#### **True or False?**

- Predicate :  $\forall x \exists y (x < y \land \neg \exists z (x < z \land z < y))$ 
  - Domain: rational numbers

#### **True or False?**

- Predicate :  $\forall x \exists y (x < y \land \neg \exists z (x < z \land z < y))$ 
  - Domain: rational numbers
  - Domain: integers

#### **True or False?**

- Predicate :  $\forall x \exists y (x < y \land \neg \exists z (x < z \land z < y))$ 
  - Domain: rational numbers
  - Domain: integers

Answer: Under rational domain, the predicate is false because for all x, y where x < y there always exists  $z = \frac{x+y}{2}$  which satisfies that condition that x < z < y. So for all x, such y doesn't exist. which means the predicate is false.

• Predicate :  $\forall x \exists y (x < y \land \neg \exists z (x < z \land z < y))$ 

- Domain: rational numbers
- Domain: integers

Answer: Under rational domain, the predicate is false because for all x, y where x < y there always exists  $z = \frac{x+y}{2}$  which satisfies that condition that x < z < y. So for all x, such y doesn't exist. which means the predicate is false. Under integer domain, there exists y = x + 1 such that no integer z exists such that x < z < y. Thus the predicate is true.

 Assume the following fact: "Every integer larger than 1 is either prime or can be written as a product of primes"

 Assume the following fact: "Every integer larger than 1 is either prime or can be written as a product of primes" Use this fact to prove: "There are infinitely many primes"

1. Suppose a finite number of primes n and seek contradiction.

1. Suppose a finite number of primes n and seek contradiction.

2. Let  $p_1, ..., p_n$  be the primes, and define  $m = (p_1 \times ... \times p_n) + 1$ 

1. Suppose a finite number of primes n and seek contradiction.

2. Let  $p_1, ..., p_n$  be the primes, and define  $m = (p_1 \times ... \times p_n) + 1$ 3. For every prime  $p_i$ , m is not divisible by  $p_i$  since there will be a remainder of 1.

1. Suppose a finite number of primes n and seek contradiction.

2. Let  $p_1, ..., p_n$  be the primes, and define  $m = (p_1 \times ... \times p_n) + 1$ 3. For every prime  $p_i$ , m is not divisible by  $p_i$  since there will be a remainder of 1.

4. Use the fact: m is either prime or can be written as a product of primes.

1. Suppose a finite number of primes n and seek contradiction.

2. Let  $p_1, ..., p_n$  be the primes, and define  $m = (p_1 \times ... \times p_n) + 1$ 

3. For every prime  $p_i$ , m is not divisible by  $p_i$  since there will be a remainder of 1.

4. Use the fact: m is either prime or can be written as a product of primes.

5. If m is prime, it is bigger than all of  $p_1, ..., p_n$ , and therefore not equal to any of them. Contradiction.

- 1. Suppose a finite number of primes n and seek contradiction.
- 2. Let  $p_1, ..., p_n$  be the primes, and define  $m = (p_1 \times ... \times p_n) + 1$ 3. For every prime  $p_i$ , m is not divisible by  $p_i$  since there will
- be a remainder of 1.
- 4. Use the fact: m is either prime or can be written as a product of primes.
- 5. If m is prime, it is bigger than all of  $p_1, ..., p_n$ , and therefore not equal to any of them. Contradiction.

6. If m is not prime, it is a product of primes. Let q be one of these primes.

- 1. Suppose a finite number of primes n and seek contradiction.
- 2. Let  $p_1, ..., p_n$  be the primes, and define  $m = (p_1 \times ... \times p_n) + 1$ 3. For every prime  $p_i$ , m is not divisible by  $p_i$  since there will
- be a remainder of 1.
- 4. Use the fact: m is either prime or can be written as a product of primes.
- 5. If m is prime, it is bigger than all of  $p_1, ..., p_n$ , and therefore not equal to any of them. Contradiction.
- 6. If m is not prime, it is a product of primes. Let q be one of these primes.
- 7. Then m is divisible by q.

- 1. Suppose a finite number of primes n and seek contradiction.
- 2. Let  $p_1, ..., p_n$  be the primes, and define  $m = (p_1 \times ... \times p_n) + 1$
- 3. For every prime  $p_i$ , m is not divisible by  $p_i$  since there will be a remainder of 1.
- 4. Use the fact: m is either prime or can be written as a product of primes.
- 5. If m is prime, it is bigger than all of  $p_1, ..., p_n$ , and therefore not equal to any of them. Contradiction.
- 6. If m is not prime, it is a product of primes. Let q be one of these primes.
- 7. Then m is divisible by q.
- 8. Since m is not divisible by any  $p_i$ , prime q is not equal to any of  $p_i$ . Contradiction.

#### **Infinite sets**

• Prove that the cardinality of the prime numbers is the same as the cardinality of the integers by defining a bijection from the integers to the primes.

Call the primes in order starting from 2 as  $p_1, p_2, p_3, \ldots$ 

Call the primes in order starting from 2 as  $p_1, p_2, p_3, \dots$  $f(0) = p_1$ 

Call the primes in order starting from 2 as  $p_1, p_2, p_3, ...$   $f(0) = p_1$  $n > 0 \Rightarrow f(n) = p_{2n}$ 

Call the primes in order starting from 2 as  $p_1, p_2, p_3, ...$   $f(0) = p_1$   $n > 0 \Rightarrow f(n) = p_{2n}$  $n < 0 \Rightarrow f(n) = p_{-2n+1}$ 

Call the primes in order starting from 2 as  $p_1, p_2, p_3, ...$   $f(0) = p_1$   $n > 0 \Rightarrow f(n) = p_{2n}$   $n < 0 \Rightarrow f(n) = p_{-2n+1}$ To show:

Call the primes in order starting from 2 as  $p_1, p_2, p_3, ...$   $f(0) = p_1$   $n > 0 \Rightarrow f(n) = p_{2n}$   $n < 0 \Rightarrow f(n) = p_{-2n+1}$ To show: Every integer has a unique image (injective)

Call the primes in order starting from 2 as  $p_1, p_2, p_3, ...$   $f(0) = p_1$   $n > 0 \Rightarrow f(n) = p_{2n}$   $n < 0 \Rightarrow f(n) = p_{-2n+1}$ To show: Every integer has a unique image (injective) Every prime has a pre-image (surjective)

Proof: If G is a bipartite graph, G can be partition into vertex set A and B such that v(A) + v(B) = t and there is no edge within set A and B.

Proof: If G is a bipartite graph, G can be partition into vertex set A and B such that v(A) + v(B) = t and there is no edge within set A and B. For every vertex in A, its degree is at most v(B),

Proof: If G is a bipartite graph, G can be partition into vertex set A and B such that v(A) + v(B) = t and there is no edge within set A and B. For every vertex in A, its degree is at most v(B), thus the total number of edges are at most  $|E| \le v(A)v(B)$ 

Proof: If G is a bipartite graph, G can be partition into vertex set A and B such that v(A) + v(B) = t and there is no edge within set A and B. For every vertex in A, its degree is at most v(B), thus the total number of edges are at most  $|E| \le v(A)v(B) = v(A)(t - v(A))$ 

Proof: If G is a bipartite graph, G can be partition into vertex set A and B such that v(A) + v(B) = t and there is no edge within set A and B. For every vertex in A, its degree is at most v(B), thus the total number of edges are at most  $|E| \leq v(A)v(B) = v(A)(t - v(A)) = \frac{t^2}{4} - (v(A) - \frac{t}{2})^2$ 

Proof: If G is a bipartite graph, G can be partition into vertex set A and B such that v(A) + v(B) = t and there is no edge within set A and B. For every vertex in A, its degree is at most v(B), thus the total number of edges are at most  $|E| \le v(A)v(B) = v(A)(t - v(A)) = \frac{t^2}{4} - (v(A) - \frac{t}{2})^2 \le \frac{t^2}{4}$ 

Proof: If G is a bipartite graph, G can be partition into vertex set A and B such that v(A) + v(B) = t and there is no edge within set A and B. For every vertex in A, its degree is at most v(B), thus the total number of edges are at most  $|E| \leq v(A)v(B) = v(A)(t - v(A)) = \frac{t^2}{4} - (v(A) - \frac{t}{2})^2 \leq \frac{t^2}{4}$ Proof completed.

• Definition: a cycle of bits such that every n-bit pattern occurs among adjacent bits

- Definition: a cycle of bits such that every n-bit pattern occurs among adjacent bits
- Example: memory wheel with 8 bits that contains all 3-bit patterns

- Definition: a cycle of bits such that every n-bit pattern occurs among adjacent bits
- Example: memory wheel with 8 bits that contains all 3-bit patterns
- Theorem: For every n, a memory wheel exists of size  $2^n$  which has all n-bit patterns

- Definition: a cycle of bits such that every n-bit pattern occurs among adjacent bits
- Example: memory wheel with 8 bits that contains all 3-bit patterns
- Theorem: For every n, a memory wheel exists of size  $2^n$  which has all n-bit patterns
- Proof: uses Eurlerian circuits

• How many ways are there to sit 7 people at a round table with 7 chairs?

- How many ways are there to sit 7 people at a round table with 7 chairs?
  - Consider two ways the same if everyone has the same
     2 neighbors (regardless of which side they are on)

- How many ways are there to sit 7 people at a round table with 7 chairs?
  - Consider two ways the same if everyone has the same 2 neighbors (regardless of which side they are on)
    What if there are 2 who can't sit next to each other?

- How many ways are there to sit 7 people at a round table with 7 chairs?
  - Consider two ways the same if everyone has the same 2 neighbors (regardless of which side they are on)
    What if there are 2 who can't sit next to each other?

• 
$$\frac{6!}{2} = 360$$

- How many ways are there to sit 7 people at a round table with 7 chairs?
  - Consider two ways the same if everyone has the same 2 neighbors (regardless of which side they are on)
    What if there are 2 who can't sit next to each other?
- $\frac{6!}{2} = 360$
- 360 5! = 360 120 = 240

• Let a be any positive number. Show that  $a^n = O(n!)$ .

• Let a be any positive number. Show that  $a^n = O(n!)$ .

#### Note we have

$$a^n = \underbrace{a \times a \dots a}_n$$

and

$$n! = n \times (n-1)...2 \times 1$$
 When  $a \leq 1$ , we have  $C = 1, k = 1$ .

#### Note we have

$$a^n = \underbrace{a \times a \dots a}_n$$

and

$$n! = n \times (n-1)...2 \times 1$$
 When  $a \leq 1$ , we have  $C = 1, k = 1$ .  
When  $a > 1, \ldots$ 

When a > 1, let  $k = 2a^2$ ,

$$n! = n \times (n-1)...\frac{n}{2} \times (\frac{n}{2} - 1)... \times 1$$

$$n! = n \times (n-1) \dots \frac{n}{2} \times (\frac{n}{2} - 1) \dots \times 1$$
$$> \underbrace{a^2 \times a^2 \dots a^2}_{\frac{n}{2}} \times (\frac{n}{2} - 1) \dots \times 1$$

$$n! = n \times (n-1) \dots \frac{n}{2} \times (\frac{n}{2} - 1) \dots \times 1$$
  
> 
$$\underbrace{a^2 \times a^2 \dots a^2}_{\frac{n}{2}} \times (\frac{n}{2} - 1) \dots \times 1$$
  
> 
$$(a^2)^{\frac{n}{2}}$$

When a > 1, let  $k = 2a^2$ , when n > k we have  $\frac{n}{2} > a^2$  and

$$n! = n \times (n-1) \dots \frac{n}{2} \times (\frac{n}{2} - 1) \dots \times 1$$

$$> \underbrace{a^2 \times a^2 \dots a^2}_{\frac{n}{2}} \times (\frac{n}{2} - 1) \dots \times 1$$

$$> (a^2)^{\frac{n}{2}}$$

$$= a^n$$

The University of Texas at Austin

When a > 1, let  $k = 2a^2$ , when n > k we have  $\frac{n}{2} > a^2$  and

$$n! = n \times (n-1) \dots \frac{n}{2} \times (\frac{n}{2} - 1) \dots \times 1$$

$$> \underbrace{a^2 \times a^2 \dots a^2}_{\frac{n}{2}} \times (\frac{n}{2} - 1) \dots \times 1$$

$$> (a^2)^{\frac{n}{2}}$$

$$= a^n$$

Thus we have C = 1,  $k = \max(1, 2a^2)$  such that for all x > k,  $a^n < Cn!$ . So we have  $a^n = O(n!)$ . Proof completed.

• Let A be a finite set and  $f : A \rightarrow A$  be a function. Prove that f is injective if and only if f is surjective.

• Let A be a finite set and  $f : A \rightarrow A$  be a function. Prove that f is injective if and only if f is surjective.

Proof: First prove that if f is injective then f is surjective.

• Let A be a finite set and  $f : A \rightarrow A$  be a function. Prove that f is injective if and only if f is surjective.

Proof: First prove that if f is injective then f is surjective. Let B be the set of the images of f(x).

• Let A be a finite set and  $f : A \rightarrow A$  be a function. Prove that f is injective if and only if f is surjective.

Proof: First prove that if f is injective then f is surjective. Let B be the set of the images of f(x). Since f is injective, we have |B| = |A|.

• Let A be a finite set and  $f : A \rightarrow A$  be a function. Prove that f is injective if and only if f is surjective.

Proof: First prove that if f is injective then f is surjective. Let B be the set of the images of f(x). Since f is injective, we have |B| = |A|. Since we have  $B \subseteq A$  and A has finite number of elements, we have B = A which means f is surjective.

• Let A be a finite set and  $f : A \rightarrow A$  be a function. Prove that f is injective if and only if f is surjective.

Proof: First prove that if f is injective then f is surjective. Let B be the set of the images of f(x). Since f is injective, we have |B| = |A|. Since we have  $B \subseteq A$  and A has finite number of elements, we have B = A which means f is surjective. Then we prove f is surjective then f is injective.

Proof: First prove that if f is injective then f is surjective. Let B be the set of the images of f(x). Since f is injective, we have |B| = |A|. Since we have  $B \subseteq A$  and A has finite number of elements, we have B = A which means f is surjective. Then we prove f is surjective then f is injective. Assume BWOC f is not injective which means there exists x, y such that f(x) = f(y) = z.

Proof: First prove that if f is injective then f is surjective. Let B be the set of the images of f(x). Since f is injective, we have |B| = |A|. Since we have  $B \subseteq A$  and A has finite number of elements, we have B = A which means f is surjective. Then we prove f is surjective then f is injective. Assume BWOC f is not injective which means there exists x, y such that f(x) = f(y) = z. Thus we have  $|B| \le |A - \{x, y\}| + 1 = |A| - 2 + 1 = |A| - 1$ 

Proof: First prove that if f is injective then f is surjective. Let B be the set of the images of f(x). Since f is injective, we have |B| = |A|. Since we have  $B \subseteq A$  and A has finite number of elements, we have B = A which means f is surjective. Then we prove f is surjective then f is injective. Assume BWOC f is not injective which means there exists x, y such that f(x) = f(y) = z. Thus we have  $|B| \le |A - \{x, y\}| + 1 = |A| - 2 + 1 = |A| - 1$  which means f is not surjective.

Proof: First prove that if f is injective then f is surjective. Let B be the set of the images of f(x). Since f is injective, we have |B| = |A|. Since we have  $B \subseteq A$  and A has finite number of elements, we have B = A which means f is surjective. Then we prove f is surjective then f is injective. Assume BWOC f is not injective which means there exists x, y such that f(x) = f(y) = z. Thus we have  $|B| \le |A - \{x, y\}| + 1 = |A| - 2 + 1 = |A| - 1$  which means f is not surjective. Contradiction.
