"Hopefully, you’ve played around a bit with The Oracle of Bacon at Virginia and discovered how few steps are necessary to link just about anybody who has ever been in a movie to Kevin Bacon, but could there be some actor or actress who is even closer to the center of the Hollywood universe?.

By processing all of the almost half of a million people in the Internet Movie Database I discovered that there are currently 1160 people who are better centers than Kevin Bacon! … By computing the average of these numbers we see that the average (Sean) Connery Number is about 2.682 making Connery a better center than Bacon”

-Who is the Center of the Hollywood Universe?, University of Virginia

That was in 2001.
In 2013 Harvey Keitel has become the center of the Hollywood Universe. Connery is 136th.
Bacon has moved up to 370th.

Leonhard Euler (1707 - 1783)
- One of the first mathematicians to study graphs

The Seven Bridges of Konigsberg Problem
- Konigsberg is now called Kaliningrad

A puzzle for the residents of the city
- The river Pregel flows through the city
- 7 bridges crossed the river
- Can you cross all bridges while crossing each bridge only once? An Eulerian Circuit

---

Konigsberg and the River Pregel

A

B

C

D

---

Clicker 1

How many solutions does the Seven Bridges of Konigsberg Problem have?
A. 0
B. 1
C. 2
D. 3
E. >= 4
How to Solve

- Brute Force?
- Euler's Solution
  - Redraw the map as a graph (really a multigraph as opposed to a simple graph, 1 or 0 edges per pair of vertices)

![Graph Diagram]

Euler's Proposal

- A connected graph has an Euler tour (cross every edge exactly one time and end up at starting node) if and only if every vertex has an even number of edges
  - Eulerian Circuit
- Clicker 2 - What if we reduce the problem to only crossing each edge (bridge) exactly once?
  - Doesn't matter if we end up where we started
  - Eulerian Trail
  - A. 0    B. 1   C. 2   D. 3   E. >= 4

Graph Definitions

- A graph is comprised of a set of vertices (nodes) and a set of edges (links, arcs) connecting the vertices
  - An edge connects 2 vertices
- In a directed graph edges are one-way
  - Movement allowed from first node to second, but not second to first
  - Directed graphs also called digraphs
- In an undirected graph edges are two-way
  - Movement allowed in either direction

Definitions

- In a weighted graph the edge has cost or weight that measures the cost of traveling along the edge
- A path is a sequence of vertices connected by edges
  - The path length is the number of edges
  - The weighted path length is the sum of the cost of the edges in a path
- A cycle is a path of length 1 or more that starts and ends at the same vertex
  - A directed acyclic graph is a directed graph with no cycles
Scientists (and academics of ALL kinds) use graphs to model all kinds of things.

Make the Ocean Blue
More Definitions

- A **dense** graph is one with a "large" number of edges
  - maximum number of edges?
- A **sparse** graph is one in which the number of edges is "much less" than the maximum possible number of edges
  - No standard cutoff for dense and sparse graphs

Graph Representation

- For dense graphs the adjacency matrix is a reasonable choice
  - For weighted graphs change booleans to double or int
  - Can the adjacency matrix handle directed graphs?
- Most graphs are sparse, not dense
- For sparse graphs an **adjacency list** is an alternative that uses less space
- Each vertex keeps a list of edges indicating the vertices it is connected to.

Graph Implementation

```java
public class Graph
{
    private static final double INFINITY = Double.MAX_VALUE;
    private Map<String, Vertex> vertices;

    public Graph() // create empty Graph
    {
    }

    public void addEdge(String source, String dest, double cost)
    {
    }

    // find all paths from given vertex
    public void findUnweightedShortestPath(String startName)
    {
    }

    // called after findUnweightedShortestPath
    public void printPath(String destName)
    {
    }
}
```

Graph Class

- This Graph class stores vertices
- Each vertex has an adjacency list
  - what vertices does it connect to?
- shortest path method finds all paths from start vertex to every other vertex in graph
- after shortest path method called queries can be made for path length from start node to destination node
Vertex Class (nested in Graph)

```java
private static class Vertex
    private String name;
    private List<Edge> adjacent;

    public Vertex(String n)
    // for shortest path algorithms
    private double distance;
    private Vertex prev;
    private int scratch;

    // call before finding new paths
    public void reset()
```

Edge Class (nested in Graph)

```java
private static class Edge
    private Vertex dest;
    private double cost;

    private Edge(Vertex d, double c)
```

Unweighted Shortest Path

- Given a vertex, S (for start) find the shortest path from S to all other vertices in the graph
- Graph is unweighted (set all edge costs to 1)

6 Degrees of Wikipedia

- [https://www.sixdegreesofwikipedia.com/](https://www.sixdegreesofwikipedia.com/)
Word Ladders

- Agree upon dictionary
- Start word and end word of same length
- Change one letter at a time to form step
- Step must also be a word
- Example: Start = silly, end = funny

Clicker 3 - Graph Representation

- What are the vertices and when does an edge exist between two vertices?

<table>
<thead>
<tr>
<th>Vertices</th>
<th>Edges</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Letters</td>
<td>Words</td>
</tr>
<tr>
<td>B. Words</td>
<td>Words that share one or more letters</td>
</tr>
<tr>
<td>C. Letters</td>
<td>Words that share one or more letters</td>
</tr>
<tr>
<td>D. Words</td>
<td>Words that differ by one letter</td>
</tr>
<tr>
<td>E. Words</td>
<td>Letters</td>
</tr>
</tbody>
</table>

Clicker 4 - Size of Graph

- Number of vertices and edges depends on dictionary
- Modified Scrabble dictionary, 5 letter words
- Words are vertices
  - 8660 words
- Edge exists between word if they are one letter different
  - 24,942 edges

Is this graph sparse or dense?

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>

<tbody>
<tr>
<td>A.</td>
<td>Sparse</td>
</tr>
<tr>
<td>B.</td>
<td>Dense</td>
</tr>
</tbody>
</table>

Max number of edges = \( \frac{N \times (N - 1)}{2} \)

\( 37,493,470 \)
Clicker 5 - Unweighted Shortest Path Algorithm

- Problem: Find the **shortest word ladder** between two words if one exists
- What kind of search should we use?

A. Breadth First Search  
B. Depth First Search  
C. Either one

**Unweighted Shortest Path Algorithm**

- Set distance of start to itself to 0
- Create a queue and add the start vertex
- while the queue is not empty
  - remove front
  - loop through all edges of current vertex
    - get vertex edge connects to
    - if this vertex has not been visited (have not found path to the destination of the edge)
      - sets its distance to current distance + 1
      - sets its previous vertex to current vertex
      - add new vertex to queue

---

**Portion of Graph**

```
smarm  
\  /  
smart  
/   \  
\    /   
smalt  
\  /  
scart
```

**Start at "smart" and enqueue it**

```
smarm 
/  
smart
/   
\    /   
smalt  
\  /  
scart
```
Dequeue (smart), loop through edges [swart]

Dequeue (smart), loop through edges [swart, start]

Dequeue (smart), loop through edges [swart, start, scart]

Dequeue (smart), loop through edges [swart, start, scart, smalt]
Deque (smart), loop through edges
[smart, start, scart, smalt, smarm]

Done with smart, dequeue (swart)
[start, scart, smalt, smarm]

loop through edges of swart (start already present)
[start, scart, smalt, smarm]

loop through edges of swart (scart already present)
[start, scart, smalt, smarm]
loop through edges of swart
[start, scart, smalt, smarm, swarm]

loop through edges of swart
[start, scart, smalt, smarm, swarm, sware]

Unweighted Shortest Path

- Implement method
demo
how is path printed?
The *diameter* of a graph is the longest shortest path in the graph
How to find?
How to find center of graph?
- many measures of centrality
  - ours: vertex connected to the largest number of other vertices with the shortest average path length

Positive Weighted Shortest Path

- Edges in graph are weighted and all weights are positive
- Similar solution to unweighted shortest path
- Dijkstra's algorithm
- Edsger W. Dijkstra (1930–2002)
- UT Professor 1984 - 2000
- Algorithm developed in 1956 and published in 1959.
**Dijkstra on Creating the Algorithm**

- What is the shortest way to travel from Rotterdam to Groningen, in general: from given city to given city. It is the algorithm for the shortest path, which I designed in about twenty minutes. One morning I was shopping in Amsterdam with my young fiancée, and tired, we sat down on the café terrace to drink a cup of coffee and I was just thinking about whether I could do this, and I then designed the algorithm for the shortest path. As I said, it was a twenty-minute invention. In fact, it was published in ’59, three years later. The publication is still readable, it is, in fact, quite nice. One of the reasons that it is so nice was that I designed it without pencil and paper. I learned later that one of the advantages of designing without pencil and paper is that you are almost forced to avoid all avoidable complexities. Eventually that algorithm became, to my great amazement, one of the cornerstones of my fame.

---

---

**Dijkstra's Algorithm**

- Pick the start vertex
- Set the cost of the start vertex to 0 and all other vertices to INFINITY
- While there are unvisited vertices:
  - Let the current vertex be the vertex with the lowest cost path from start to it that has not yet been visited
  - mark current vertex as visited
  - for each edge from the current vertex
    - if the sum of the cost of the current vertex and the cost of the edge is less than the cost of the destination vertex
      - update the cost of the destination vertex
      - set the previous of the destination vertex to the current vertex
      - THIS IS NOT VISITING THE NEIGHBORING VERTEX

---

**Vertex Class (nested in Graph)**

```java
private static class Vertex
    private String name;
    private List<Edge> adjacent;
    public Vertex(String n)
        // for shortest path algorithms
        private double distance;
        private Vertex prev;
        private int scratch;
        // call before finding new paths
        public void reset()
```
Clicker 6 - What is the cost of the lowest cost path from A to E?
A. 5  
B. 17  
C. 20  
D. 28  
E. 37

A is start vertex
Set cost of A to 0, all others to INFINITY
Place A in a priority queue

[(A,0)] pq
dequeue (A,0)
Mark A as visited

[] pq
current vertex A:
loop through A's edges
if sum of cost from A to dest is less than current cost
update cost and prev
[ ] pq
A -> B, 0 + 1 < INFINITY
[(B,1)] pq

[(B,1), (C, 7)] pq
A -> C, 0 + 7 < INFINITY
[(B,1), (C, 7)] pq

[(B,1), (C, 7), (G, 17)] pq
current vertex B:
loop through B's edges
if sum of cost from B to edge is less than current cost
update cost and prev

[(B,1), (C, 7), (G, 17)] pq

[(B,1), (C, 7), (G, 17)] pq
[(C, 7), (G, 17)] pq
B -> C, 1 + 3 < 7
update C's cost and previous
[(C, 4), (C, 7), (G, 17)] pq

[(C, 4), (C, 7), (G, 17)] pq
B -> D, 1 + 21 < INFINITY
[(C, 4), (C, 7), (G, 17), (D, 22)] pq

[(C, 4), (C, 7), (G, 17), (D, 22)] pq
C -> A, 7 + 4 !< 0, skip
[(C, 7), (G, 17), (D, 22)] pq
C -> A, 7 + 4 !< 0, skip
[(C, 7), (G, 17), (D, 22)] pq
C -> B, 4 + 3 <= 1, skip

[(C, 7), (G, 17), (D, 22)] pq
C -> F, 4 + 3 < INFINITY
[(C, 7), (F, 7), (G, 17), (D, 22)] pq

current vertex is C
Already visited so skip

[(F, 7), (G, 17), (D, 22)] pq
current vertex is F
loop through F's edges
[(G, 17), (D, 22)] pq
F -> C, 7 + 3 ≤ 4, so skip

[(G, 17), (D, 22)] pq
F -> D, 7 + 4 < 22
update D's cost and previous

[(D, 11), (G, 17), (D, 22)] pq

current vertex is D
loop through D's edges

[(D, 11), (G, 17), (D, 22)] pq
D -> B, 11 + 21 ≤ 1, so skip
[(G, 17), (D, 22)] pq
D -> E, 11 + 6 < INFINITY
update E's cost and previous

[(G, 17), (E, 17), (D, 22)] pq

D -> F, 4 + 11 !< 7, so skip

[(G, 17), (D, 22)] pq
D -> G, 11 + 5 < 17
update G's cost and previous

[(G, 16), (G, 17), (E, 17), (D, 22)] pq

current vertex is G
loop though edges, already visited all neighbors
Implementing Dijkstra's

- Create a Path class to allow for multiple distances to a given vertex

```java
private static class Path implements Comparable<Path> {
    private Vertex dest;
    private double cost;
}
```

- Use a priority queue of Paths to store the vertices and distances

Why? References!!!

- Slide 74 and 75, adding new, lower cost path to Vertex D
- Abstractly: \([(G, 17), (D, 22)] \) became \([(D, 11), (G, 17), (D, 22)] \)
- What does priority queue store? **References to Vertex Objects**

<table>
<thead>
<tr>
<th>Vertex</th>
<th>name</th>
<th>distance</th>
</tr>
</thead>
<tbody>
<tr>
<td>G</td>
<td></td>
<td>17</td>
</tr>
<tr>
<td>D</td>
<td></td>
<td>22</td>
</tr>
</tbody>
</table>
Lower Cost Path to D

- New, lower cost path to D. Alter Vertex D's distance to 11 and add to priority queue

- PROBLEMS?????
- Abstractly [(D, 11), (G, 17), (D, 11)]

Alternatives to Dijkstra's Algorithm

- **A**, pronounced "A Star"
- A heuristic, goal of finding shortest weighted path from single start vertex to goal vertex
- Uses actual distance like Dijkstra's but also estimates remaining cost or distance
  - distance is set to current distance from start PLUS the estimated distance to the goal
- For example when finding a path between towns, estimate the remaining distance as the straight-line (as the crow flies) distance between current location and goal.

Spanning Tree

- **Spanning Tree**: A tree of edges that connects all the vertices in a graph

Clicker 7 - Minimum Spanning Tree

- **Minimum Spanning Tree**: A spanning tree in a weighted graph with the lowest total cost
  - used in network design, taxonomy, Image registration, and more!
Prim's Algorithm

- Pick a vertex arbitrarily from graph
  - In other words, it doesn't matter which one
- Add lowest cost edge between the tree and a vertex that is not part of the tree UNTIL every vertex is part of the tree
- Greedy Algorithm, very similar to Dijkstra's

Lowest cost edge from tree to vertex not in Tree?
2 from D to A (or C)

Lowest cost edge from tree to vertex not in Tree?
2 from D to C (OR from A o B)
Prim's Algorithm

- Lowest cost edge from tree to vertex not in Tree?
