# Securely Sampling Biased Coins with Applications to Differential Privacy 

Jeffrey Champion, abhi shelat, Jonathan Ullman
Northeastern University

## This talk

Asymptotically and
concretely more efficient

Improved protocols for securely generating noise from common distributions
arising in differential privacy [DMNS'06]
eg.
geometric,
binomial,
poisson

Suppose two or more hospitals want to jointly compute statistics of their patients data

However, sharing data may be prohibited

## An ideal solution: find a trusted third party

Trusted party

A trusted party is usually not available
Release only the output of the study

## Secure Computation

> Even the output will reveal patient data [DNO3]

Encrypted protocol

f( ${ }^{\text {曷) }}$

Reveal only the output

## Differential Privacy [DMNS06]

Strong guarantee of privacy for the patients.
Widely deployed in practice (e.g. Google, Apple, Uber, US Census Bureau)

Have to design secure protocols

## Bottleneck: generating random noise

Typical DP algorithms use noise from Gaussian, Laplace, or Exponential distributions:

Approximating using floating points can destroy privacy [Mironov'12]

## Bottleneck: generating random noise

Discrete distributions are more amenable to secure computation:

Still need to sample with high precision to ensure privacy

## Prior work

- Inspired by [DKMMN'06]
- Proposed combining differential privacy and secure computation
- Identified the problem of noise generation
- Gave protocols for sampling noise with various tradeoffs between resources
- [EKMPP'14] implemented floating point arithmetic in secure computation in order to compute Laplace noise
- [AC'15] implemented Laplace noise sampling with two parties using a cut-and-choose protocol (polynomial security)

## Our Work - Theory

Reduce the complexity for sampling common noise distributions securely

- Improved amortized complexity for sampling a biased coin from $O(\lambda)$ to $O(\log \lambda)$
- Novel use of oblivious stacks [ZE'13]

Application to widely used differentially private algorithms (e.g. report-noisy-max/exponential mechanism [MT'07])

## Our Work - Empirical

## Full open source implementation in Obliv-C [ZE'15]

- Includes both our protocol and [DKMMN’06]

## Experimental evaluation

- Consider a practical variant of our protocol (slightly worse asymptotic complexity)
- Improved cost, runtime, and communication for generating noise in specific differential privacy applications

## Practical improvement

Experiment: generating $d$ samples of geometric noise in 2PC with our method and the trivial method

[EKMPP'14] generate one Laplace sample in 15s [AC'15] generate one Laplace sample in 9s

## Generating Noise Insecurely

## Steps to sample geometric noise with parameter $0<p^{\circ}<1$

1. Sample a uniform real number: $0<u<1$
2. Compute the inverse CDF:

$$
F^{-1}(u)=\left\lfloor\frac{\ln (1-u)}{\ln (1-p)}\right\rfloor
$$

Computing logarithms is costly in MPC. Using finite arithmetic has hard-to-understand effects.

## Generating Noise Insecurely: Biased Coins

## Steps to sample geometric noise with parameter $0<p<1$

1. Find a coin with bias $p$ ( $\mathrm{P}[$ heads $]=p$ )
2. Flip the coin until it comes up heads
3. Count the number of tails before the first heads

Only simple, discrete operations. Using finite precision has predictable effects.

## Securely sampling fair coins

Sampling fair coins in a secure computation is easy

How can we convert fair coins to biased coins in a secure computation?

## Insecure Biased Coins: Lazy Comparison

Stream of random bits

| $r_{1}$ | $r_{2}$ | $r_{3}$ | $r_{4}$ | $r_{5}$ | $r_{6}$ | $\ldots$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Binary expansion of bias $0<p<1$

| $b_{1}$ | $b_{2}$ | $b_{3}$ | $b_{4}$ | $b_{5}$ | $b_{6}$ | $\ldots$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

## Insecure Biased Coins: Lazy Comparison

Stream of random bits

| 0 | 1 | 1 | 1 | 0 | 0 | ... |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

rand

Binary expansion of bias (1/3)
bias

| 0 | 1 | 0 | 1 | 0 | 1 | $\ldots$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

## Insecure Biased Coins: Lazy Comparison

$$
\begin{aligned}
& \text { If (rand } \neq \text { bias): } \\
& \text { output bias }
\end{aligned}
$$

No output

## Insecure Biased Coins: Lazy Comparison

$$
\begin{gathered}
\text { If (rand } \neq \text { bias): } \\
\text { output bias }
\end{gathered}
$$

No output

## Insecure Biased Coins: Lazy Comparison

| If (rand $\neq$ bias): |
| :---: |
| output bias |

Stream of random bits

| 0 | 1 | 1 | 1 | 0 | 0 | $\ldots$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |$\longrightarrow 1$

E[\# of comparisons] = 2 per coin $O(1)$ time per coin
Output: 0

## Securely Generating Biased Coins?

If (rand $\neq$ bias):
output bias

Stream of random bits

| 0 | 1 | 1 | 1 | 0 | 0 | ... |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

rand

Binary expansion of bias (1/3)
bias
$\square$

## Securely Generating Biased Coins?

$$
\begin{aligned}
& \text { If (rand } \neq \text { bias): } \\
& \text { output bias }
\end{aligned}
$$

Stream of random bits

Binary expansion of bias (1/3)

```
\begin{array} { | l | l | l | l l l l l l l l } { \hline 0 } & { 1 } & { 0 } & { 1 } & { 0 } & { 1 } & { 0 } \\ { \hline } \end{array}
```

$\lambda$ bits of precision (error $2^{-\lambda}$ )

## Securely Generating Biased Coins?

$$
\begin{gathered}
\text { If (rand } \neq \text { bias): } \\
\text { output bias }
\end{gathered}
$$

Stream of random bits

bias

Binary expansion of bias (1/3)

No output

## Securely Generating Biased Coins?

| If (rand $\neq$ bias): |
| :---: |
| output bias |

Stream of random bits

bias

Binary expansion of bias (1/3)
$\square$

No output

## Securely Generating Biased Coins?

$$
\begin{aligned}
& \text { If (rand } \neq \text { bias): } \\
& \text { output bias }
\end{aligned}
$$

Stream of random bits

bias
$\square$

Binary expansion of bias (1/3)

Stopping at the third bit reveals the output even though the value is encrypted!

## Securely Generating Biased Coins

## Output rand ${ }^{2}<$ bias

Stream of random bits
Binary expansion of bias (1/3)

## Our Work - Theory

Reduce the complexity for sampling common noise distributions securely

- Improved amortized complexity for sampling a biased coin from $O(\lambda)$ to $O(\log \lambda)$
- Novel use of oblivious stacks [ZE'13]

Application to widely used differentially private algorithms (e.g. report-noisy-max/exponential mechanism [MT’07])

## Our Approach - secure lazy sampling

Stream of random bits

| 1 | 1 | 1 | 1 | 0 | 0 | 1 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

rand

Binary expansion of bias
bias
$\square$

## Our Approach - secure lazy sampling

Stream of random bits

| 1 | 1 | 1 | 1 | 0 | 0 | 1 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

1. Get current bit of bias and compare to rand
2. If bits are not equal:
a. Make coin
b. Reset bias

Binary expansion of bias
bias

Need to produce correct bit of bias and hide when we restart bias

## Output: 0

## Want to hide whether a biased coin was output

## Oblivious data structures

- Best known example: ORAM [GO’97]
- Major recent progress, but not suited for single bit data blocks
- Oblivious stacks [ZE13] are a more efficient alternative
- We modify the construction from [ZE13] to suit our application

## Push-only stack

## Conditional push

Given input element $e$ and condition $c$ :
If $c=1$ :

If $c=0$ :

## Pop-only stack

## Pop

Given reset bit $r$ :

$$
\begin{array}{ll}
\text { If } r=1: & a \longleftarrow \square|b| c \\
\text { If } r=0: & b \longleftarrow \square \square
\end{array} \quad \text { (reset to initial and pop) }
$$

## Pop-only stack

## Conditional reset

Given reset bit $r$ and condition $c$ (stack is untouched):

$$
\begin{array}{ll}
\text { If } c=1: & \text { set } r=1 \\
\text { If } c=0: & \text { nothing }
\end{array}
$$

## Oblivious stack complexity

Conditional push, pop, and conditional reset can all be implemented such that the amortized complexity per operation is $\mathrm{O}(\log n)$ for total capacity $n$

## Oblivious Stacks in context

Stream of random bits

| 0 | 1 | 1 | 1 | 0 | 0 | 1 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

rand

bias
Pop-only stack (filled with binary expansion)

$$
r=0
$$

Push-only stack (receives coins)

## Oblivious Stacks in context

Stream of random bits

| 0 | 1 | 1 | 1 | 0 | 0 | 1 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Pop-only stack (filled with binary expansion)
bias

$$
r=0
$$

Push-only stack (receives coins)

$c=0, e=0 \xrightarrow{\text { Empty push }}$|  |  |
| :--- | :--- | :--- |

If $c=1$ : push $e$

## Oblivious Stacks in context

Stream of random bits

| 0 | 1 | 1 | 1 | 0 | 0 | 1 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

## Oblivious Stacks in context

Stream of random bits

Pop-only stack (filled with binary expansion)

$r=\mathbb{Q}$

Push-only stack (receives coins)

$$
c=1, e=0 \xrightarrow{\text { Real push }} \begin{array}{|l|l|l|}
\hline & & \\
\hline
\end{array}
$$

$$
\text { If } c=1 \text { : push } e
$$

## Oblivious Stacks in context

Stream of random bits

| 0 | 1 | 1 | 1 | 0 | 0 | 1 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Pop-only stack (filled with binary expansion)
bias

$$
r=\mathbb{Q}
$$

Push-only stack (receives coins)

$$
\text { If } c=1 \text { : push } e
$$

## Oblivious Stacks in context

Stream of random bits

$$
\begin{gathered}
\text { rand } \\
0
\end{gathered}
$$

Pop-only stack (filled with binary expansion)

## Oblivious Stacks in context

Stream of random bits

Pop-only stack (filled with binary expansion)

## Oblivious Stacks in context

Stream of random bits

Pop-only stack (filled with binary expansion)

## Summary

Our secure sampling protocol allows us to:

- Exponentially reduce the amortized cost of flipping a biased coin
- Sample hundreds of times faster than previous implementations
- Generate 500 k samples from the geometric distribution in 7 min

We give the first complete, secure implementation of the exponential mechanism [MT07] for differential privacy
