

# CS 327E Lecture 7

Shirley Cohen

February 15, 2016

# Agenda

- Reading Quiz
- Views Discussion
- Concept Questions
- Midterm #1 Discussion

Reminder: Midterm #1 is next class

# Homework for Today

- Chapter 14 from the Learning SQL book
- Exercises at the end of Chapter 14

# Question 1

What is a database view?

- A. A mechanism for reading raw data files from disk
- B. A mechanism for querying database tables
- C. A mechanism for doing bulk imports and exports
- D. A web-based interface for running SQL queries
- E. None of the above

## Question 2

What is **NOT** a motivation for views?

- A. Aggregation: to appear as though data is aggregated
- B. Complexity: making multiple tables appear to be a simple table
- C. Security: to avoid having to reveal individual data rows
- D. Space saving: to reduce the storage of database tables

## Question 3

Can you update data through a view?

- A. No, views are only designed to simplify a `SELECT` statement
- B. No, views are statically-generated tables and do not update
- C. Yes, with several restrictions on clauses and functions
- D. Yes, for all views

# Question 4

```
mysql> desc customer;
```

Field	Type	Null	Key	Default	Extra
cust_id	int(10) unsigned	NO	PRI	NULL	auto_increment
fed_id	varchar(12)	NO		NULL	
cust_type_cd	enum('I','B')	NO		NULL	

Which of these views hides the `fed_id` field from the `customer` table?

- A. 

```
CREATE VIEW customer_vw (cust_id, cust_type_cd) AS
  SELECT cust_id, cust_type_cd
  FROM customer;
```
- B. 

```
CREATE VIEW customer_vw AS
  SELECT cust_id, cust_type_cd
  FROM customer;
```
- C. 

```
CREATE VIEW customer_vw (cust_id, cust_type_cd) AS
  SELECT c.cust_id, c.cust_type_cd
  FROM customer c;
```
- D. 

```
CREATE VIEW customer_vw (cust_num, cust_type) AS
  SELECT cust_id, cust_type_cd
  FROM customer;
```
- E. All of the above

# Views

- Views are like procedures in SQL
- They are defined by a SQL query
- They return a table of results from the SQL query

Example view:

Employees(ssn, first\_name, last\_name, role, title, salary)

```
CREATE VIEW SeniorStaff AS
  SELECT ssn, first_name, last_name, role, title, salary
  FROM Employees
  WHERE title LIKE 'Senior%'
  ORDER BY salary
```

SeniorStaff(ssn, first\_name, last\_name, title, salary) = virtual table

We can now use the *SeniorStaff* view as if it were a table

# Types of Views

- **Virtual views:**
  - computed only on-demand
  - always up-to-date
- **Materialized views:**
  - pre-computed offline
  - requires extra storage
  - may be out-of-date with the base tables

# Query Modification

Orders(order\_id, item\_id, customer\_id, quantity, store)  
Items(id, item\_name, price)

```
CREATE VIEW CustomerSales AS
  SELECT o.customer_id, i.price
  FROM   Orders o, Items i
  WHERE  o.item_id = i.id
```

CustomerSales(customer\_id, price) = virtual table

Using the view:

```
SELECT c.customer_id, c.price, o.store
FROM   CustomerSales c, Orders o
WHERE  c.customer_id = o.customer_id
AND    c.price > 100
```

Question: How will this query be computed?

# Query Modification

Using the view:

```
SELECT c.customer_id, c.price, o.store
FROM   CustomerSales c, Orders o
WHERE  c.customer_id = o.customer_id
AND    c.price > 100
```

Modified query (at runtime):

```
SELECT c.customer_id, c.price, o.store
FROM   (SELECT x.customer_id, y.price,
              FROM Orders x, Items y
              WHERE x.item_id = y.id) c, Orders o
WHERE  c.customer_id = o.customer_id
AND    c.price > 100
```

# Query Modification

Rewritten query (at runtime):

```
SELECT c.customer_id, c.price, o.store
FROM   (SELECT x.customer_id, y.price,
              FROM Orders x, Items y
              WHERE x.item_id = y.id) c, Orders o
WHERE  c.customer_id = o.customer_id
AND    c.price > 100
```

Flattened query (at runtime):

```
SELECT o.customer_id, i.price, o.store
FROM   Orders o, Items i
WHERE  o.item_id = i.id
AND    i.price > 100
```

# Concept Question 1

Orders(order\_id, item\_id, customer\_id, quantity, store)  
Items(id, item\_name, price)

```
CREATE VIEW CustomerSales AS
  SELECT o.customer_id, o.store, i.price
  FROM Orders o, Items i
  WHERE o.item_id = i.id
```

CustomerSales(customer\_id, store, price) = virtual table

Using the View:

```
SELECT customer_id
FROM CustomerSales
WHERE store = 'Texas Union'
```

Question: Which base table(s) will be used to answer this query?

- A. Only Orders      B. Orders and Item      C. Only Item      D. Customer\_Sales

# Applications of Views

- Logical Data Independence  
(recall: Physical Data Independence)
- Optimizations
  - vertical partitioning
  - horizontal partitioning
- Security
  - controlled access to fields and records

# Vertical Partitioning

Students(eid, first\_name, middle\_initial, last\_name)  
Students\_Photo(eid, photo, date\_taken)

```
CREATE VIEW StudentsView AS
  SELECT s.eid, s.first_name, s.middle_initial,
         s.last_name, p.photo, p.date_taken
  FROM   Students s, Student_Photo p
  WHERE  s.eid = p.eid
```

Using the View:

```
SELECT eid, first_name, middle_initial
FROM   StudentsView
WHERE  last_name = 'Evans'
```

Concept Question 2: Which base table(s) will be used to answer this query?

A. Only *Students\_Photo*

B. *Students* and *Students Photo*

C. Only *Students*

# Horizontal Partitioning

Students(eid, first\_name, middle\_initial, last\_name)

Students\_Photo\_2015(eid, photo, date\_taken)

Students\_Photo\_2016(eid, photo, date\_taken)

```
CREATE VIEW Students_Photos AS
  SELECT eid, photo, date_taken
  FROM   Student_Photo_2015
  UNION ALL
  SELECT eid, photo, date_taken
  FROM   Student_Photo_2016
```

Using the View:

```
SELECT s.eid, s.first_name, s.middle_initial, s.last_name,
       p.photo, p.date_taken
FROM   Students s, Students_Photos p
WHERE  s.eid = p.eid
AND    p.date_taken < '2015-09-01'
```

**Concept Question 3:** Which base table(s) will be used to answer this query?

A. Only *Students*

B. *Students* and *Students\_Photo\_2015*

C. All base tables

# Security Views

Employees(ssn, first\_name, last\_name, role, title, salary)

```
CREATE VIEW All_Employee_View AS
  SELECT first_name, last_name, role, title
  FROM Employees
  ORDER BY last_name, first_name
```

```
CREATE VIEW Manager_Employee_View AS
  SELECT ssn, first_name, last_name, role, title, salary
  FROM Employees
  WHERE role <> 'Executive'
  ORDER BY last_name, first_name
```

Concept Question 4: what data do these two views hide?

- A. Salary information for all employees
- B. Salary information for executives
- C. All employee records
- D. Only executive employee records
- E. A and D

# Midterm #1 Topics

- CREATE TABLE
- SELECT CLAUSE
- FROM CLAUSE
- WHERE CLAUSE
- ORDER BY CLAUSE
- Null values
- INNER JOINS
- OUTER JOINS
- GROUP BY and HAVING CLAUSE
- Aggregate functions (count, sum, avg, min, max)
- CREATE VIEWS

# Midterm #1 Format

- Closed book exam
- Lasts 90 minutes
- 11 short-answer questions
- Budget 5-7 minutes per question
