There's nothing in your head the sorting hat can't see. So try me on and I will tell you where you ought to be.

- The Sorting Hat, *Harry Potter and the Sorcerer's Stone*

**Searching**

Given an array or list of data find the location of a particular value or report that value is not present

- linear search
  - intuitive approach?
  - start at first item
  - is it the one I am looking for?
  - if not go to next item
  - repeat until found or all items checked

- If items not sorted or unsortable this approach is necessary

**Sorting and Searching**

- Fundamental problems in computer science and programming
- Sorting done to make searching easier
- Multiple different algorithms to solve the same problem
  - How do we know which algorithm is "better"?
- Look at searching first
- Examples use arrays of ints to illustrate algorithms
Linear Search

/* pre: data != null
   post: return the index of the first occurrence
   of target in data or -1 if target not present in
   data */

public int linearSearch(int[] data, int target) {
    for (int i = 0; i < data.length; i++)
        if (data[i] == target)
            return i;
    return -1;
}

Linear Search, Generic

/* pre: data != null, no elements of data == null
   target != null
   post: return the index of the first occurrence
   of target in data or -1 if target not present in
   data */

public int linearSearch(Object[] data, Object target) {
    for (int i = 0; i < data.length; i++)
        if (target.equals(data[i]))
            return i;
    return -1;
}

T(N) ? Big O? Best case, worst case, average case?

Clicker 1

- What is the average case Big O of linear search in an array with N items, if an item is present once?
  A. O(1)
  B. O(logN)
  C. O(N)
  D. O(NlogN)
  E. O(N^2)

Searching in a Sorted Array or List

- If items are sorted then we can divide and conquer
  - dividing your work in half with each step
    - generally a good thing
  - The Binary Search with array in ascending order
    - Start at middle of list
    - is that the item?
    - If not is it less than or greater than the item?
    - less than, move to second half of list
    - greater than, move to first half of list
    - repeat until found or sub list size = 0
Binary Search

Is middle item what we are looking for? If not is it more or less than the target item? (Assume lower)

And so forth...

public static int bsearch(int[] data, int target) {
    int indexOfTarget = -1;
    int low = 0;
    int high = data.length - 1;
    while(indexOfTarget == -1 && low <= high ) {
        int mid = low + ((high - low) / 2);
        if( data[mid] == target )
            indexOfTarget = mid;
        else if( data[mid] < target)
            low = mid + 1;
        else
            high = mid - 1;
    }
    return indexOfTarget;
}

// mid = (low + high) / 2; // may overflow!!!
// or mid = (low + high) >>> 1; using bitwise op

Variables of Interest?

Clicker 2

What is the worst case Big O of binary search in an array with N items, if an item is present?

A. O(1)
B. O(logN)
C. O(N)
D. O(NlogN)
E. O(N²)
Generic Binary Search

```java
public static <T extends Comparable<? super T>> int bsearch(T[] data, T target) {
    int result = -1;
    int low = 0;
    int high = data.length - 1;
    while (result == -1 && low <= high) {
        int mid = low + ((high - low) / 2);
        int compareResult = target.compareTo(data[mid]);
        if (compareResult == 0)
            result = mid;
        else if (compareResult > 0)
            low = mid + 1;
        else
            high = mid - 1; // compareResult < 0
    }
    return result;
}
```

Recursive Binary Search

```java
public static int bsearch(int[] data, int target) {
    return bsearch(data, target, 0, data.length - 1);
}

public static int bsearch(int[] data, int target, int low, int high) {
    if (low <= high) {
        int mid = low + ((high - low) / 2);
        if (data[mid] == target)
            return mid;
        else if (data[mid] > target)
            return bsearch(data, target, low, mid - 1);
        else
            return bsearch(data, target, mid + 1, high);
    }
    return -1;
}
```

// Clicker 3 Is this a recursive backtracking algorithm?
A. NO
B. YES

Other Searching Algorithms

- Interpolation Search
  - more like what people really do
- Indexed Searching
- Binary Search Trees
- Hash Table Searching
- best-first
- A*
Sorting
- A fundamental application for computation
- Done to make finding data (searching) faster
- Many different algorithms for sorting
- One of the difficulties with sorting is working with a fixed size storage container (array)
  - if resize, that is expensive (slow)
- The simple sorts are slow
  - bubble sort
  - selection sort
  - insertion sort

Selection Sort

Algorithm
- Search through the data and find the smallest element
- swap the smallest element with the first element
- repeat starting at second element and find the second smallest element

```
public static void selectionSort(int[] data) {
    for (int i = 0; i < data.length - 1; i++) {
        int min = i;
        for (int j = i + 1; j < data.length; j++)
            if (data[j] < data[min])
                min = j;
        int temp = data[i];
        data[i] = data[min];
        data[min] = temp;
    }
}
```

Selection Sort in Practice

```
44 68 191 119 119 37 83 82 191 45 158 130 76 153 39 25
```

What is the T(N), actual number of statements executed, of the selection sort code, given an array of N elements? What is the Big O?

Generic Selection Sort

```
public static <T extends Comparable<? super T>>
void selectionSort(T[] data) {
    for(int i = 0; i < data.length - 1; i++) {
        int min = i;
        for(int j = i + 1; j < data.length; j++)
            if( data[min].compareTo(data[j]) > 0 )
                min = j;
        T temp = data[i];
        data[i] = data[min];
        data[min] = temp;
    }
}
```
Insertion Sort

- Another of the $O(N^2)$ sorts
- The first item is sorted
- Compare the second item to the first
  - if smaller swap
- Third item, compare to item next to it
  - need to swap
  - after swap compare again
- And so forth…

Insertion Sort Code

```java
public void insertionSort(int[] data) {
    for(int i = 1; i < data.length; i++) {
        int temp = data[i];
        int j = i;
        while(j > 0 && temp < data[j - 1]){
            // swap elements
            data[j] = data[j - 1];
            data[j - 1] = temp;
            j--;
        }
    }
}
```

Best case, worst case, average case Big O?

Clicker 4 - Comparing Algorithms

- Which algorithm do you think has a smaller $T(N)$ given random data, selection sort or insertion sort?
  A. Insertion Sort
  B. Selection Sort
  C. About the same
