Topic 24
Sorting and Searching arrays

"There's nothing in your head the sorting hat can't see. So try me on and I will tell you where you ought to be."
- The Sorting Hat, *Harry Potter and the Sorcerer's Stone*

Searching

- Given an array of ints find the index of the first occurrence of a target int

<table>
<thead>
<tr>
<th>index</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>89</td>
<td>0</td>
<td>27</td>
<td>-5</td>
<td>42</td>
<td>11</td>
</tr>
</tbody>
</table>

- Given the above array and a target of 27 the method returns 2
- What if not present?
- What if more than one occurrence?

Clicker 1

- Given an array with 1,000,000 distinct elements in random order, how many elements do you expect to look at (on average) when searching if:

  - item present
  - item not present

A. 1 1,000,000
B. 500,000 1,000,000
C. 1,000,000 1,000,000
D. 1,000 500,000
E. 20 1,000,000

linear or sequential search
Sorting

A fundamental application for computers
- Done to make finding data (searching) faster
- Many different algorithms for sorting
- One of the difficulties with sorting is working with a fixed size storage container (array)
  - if resize, that is expensive (slow)
  - Trying to apply a human technique of sorting can be difficult
  - try sorting a pile of papers and clearly write out the algorithm you follow

Insertion Sort
- Another of the Simple sort
- The first item is sorted
- Compare the second item to the first
  - if smaller swap
- Third item, compare to item next to it
  - need to swap
  - after swap compare again
- And so forth...

Insertion Sort in Practice

- Determine how long it takes to sort an array with 100,000 elements in random order using insertion sort. When the number of elements is increased to 200,000 how long will it take to sort the array?

A. About the same  
B. 1.5 times as long  
C. 2 times as long  
D. 4 times as long  
E. 8 times as long

Searching in a Sorted List

- If items are sorted then we can divide and conquer
- dividing your work in half with each step  
  - generally a good thing
- The Binary Search on List in Ascending order
  - Start at middle of list  
  - is that the item?  
  - If not is it less than or greater than the item?  
  - less than, move to second half of list  
  - greater than, move to first half of list  
  - repeat until found or sub list size = 0

Binary Search

<table>
<thead>
<tr>
<th>list</th>
<th>low item</th>
<th>middle item</th>
<th>high item</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Is middle item what we are looking for? If not is it more or less than the target item? (Assume lower)

<table>
<thead>
<tr>
<th>list</th>
<th>low item</th>
<th>middle item</th>
<th>high item</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

and so forth...
Implement Binary Search

Tracing When Key == 3

Variables of Interest?

Clicker 3

Given an array with 1,000,000 elements in sorted order, how many elements do you expect to look at when searching (with binary search) for a value if:

- item present once
- item not present

- A. 1 500,000
- B. 20 20
- C. 1 1,000,000
- D. 1,000 500,000
- E. 1,000 1,000

Selection Sort

- To sort a list into ascending order:
  - Find the smallest item in an array, the minimum
  - Put that value in the first element of the array
    - Where to put the value that was in the first location?
  - And now...?
Selection Sort in Practice
