

Topic 5

for loops and nested loops

“Always to see the general in the particular is the very foundation of genius.”

-Arthur Schopenhauer

Based on slides by Marty Stepp and Stuart Reges
from <http://www.buildingjavaprograms.com/>

Repetition with for loops

- So far, repeating a statement is redundant:

```
System.out.println("Mike says:");
System.out.println("Do Practice-It problems!");
System.out.println("Do Practice-It problems!");
System.out.println("Do Practice-It problems!");
System.out.println("Do Practice-It problems!");
System.out.println("Do Practice-It problems!");
System.out.println("It makes a HUGE difference.");
```

- Java's **for loop** statement performs a task many times.

```
System.out.println("Mike says:");
for (int i = 1; i <= 5; i++) {    // repeat 5 times
    System.out.println("Do Practice-It problems!");
}
System.out.println("It makes a HUGE difference.");
```

for loop syntax

```
for (<initialization>; <test>; <update>) { } header
    <statement>;
    <statement>;
    ...
    <statement>;
}
```

body

- Perform **<initialization>** once.
- Repeat the following:
 - Check if the **<test>** is true. If not, stop.
 - Execute the **<statement>**s.
 - Perform the **<update>**.

Initialization

```
for (int i = 1; i <= 5; i++) {
    System.out.println("Do Practice-It!");
}
```

- Tells Java compiler what variable to use in the loop
 - Performed once as the loop begins
 - The variable is called a *loop counter* or *loop control variable*
 - can use any name, not just *i*
 - can start at any value, not just 1

Test

```
for (int i = 1; i <= 5; i++) {  
    System.out.println("Do Practice-It!");  
}
```

► Tests the loop counter variable against a limit

– Uses comparison operators:

- < less than
- <= less than or equal to
- > greater than
- >= greater than or equal to
- == equality != not equals

5

Body

```
for (int i = 1; i <= 5; i++) {  
    System.out.println("Do Practice-It!");  
}
```

- If the test is true, the statements in the body of the loop execute in sequential order one time
- The body of the loop is between the curly braces
- If the body is one statement the curly braces are not required, but by convention we still add them
- After the body of the loop completes the update statement is executed.

6

Update

```
for(int i = 1; i <= 5; i++) {  
    System.out.println("Do Practice-It!");  
}
```

► Perform update step

- Generally adding one to loop control variable
- Could be other operations such as subtracting one, multiplying

7

Aside: Increment and Decrement Operators

shortcuts to increase or decrease a variable's value by 1

Shorthand

<variable>++;

<variable>--;

Equivalent longer version

<variable> = <variable> + 1;

<variable> = <variable> - 1;

int x = 2;

x++;

// x = x + 1;

// x now stores 3

double gpa = 2.5;

gpa--;

// gpa = gpa - 1;

// gpa now stores 1.5

8

Aside: Modify-and-assign operators

shortcuts to modify a variable's value

Shorthand

```
<variable> += <exp>;  
<variable> -= <exp>;  
<variable> *= <exp>;  
<variable> /= <exp>;  
<variable> %= <exp>;
```

Equivalent longer version

```
<variable> = <variable> + (<exp>);  
<variable> = <variable> - (<exp>);  
<variable> = <variable> * (<exp>);  
<variable> = <variable> / (<exp>);  
<variable> = <variable> % (<exp>);
```

```
x += 3;           // x = x + 3;  
gpa -= 0.5;       // gpa = gpa - 0.5;  
number *= 2 + 1;  // number = number * (2 + 1);
```

Clicker 1

► What is output by the following code?

```
int x = 2;  
int y = 5;  
x *= 3 + y + x;  
System.out.println(x + " " + y);
```

- A. 20 5
- B. 2 5
- C. 13 5
- D. 20 10
- E. Something other than A - D

10

for loop is **NOT** a method

- The `for` loop is a **control structure**
 - a syntactic structure that *controls* the execution of other statements.
- Example:
 - “Shampoo hair. Rinse. **Repeat.**”

11

Repetition over a range

```
System.out.println("1 squared = " + 1 * 1);  
System.out.println("2 squared = " + 2 * 2);  
System.out.println("3 squared = " + 3 * 3);  
System.out.println("4 squared = " + 4 * 4);  
System.out.println("5 squared = " + 5 * 5);  
System.out.println("6 squared = " + 6 * 6);
```

– Intuition: "I want to print a line for each number from 1 to 6"

► The `for` loop does exactly that!

```
for (int i = 1; i <= 6; i++) {  
    System.out.println(i + " squared = " + (i * i));  
}
```

– "For each integer `i` from 1 through 6, print ..."

12

Loop walkthrough

```

1   for (int i = 1; i <= 4; i++) {
2       3 System.out.println(i + " squared = " + (i * i));
3   }
4   5 System.out.println("Whoo!");

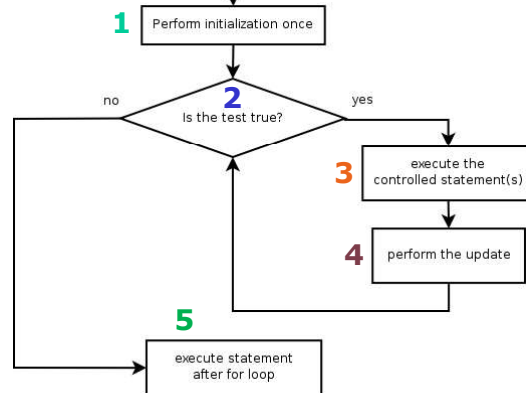

```

Output:

```

1 squared = 1
2 squared = 4
3 squared = 9
4 squared = 16
Whoo!

```

13

Simple Loop Example

- Write a program to calculate and print out the values of N! from 1 to 50 using a for loop
- $0! = 1$
- $1! = 1 * 0! = 1 * 1 = 1$
- $2! = 2 * 1! = 2 * 1 * 1 = 2$
- $3! = 3 * 2! = 3 * 2 * 1 * 1 = 6$
- $4! = 4 * 3! = 4 * 3 * 2 * 1 * 1 = 24$

14

Multi-line loop body

```

System.out.println("+-----+");
for (int i = 1; i <= 3; i++) {
    System.out.println("\    /");
    System.out.println("/    \");
}
System.out.println("+-----+");

```

Output:

```

+-----+
\    /
/    \
\    /
/    \
\    /
/    \
+-----+

```

15

Expressions for counter

```

int highTemp = 5;
for (int i = -3; i <= highTemp / 2; i++) {
    System.out.println(i * 1.8 + 32);
}

```

- This computes the Fahrenheit equivalents for -3 degrees Celsius to 2 degrees Celsius.

Output:

```

26.6
28.4
30.2
32.0
33.8
35.6

```

16

System.out.print

- Prints without moving to a new line
 - allows you to print partial messages on the same line

```
int highestTemp = 5;
for (int i = -3; i <= highestTemp / 2; i++) {
    System.out.print((i * 1.8 + 32) + " ");
}
```

- Output:

26.6 28.4 30.2 32.0 33.8 35.6

- Concatenate " " to separate the numbers

17

Clicker 2

- How many asterisks are output by the following code?

```
for(int i = -2; i <= 13; i++) {
    System.out.print("*");
    System.out.print("**");
}
```

- A. 0 B. 15 C. 45
D. 48 E. 68

18

Counting down

- The **<update>** can use -- to make the loop count down.
 - The **<test>** must say > instead of < (or logic error)

```
System.out.print("T-minus ");
for (int i = 10; i >= 1; i--) {
    System.out.print(i + ", ");
}
System.out.println("blastoff!");
System.out.println("The end.");
```

- Output:

T-minus 10, 9, 8, 7, 6, 5, 4, 3, 2, 1, blastoff!
The end.

19

Practice Problem

- Newton's method for approximating square roots adapted from the Dr. Math website
The goal is to find the square root of a number. Let's call it num
- 1. Choose a rough approximation of the square root of num, call it approx.
 - How to choose?
- 2. Divide num by approx and then average the quotient with approx,
 - in other words we want to evaluate the expression $((\text{num}/\text{approx}) + \text{approx}) / 2$
- 3. How close are we? In programming we would store the result of the expression back into the variable approx.
- 4. How do you know if you have the right answer?

20

Sample of Newton's Method

num	approx	$((\text{num}/\text{approx}) + \text{approx})/2$	$\text{approx} * \text{approx}$
12	6	$(12 / 6 + 6) / 2 = 4$	16
12	4	$(12 / 4 + 4) / 2 = 3.5$	12.25
12	3.5	$(12 / 3.5 + 3.5) / 2 = 3.4642857...$	12.0012..
12	3.4642857	$= 3.46410162...$	12.00000003
12	3.46410162	$= 3.46410161...$	11.999999999

3.4641016151377544 after 5 steps

3.4641016151377545870548926830117 (from calculator)

21

Nested loops

reading: 2.3

22

Nested loops

- **nested loop:** A loop placed inside another loop.

```
for (int i = 1; i <= 5; i++) {  
    for (int j = 1; j <= 10; j++) {  
        System.out.print("*");  
    }  
    System.out.println();    // to end the line  
}
```

- **Output:**

```
*****  
*****  
*****  
*****  
*****
```

- The outer loop repeats 5 times; the inner one 10 times.
 - "sets and reps" exercise analogy

23

Nested for loop exercise

- What is the output of the following nested for loops?

```
for (int i = 1; i <= 5; i++) {  
    for (int j = 1; j <= i; j++) {  
        System.out.print("*");  
    }  
    System.out.println();  
}
```

- **Output:**

```
*  
**  
***  
****  
*****
```

24

Nested for loop exercise

- What is the output of the following nested for loops?

```
for (int i = 1; i <= 5; i++) {  
    for (int j = 1; j <= i; j++) {  
        System.out.print(i);  
    }  
    System.out.println();  
}
```

- Output:

```
1  
22  
333  
4444  
55555
```

25

Clicker 3

- What is output by the following code?

```
int total = 0;  
for(int i = 1; i <= 4; i++) {  
    for(int j = 1; j <= i; j++) {  
        total += i;  
    }  
}  
System.out.println(total);
```

A. 4 B. 10 C. 16 D. 24 E. 30

26

Common errors

- Both of the following sets of code produce *infinite loops*:

```
for (int i = 1; i <= 5; i++) {  
    for (int j = 1; i <= 10; j++) {  
        System.out.print("*");  
    }  
    System.out.println();  
}
```

```
for (int i = 1; i <= 5; i++) {  
    for (int j = 1; j <= 10; i++) {  
        System.out.print("*");  
    }  
    System.out.println();  
}
```

27

Complex output

- Write a nested for loop to produce the following output.
inner loop (repeated characters on each line)

```
....1  
...2  
..3  
.4  
5
```

outer loop (loops 5 times because there are 5 lines)

- We must build multiple complex lines of output using:
 - an *outer "vertical" loop* for each of the lines
 - an *inner "horizontal" loop(s)* for the patterns within each line

28

Outer and inner loop

- First write the outer loop, from 1 to the number of lines.

```
for (int line = 1; line <= 5; line++) {  
    ...  
}
```

- Now look at the line contents. Each line has a pattern:
 - some dots (0 dots on the last line), then a number

```
....1  
...2  
..3  
.4  
5
```

- Observation: the number of dots is related to the line number.

Mapping loops to numbers

```
for (int count = 1; count <= 5;  
    count++) {  
    System.out.print( ... );  
}
```

- What statement in the body would cause the loop to print:

4 7 10 13 16

```
for (int count = 1; count <= 5; count++) {  
    System.out.print(3 * count + 1 + " ");  
}
```

30

Loop tables

- What statement in the body would cause the loop to print:
2 7 12 17 22
- To see patterns, make a table of `count` and the numbers.
 - Each time `count` goes up by 1, the number should go up by 5.
 - But `count * 5` is too great by 3, so we subtract 3.

count	number to print	5 * count	5 * count - 3
1	2	5	2
2	7	10	7
3	12	15	12
4	17	20	17
5	22	25	22

31

Loop tables question

- What statement in the body would cause the loop to print:
17 13 9 5 1
- Let's create the loop table together.
 - Each time `count` goes up 1, the number printed should ...
 - But this multiple is off by a margin of ...

count	number to print	-4 * count	-4 * count + 21
1	17	-4	17
2	13	-8	13
3	9	-12	9
4	5	-16	5
5	1	-20	1

32

Another view: Slope-intercept

- ▶ The next three slides present the mathematical basis for the loop tables.

count (x)	number to print (y)
1	2
2	7
3	12
4	17
5	22

33

Another view: Slope-intercept

- ▶ **Caution:** This is algebra, not assignment!
- ▶ Recall: slope-intercept form ($y = mx + b$)
- ▶ Slope is defined as “rise over run” (i.e. rise / run). Since the “run” is always 1 (we increment along x by 1), we just need to look at the “rise”. The rise is the difference between the y values. Thus, the slope (m) is the difference between y values; in this case, it is +5.
- ▶ To compute the y -intercept (b), plug in the value of y at $x = 1$ and solve for b . In this case, $y = 2$.

$$y = m * x + b$$

$$2 = 5 * 1 + b$$

$$\text{Then } b = -3$$

- ▶ So the equation is

$$y = m * x + b$$

$$y = 5 * x - 3$$

$$y = 5 * \text{count} - 3$$

count (x)	number to print (y)
1	2
2	7
3	12
4	17
5	22

34

Another view: Slope-intercept

- ▶ Algebraically, if we always take the value of y at $x = 1$, then we can solve for b as follows:

$$y = m * x + b$$

$$y_1 = m * 1 + b$$

$$y_1 = m + b$$

$$b = y_1 - m$$

- ▶ In other words, to get the y -intercept, just subtract the slope from the first y value ($b = 2 - 5 = -3$)

– This gets us the equation

$$y = m * x + b$$

$$y = 5 * x - 3$$

$$y = 5 * \text{count} - 3$$

(which is exactly the equation from the previous slides)

35

Nested for loop exercise

- ▶ Make a table to represent any patterns on each line.

....1

...2

..3

.4

5

line	# of dots	$-1 * \text{line}$	$-1 * \text{line} + 5$
1	4	-1	4
2	3	-2	3
3	2	-3	2
4	1	-4	1
5	0	-5	0

- ▶ To print a character multiple times, use a for loop.

```
for (int j = 1; j <= 4; j++) {
    System.out.print(".");    // 4 dots
}
```

36

Nested for loop solution

► Answer:

```
for (int line = 1; line <= 5; line++) {  
    for (int j = 1; j <= (-1 * line + 5); j++) {  
        System.out.print(".");  
    }  
    System.out.println(line);  
}
```

► Output:

```
....1  
...2  
..3  
.4  
5
```

37

Nested for loop exercise

► What is the output of the following nested for loops?

```
for (int line = 1; line <= 5; line++) {  
    for (int j = 1; j <= (-1 * line + 5); j++) {  
        System.out.print(".");  
    }  
    for (int k = 1; k <= line; k++) {  
        System.out.print(line);  
    }  
    System.out.println();  
}
```

► Answer:

```
....1  
...22  
..333  
.4444  
55555
```

38

Nested for loop exercise

► Modify the previous code to produce this output:

```
....1  
...2.  
..3..  
.4...  
5....
```

```
for (int line = 1; line <= 5; line++) {  
    for (int j = 1; j <= (-1 * line + 5); j++) {  
        System.out.print(".");  
    }  
    System.out.print(line);  
    for (int j = 1; j <= (line - 1); j++) {  
        System.out.print(".");  
    }  
    System.out.println();  
}
```

39
