

## CS311H: Discrete Mathematics

### Graph Theory II

Instructor: Işıl Dillig

## Connectivity in Graphs

- ▶ Typical question: Is it possible to get from some node  $u$  to another node  $v$ ?
- ▶ Example: Train network – if there is path from  $u$  to  $v$ , possible to take train from  $u$  to  $v$  and vice versa.
- ▶ If it's possible to get from  $u$  to  $v$ , we say  $u$  and  $v$  are **connected** and there is a **path** between  $u$  and  $v$

## Paths

- ▶ A **path** between  $u$  and  $v$  is a sequence of edges that starts at vertex  $u$ , moves along adjacent edges, and ends in  $v$ .
- ▶ **Example:**  $u, x, y, w$  is a path, but  $u, y, v$  and  $u, a, x$  are not
- ▶ Length of a path is the number of edges traversed, e.g., length of  $u, x, y, w$  is 3
- ▶ A **simple path** is a path that does not repeat any edges
- ▶  $u, x, y, w$  is a simple path but  $u, x, u$  is not

## Example

- ▶ Consider a graph with vertices  $\{x, y, z, w\}$  and edges  $(x, y), (x, w), (x, z), (y, z)$
- ▶ What are all the simple paths from  $z$  to  $w$ ?
- ▶ What are all the simple paths from  $x$  to  $y$ ?
- ▶ How many paths (can be non-simple) are there from  $x$  to  $y$ ?

## Connectedness

- ▶ A graph is **connected** if there is a path between every pair of vertices in the graph
- ▶ **Example:** This graph not connected; e.g., no path from  $x$  to  $d$
- ▶ A **connected component** of a graph  $G$  is a maximal connected subgraph of  $G$

## Example

- ▶ **Prove:** Suppose graph  $G$  has exactly two vertices of odd degree, say  $u$  and  $v$ . Then  $G$  contains a path from  $u$  to  $v$ .
- ▶
- ▶
- ▶
- ▶

## Circuits

- ▶ A **circuit** is a path that begins and ends in the same vertex.
- ▶  $u, x, y, x, u$  and  $u, x, y, u$  are both circuits
- ▶ A **simple circuit** does not contain the same edge more than once
- ▶  $u, x, y, u$  is a simple circuit, but  $u, x, y, x, u$  is not
- ▶ Length of a circuit is the number of edges it contains, e.g., length of  $u, x, y, u$  is 3
- ▶ In this class, we only consider circuits of length 3 or more

## Cycles

- ▶ A **cycle** is a simple circuit with no repeated vertices other than the first and last ones.
- ▶ For instance,  $u, x, a, b, x, y, u$  is a circuit but not a cycle
- ▶ However,  $u, x, y, u$  is a cycle

## Example

- ▶ **Prove:** If a graph has an odd length circuit, then it also has an odd length cycle.
- ▶ **Huh?** Recall that not every circuit is a cycle.
- ▶ According to this theorem, if we can find an odd length circuit, we can also find odd length cycle.
- ▶ **Example:**  $d, c, a, b, c, d$  is an odd length circuit, but graph also contains odd length cycle

## Proof

**Prove:** If a graph has an odd length circuit, then it also has an odd length cycle.

- ▶ Proof by strong induction on the length of the circuit.

▶

## Proof, cont.

**Prove:** If a graph has an odd length circuit, then it also has an odd length cycle.

- ▶
- ▶
- ▶
- ▶

## Proof, cont.

**Prove:** If a graph has an odd length circuit, then it also has an odd length cycle.

- ▶
- ▶
- ▶
- ▶

## Colorability and Cycles

**Prove:** If a graph is 2-colorable, then all cycles are of even length.

- ▶
- ▶
- ▶
- ▶
- ▶

## Example

- ▶ Is this graph 2-colorable?

## Distance Between Vertices

- ▶ The **distance between** two vertices  $u$  and  $v$  is the length of the shortest path between  $u$  and  $v$
- ▶ What is the distance between  $u$  and  $b$ ?
- ▶ What is the distance between  $u$  and  $x$ ?
- ▶ What is the distance between  $x$  and  $w$ ?

## More Colorability and Cycles

**Prove:** If graph has no odd length cycles, then graph is 2-colorable.

- ▶ To prove this, we first consider an algorithm for coloring the graph with two colors.
- ▶ Then, we will show that this algorithm works if graph does not have odd length cycles.

## The Algorithm

- ▶ Pick any vertex  $v$  in the graph.
- ▶ If a vertex  $u$  has odd distance from  $v$ , color it **blue**
- ▶ Otherwise, color it **red**

## Proof

- ▶ We will now prove: "If the graph does not have odd length cycles, the algorithm is correct."
- ▶ Correctness of the algorithm implies graph is 2-colorable.
- ▶ Proof by contradiction.
- ▶ Suppose graph does not have odd length cycles, but the algorithm produces an invalid coloring.
- ▶ Means there exist two vertices  $x$  and  $y$  that are assigned the same color.

## Proof, cont.

- ▶ Case 1: They are both assigned **red**

- ▶ We know  $n, m$  are both even
- ▶ This means we now have an **odd-length circuit** involving  $n, m$
- ▶ By theorem from earlier, this implies that graph has odd length cycle, i.e., contradiction
- ▶ Case 2 is exactly the same.

## Putting It All Together

- ▶ **Theorem:** A graph is 2-colorable **if and only if** it does not have odd-length cycles
- ▶ **Corollary:** A graph is bipartite **if and only if** it does not have odd-length cycles
- ▶ **Example:** Consider a graph  $G$  with vertices  $a, b, c, d, e, f$ 
  - ▶ Is  $G$  bipartite if its edges are  $(a, f), (e, f), (e, d), (c, d), (a, c)$ ?

## Trees

- ▶ A **tree** is a connected undirected graph with no cycles.
- ▶ Examples and non-examples:

- ▶ An undirected graph with no cycles is a **forest**.

## Fact About Trees

**Theorem:** An undirected graph  $G$  is a tree if and only if there is a **unique simple path** between any two of its vertices.

- ▶
- ▶
- ▶
- ▶
- ▶

## Leaves of a Tree

- ▶ Given a tree, a vertex of degree 1 is called a **leaf**.

- ▶ **Important fact:** Every tree with more than 2 nodes has at least two leaves.

## Why is this true?

- ▶
- ▶
- ▶

## Number of Edges in a Tree

**Theorem:** A tree with  $n$  vertices has  $n - 1$  edges.

- ▶ Proof is by induction on  $n$
- ▶ Base case:  $n = 1$  ✓
- ▶ **Induction:** Assume property for tree with  $n$  vertices, and show tree  $T$  with  $n + 1$  vertices has  $n$  edges
- ▶ Construct  $T'$  by removing a leaf from  $T$ ;  $T'$  is a tree with  $n$  vertices (tree because connected and no cycles)
- ▶ By IH,  $T'$  has  $n - 1$  edges
- ▶ Add leaf back:  $n + 1$  vertices and  $n$  edges

## Rooted Trees

- ▶ A **rooted tree** has a designated root vertex and every edge is directed away from the root.
- ▶ Vertex  $v$  is a **parent** of vertex  $u$  if there is an edge from  $v$  to  $u$ ; and  $u$  is called a **child** of  $v$
- ▶ Vertices with the same parent are called **siblings**
- ▶ Vertex  $v$  is an **ancestor** of  $u$  if  $v$  is  $u$ 's parent or an ancestor of  $u$ 's parent.
- ▶ Vertex  $v$  is a **descendant** of  $u$  if  $u$  is  $v$ 's ancestor

## Questions about Rooted Trees

- ▶ Suppose that vertices  $u$  and  $v$  are siblings in a rooted tree.
- ▶ Which statements about  $u$  and  $v$  are true?
  1. They must have the same ancestors
  2. They can have a common descendant
  3. If  $u$  is a leaf, then  $v$  must also be a leaf

## Subtrees

- ▶ Given a rooted tree and a node  $v$ , the **subtree** rooted at  $v$  includes  $v$  and its descendants.

- ▶ **Level** of vertex  $v$  is the length of the path from the root to  $v$ .
- ▶ The **height** of a tree is the maximum level of its vertices.

## True-False Questions

1. Two siblings  $u$  and  $v$  must be at the same level.
2. A leaf vertex does not have a subtree.
3. The subtrees rooted at  $u$  and  $v$  can have the same height only if  $u$  and  $v$  are siblings.
4. The level of the root vertex is 1.

## $m$ -ary Trees

- ▶ A rooted tree is called an  **$m$ -ary tree** if every vertex has no more than  $m$  children.
- ▶ An  $m$ -ary tree where  $m = 2$  is called a **binary tree**.
- ▶ A **full  $m$ -ary tree** is a tree where every internal node has exactly  $m$  children.
- ▶ Which are full binary trees?

## Useful Theorem

**Theorem:** An  $m$ -ary tree of height  $h \geq 1$  contains at most  $m^h$  leaves.

- ▶ Proof is by induction on height  $h$ .

## Corollary

**Corollary:** If  $m$ -ary tree has height  $h$  and  $n$  leaves, then  $h \geq \lceil \log_m n \rceil$

## Questions

- ▶ What is maximum number of leaves in binary tree of height 5?
- ▶ If binary tree has 100 leaves, what is a lower bound on its height?
- ▶ If binary tree has 2 leaves, what is an upper bound on its height?

## Balanced Trees

- ▶ An  $m$ -ary tree is balanced if all leaves are at levels  $h$  or  $h - 1$

- ▶ "Every full tree must be balanced." – true or false?
- ▶ "Every balanced tree must be full." – true or false?
