Processing: Basic Shapes

Elements of Graphics
CS324e

Processing Language

- ❖ Java-based syntax for achieving graphics functionality
- ❖ Incorporates usual programming language features:
 - ❖ Functions
 - ❖ Comments
 - ❖ Expressions

Primitive Data Types

- ❖ boolean
- ❖ byte
- ❖ char
- ❖ int
- ❖ float
- ❖ color

Example Processing Setup

```
void setup() {  
    size(200, 200);  
}
```

Draw Loop

- ❖ Code inside `setup()` runs once
- ❖ Code inside `draw()` runs as a continuous loop

```
void draw( ) {  
    background( 102 );  
}
```

Variable scope

- ❖ Variables declared within a block are **local** to that block
- ❖ Global variables are declared outside of all blocks
- ❖ What is the relationship between global variables, `setup()` and `draw()`?

Consider...

```
int x = 0;  
void setup() {  
    x += 3;  
}
```

```
void draw() {  
    x++;  
}
```

Coordinate Systems

- ❖ Coordinate systems define the “space” of the scene within the computer
- ❖ Common coordinate systems:
 - ❖ World coordinate system
 - ❖ Object coordinate system
 - ❖ Camera coordinate system
 - ❖ Screen coordinate system
- ❖ Multiple coordinate systems allow for multiple levels of interaction
 - ❖ Multiple coordinate systems also require conversion between systems

Screen Coordinate System

- ❖ 2-D, pixel-based coordinate system
- ❖ Based on the size (resolution) of the screen / window
- ❖ Pixel position defined using (x, y) coordinate notion

Defining Geometry in Processing

- ❖ Function `point(x, y)` defines a pixel within the window
- ❖ Function `line(x1, y1, x2, y2)` defines a line of pixels between $(x1, y1)$ and $(x2, y2)$

`point(x, y)`

`line(x1, y1, x2, y2)`

Shape Primitives

- ❖ Other shape primitives in Processing:

- ❖ `rect(a,b,c,d)`

- ❖ `ellipse(a,b,c,d)`

- ❖ `triangle(x1,y1,x2,y2,x3,y3)`

- ❖ `quad(x1,y1,x2,y2,x3,y3,x4,y4)`

`rect(a, b, c, d)`

`triangle(x1, y1, x2, y2, x3, y3)`

`quad(x1, y1, x2, y2, x3, y3, x4, y4)`

`ellipse(a, b, c, d)`

Curves

- ❖ `arc(a,b,c,d,start,stop)`
- ❖ `bezier(x1,y1,x2,y2,x3,y3,x4,y4)`

`arc(a, b, c, d, start, stop)`

`bezier(x1, y1, x2, y2, x3, y3, x4, y4)`

- ❖ `arc` models elliptical arcs
- ❖ `arc` expects radians (0 to 2π) rather than degrees (0 to 360) by default
- ❖ `bezier` models cubic Bezier curves
- ❖ Bezier curves are
 - ❖ Smooth
 - ❖ Scalable
 - ❖ Parametric
- ❖ `bezierVertex` can model higher order Bezier curves
 - ❖ We will come back to this concept later in the semester

Hands-on: Creating Geometry

❖ Today's activities:

1. Create a Processing sketch
2. Use the `point`, `line`, `rect`, `ellipse`, `triangle`, and `quad` methods at least two times each
3. Create at least one shape with the `arc` method
4. Create at least one shape with the `bezier` method
