ $p \wedge F \equiv F$
- ▶ **Idempotent Laws:** $p \vee p \equiv p$ $p \wedge p \equiv p$
- ▶ **Negation Laws:** $p \wedge \neg p \equiv F$ $p \vee \neg p \equiv T$

Commutativity and Distributivity Laws

- ▶ **Commutative Laws:** $p \vee q \equiv q \vee p$ $p \wedge q \equiv q \wedge p$
- ▶ **Distributivity Law #1:** $(p \vee (q \wedge r)) \equiv (p \vee q) \wedge (p \vee r)$
- ▶ **Distributivity Law #2:** $(p \wedge (q \vee r)) \equiv (p \wedge q) \vee (p \wedge r)$
- ▶ **Associativity Laws:** $p \vee (q \vee r) \equiv (p \vee q) \vee r$
 $p \wedge (q \wedge r) \equiv (p \wedge q) \wedge r$

De Morgan's Laws

- ▶ Let **cs243** be the proposition "John took CS243" and **cs303** be the proposition "John took CS303"
- ▶ In simple English what does $\neg(cs243 \wedge cs303)$ mean?
- ▶ DeMorgan's law expresses exactly this equivalence!
- ▶ De Morgan's Law #1: $\neg(p \wedge q) \equiv (\neg p \vee \neg q)$
- ▶ De Morgan's Law #2: $\neg(p \vee q) \equiv (\neg p \wedge \neg q)$
- ▶ When you "push" negations in, \wedge becomes \vee and vice versa

Using Equivalences

- ▶ We saw one way to prove two formulas are equivalent: use truth table
- ▶ Another way: use known equivalences to rewrite one formula as the other
- ▶ Examples: Prove following formulas are equivalent using known equivalences.
 1. $\neg(p \vee (\neg p \wedge q))$ and $\neg p \wedge \neg q$
 2. $\neg(p \rightarrow q)$ and $p \wedge \neg q$

Formalizing English Arguments in Logic

- ▶ We can use logic to prove correctness of English arguments.
- ▶ For example, consider the argument:
 - ▶ If Joe drives fast, he gets a speeding ticket.
 - ▶ Joe did not get a ticket.
 - ▶ Therefore, Joe did not drive fast.
- ▶ Let **f** be the proposition "Joe drives fast", and **t** be the proposition "Joe gets a ticket"
- ▶ How do we encode this argument as a logical formula?

Example, cont

"If Joe drives fast, he gets a speeding ticket. Joe did not get a ticket. Therefore, he did not drive fast.": $((f \rightarrow t) \wedge \neg t) \rightarrow \neg f$

- ▶ How can we prove this argument is valid?
- ▶ Can do this in two ways:
 1. Use truth table to show formula is tautology
 2. Use known equivalences to rewrite formula to true
- ▶ Let's use equivalences

Another Example

- ▶ Can also use to logic to prove an argument is not valid.
- ▶ Suppose your friend George make the following argument:
 - ▶ If Jill carries an umbrella, it is raining.
 - ▶ Jill is not carrying an umbrella.
 - ▶ Therefore it is not raining.
- ▶ Let's use logic to prove George's argument doesn't hold water.
- ▶ Let **u** = "Jill is carrying an umbrella", and **r** = "It is raining"
- ▶ How do we encode this argument in logic?

Example, cont.

"If Jill carries an umbrella, it is raining. Jill is not carrying an umbrella. Therefore it is not raining.": $((u \rightarrow r) \wedge \neg u) \rightarrow \neg r$

- ▶ How can we prove George's argument is invalid?

Summary

- ▶ A formula is **valid** if it is true for all interpretations.
- ▶ A formula is **satisfiable** if it is true for at least one interpretation.
- ▶ A formula is **unsatisfiable** if it is false for all interpretations.
- ▶ A formula is **contingent** if it is true in at least one interpretation, and false in at least one interpretation.
- ▶ Two formulas F_1 and F_2 are **equivalent**, written $F_1 \equiv F_2$, if $F_1 \leftrightarrow F_2$ is valid
