CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

1/37

Review

- ▶ Previous lecture: talked about signature and axioms of $T_=$

$$\Sigma_= : \{=, a, b, c, \dots, f, g, h, \dots, p, q, r, \dots\}$$

- ▶ Axioms:

1. $\forall x. x = x$ (reflexivity)

2. $\forall x, y. x = y \rightarrow y = x$ (symmetry)

3. $\forall x, y, z. x = y \wedge y = z \rightarrow x = z$ (transitivity)

4. $\forall x_1, \dots, x_n, y_1, \dots, y_n. \bigwedge_i x_i = y_i \rightarrow f(x_1, \dots, x_n) = f(y_1, \dots, y_n)$ (congruence)

5. for each positive integer n and n -ary predicate symbol p ,

$$\forall x_1, \dots, x_n, y_1, \dots, y_n. \bigwedge_i x_i = y_i \rightarrow (p(x_1, \dots, x_n) \leftrightarrow p(y_1, \dots, y_n))$$
 (equivalence)

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

2/37

Overview

- ▶ **Today:** look at decision procedures for deciding satisfiability in the quantifier-free fragment of $T_=$
- ▶ However, our decision procedure has two "restrictions":
 - ▶ formulas consist of conjunctions of literals
 - ▶ we'll allow functions, but no predicates
- ▶ However, these "restrictions" are not real restrictions – why?

Işıl Dillig

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

3/37

Eliminating Predicates

- ▶ Simple transformation yields equisatisfiable formula with only functions
- ▶ **The trick:** For each relation constant p :
 1. introduce a fresh function constant f_p
 2. rewrite $p(x_1, \dots, x_n)$ as $f_p(x_1, \dots, x_n) = t$ where t is a fresh object constant
- ▶ **Example:** How do we transform $x = y \rightarrow (p(x) \leftrightarrow p(y))$ to equisat formula?

Işıl Dillig

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

4/37

$T_=$ without Predicates

- ▶ Signature without predicates:

$$\Sigma_= : \{=, a, b, c, \dots, f, g, h, \dots\}$$

- ▶ Axioms:

1. $\forall x. x = x$ (reflexivity)

2. $\forall x, y. x = y \rightarrow y = x$ (symmetry)

3. $\forall x, y, z. x = y \wedge y = z \rightarrow x = z$ (transitivity)

4. $\forall x_1, \dots, x_n, y_1, \dots, y_n. \bigwedge_i x_i = y_i \rightarrow f(x_1, \dots, x_n) = f(y_1, \dots, y_n)$ (congruence)

Işıl Dillig

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

5/37

Examples

- ▶ Let's consider some examples
- ▶ Is the formula $x \neq y \wedge f(x) = f(y)$ sat, unsat, valid?
- ▶ What about $x = g(y, z) \rightarrow f(x) = f(g(y, z))$?
- ▶ What about $f(a) = a \wedge f(f(a)) \neq a$?
- ▶ What about $f(f(f(a))) = a \wedge f(f(f(f(f(a)))))) = a \wedge f(a) \neq a$?

Işıl Dillig

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

6/37

Equivalence Relations

- ▶ Decision procedure for theory of equality known as **congruence closure** algorithm
- ▶ Computes the congruence closure of the binary relation defined by formula \Rightarrow need to understand congruence closure
- ▶ A binary relation R over a set S is an **equivalence relation** if
 1. reflexive: $\forall s \in S. sRs$
 2. symmetric: $\forall s_1, s_2 \in S. s_1Rs_2 \rightarrow s_2Rs_1$;
 3. transitive: $\forall s_1, s_2, s_3 \in S. s_1Rs_2 \wedge s_2Rs_3 \rightarrow s_1Rs_3$.

ljl Dillig

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

7/37

Examples

- ▶ Which of these are equivalence relations?
 - ▶ The relation \equiv_2 over \mathbb{Z} ?
 - ▶ The relation \geq over \mathbb{N} ?
 - ▶ The relation $R(x, y)$ defined as $|x| = |y|$ on \mathbb{R} ?

ljl Dillig

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

8/37

Congruence Relations

- ▶ Consider set S equipped with functions $F = \{f_1, \dots, f_n\}$
- ▶ A relation R over S is a **congruence relation** if it is an equivalence relation and for every n 'ary function $f \in F$:

$$\forall \vec{s}, \vec{t}. \bigwedge_{i=1}^n s_i R t_i \rightarrow f(\vec{s}) R f(\vec{t}).$$

- ▶ Which of these are congruence relations?
 - ▶ The relation $=$ on \mathbb{N} equipped with a successor function?
 - ▶ The relation \equiv_2 on \mathbb{N} equipped with a successor function?
 - ▶ The relation $R(x, y)$ defined as $|x| = |y|$ on \mathbb{Z} equipped with successor function?

ljl Dillig

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

9/37

Equivalence and Congruence Classes

- ▶ For a given equivalence relation over S , every member of S belongs to an **equivalence class**
- ▶ The equivalence class of $s \in S$ under R is the set:
$$[s]_R \stackrel{\text{def}}{=} \{s' \in S : sRs'\}.$$
- ▶ If R is a congruence relation, then this set is called **congruence class**
- ▶ **Example:** What is the equivalence class of 1 under \equiv_2 ?
- ▶ What is the equivalence class of 6 under \equiv_3 ?

ljl Dillig

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

10/37

Equivalence Closure

- ▶ The **equivalence closure** R^E of a binary relation R over S is the equivalence relation such that:
 1. $R \subseteq R^E$
 2. for all other equivalence relations R' s.t. $R \subseteq R', R^E \subseteq R'$
- ▶ Thus, R^E is the smallest equivalence relation that includes R .

ljl Dillig

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

11/37

Equivalence Closure Example

- ▶ Consider set $S = \{a, b, c, d\}$ and binary relation
$$R : \{\langle a, b \rangle, \langle b, c \rangle, \langle d, d \rangle\}$$
- ▶ Is R an equivalence relation?
- ▶ What is the equivalence closure of R ?

ljl Dillig

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

12/37

Congruence Closure

- ▶ Given a set S and binary relation R , we also define **congruence closure** of R
- ▶ Congruence closure is similar to equivalence closure, but it is the smallest **congruence relation** that covers R
- ▶ Formally, the **congruence closure** R^C of a binary relation R over S is the congruence relation such that:

1. $R \subseteq R^E$
2. for all other congruence relations R' s.t. $R \subseteq R'$, $R^E \subseteq R'$

Example

- ▶ Consider the set $S = \{a, b, c\}$ and function f such that:

$$f(a) = b, f(b) = c, f(c) = c$$

- ▶ What is the congruence closure of relation $\{\{a, b\}\}$?

Congruence Closure Algorithm

- ▶ The decision procedure for $T_{=}$ computes **congruence closure** of equality over the **subterm set** of formula
- ▶ **Subterm set** S_F of F is the set of all subterms of F
- ▶ **Example:** Consider formula $F : f(a, b) = a \wedge f(f(a, b), b) \neq a$
- ▶ What is S_F ?

Satisfiability using Congruence Relations

- ▶ We can now define satisfiability of a $\Sigma_{=}$ formula in terms of congruence closure over subterm set
- ▶ Consider $\Sigma_{=}$ formula F :

$$F : s_1 = t_1 \wedge \dots \wedge s_m = t_m \wedge s_{m+1} \neq t_{m+1} \wedge \dots \wedge s_n \neq t_n$$

- ▶ Let $R_F = \{\langle x, y \rangle \mid x = s_i, y = t_i, i \in [1, m]\}$
- ▶ **Theorem:** F is satisfiable if the congruence closure \sim of R_F satisfies $s_i \not\sim t_i$ for all $i \in [m+1, n]$

Congruence Closure Algorithm: Basic Idea

Congruence closure algorithm decide satisfiability of

$$F : s_1 = t_1 \wedge \dots \wedge s_m = t_m \wedge s_{m+1} \neq t_{m+1} \wedge \dots \wedge s_n \neq t_n$$

1. Construct the **congruence closure** \sim of R_F (defined previously) over the subterm set S_F .
2. If $s_i \sim t_i$ for any i in $[m+1, n]$, F is unsatisfiable
3. Otherwise, F is satisfiable

Example

- ▶ Consider the formula $F : f(a, b) = a \wedge f(f(a, b), b) \neq a$
- ▶ We'll represent \sim as a set of congruence classes, i.e., if t_1 and t_2 are in the same set, this means $t_1 \sim t_2$, otherwise $t_1 \not\sim t_2$
- ▶ First, construct subterm set S_F and place each subterm in a separate set:
- ▶ Because of equality $f(a, b) = a$, merge congruence classes of $f(a, b)$ and a :

Example, cont

▶ Formula $F : f(a, b) = a \wedge f(f(a, b), b) \neq a$

▶ Current congruence classes:

$$\{\{a, f(a, b)\}, \{b\}, \{f(f(a, b), b)\}\}$$

▶ Using $a \sim f(a, b)$ and $b \sim b$, what does function congruence imply?

▶ Thus, merge congruence classes of $f(a, b)$ and $f(f(a, b), b)$:

$$\{\{a, f(a, b), f(f(a, b), b)\}, \{b\}\}$$

▶ This represents the congruence closure over S_F .

Ipl Dillig,

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

19/37

Example, cont

▶ Formula $F : f(a, b) = a \wedge f(f(a, b), b) \neq a$

▶ Congruence closure: $\{\{a, f(a, b), f(f(a, b), b)\}, \{b\}\}$

▶ Is F satisfiable?

▶ Since a and $f(f(a, b), b)$ are in same congruence class, we have $a \sim f(f(a, b), b)$

▶ This contradicts $f(f(a, b), b) \neq a$!

Ipl Dillig,

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

20/37

Another Example

▶ Consider formula:

$$F : f(f(f(a))) = a \wedge f(f(f(f(f(a)))))) = a \wedge f(a) \neq a$$

▶ What is the subterm set S_F ?

▶ Initially, place each subterm in its own congruence class:

$$\{\{a\}, \{f(a)\}, \{f^2(a)\}, \{f^3(a)\}, \{f^4(a)\}, \{f^5(a)\}\}$$

▶ Because of equality $f^3(a) = a$, $f^3(a)$ and a are placed in same congruence class:

Ipl Dillig,

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

21/37

Another Example, cont

▶ Formula $F : f^3(a) = a \wedge f^5(a) = a \wedge f(a) \neq a$

▶ Current congruence classes:

$$\{\{a, f^3(a)\}, \{f(a)\}, \{f^2(a)\}, \{f^4(a)\}, \{f^5(a)\}\}$$

▶ From $a = f^3(a)$, what can we infer using function congruence?

▶ Resulting congruence classes:

Ipl Dillig,

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

22/37

Another Example, cont

▶ Formula $F : f^3(a) = a \wedge f^5(a) = a \wedge f(a) \neq a$

▶ Current congruence classes:

$$\{\{a, f^3(a)\}, \{f(a), f^4(a)\}, \{f^2(a), f^5(a)\}\}$$

▶ Now, process equality $f^5(a) = a$; which classes do we merge?

▶ From $a = f^2(a)$, what can we infer via function congruence?

▶ Thus, merge the two congruence classes:

$$\{\{a, f(a), f^2(a), f^3(a), f^4(a), f^5(a)\}\}$$

Ipl Dillig,

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

23/37

Another Example, cont

▶ Formula $F : f^3(a) = a \wedge f^5(a) = a \wedge f(a) \neq a$

▶ Current congruence classes:

$$\{\{a, f(a), f^2(a), f^3(a), f^4(a), f^5(a)\}\}$$

▶ Is the formula satisfiable?

▶ Since $f(a)$ and a are in same congruence class, this contradicts $f(a) \neq a$

Ipl Dillig,

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

24/37

One More Example

- ▶ Consider formula $F : f(x) = f(y) \wedge x \neq y$
- ▶ What is the subterm set? $\{x, y, f(x), f(y)\}$
- ▶ Each subterm starts in its own congruence class: $\{\{x\}, \{y\}, \{f(x)\}, \{f(y)\}\}$
- ▶ Process equality $f(x) = f(y) \Rightarrow$
- ▶ What new equalities can we infer from congruence?
- ▶ Is the formula satisfiable?

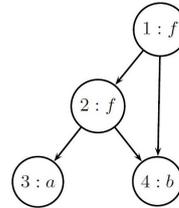

Ipl Dillig

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

25/37

Algorithm to Compute Congruence Closure

- ▶ To compute congruence closure efficiently, we'll represent the subterm set of the formula as a DAG

- ▶ Each node corresponds to a subterm and has unique id
- ▶ Edges point from function symbol to arguments
- ▶ Question: What subterm does node labeled 1 represent? $f(f(a,b), b)$

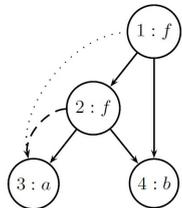

Ipl Dillig

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

26/37

Representative of Congruence Class

- ▶ To compute congruence closure, we need to merge congruence classes
- ▶ To do this efficiently, each congruence class has a **representative**: When merging two classes, only need to update the representative

- ▶ Each subterm contains a **find** pointer that eventually leads to the representative of its congruence class (representative points to itself)
- ▶ In this example, $a, f(a, b), f(f(a, b), b)$ are in same congruence class; a is the representative

Ipl Dillig

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

27/37

Parents of a Subterm

- ▶ In addition to efficiently finding representative, also need to efficiently find **parents** of terms – why?
- ▶ Thus, keep pointer from **representative** of congruence class to **parents of all subterms** in the congruence class
- ▶ If a term is not a representative, then its **parents** field is empty

Ipl Dillig

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

28/37

Merging Congruence Classes

- ▶ Using this data structure, how do we merge congruence classes of two terms t_1 and t_2 ?
- ▶ First find representatives of t_1 and t_2 by chasing pointers
- ▶ Want to make $Rep(t_2)$ new representative for merged class
- ▶ Thus, change **find** field of $Rep(t_1)$ to point to $Rep(t_2)$
- ▶ Update parents: add parent terms stored in $Rep(t_1)$ to those of $Rep(t_2)$, and remove parents stored in $Rep(t_1)$

Ipl Dillig

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

29/37

Processing Equalities, cont

To process equality $t_1 = t_2$:

1. Find representatives of t_1 and t_2
2. Merge equivalence classes
3. Retrieve the set of parents P_1, P_2 stored in $Rep(t_1), Rep(t_2)$
4. For each $(p_i, p_j) \in P_1 \times P_2$, if p_i and p_j are congruent, **process equality** $p_i = p_j$

Observe: Processing one equality creates new equalities, which in turn might generate other new equalities!

Ipl Dillig

CS389L: Automated Logical Reasoning Lecture 11: Theory of Equality with Uninterpreted Functions

30/37

Full Algorithm for Deciding Satisfiability

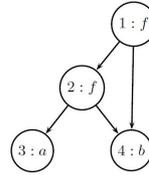

Algorithm to decide satisfiability of $T_{=}$ formula

$$F : s_1 = t_1 \wedge \dots \wedge s_m = t_m \wedge s_{m+1} \neq t_{m+1} \wedge \dots \wedge s_n \neq t_n$$

1. Compute subterms and construct initial DAG (each node's representative is itself)
2. For each $i \in [1, m]$, process equality $s_i = t_i$ as described
3. For each $i \in [m + 1, n]$, check if $Rep(s_i) = Rep(t_i)$
4. If there exists some $i \in [m + 1, n]$ for which $Rep(s_i) = Rep(t_i)$, return **UNSAT**
5. If for all i , $Rep(s_i) \neq Rep(t_i)$, return **SAT**

Example

- ▶ Consider formula $F : f(a, b) = a \wedge f(f(a, b), b) \neq a$
- ▶ Subterms: $a, b, f(a, b), f(f(a, b), b)$

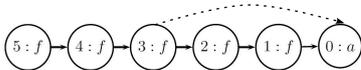

- ▶ Construct initial DAG
- ▶ Process equality $f(a, b) = a$
- ▶ Are parents $f(a, b)$ and $f(f(a, b), b)$ congruent?
- ▶ Yes, so process equality $f(a, b) = f(f(a, b), b)$
- ▶ Formula unsatisfiable because $f(f(a, b), b)$ and a have same representative!

Example II

- ▶ Consider formula: $F : f^3(a) = a \wedge f^5(a) = a \wedge f(a) \neq a$
- ▶ Initial DAG:

- ▶ Process equality $f^3(a) = a$:

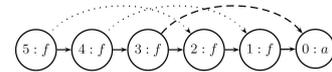

- ▶ Are parents congruent? **Yes**
- ▶ Process equality $f^4(a) = f(a)$

Example II, cont

- ▶ After merging classes:

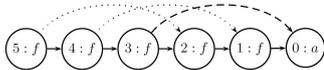

- ▶ Are $f^4(a)$'s and $f(a)$'s parents congruent? **Yes**
- ▶ Process equality $f^5(a) = f^2(a)$

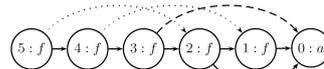

Example II, cont

- ▶ Formula: $F : f^3(a) = a \wedge f^5(a) = a \wedge f(a) \neq a$

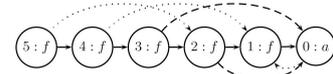

- ▶ Process equality $f^5(a) = a$:

- ▶ Now, parents $f^2(a)$ and a congruent; so process equality $f^3(a) = f(a)$

Example II, cont

- ▶ Formula: $F : f^3(a) = a \wedge f^5(a) = a \wedge f(a) \neq a$

- ▶ Now, everything in same congruence class; so we are done.
- ▶ Formula **UNSAT** because a and $f(a)$ have same representative

Summary

- ▶ Congruence closure algorithm is used for determining satisfiability of $T_{=}$ formulas (without disjunction)
- ▶ Deciding conjunctive $T_{=}$ formulas is inexpensive: our algorithm is $O(e^2)$, but can be solved in $O(e \log(e))$
- ▶ To decide satisfiability of formulas containing disjunctions, can either convert to DNF or use $DPLL(\mathcal{T})$ (more on this later)
