Based on the Neuroevolution Book

Neuroevolution: Harnessing Creativity in AI Agent Design

An MIT Press Book by [Sebastian Risi](#), [Yujin Tang](#), [David Ha](#), and [Risto Miikkulainen](#)

Foreword by [Melanie Mitchell](#)

The online version of the book is now freely available in an open-access HTML format. The print edition will be released later in 2026.

[Access the Free Online Edition](#)

"Covering one of the most influential developments in evolutionary computing, this book is a must-read for experts in the field and newcomers alike. Its easily accessible style, combined with illustrative examples and software, provides a comprehensive overview of several decades of work that have merged neural-based learning with evolutionary methods."

—[Stephanie Forrest](#), Regents Professor at Arizona State University

"This book is the one and only comprehensive overview of the field of neuroevolution. It is a superb reference and will undoubtedly long serve as the definitive practical and historical introduction to evolving neural networks."

—[Ken Stanley](#), SVP at Life Sciences

[Overview](#) [Authors](#) [Table of Contents](#) [Demos](#) [Exercises](#) [Course and Tutorials](#) [For Instructors](#) [Community](#) [Cite](#)

Neuroevolution is a population-based search method that makes it possible to train neural networks when training targets are not known, and good performance requires many decisions over time, such as robotic control, game playing, and decision-making. This is the first comprehensive book on this topic: it reviews decades of work on building intelligent agents for such tasks, recent approaches for optimizing deep learning, RL, and GenAI models, experiments to gain insight into biological intelligence, and methods for optimizing neural networks for hardware implementation. In all these areas neuroevolution can be harnessed to discover surprising, effective solutions that often elude human designers. In addition to the book, the website includes animations, interactive demos, tutorials, exercises, and class materials that illustrate neuroevolution at work, and can serve as a starting point for your own explorations in creative agent design. We hope you find these resources useful!

- MIT Press, 2026
- A comprehensive overview
- Software platform: Demos, exercises
- Open access
- <https://neuroevolutionbook.com>

Outline

1. Motivation for Neuroevolution
2. Basics
 1. Fundamentals of Evolution
 2. Fundamentals of Neuroevolution
3. Advances
 1. Taking Advantage of Indirect Encodings
 2. Taking Advantage of Diversity
4. Evolving Intelligent Agents
 1. Control
 2. Strategy
 3. Decision-making
 4. Collective behavior
5. Synergies with other ML
 1. Deep Learning
 2. Reinforcement Learning
 3. LLMs
6. Insights into Biology
7. Conclusion

Hands-on exercise (off-line)

1. Motivation: From Imitation to Creativity

- Much of AI so far focuses on imitation
 - I.e. gradient descent on labeled datasets
 - Powerful in prediction: object recognition, diagnosis, forecasting, etc.
- Agentic AI focuses on behavior
 - Gradients not available
 - Needs to be discovered
- How can we create novel behaviors?

2.1 Evolution Basics: Encoding, Evaluation, and Selection

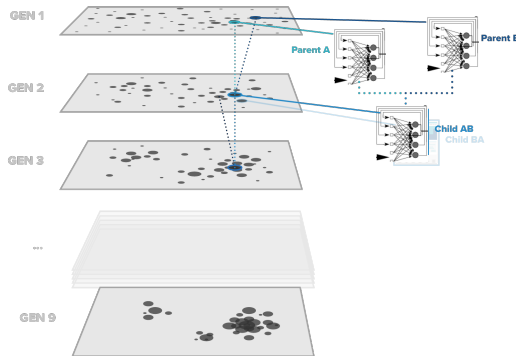

- A population of encodings (e.g. lists or trees)
- Decoded into individuals that are evaluated in the domain
- Good individuals retained, bad thrown away

Creating Variation

- New individuals generated from the parent encodings
 - Crossover: combine building blocks from two parents
 - Mutation: create new building blocks

Population-based Search

2.2 Basic Neuroevolution

- ▶ Evolving connection weights in a population of networks
- ▶ Chromosomes are strings of connection weights (bits or real)
 - ▶ E.g. 10010110101100101111001
 - ▶ Usually fully connected, fixed, initially random topology
- ▶ A natural mapping between genotype and phenotype
 - ▶ GA and NN are a good match!

Example: Learning to Walk

Demo

Advanced Neuroevolution

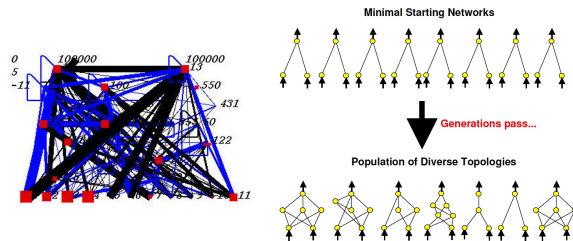

E.g. Neuroevolution of Augmenting Topologies (NEAT)

- *Historical markings* match up different structures
- Speciation
 - Keeps incompatible networks apart
 - Protects innovation
- Incremental growth from minimal structure, i.e. *complexification*
 - Avoids searching in unnecessarily high-d space
 - Makes finding high-d solutions possible

(Stanley and Miikkulainen, 2002)

Why Is It a Good Idea?

- ▶ NN search space is complex with nonlinear interactions
- ▶ Complexification keeps the search tractable
 - ▶ Start simple, add more sophistication
- ▶ Incremental discovery of complex solutions

Discovering Compact, Interpretable Structure

- E.g. in double pole balancing
 - Easy when position, velocity of both poles and the cart are given
 - Hard when only positions: need to figure out how they are moving
- Discovers recurrent structure
 - Either representing velocities separately
 - Or simply the derivative of the difference of the poles!
- Big improvement from other approaches
 - Standard value-function RL unsuccessful

Method	Evaluations
Genç et al. 1996 Cellular Encoding	840,000
Genç and Miikkulainen 1999 ESP	169,466
NEAT	33,184

20 trials

Outline

1. Motivation for Neuroevolution
2. Basics
 1. Fundamentals of Evolution
 2. Fundamentals of Neuroevolution
3. Advances
 1. Taking Advantage of Indirect Encodings
 2. Taking Advantage of Diversity
4. Evolving Intelligent Agents
 1. Control
 2. Strategy
 3. Decision-making
 4. Collective behavior
5. Synergies with other ML
 1. Deep Learning
 2. Reinforcement Learning
 3. LLMs
6. Insights into Biology
7. Conclusion

Hands-on exercise (off-line)

3.1 Indirect Encoding: (A) Development

- ▶ Instructions for constructing the network evolved
 - ▶ Instead of specifying each unit and connection
- ▶ E.g. Cellular Encoding (CE) Gruau & Whitley 1993
- ▶ Grammar tree describes construction
 - ▶ Sequential and parallel cell division
 - ▶ Changing thresholds, weights
 - ▶ A "developmental" process that results in a network

3.1 Indirect Encoding: (B) Hypernetworks

- ▶ Encode the networks as spatial patterns
- ▶ E.g. Hypercube-based NEAT (HyperNEAT)
- ▶ Evolve a neural network (CPPN) to generate spatial patterns
 - ▶ 2D CPPN: (x, y) input \rightarrow grayscale output
 - ▶ 4D CPPN: (x_1, y_1, x_2, y_2) input $\rightarrow w$ output
 - ▶ Connectivity and weights can be evolved indirectly
 - ▶ Works with very large networks (millions of connections)

Why are Indirect Encodings a Good Idea?

- ▶ Describes structure efficiently
 - ▶ Recurrency symbol in CE: XOR \rightarrow parity
 - ▶ Repetition with variation in CPPNs
- ▶ Useful for evolving topology
 - ▶ E.g. large structured networks
 - ▶ E.g. repetition of motifs

Future Opportunities

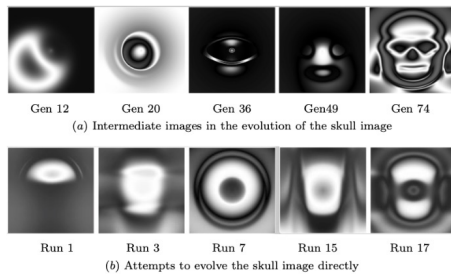

- ▶ Several possible directions
 - ▶ More general L-systems; developmental codings; embryogeny
 - ▶ Scaling up spatial coding
 - ▶ Genetic Regulatory Networks
 - ▶ Evolution of symmetries
- ▶ Theory starting to emerge
 - ▶ Expressive Encodings
 - ▶ Simple GAs are universal probability approximators

3.2 Diversity: (A) Searching for Novelty

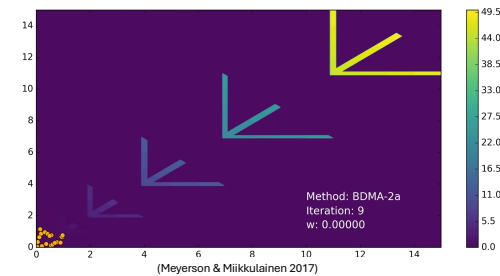

- ▶ Motivated by humans as fitness functions
- ▶ E.g. picbreeder.com, endlessforms.com (Secretan et al. 2011; Clune et al 2011)
 - ▶ CPPNs evolved; Human users select parents
- ▶ No specific goal
 - ▶ Interesting solutions preferred
 - ▶ Similar to biological evolution?

Novelty Search

- ▶ Evolutionary algorithms maximize a performance objective
 - ▶ But sometimes hard to achieve it step-by-step
- ▶ Novelty search rewards candidates that are simply different
 - ▶ Stepping stones for constructing complexity

Novelty Search Demo 1

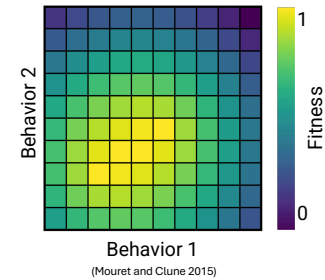

- ▶ Illustration of stepping stones
 - ▶ Nonzero fitness on "feet" only; stepwise increase
 - ▶ Top and right "toes" are stepping stones to next "foot"
 - ▶ Difficult for fitness based search; novelty can do it
- ▶ DEMO

Novelty Search Demo 2

- ▶ Fitness-based evolution is rigid
 - ▶ Requires gradual progress
- ▶ Novelty-based evolution is more innovative, natural
 - ▶ Allows building on stepping stones
- ▶ How to guide novelty search towards useful solutions?
 - ▶ Quality Diversity methods
- ▶ DEMO

(B) Combining Quality with Diversity

Goal: Find a set of different high-quality solutions for a given problem
 Ex: Find fast walking gaits for a legged robot for every direction

Popular QD Method: Multi-dimensional Archive of Phenotypic Elites¹ (MAP-Elites)

Idea: Evolve an archive of different high-quality solutions (= elites)

Multi-dimensional Archive of Phenotypic Elites (MAP-Elites)

MAP-Elites algorithm

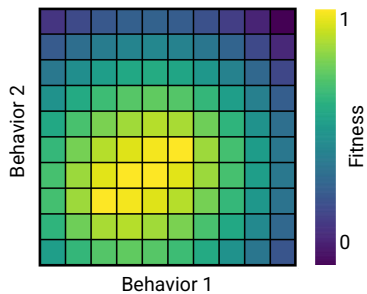

Initialization

1. Divide the behavior space into cells (= the Archive)
2. Initialize with random solutions until n_{init} elites are found

Main loop

1. Pick two elites from the Archive
2. Apply crossover and mutation
3. Evaluate new solution
4. If new behavior or better fitness the solution becomes an elite

Hands-on Exercise!

Outline

1. Motivation for Neuroevolution
2. Basics
 1. Fundamentals of Evolution
 2. Fundamentals of Neuroevolution
3. Advances
 1. Taking Advantage of Indirect Encodings
 2. Taking Advantage of Diversity
4. Evolving Intelligent Agents
 1. Control
 2. Strategy
 3. Decision-making
 4. Collective behavior
5. Synergies with other ML
 1. Deep Learning

 3. LLMs
6. Insights into Biology
7. Conclusion

Hands-on exercise (off-line)

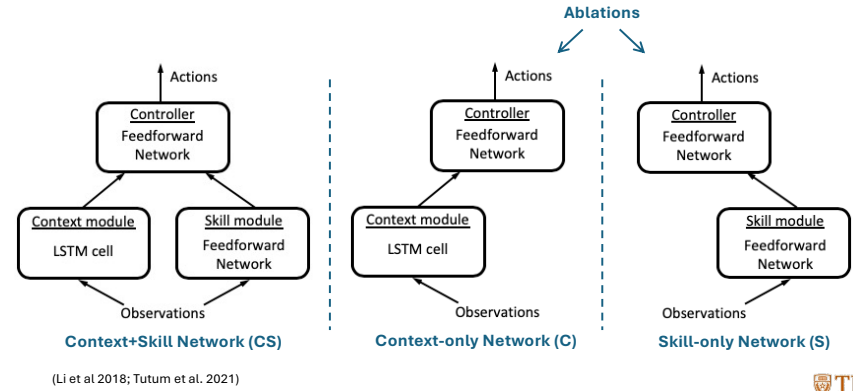

4.1 Evolving Controllers

- The main challenge for evolved controllers: Extrapolation
- Need to generalize immediately to unseen situations
 - Games, robotics, process control, healthcare, finance

Solution: Modeling Context Explicitly

(Li et al 2018; Tutum et al. 2021)

FlappyBall Domain

Demo

- Extension of Flappy Bird: FlapFwd, Drag
- **Inputs:** 6 numerical state values
 - Vertical position, distance to next pipe
 - Horizontal and vertical velocity
 - Height of the upper and lower pipe
- **Outputs:** select FlapUp, FlapFwd, glide
- **Objectives:**
 - Safety: Don't hit pipes, ceiling, ground
 - Performance: Fly fast
- **Task Variation:**
 - Strength of Gravity, Drag, FlapUp, FlapFwd
- **Extrapolation:**
 - Evaluated with 4x range in all combinations

Example Behaviors in FlappyBall

- Extrapolated conditions: $F=-7.0$, $G=0.58$, $Fwd=8.75$, $D=0.58$

Context+Skill Network (CS)

Pipes = 21
Hits = 0

DEMO

Context-only Network (C)

Pipes = 15
Hits = 6

Skill-only Network (S)

Pipes = 16
Hits = 5

Modulation by Context

- Output of Context and Skill modules mapped to 2D with PCA
- Difference in an extrapolated task and the nominal task plotted
- Differences are smaller in CS than in C-only and S-only
 - Decision network needs to deal with less variance
 - Easier to generalize
 - CS evolves to make new tasks look more familiar
- Allows coping robustly in novel situations

4.2 Evolving Behavioral Strategies

(Schrum and Miikkulainen 2015)

Strategy: different behaviors at different times

Ms. Pac-Man:

- ▶ Agents perform many different tasks
 - ▶ E.g. eat pills, avoid ghosts, eat powerpills, eat ghosts
 - ▶ Sometimes clearly separate in time
 - ▶ Sometimes multiple tasks at once
- ▶ How can we evolve them into a single network?

MM-NEAT: Modular Multiobjective Approach

- ▶ Evolution discovers modules and when to use them
 - ▶ Vs. human-designed division with multitasking
- ▶ Multiple modules with preference neurons
 - ▶ Modules implement different behaviors
 - ▶ Preference neurons used to choose among them
 - ▶ Module-mutation adds new modules
- ▶ Evolved towards multiple objectives
 - ▶ Correspond to dimensions of game play
 - ▶ E.g. pills and ghosts in Ms. Pac-Man

Human-Designed Task Division

▶ Multitask approach

- ▶ One module for threat ghosts
- ▶ Another module for edible ghosts
- ▶ Works ok, but...
- ▶ DEMO

Evolution-Discovered Task Division

- ▶ One module used 95% of the time
 - Eat pills, avoid ghosts, chase ghosts
 - Different behaviors with a common base
- ▶ A second module used 5% of the time
 - Luring ghosts near a power pill
 - Escaping from tight spaces
- ▶ A different multimodal perspective
- ▶ Not as obvious, but more powerful
- ▶ DEMO

4.3 Optimizing Decision-Making

Organizations have lots of data

- Can build predictive models of patients, customers, students...
- Such models do not specify how to make decisions
- Optimal decisions not known

Need to search for decision strategies

- But testing strategy candidates in the real world is costly

Surrogate Optimization Approach

Use a predictive model as a surrogate for the world

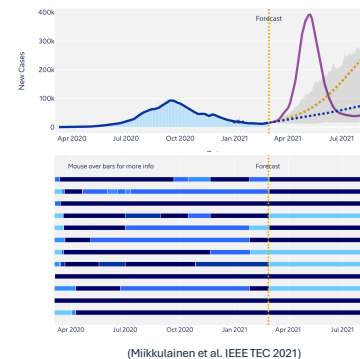

Train model with historical data: Context+Actions → Outcomes

- Phenomenological model (based on data)
- Not a simulation from first principles

Search for a good decision strategy (i.e. policy): Context → Actions

- Use the model to evaluate strategies
- Evolve a neural network to represent the strategy

Optimizing Interventions in COVID-19

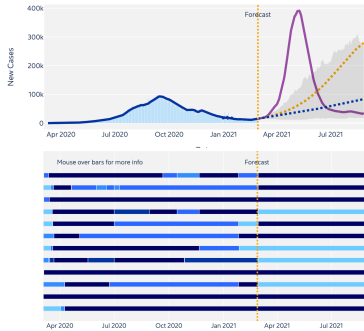

Based on two models:

1. A predictive model
 - Given a history of cases and nonpharma interventions (NPIs)
 - Predict number of cases daily
2. A prescriptive model
 - Given a history of cases and NPIs
 - Prescribe NPIs daily to minimize cases and restrictions

Not just what will happen, but what we should do about it

COVID-19 Predictions and Prescriptions

Retrained daily May 2020 – December 2022

- Based on data from Oxford University
- Adapting to the different stages of the pandemic
- Generalizing from experiences across the world

Recommendations about two weeks in advance, e.g.

- May 2020: Focus on schools and workplaces (i.e. indoors)
- Sept 2020: Focus on gatherings, travel restrictions
- March 2021: Delta surge: India lockdown
- August 2021: Recommendations for schools (Iceland)
- Dec 2021: Missed omicron surge; everywhere at once
- March 2022: Masking to avoid a second omicron surge

Interactive demo:

- <https://evolution.ml/demos/npidashboard/>

Leveraging Human Expertise with AI

XPRIZE competition resulted in 169 human expert strategies

- Many useful, diverse ideas

Can be used as an initial population for search

- Improve further; better than search from scratch
- Can realize latent potential of ideas

- How much DNA in the final Pareto front

Technology to bring the community effort together

- There is power in diversity

4.4 Evolving Collective Behavior

Natural predators and prey

Formalization of behavior

- ▶ Complex cooperation observed in pursuit and evasion
 - ▶ Motivated by biology, esp. hyenas vs. zebras (Kay Holekamp, MSU)
 - ▶ Largely innate, possible to see behaviors and their evolution
- ▶ Such behaviors evolve together, in coevolutionary environment
 - ▶ Simultaneous competitive and cooperative coevolution

Experimental Setup

(Rawal et al. 2010)

- ▶ Toroidal grid world
- ▶ Predators, prey move with same speed in 4 directions
- ▶ No direct communication between team members
 - ▶ Communication still possible through stigmergy
- ▶ Does a coevolutionary arms race result? DEMO

Evolutionary Arms Race

50-75: Single predator catches the prey

75-100: Prey evades by circling

Evolutionary Arms Race

100-150: Two predators cooperate

150-180: Prey baits and escapes

Predators and prey populations develop increasingly sophisticated behaviors

- Each improvement provides a challenge to the other population

Evolutionary Arms Race

180-200: All predators cooperate

Evolutionary Arms Race

200-250: Predators herd two prey

250-300: Prey evade by scattering

Outline

1. Motivation for Neuroevolution
2. Basics
 1. Fundamentals of Evolution
 2. Fundamentals of Neuroevolution

 3. Decision-making
 4. Collective behavior
5. Synergies with other ML
 1. Deep Learning
 2. Reinforcement Learning
 3. LLMs
6. Insights into Biology
7. Conclusion

Hands-on exercise (off-line)

5.1 Neuroevolution Synergies with Deep Learning

(A) Fundamental: Neural Architecture Search

- Optimizing structure and hyperparameters
- Takes advantage of exploration in EC

(B) Extended: Data and training

- Loss functions, activation functions, data augmentation, initialization, learning algorithm
- Takes advantage of flexibility of EC

(A) Evolutionary Neural Architecture Search

Evolution is a natural fit:

- Population-based search covers the space
- Crossover between structures discovers principles

Moreover,

- Can build on Neuroevolution work since the 1990s:
 - partial solutions, complexification, indirect encoding, novelty search
- Applies to continuous values; discrete choices; graph structures; combinations
- Can evolve hyperparameters; nodes; modules; topologies; multiple tasks

E.G. NAS with CoDeepNEAT

Evolution at three levels

- Module subpopulations optimize building blocks
- Blueprint population optimizes their combinations
- Hyperparameter evolution optimizes their instantiation

Fitness of the complete network drives evolution

- Candidates need to be evaluated through training
- Expensive; use partial training, surrogates...

(B) Optimizing Other Aspects of Deep Learning Design

Optimizing activation functions and loss functions (Bingham and Miikkulainen, 2022; Neural Networks Best Paper Award at IJCNN-25!) (Gonzalez and Miikkulainen, 2020)

Designing machine learning algorithms with GP (Real et al. 2020)

- Regularization and refinement
- Adapts to different task types
- Discovering new layer types

Coevolution of multiple aspects of network design?

Example: Evolving Age-Estimation Networks

Parameter	Possible Values	Type	Class
Algorithm	[adam, rmsprop]	Enum	Opt
Initial Learning Rate (LR)	[1e-5, 1e-3]	Float	Opt
Momentum	[0.7, 0.99]	Float	Opt
(Weight Decay) / LR [26]	[1e-7, 1e-3]	Float	Opt
Patience (Epochs)	[1, 20]	Int	Opt
SWA Epochs [21]	[1, 20]	Int	Opt
Rotation Range (Degrees)	[1, 60]	Int	Aug
Width Shift Range	[0.01, 0.3]	Float	Aug
Height Shift Range	[0.01, 0.3]	Float	Aug
Shear Range	[0.01, 0.3]	Float	Aug
Zoom Range	[0.01, 0.3]	Float	Aug
Horizontal Flip	[True, False]	Bool	Aug
Vertical Flip	[True, False]	Bool	Aug
Cutout Probability [7]	[0.01, 0.999]	Float	Aug
Cutout Max Proportion [7]	[0.05, 0.5]	Float	Aug
Pretrained Base Model	Keras App. [5]	Enum	Arch
Base Model Output Blocks	[B0, B1, B2, B3]	Subset	Arch
Loss function λ in Eq. 5	[0, 1]	Float	Arch

(Miikkulainen et al. 2021)

Estimate age from a facial image

Evolving multiple design aspects

- Learning, data augmentation hyperparameters
- Seeded architecture search
- Loss-function optimization: Combination of MAE and CE

Also

- Population-based training
- Ensembling of evolved solutions

Age-Estimation Results

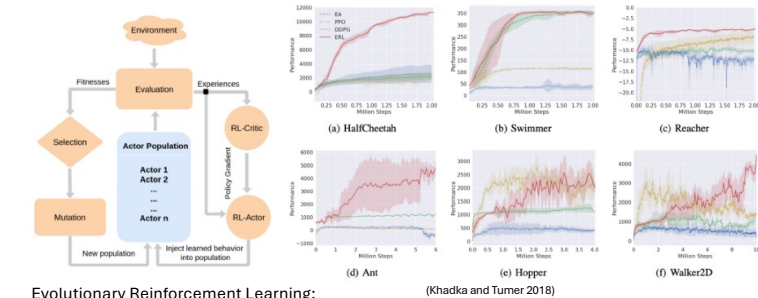

- D0 stages: ResNet-50, DenseNet-121
- D1 stages: DenseNet-169, DenseNet-201, more epochs. EfficientNet-B6, ensembling
- Human optimization of ResNet-50 (D0), EfficientNet-B6 (D1)

Evolution improves significantly over SotA image models

- Fit the design to the task
- Optimizes better than humans can
- Many more parameters simultaneously
- Performance exceeds that of humans: 2.19 vs. 3-4 years

5.2 Neuroevolution Synergies with RL

(A) Combining population-based search and RL-based search

Evolutionary Reinforcement Learning:

- A population of networks evolved to maximize rewards
- Evaluations create off-policy training data for Deep RL
- Trained networks periodically injected into the population
- ERL outperforms both EA and Deep RL alone

(B) Evolving Value Function Networks

NEAT+Q

- Many RL methods rely on value functions to estimate rewards
- NEAT evolves both weights and topologies for better value-function networks
- NEAT+Q outperforms other value-function approximation methods and manually designed networks in e.g. mountain car and server job scheduling

(C) Evolving Starting Points for RL

MAML-Baldwin, ES-MAML (Fernando et al. 2018; Song et al. 2019)

- Model-agnostic Meta-Learning (MAML) finds good starting points for learning
- Evolutionary methods like MAML-Baldwin and ES-MAML improve by evolving the starting points
- Evolve initial weights that adapt to different tasks during the agent's lifetime.
- E.g. in half-cheetah task, adapts to changing direction rewards within seconds

5.3 Neuroevolution Synergies with LLMs

(A) Neuroevolution through Large Language Models

Better evolution through LLMs?

- Evolution through large models (ELM)
- Language model crossover (LMX)
- Level generation for Mario (MarioGPT)

E.g. Evolutionary prompting for NAS (EvoPrompting)

- Existing architectures as prompts; generate new
- Tune the prompts based on performance

(B) Neuroevolution of Large Language Models

Better LLMs through evolution?

Model merging: combine multiple fine-tuned LLMs to one

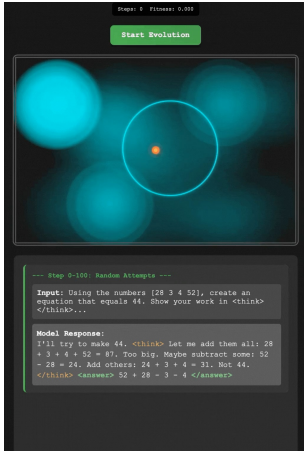

- E.g. Japanese LLM with Math
- Evolving prompts: Promptbreeder

Evolving multi-LLM interactions

- E.g. roles for collaborative problem solving

Fine-tuning LLMs with Evolutionary Strategies

- In parameter space instead of action space (PPO, GRPO)
 - Works for billions of parameters
- Demonstrated in the Countdown task:
 - Find an expression using +-*/* for 28 3 4 52 that = 44
Solution: $28 + 52/4 + 3 = 44$
 - Improved accuracy 36% (vs. PPO 18%, GRPO 21%)

- Higher rewards with smaller changes
- Finds principled and systematic solutions that underlie behavior

Outline

- Motivation for Neuroevolution
- Basics
 - Fundamentals of Evolution
 - Fundamentals of Neuroevolution
- Advances
 - Taking Advantage of Indirect Encodings
 - Taking Advantage of Diversity
- Evolving Intelligent Agents
 - Control
 - Strategy
 - Decision-making
 - Collective behavior
- Synergies with other ML
 - Deep Learning
 - Reinforcement Learning
 - LLMs
- Insights into Biology
- Conclusion

Hands-on exercise (off-line)

6. Example: Evolution of Intelligent Coordinated Behavior

Stealing a kill from lions

- Succeeds in an otherwise impossible task (sometimes)
- More sophisticated than other hyena behaviors
- Highly rewarding compared to normal hunting
- Largely genetically determined
- A breakthrough in evolution of intelligence?

A collaboration with Kay Holekamp's lab (MSU)

- Studying hyenas in Masai Mara since 1982

(Rajagopalan et al. 2021)

DEMO

Simulation Setup

Lion at a kill, with an interaction circle around it
Ten hyenas chosen and placed randomly in the field
If four or more hyenas enter the circle simultaneously, they get the kill

- Otherwise they die
- Does mobbing behavior evolve?
- What are the stepping stones for it?

Initial Behaviors

- Risk evasion is common
- Never reach the circle; Medium fitness
- Risk taking is common
- Charge the circle; Frequent low fitness
 - Occasional high fitness by accident

DEMO

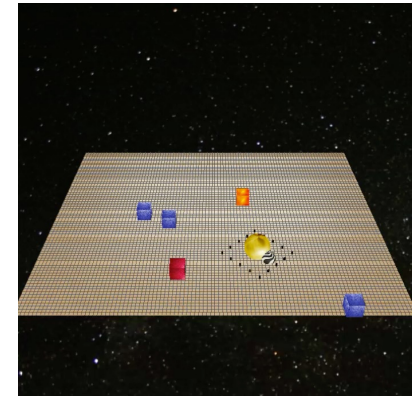

Early Behaviors

- Risk taking grows
- As long as it is successful often enough
- Risk evasion also persists
- Evasion at the circle starts to emerge
- Is mostly detrimental, but an important stepping stone

DEMO

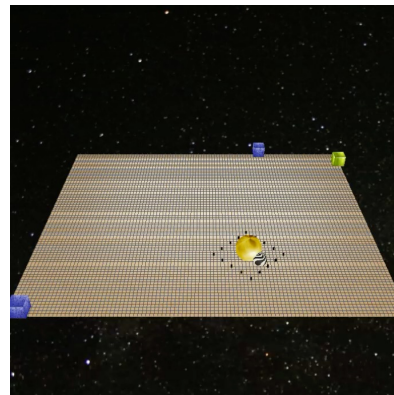

Later Behaviors

- Mobbing emerges
- Not just coincidence of risk takers
 - Hyenas wait until there's enough of them
- Risk-evaders evolve into latecomers
- Simple risk-taking and risk-evasion still exist

DEMO

Insight into Real-life Behaviors

These behaviors are observed in real-life hyenas as well

A computational explanation of why they are there:

- Stepping stones in discovery
- Safeguards in maintaining

Future Challenge: Evolution of Language

- Signaling is possible to evolve in ecological simulations
 Structured language is much harder
 Perhaps language evolved not from signaling, but cognition
- Complex social structure, with modifiable roles
 - Language structure can reuse the same conceptual structures
- Enough compute, complex simulations to study now?

Conclusion

AI is progressing from imitation to creativity; from models to agents

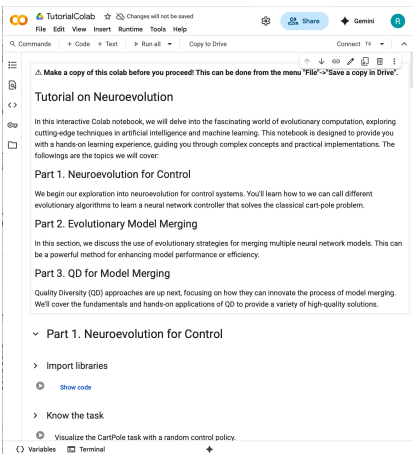

- Neuroevolution is a powerful approach to discovering behavior
- Control, strategy, collective behavior, decision-making
- Neuroevolution can provide a boost to ML
- Deep learning designs; RL exploration; LLM optimization
 - Automatic design of learning machines

Neuroevolution can provide insight into biological evolution

- Evolutionary origins of circuits, behavior, intelligence
- Evolution of language as a current challenge
- A possible path to AGI
