Topic 5
for loops and nested loops

“Always to see the general in the particular is the very foundation of genius.”

-Arthur Schopenhauer

Based on slides by Marty Stepp and Stuart Reges from http://www.buildingjavaprograms.com/
Repetition with `for` loops

- So far, repeating a statement is redundant:

  ```java
  System.out.println("Mike says:");
  System.out.println("Do Practice-It problems!");
  System.out.println("Do Practice-It problems!");
  System.out.println("Do Practice-It problems!");
  System.out.println("Do Practice-It problems!");
  System.out.println("It makes a HUGE difference.");
  ```

- Java's `for` loop statement performs a task many times.

  ```java
  System.out.println("Mike says:");
  for (int i = 1; i <= 5; i++) { // repeat 5 times
      System.out.println("Do Practice-It problems!");
  }
  System.out.println("It makes a HUGE difference.");
  ```
for loop syntax

for (<initialization>; <test>; <update>) {
    <statement>;
    <statement>;
    ...
    <statement>;
}

- Perform <initialization> once.
- Repeat the following:
  • Check if the <test> is true. If not, stop.
  • Execute the <statement>s.
  • Perform the <update>. 
for (int i = 1; i <= 5; i++) {
    System.out.println("Do Practice-It!");
}

- Tells Java compiler what variable to use in the loop
  - Performed once as the loop begins
  - The variable is called a loop counter or loop control variable
    - can use any name, not just i
    - can start at any value, not just 1
```java
for (int i = 1; i <= 5; i++) {
    System.out.println("Do Practice-It!");
}
```

- Tests the loop counter variable against a limit
  - Uses comparison operators:
    - `<` less than
    - `<=` less than or equal to
    - `>` greater than
    - `>=` greater than or equal to
for(int i = 1; i <= 5; i++) {
    System.out.println("Do Practice-It!");
}

- Perform update step
  - Generally adding one to loop control variable
  - Could be other operations such as subtracting one, multiplying
Aside: Increment and Decrement Operators

shortcuts to increase or decrease a variable's value by 1

Shorthand

<variable>++;
<variable>--;  

Equivalent longer version

<variable> = <variable> + 1;
<variable> = <variable> - 1;

int x = 2;
x++;  // x = x + 1;
// x now stores 3

double gpa = 2.5;
gpa--; // gpa = gpa - 1;
// gpa now stores 1.5
Aside: Modify-and-assign operators

shortcuts to modify a variable's value

<table>
<thead>
<tr>
<th>Shorthand</th>
<th>Equivalent longer version</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;variable&gt;</code> += <code>&lt;exp&gt;</code>;</td>
<td><code>&lt;variable&gt;</code> = <code>&lt;variable&gt;</code> + (<code>&lt;exp&gt;</code>);</td>
</tr>
<tr>
<td><code>&lt;variable&gt;</code> -= <code>&lt;exp&gt;</code>;</td>
<td><code>&lt;variable&gt;</code> = <code>&lt;variable&gt;</code> - (<code>&lt;exp&gt;</code>);</td>
</tr>
<tr>
<td><code>&lt;variable&gt;</code> *= <code>&lt;exp&gt;</code>;</td>
<td><code>&lt;variable&gt;</code> = <code>&lt;variable&gt;</code> * (<code>&lt;exp&gt;</code>);</td>
</tr>
<tr>
<td><code>&lt;variable&gt;</code> /= <code>&lt;exp&gt;</code>;</td>
<td><code>&lt;variable&gt;</code> = <code>&lt;variable&gt;</code> / (<code>&lt;exp&gt;</code>);</td>
</tr>
<tr>
<td><code>&lt;variable&gt;</code> %= <code>&lt;exp&gt;</code>;</td>
<td><code>&lt;variable&gt;</code> = <code>&lt;variable&gt;</code> % (<code>&lt;exp&gt;</code>);</td>
</tr>
</tbody>
</table>

```plaintext
x += 3; // x = x + 3;
gpa -= 0.5; // gpa = gpa - 0.5;
number *= 2 + 1; // number = number * (2 + 1);
```
What is output by the following code?

```java
int x = 2;
int y = 5;
x *= 3 + y + x;
System.out.println(x + " " + y);
```

A. 20 5
B. 2 5
C. 13 5
D. 20 10
E. Something other than A - D
for loop is NOT a method

The for loop is a control structure
– a syntactic structure that controls the execution of other statements.

Example:
– “Shampoo hair. Rinse. Repeat.”
Repetition over a range

System.out.println("1 squared = " + 1 * 1);
System.out.println("2 squared = " + 2 * 2);
System.out.println("3 squared = " + 3 * 3);
System.out.println("4 squared = " + 4 * 4);
System.out.println("5 squared = " + 5 * 5);
System.out.println("6 squared = " + 6 * 6);

– Intuition: "I want to print a line for each number from 1 to 6"

The for loop does exactly that!

```
for (int i = 1; i <= 6; i++) {
    System.out.println(i + " squared = " + (i * i));
}
```

– "For each integer i from 1 through 6, print ..."
Loop walkthrough

```java
for (int i = 1; i <= 4; i++) {
    System.out.println(i + " squared = " + (i * i));
}
System.out.println("Whoo!");
```

Output:
1 squared = 1
2 squared = 4
3 squared = 9
4 squared = 16
Whoo!
System.out.println("+-----+");
for (int i = 1; i <= 3; i++) {
    System.out.println("\\  /");
    System.out.println("/  \\");
}
System.out.println("+-----+");

Output:

+-----+
\  /   
/  \   
/    \   
/     \   
/      \   
/       \   
/         \   
/           \   
+-----+
Expressions for counter

```java
int highTemp = 5;
for (int i = -3; i <= highTemp / 2; i++) {
    System.out.println(i * 1.8 + 32);
}
```

– This computes the Fahrenheit equivalents for -3 degrees Celsius to 2 degrees Celsius.

Output:

26.6
28.4
30.2
32.0
33.8
35.6
Prints without moving to a new line
– allows you to print partial messages on the same line

```java
int highestTemp = 5;
for (int i = -3; i <= highestTemp / 2; i++) {
    System.out.print((i * 1.8 + 32) + "  ");
}
```

• Output:
  26.6  28.4  30.2  32.0  33.8  35.6

• Concatenate "  " to separate the numbers
Clicker Question

How many asterisks are output by the following code?

```java
for(int i = -2; i <= 13; i++) {
    System.out.print("*");
    System.out.print("**");
}
```

A. 0  B. 15  C. 45
D. 48  E. 68
Counting down

- The `<update>` can use -- to make the loop count down.
  - The `<test>` must say > instead of < (or logic error)

```java
System.out.print("T-minus ");
for (int i = 10; i >= 1; i--)

  System.out.print(i + ", ");
}
System.out.println("blastoff!");
System.out.println("The end.");
```

Output:

T-minus 10, 9, 8, 7, 6, 5, 4, 3, 2, 1, blastoff!
The end.
Newton's method for approximating square roots adapted from the Dr. Math website

The goal is to find the square root of a number. Let's call it \textit{num}.

1. Choose a rough approximation of the square root of \textit{num}, call it \textit{approx}.

   How to choose?

2. Divide \textit{num} by \textit{approx} and then average the quotient with \textit{approx},

   in other words we want to evaluate the expression \[
   \frac{(\text{num}/\text{approx}) + \text{approx}}{2}
   \]

3. How close are we? In programming we would store the result of the expression back into the variable \textit{approx}.

4. How do you know if you have the right answer?
### Sample of Newton's Method

<table>
<thead>
<tr>
<th>num</th>
<th>approx</th>
<th>((\text{num}/\text{approx})+\text{approx})/2)</th>
<th>\text{approx}^2</th>
<th>approx \text{approx}</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>6</td>
<td>((12 / 6 + 6) / 2 = 4)</td>
<td>16</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>4</td>
<td>((12 / 4 + 4) / 2 = 3.5)</td>
<td>12.25</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>3.5</td>
<td>((12 / 3.5 + 3.5) / 2 = 3.4642857\ldots)</td>
<td>12.0012..</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>3.4642857</td>
<td>= 3.46410162\ldots</td>
<td>12.000000003</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>3.46410162</td>
<td>= 3.46410161\ldots</td>
<td>11.9999999999</td>
<td></td>
</tr>
</tbody>
</table>

Nested loops

reading: 2.3
Nested loops

- **nested loop**: A loop placed inside another loop.

```java
for (int i = 1; i <= 5; i++) {
    for (int j = 1; j <= 10; j++) {
        System.out.print("*");
    }
    System.out.println(); // to end the line
}
```

- **Output:**
  
  ***********
  ***********
  ***********
  ***********
  ***********

- The outer loop repeats 5 times; the inner one 10 times.
  - "sets and reps" exercise analogy
Nested `for` loop exercise

What is the output of the following nested `for` loops?

```java
for (int i = 1; i <= 5; i++) {
    for (int j = 1; j <= i; j++) {
        System.out.print("*");
    }
    System.out.println();
}
```

Output:

```
*  
** 
*** 
**** 
***** 
```

Nested for loop exercise

What is the output of the following nested for loops?

```java
for (int i = 1; i <= 5; i++) {
    for (int j = 1; j <= i; j++) {
        System.out.print(i);
    }
    System.out.println();
}
```

Output:

1
22
333
4444
55555
clicker Question

What is output by the following code?

```java
int total = 0;
for(int i = 1; i <= 4; i++) {
    for(int j = 1; j <= i; j++) {
        total += i;
    }
}
System.out.println(total);
```

A. 10  B. 20  C. 30  D. 40  E. 50
Common errors

- Both of the following sets of code produce **infinite loops**:

```java
for (int i = 1; i <= 5; i++) {
    for (int j = 1; i <= 10; j++) {
        System.out.print("*");
    }
    System.out.println();
}
```

```java
for (int i = 1; i <= 5; i++) {
    for (int j = 1; j <= 10; i++) {
        System.out.print("*");
    }
    System.out.println();
}
```
Write a nested for loop to produce the following output.

inner loop (repeated characters on each line)

We must build multiple complex lines of output using:

– an outer "vertical" loop for each of the lines
– inner "horizontal" loop(s) for the patterns within each line
First write the outer loop, from 1 to the number of lines.

```
for (int line = 1; line <= 5; line++) {
    ...
}
```

Now look at the line contents. Each line has a pattern:
- some dots (0 dots on the last line), then a number

```
. . . . 1
...2
..3
.4
5
```
- Observation: the number of dots is related to the line number.
for (int count = 1; count <= 5; count++) {
    System.out.print(" ... ");
}

– What statement in the body would cause the loop to print:

4 7 10 13 16

for (int count = 1; count <= 5; count++) {
    System.out.print(3 * count + 1 + " ");
}
Loop tables

- What statement in the body would cause the loop to print:
  2 7 12 17 22

- To see patterns, make a table of count and the numbers.
  - Each time count goes up by 1, the number should go up by 5.
  - But count * 5 is too great by 3, so we subtract 3.

<table>
<thead>
<tr>
<th>count</th>
<th>number to print</th>
<th>5 * count</th>
<th>5 * count - 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
<td>5</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>7</td>
<td>10</td>
<td>7</td>
</tr>
<tr>
<td>3</td>
<td>12</td>
<td>15</td>
<td>12</td>
</tr>
<tr>
<td>4</td>
<td>17</td>
<td>20</td>
<td>17</td>
</tr>
<tr>
<td>5</td>
<td>22</td>
<td>25</td>
<td>22</td>
</tr>
</tbody>
</table>
Loop tables question

- What statement in the body would cause the loop to print:
  17 13 9 5 1
- Let's create the loop table together.
  - Each time count goes up 1, the number printed should ...
  - But this multiple is off by a margin of ...

<table>
<thead>
<tr>
<th>count</th>
<th>number to print</th>
<th>-4 * count</th>
<th>-4 * count + 21</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>17</td>
<td>-4</td>
<td>17</td>
</tr>
<tr>
<td>2</td>
<td>13</td>
<td>-8</td>
<td>13</td>
</tr>
<tr>
<td>3</td>
<td>9</td>
<td>-12</td>
<td>9</td>
</tr>
<tr>
<td>4</td>
<td>5</td>
<td>-16</td>
<td>5</td>
</tr>
<tr>
<td>5</td>
<td>1</td>
<td>-20</td>
<td>1</td>
</tr>
</tbody>
</table>
Another view: Slope-intercept

The next three slides present the mathematical basis for the loop tables.

<table>
<thead>
<tr>
<th>count (x)</th>
<th>number to print (y)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>7</td>
</tr>
<tr>
<td>3</td>
<td>12</td>
</tr>
<tr>
<td>4</td>
<td>17</td>
</tr>
<tr>
<td>5</td>
<td>22</td>
</tr>
</tbody>
</table>
Another view: Slope-intercept

- **Caution**: This is algebra, not assignment!
- Recall: slope-intercept form \((y = mx + b)\)
- Slope is defined as “rise over run” (i.e. rise / run). Since the “run” is always 1 (we increment along \(x\) by 1), we just need to look at the “rise”. The rise is the difference between the \(y\) values. Thus, the slope \((m)\) is the difference between \(y\) values; in this case, it is +5.
- To compute the \(y\)-intercept \((b)\), plug in the value of \(y\) at \(x = 1\) and solve for \(b\). In this case, \(y = 2\).

\[
y = m \times x + b
2 = 5 \times 1 + b
\]

Then \(b = -3\)
- So the equation is

\[
y = 5 \times x - 3
y = 5 \times \text{count} - 3
\]

<table>
<thead>
<tr>
<th>count ((x))</th>
<th>number to print ((y))</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>7</td>
</tr>
<tr>
<td>3</td>
<td>12</td>
</tr>
<tr>
<td>4</td>
<td>17</td>
</tr>
<tr>
<td>5</td>
<td>22</td>
</tr>
</tbody>
</table>
Another view: Slope-intercept

- Algebraically, if we always take the value of $y$ at $x = 1$, then we can solve for $b$ as follows:
  
  \[ y = mx + b \]
  \[ y_1 = m \cdot 1 + b \]
  \[ y_1 = m + b \]
  \[ b = y_1 - m \]

- In other words, to get the $y$-intercept, just subtract the slope from the first $y$ value ($b = 2 - 5 = -3$)
  
  - This gets us the equation
    
    \[ y = mx + b \]
    \[ y = 5 \cdot x - 3 \]
    \[ y = 5 \cdot \text{count} - 3 \]

  (which is exactly the equation from the previous slides)
Nested for loop exercise

- Make a table to represent any patterns on each line.

```

<table>
<thead>
<tr>
<th>line</th>
<th># of dots</th>
<th>-1 * line</th>
<th>-1 * line + 5</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>4</td>
<td>-1</td>
<td>4</td>
</tr>
<tr>
<td>2</td>
<td>3</td>
<td>-2</td>
<td>3</td>
</tr>
<tr>
<td>3</td>
<td>2</td>
<td>-3</td>
<td>2</td>
</tr>
<tr>
<td>4</td>
<td>1</td>
<td>-4</td>
<td>1</td>
</tr>
<tr>
<td>5</td>
<td>0</td>
<td>-5</td>
<td>0</td>
</tr>
</tbody>
</table>
```

- To print a character multiple times, use a for loop.

```
for (int j = 1; j <= 4; j++) {
    System.out.print("."); // 4 dots
}
```
Nested for loop solution

Answer:

```java
for (int line = 1; line <= 5; line++) {
    for (int j = 1; j <= (-1 * line + 5); j++) {
        System.out.print(".");
    }
    System.out.println(line);
}
```

Output:

```
.....1
...2
..3
.4
5
```
Nested for loop exercise

What is the output of the following nested for loops?

```java
for (int line = 1; line <= 5; line++) {
    for (int j = 1; j <= (-1 * line + 5); j++) {
        System.out.print(".");
    }
    for (int k = 1; k <= line; k++) {
        System.out.print(line);
    }
    System.out.println();
}
```

Answer:

```
....1
...22
..333
.4444
55555
```
Nested for loop exercise

Modify the previous code to produce this output:

....1
...2.
..3..
.4...
5....

```java
for (int line = 1; line <= 5; line++) {
    for (int j = 1; j <= (-1 * line + 5); j++) {
        System.out.print(".");
    }
    System.out.println(line);
    for (int j = 1; j <= (line - 1); j++) {
        System.out.print(".");
    }
    System.out.println();
}
```
